1. Introduction to trace components

Fast Models provides an interface called Model Trace Interface (MTI) which enables the generation and capture of trace events during a simulation.

MTI represents trace using a hierarchy, as shown in this figure:

Figure 1-1: MTI hierarchy

Each platform contains a set of trace components. Each trace component can contain one or more trace sources. Each trace source can contain one or more data fields.

A trace source provides information about a specific event that occurred, for example an instruction that was executed, a cache miss, or an MMU translation. It can also be a model-specific event, such as a `sync` event, which occurs at every quantum boundary. While the simulation is running, each trace source generates a stream of trace events.

The fields within the trace source give more information about the event, including a text description. When the field is of type `MTI_ENUM`, the values for this field are also listed.

For example, the `pvcache` trace component has several trace sources, one of which is `CACHE_READ_MISS`, which has the following fields:

```
Source CACHE_READ_MISS (Read access cache miss and cache miss latency.)
  Field IS_SHARED type:MTI_ENUM size:1 (Is the access shared)
    0x0 = NON_SHARED
    0x1 = SHARED
  Field IS_PRELOAD type:MTI_ENUM size:1 (Is the access a preload)
    0x0 = NOT_PRELOAD
    0x1 = PRELOAD
  Field MANAGER_ID type:MTI_UNSIGNED_INT size:4 (Indicates the manager ID
associated with this monitor)
  Field LATENCY type:MTI_UNSIGNED_INT size:8 (Cache miss latency in ticks per
access)
```

Most consumers of trace events are MTI plug-ins, which might respond to events by logging them, increasing a counter, or updating the state of the model. Arm provides several pre-built MTI plug-ins for capturing trace or for listing the available trace sources. They are documented in [Plug-ins for Fast Models](#) in *Fast Models Reference Guide*. Source code for some of these plug-ins and for other example plug-ins is provided in `$PVLIB_HOME/examples/MTI/`.

2. Fast Models trace components

This chapter describes all trace components in Fast Models.

2.1 AHCI_SATA

This section describes the trace sources.

AHCI_REG_GHC_READ

GHC Register read access to AHCI. Fields:

ADDRESS unsigned int

Address Offset within GHC space.

DATA unsigned int

Data returned by this register.

GHC_REGISTER enum

Name of the GHC register.

AHCI_REG_GHC_WRITE

GHC Register write access to AHCI. Fields:

ADDRESS unsigned int

Address Offset within GHC space.

DATA unsigned int

Data written to this register.

GHC_REGISTER enum

Name of the GHC register.

AHCI_REG_PORT_READ

PORT Register read access to AHCI. Fields:

ADDRESS unsigned int

Address Offset within PORTx space.

DATA unsigned int

Data returned by this register.

PORT unsigned int

SATA port number.

PORTx_REGISTER enum

Name of the PORTx register.

AHCI_REG_PORT_WRITE

PORT Register write access to AHCI. Fields:

ADDRESS unsigned int

Address Offset within PORTx space.

DATA unsigned int

Data written to this register.

PORT unsigned int

SATA port number.

PORTx_REGISTER enum

Name of the PORTx register.

ATA_COMMAND

ATA command received by SATA device. Fields:

COMMAND enum

ATA Command.

FIS_COUNT unsigned int

Raw value of the Count field in the FIS. (Sector count for non-NCQ commands.).

FIS_DEVICE unsigned int

Raw value of the Device fields on the FIS. Bit 6 indicates LBA (28 or 48 bit access).

FIS_FEATURE unsigned int

Raw value of the Feature field in the FIS. (Sector count for NCQ commands.).

LBA unsigned int

Starting sector index.

PORT unsigned int

SATA port number (0-31).

SECTOR_COUNT unsigned int

Sector count.

ATA_COMMAND_HEADER

ATA Command header. Fields:

CFIS_LEN unsigned int

CFIS length.

CMD_TABLE_BASE unsigned int

Command table Base.

IS_WRITE bool

Write?.

PORT unsigned int

SATA port number (0-31).

PRD_COUNT unsigned int

Number of PRDs.

PRD_TABLE_LEN unsigned int

PRD table length.

ArchMsg.Error.invalid_access_width

Access with invalid access width in AHCI. Fields:

ACCESS_WIDTH unsigned int

Access Width to a register.

ADDRESS unsigned int

Address Offset within GHC space.

DATA unsigned int

Data with access width of 32 bits.

ArchMsg.Error.invalid_register

Access to invalid register offsets in AHCI. Fields:

ADDRESS unsigned int

Address Offset within GHC or port space.

PORT unsigned int

SATA port number or 0xff for GHC.

CFIS

Command FIS. Fields:

CFIS unsigned int

CFIS content.

PORT unsigned int

SATA port number (0-31).

CMD_SLOT

Command Slot in Command List. Fields:

CMD_SLOT unsigned int

Command Slot.

PORT unsigned int

SATA port number (0-31).

DATA_READ

Data read from ahci_dma_m. Fields:

ADDRESS unsigned int

Address.

DATA unsigned int

Data Read.

PORT unsigned int

SATA port number (0-31).

DATA_READ_ABORT

The data read by the device aborted. Fields:

ADDR **unsigned int**

Address.

NS **bool**

Non-secure access.

PORT **unsigned int**

SATA port number (0-31).

SIZE **unsigned int**

The data size in bytes.

DATA_WRITE

Data write from ahci_dma_m. Fields:

ADDRESS **unsigned int**

Address.

DATA **unsigned int**

Data Write.

PORT **unsigned int**

SATA port number (0-31).

DATA_WRITE_ABORT

The data write by the device aborted. Fields:

ADDR **unsigned int**

Address.

NS **bool**

Non-secure access.

PORT **unsigned int**

SATA port number (0-31).

SIZE **unsigned int**

The data size in bytes.

FIS

FIS received by AHCI controller from SATA device. Fields:

DATA **unsigned int**

FIS content (first byte is the FIS type).

PORT **unsigned int**

SATA port number (0-31).

MSI_INTERRUPT

MSI interrupt generated by AHCI. Fields:

GHC_IS unsigned int

Contents of GHC.IS register.

MSI_VECTOR unsigned int

MSI vector number.

PORT_INTERRUPT

Interrupt generated by port. This is emitted only when the corresponding interrupt is enabled in PxlE, but regardless whether interrupts are globally enabled in GHC.IE. Fields:

INTRRUPT_TYPE enum

Interrupt type.

PORT unsigned int

SATA port number (0-31).

PRDT_ENTRY

PRDT_ENTRY. Fields:

ADDR unsigned int

PRD entry address.

COUNT unsigned int

Bytes for this PRD entry.

IRQ bool

Raise an interrupt upon completion.

PORT unsigned int

SATA port number (0-31).

SATA_BS_PERF

SATA backend storage periodic performance indicator. This allows to monitor the data throughput in terms of host time. This emits a trace event, at most once per second, which indicates the data rate for reads, writes and the sum (throughput) in the interval since the last event. An event is only generated when there was at least one read/write access in the last second. Fields:

PERF string

Throughput/read/write performance as a formatted string.

SATA_PORT unsigned int

Index of the SATA port this backend storage is attached to.

SATA_BS_READ

SATA backend storage read. Fields:

SATA_PORT unsigned int

Index of the SATA port this backend storage is attached to.

SECTOR_COUNT unsigned int

Number of sectors read (512 byte sectors).

SECTOR_INDEX unsigned int

Access starts at this sector index (512 byte sectors).

SATA_BS_READ_DATA

SATA backend storage read. This trace is issued for each individual 512-byte sector of the original access size. Fields:

DATA unsigned int

Sector Data (always 512 bytes).

SATA_PORT unsigned int

Index of the SATA port this backend storage is attached to.

SECTOR_INDEX unsigned int

Sector index of this data (512 byte sectors).

SATA_BS_TRIM

SATA backend storage trim (marking sectors as unused). Fields:

SATA_PORT unsigned int

Index of the SATA port this backend storage is attached to.

SECTOR_COUNT unsigned int

Number of sectors read (512 byte sectors).

SECTOR_INDEX unsigned int

Access starts at this sector index (512 byte sectors).

SATA_BS_WRITE

SATA backend storage write. Fields:

SATA_PORT unsigned int

Index of the SATA port this backend storage is attached to.

SECTOR_COUNT unsigned int

Number of sectors read (512 byte sectors).

SECTOR_INDEX unsigned int

Access starts at this sector index (512 byte sectors).

SATA_BS_WRITE_DATA

SATA backend storage write. This trace is issued for each individual 512-byte sector of the original access size. Fields:

DATA unsigned int

Sector Data (always 512 bytes).

SATA_PORT unsigned int

Index of the SATA port this backend storage is attached to.

SECTOR_INDEX unsigned int

Sector index of this data (512 byte sectors).

SET_FEATURE

SET FEATURE. Fields:

PARAMETER unsigned int

Sub command parameter.

PORT unsigned int

SATA port number (0-31).

SUB_COMMAND enum

Set Feature sub command.

2.2 AMBAPV2PVBUS

This section describes the trace sources.

READ_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

READ_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

2.3 AMBAPVACE2PVBUS

This section describes the trace sources.

READ_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

READ_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

LATENCY unsigned int

Time downstream (ticks).

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

WRITE_ACCESS_START

Logger. Fields:

ACCESS_SIZE unsigned int

Log2 of access size (i.e. 0=byte, 1=halfword, 2=word, 3=doubleword ...).

ACE enum

Encodes the ACE operation.

ATTR unsigned int

Transaction Attributes: [12] Instruction fetch [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

DATA unsigned int

The data transferred.

EXTENDED_ID unsigned int

The Extended ID.

MANAGER_ID unsigned int

The AXI Manager ID.

NUMBER_OF_BEATS unsigned int

The number of data transfers (beats) in this burst.

PADDR unsigned int

Physical address of access.

USER_FLAGS unsigned int

Core specific additional signals.

2.4 AMBAPVSignal2SGSignalx8

This section describes the trace sources.

ArchMsg.Warning.AMBAPVSignal2SGSignal_unconnected_warning

Unconnected Warning. DISPLAY An unconnected signal with index: %{index} and export_id: %{export_id} was toggled to state: %{state}. Fields:

export_id signed int

Received export_id.

index unsigned int

The index of unconnected toggled signal.

state bool

The toggled to Signal state.

2.5 ARM_AEM-A_MP

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZTO. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS UNPREDICTABLE DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS UNPREDICTABLE DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS UNPREDICTABLE DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the `%{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d}` translation regime (`vmid=%{VMID:x}`) without invalidating `%{INVALIDITY:(|d-side |i-side |)}` entries since power-on: `%{INVALIDITY:(|D|I)}` TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses. DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at `%{ADDR1}` with FSTATUS `%{FSTATUS1}` or `%{ADDR2}` with FSTATUS `%{FSTATUS2}`. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page. Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode. Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS UNPREDICTABLE DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS UNPREDICTABLE DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS UNPREDICTABLE DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS UNPREDICTABLE DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS UNPREDICTABLE DISPLAY Illegal or UNPREDICTABLE mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS **UNPREDICTABLE** DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS **UNPREDICTABLE** DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS **UNPREDICTABLE** DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS **UNPREDICTABLE** DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS **UNPREDICTABLE** DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS **UNPREDICTABLE** DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS **UNPREDICTABLE** DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS UNPREDICTABLE DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS UNPREDICTABLE DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS UNPREDICTABLE DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS UNPREDICTABLE DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are UNPREDICTABLE. TAGS UNPREDICTABLE. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS UNPREDICTABLE DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS UNPREDICTABLE DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED** UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `{TEXCB}` when tex remap is `{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of `VTCR.T0SZ={T0SZ:d}` and `VTCR.SL0={SL0:d}` is unpredictable. Fields:

SL0 signed int

`VTCR.SL0`, starting level for stage 2 translation table walks.

T0SZ signed int

`VTCR.T0SZ`, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable.
Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by
DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC},
target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

INST_COUNT unsigned int
The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISSET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISSET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

VALUE unsigned int
The value read.

opc1 unsigned int
opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate

when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAAE bool

Is this for an LPAAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.6 ARM_AEMv8-R_MP

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Info.invalid_region_programmed

DISPLAY MPU Stage %{STAGE:d}: Region ID %{REGION_ID:d} has base address greater than end address Base Addr=%{BASE_ADDR:x}, End Addr=%{END_ADDR:x}. Fields:

BASE_ADDR unsigned int

Base Address.

END_ADDR unsigned int

End Address.

REGION_ID unsigned int

Region ID.

STAGE unsigned int

MPU Stage.

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has been read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}.
Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

DISPLAY %{SIDE:(D|I)}-Cache was enabled but was not invalidated since power-on: cache lines could contain **UNKNOWN** content. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS UNPREDICTABLE DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS UNPREDICTABLE DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDEExpandImmUnexpectedZero

TAGS UNPREDICTABLE DISPLAY AdvSIMDEExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

TAGS UNPREDICTABLE DISPLAY SMC instruction has UNPREDICTABLE effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS UNPREDICTABLE DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEN<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int
Core number in a multi processor.

OLD_VALUE unsigned int
The old CPSR value.

UNKNOWN unsigned int
Bits within the register that have unknown value.

VALUE unsigned int
The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC **unsigned int**

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use *DESC_KIND*).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

MPU_TRANS

Address translation information. Fields:

ACCESS_STATUS enum

Access status(0xAA/0xBB/0xDD/0xEE=overlap/bg hit/default/bg fault).

CORE_NUM unsigned int

Core number in a multi processor.

EXEC_PERM enum

Execution Permission.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MEMTYPE enum

Memory type.

NSDESC enum

Is non secure access.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS accessed is secure or nonsecure memory.

READ_PERM enum

Read Permission.

REG_NUM unsigned int

MPU region-number 0-31.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE unsigned int

The translation stage.

WRITE_PERM enum

Write Permission.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYP unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRE

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.7 ARM_AEMv8M

This section describes the trace sources.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_SLAVE_ACCESS

Information on the atomic operation at slave side. Fields:

ACCESS_RESULT unsigned int

Result of atomic access.

COMPARE_VALUE unsigned int

Value to be compared with memory by CAS.

LOAD_VALUE unsigned int

Value to be loaded from memory as a result of atomic operation.

MANAGER unsigned int

ID of manager which initiated the transaction.

NS bool

Transaction is Non-Secure.

OPERAND_VALUE unsigned int

Incoming operand value provided by core.

OPERATION enum

Type of atomic operation.

PADDR unsigned int

Full physical address of TCM.

STORE_VALUE unsigned int

Value to be stored to memory as a result of atomic operation.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}.

Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dap_csw_bad_size

A write to CM3DAP CSW has an invalid size field. DISPLAY Write %{DATA} to CM3DAP CSW has invalid size field. Fields:

DATA unsigned int

bits[2:0] are size.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_frachitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %**{ADDR}**. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %**{ITSTATE}**. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.secure_vector_fetch_from_nonsecure

DISPLAY Secure vector table is being fetched from Non-secure memory.

ArchMsg.Warning.sg_in_it_block

Arm recommends that software does not place SG (security gate instruction) inside an IT instruction block.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %**{ADDR1}** with FSTATUS %**{FSTATUS1}** or %**{ADDR2}** with FSTATUS %**{FSTATUS2}**. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDEExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDEExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL
%{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or
CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only
%{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing
%{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug
register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int
index.

WVR unsigned int
DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int
Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int
Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int
New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS **UNPREDICTABLE** DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS UNPREDICTABLE DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY **%{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits)** is out of range. Must be between 25 and **%{TSIZE_MAX:d}**. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame **%{FRAME_ADDR:x}** in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to **%{TEXCB}** when tex remap is **%{TEX_REMAP}**. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=**%{TOSZ:d}** and VTCR.SL0=**%{SL0:d}** is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.warning_unpred_system_register_access

DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to system register offset %{OFFSET}. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate

(Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes

([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DTCM_ACCESS

Trace TCM accesses.

DTCM_ACCESS_RAZ_WI

Trace TCM accesses. Fields:

ADDR **unsigned int**

Address of the **RAZ/WI** access.

DWT_MATCH

DWT comparator matches. Fields:

NUM **unsigned int**

DWT comparator number.

TYPE **enum**

DWT comparator configuration.

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT **unsigned int**

Number of basic blocks exited due to page boundary since **START_COMPILE**.

FETCHFAIL_COUNT **unsigned int**

Number of basic blocks exited due to ifetch failure **START_COMPILE**.

INST_COUNT **unsigned int**

Number of instructions compiled since **START_COMPILE**.

NONSEQ_COUNT **unsigned int**

Number of basic blocks exited due to non-sequential instructions since **START_COMPILE**.

PAGE_STRADDLE_COUNT **unsigned int**

Number of basic blocks exited due to unaligned instructions crossing page since **START_COMPILE**.

EXCEPTION

Exceptions that are taken. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

ISSET **enum**

The instruction set of the processor when the exception occurred.

LR **unsigned int**

The value assigned to the link register.

NS **enum**

The core's non-secure bit.

PC unsigned int

The location where the exception occurred.

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

EXCEPTION_END

Every exception completed. Fields:

NS enum

The core's non-secure bit.

EXCEPTION_ENTRY

Event marking the entry of an exception. All pushes of registers to the stack will follow this event. Fields:

PC unsigned int

The location where the exception occurred.

VECTOR enum

The exception that occurred.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Marks the end of an exception, but on an M core does not indicate a program flow change (branch). In most situations it will be followed by an indirect branch. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

PC unsigned int

The address of the branch instruction.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started. Fields:

NS enum

The core's non-secure bit.

EXCEPTION_VECTOR_FETCH

I-side vector fetch for M-class exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Result of fetch if OK.

RESPONSE enum

0=Aborted, 1=OK.

VADDR unsigned int

Where the vector is fetched from (including VTOR).

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INFO_EXCEPTION_REASON

Provide information of real cause of exception. Fields:

FaultCause enum

Which bit of which V7M/V8M-mainline FSR/HFSR would have been set.

PC unsigned int

The location where the exception occurred.

PHASE enum

What we are doing with the exception.

REASONS enum

Why we are doing it.

SecurityState enum

Privacy State of exception.

VECTOR enum

The exception that occurred.

INFO_FP_CONTEXT

Inform when ExecuteFPCheck writes CONTROL.FPCA and FPSCR etc. Fields:

WHAT enum

What we are doing.

INFO_STACKING

Provide information of real cause of exception. Fields:

PHASE enum

Are we starting or ending a sequence of stack writes.

REASONS enum

Why we are doing it.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

ITCM_ACCESS

Trace TCM accesses.

ITCM_ACCESS_RAZ_WI

Trace TCM accesses. Fields:

ADDR unsigned int

Address of the **RAZ/WI** access.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

LOCKUP_CYCLE

This event is triggered if the core enters or stays in the lock-up state. Fields:

CAUSE enum

What causes the lockup?.

LOCKUP_ENTRY

This event is triggered if the core enters the lock-up state. Fields:

PC unsigned int

The PC when the lockup state is entered.

LOCKUP_EXIT

This event is triggered if the core leaves the lock-up state.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

OLD_MODE enum

The old mode.

MPU_TRANS

Address translation information. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

EXEC_PERM enum

Execution Permission.

IDAU_REG_NUM enum

IDAU region-number or code.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MEMTYPE enum

Memory type.

NSDESC enum

Security-attributes of the transaction.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS accessed is secure or nonsecure memory.

READ_PERM enum

Read Permission.

REG_NUM unsigned int

MPU register based region-number 0-15 (else 0xFF=none, 0xBB/0xDD=background/default).

SAU_REG_NUM enum

SAU region-number or code.

SAU_RGN_TYPE enum

Privacy Region Type.

SH enum

Shareability.

SIDE enum

Inst / Data.

WRITE_PERM enum

Write Permission.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PPB_READ_ACCESS

Trace reads from the core to memory mapped registers in the PPB (private peripheral bus) address range. Fields:

ACCESS_SIZE unsigned int

Logarithm of the access size: 0=byte, 1=halfword, 2=word, 3=doubleword, ...

BURST_LEN unsigned int

The number of data transfers (beats) in this burst.

DATA unsigned int

The data transferred.

INNER_ATTRIBUTES unsigned int

The inner attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

INST bool

Is an instruction fetch.

LOCK enum

Normal / Locked / Exclusive.

MANAGER_ID unsigned int

The AXI manager ID.

NS bool

Is a nonsecure access.

OUTER_ATTRIBUTES unsigned int

The outer attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

PADDR unsigned int

Physical address of access.

PRIV bool

Is privileged access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

PPB_WRITE_ACCESS

Trace writes from the core to memory mapped registers in the PPB (private peripheral bus) address range. Fields:

ACCESS_SIZE unsigned int

Logarithm of the access size: 0=byte, 1=halfword, 2=word, 3=doubleword, ...

BURST_LEN unsigned int

The number of data transfers (beats) in this burst.

DATA unsigned int

The data transferred.

INNER_ATTRIBUTES unsigned int

The inner attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

INST bool

Is an instruction fetch.

LOCK enum

Normal / Locked / Exclusive.

MANAGER_ID unsigned int

The AXI manager ID.

NS bool

Is a nonsecure access.

OUTER_ATTRIBUTES unsigned int

The outer attributes: bit0=write allocate, bit1=read allocate, bit2=cachable, bit3=bufferable, bit4=shareable.

PADDR unsigned int

Physical address of access.

PRIV bool

Is privileged access.

RESPONSE enum

Whether the transaction was successful, or an error occurred.

USER_FLAGS unsigned int

Core specific additional signals.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ

Trace reads from system registers. Fields:

REG_NAME enum

Register number.

VALUE unsigned int

The value read.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

SYSREG_WRITE

Trace write to system registers. Fields:

REG_ACCESS enum

Register access status.

REG_NAME enum

Register number.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

Value written to the register.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT **unsigned int**

Ticks count when WFI wakeup occurred.

REASON **enum**

Reason for wakeup.

XPSR

Changes to the xPSR register. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

OLD_VALUE **unsigned int**

The old xPSR value.

UNKNOWN **unsigned int**

Bits within the register that have unknown value.

VALUE **unsigned int**

The new xPSR value.

2.8 ARM_C1-Nano

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZTO. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has been read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}.
Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content.
DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content
%{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_frachitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS UNPREDICTABLE DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS UNPREDICTABLE DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS UNPREDICTABLE DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
 DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS UNPREDICTABLE DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS UNPREDICTABLE DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS UNPREDICTABLE DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS UNPREDICTABLE DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS UNPREDICTABLE DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}.
Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS **IMP_DEF**. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS **UNPREDICTABLE** DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{REQUEST:d}K not implemented - using %{SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS **UNPREDICTABLE** DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS **UNPREDICTABLE** DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS **UNPREDICTABLE** DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS **UNPREDICTABLE** DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdttrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdttrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS UNPREDICTABLE DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEN<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SL0=%{SL0:d} is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCRn_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.
Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

MOPS_LD_RETIRED

Load instructions architecturally executed for MOPS.

MOPS_ST_RETIRED

Store instructions architecturally executed for MOPS. Fields:

IS_MEMCPY bool

Whether the memory operation is MEMCPY.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

Copyright © 2023–2025 Arm Limited (or its affiliates). All rights reserved.

Non-Confidential

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRE

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.9 ARM_C1-Premium

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS UNPREDICTABLE DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL
%{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or
CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only
%{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing
%{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS **IMP_DEF**. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS **IMP_DEF** DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY {%TTBR}[{%MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEN<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int

VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

ArchMsg.warning_invalid_interval_counter_reload_value

Invalid interval counter reload value in PMSIRR_EL1.INTERVAL: software should set this to a value greater than or equal to the minimum indicated by PMSIDR_EL1.Interval.

ArchMsg.warning_invalid_spe_buffer_write_pointer

Invalid value programmed in PMBPTR_EL1.PTR or PMBLIMITR_EL1.LIMIT: Current write pointer must be at least one sample record below the write limit pointer and PMBPTR_EL1.PTR[63:56] must be equal to PMBLIMITR_EL1.LIMIT[63:56].

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as log2(size in bytes).

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

VALUE unsigned int
The value read.

opc1 unsigned int
opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate

when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

MOPS_LD_RETIRED

Load instructions architecturally executed for MOPS.

MOPS_ST_RETIRED

Store instructions architecturally executed for MOPS. Fields:

IS_MEMCPY bool

Whether the memory operation is MEMCPY.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SBP_SAMPLE_COLLISION

DISPLAY Statistical profiling samples collided .

SBP_SAMPLE_DISCARDED

DISPLAY Operation discarded by statistical profiling unit when configured in discard mode.
Fields:

BUFFER_POINTER unsigned int

Value of buffer pointer.

DATA unsigned int

Data discarded.

SIZE unsigned int

Size of sample, in bytes.

SBP_SAMPLE_END

DISPLAY Statistical profiling of an operation ended.

SBP_SAMPLE_POP

DISPLAY Operation which might be sampled by statistical profiling.

SBP_SAMPLE_RECORDED

DISPLAY Operation sampled by statistical profiling has been written to the buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

SBP_SAMPLE_START

DISPLAY Statistical profiling of an operation started.

SBP_SAMPLE_TAKEN

DISPLAY Operation sampled by statistical profiling after filtering.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int
Value written to the register.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int
Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.10 ARM_C1-Pro

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID `enum`

The register identifier.

MASK `unsigned int`

Bitmask of the register to signal the modified bits in the VALUE field.

SM `bool`

Whether the PE is in Streaming Mode.

VALUE `unsigned int`

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT `unsigned int`

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR `unsigned int`

Physical Address (or 0 if unavailable).

VADDR `signed int`

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL `bool`

Memory access failed.

ADDR `unsigned int`

The virtual address of the access.

ATTR `unsigned int`

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE `unsigned int`

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDEExpandImmUnexpectedZero

TAGS UNPREDICTABLE DISPLAY AdvSIMDEExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

TAGS UNPREDICTABLE DISPLAY SMC instruction has UNPREDICTABLE effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS UNPREDICTABLE DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d};0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

ArchMsg.warning_invalid_interval_counter_reload_value

Invalid interval counter reload value in PMSIRR_EL1.INTERVAL: software should set this to a value greater than or equal to the minimum indicated by PMSIDR_EL1.Interval.

ArchMsg.warning_invalid_spe_buffer_write_pointer

Invalid value programmed in PMBPTR_EL1.PTR or PMBLIMITR_EL1.LIMIT: Current write pointer must be at least one sample record below the write limit pointer and PMBPTR_EL1.PTR[63:56] must be equal to PMBLIMITR_EL1.LIMIT[63:56].

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int
data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum
The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum
READ / WRITE.

PADDR unsigned int
The physical address of the DMI.

PTR unsigned int
DMI range pointer.

SIDE enum
DSIDE / ISIDE.

SIZE unsigned int
The size of DMI.

VADDR unsigned int
The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum
READ / WRITE.

PADDR unsigned int
The physical address of the DMI.

SIDE enum
DSIDE / ISIDE.

SIZE unsigned int
The size of the DMI.

VADDR unsigned int
The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum
READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate

(Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes

([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

MOPS_LD_RETIRED

Load instructions architecturally executed for MOPS.

MOPS_ST_RETIRED

Store instructions architecturally executed for MOPS. Fields:

IS_MEMCPY bool

Whether the memory operation is MEMCPY.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE *bool*

Authentication result.

KEY_USED *enum*

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX *unsigned int*

New POTIndex.

OLD_POTINDEX *unsigned int*

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP *enum*

Prefetch hint.

VADDR *unsigned int*

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP *enum*

Prefetch hint.

VADDR *unsigned int*

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR *unsigned int*

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR *unsigned int*

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SBP_SAMPLE_COLLISION

DISPLAY Statistical profiling samples collided .

SBP_SAMPLE_DISCARDED

DISPLAY Operation discarded by statistical profiling unit when configured in discard mode.
Fields:

BUFFER_POINTER unsigned int

Value of buffer pointer.

DATA unsigned int

Data discarded.

SIZE unsigned int

Size of sample, in bytes.

SBP_SAMPLE_END

DISPLAY Statistical profiling of an operation ended.

SBP_SAMPLE_POP

DISPLAY Operation which might be sampled by statistical profiling.

SBP_SAMPLE_RECORDED

DISPLAY Operation sampled by statistical profiling has been written to the buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

SBP_SAMPLE_START

DISPLAY Statistical profiling of an operation started.

SBP_SAMPLE_TAKEN

DISPLAY Operation sampled by statistical profiling after filtering.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRE

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int
Value written to the register.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

REGNUM enum
Internal register number.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.11 ARM_C1-Ultra

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPERn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPER<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

ArchMsg.warning_invalid_interval_counter_reload_value

Invalid interval counter reload value in PMSIRR_EL1.INTERVAL: software should set this to a value greater than or equal to the minimum indicated by PMSIDR_EL1.Interval.

ArchMsg.warning_invalid_spe_buffer_write_pointer

Invalid value programmed in PMBPTR_EL1.PTR or PMBLIMITR_EL1.LIMIT: Current write pointer must be at least one sample record below the write limit pointer and PMBPTR_EL1.PTR[63:56] must be equal to PMBLIMITR_EL1.LIMIT[63:56].

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE **unsigned int**

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

ID **enum**

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE **unsigned int**

The old value overwritten.

VALUE **unsigned int**

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID **enum**

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE **unsigned int**

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE **enum**

Current power mode of core.

REASON **string**

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE **enum**

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE **enum**

The type of instruction performing the access.

ACQREL **enum**

Is this an acquire/release.

ATTR **unsigned int**

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int
opcode 1.

opc2 unsigned int
opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP14 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc1 unsigned int
opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int
data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum
The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum
READ / WRITE.

PADDR unsigned int
The physical address of the DMI.

PTR unsigned int
DMI range pointer.

SIDE enum
DSIDE / ISIDE.

SIZE unsigned int
The size of DMI.

VADDR unsigned int
The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum
READ / WRITE.

PADDR unsigned int
The physical address of the DMI.

SIDE enum
DSIDE / ISIDE.

SIZE unsigned int
The size of the DMI.

VADDR unsigned int
The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum
READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISSET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate

(Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes

([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAAE bool

Is this for an LPAAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

MOPS_LD_RETIRED

Load instructions architecturally executed for MOPS.

MOPS_ST_RETIRED

Store instructions architecturally executed for MOPS. Fields:

IS_MEMCPY bool

Whether the memory operation is MEMCPY.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE *bool*

Authentication result.

KEY_USED *enum*

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX *unsigned int*

New POTIndex.

OLD_POTINDEX *unsigned int*

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP *enum*

Prefetch hint.

VADDR *unsigned int*

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP *enum*

Prefetch hint.

VADDR *unsigned int*

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR *unsigned int*

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR *unsigned int*

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SBP_SAMPLE_COLLISION

DISPLAY Statistical profiling samples collided .

SBP_SAMPLE_DISCARDED

DISPLAY Operation discarded by statistical profiling unit when configured in discard mode.
Fields:

BUFFER_POINTER unsigned int

Value of buffer pointer.

DATA unsigned int

Data discarded.

SIZE unsigned int

Size of sample, in bytes.

SBP_SAMPLE_END

DISPLAY Statistical profiling of an operation ended.

SBP_SAMPLE_POP

DISPLAY Operation which might be sampled by statistical profiling.

SBP_SAMPLE_RECORDED

DISPLAY Operation sampled by statistical profiling has been written to the buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

SBP_SAMPLE_START

DISPLAY Statistical profiling of an operation started.

SBP_SAMPLE_TAKEN

DISPLAY Operation sampled by statistical profiling after filtering.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int
Value written to the register.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

REGNUM enum
Internal register number.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.12 ARM_Cortex-A32

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL
%{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or
CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only
%{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing
%{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS **IMP_DEF**. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS **IMP_DEF** DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY {%TTBR}[{%MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int

VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND **enum**

The condition of the conditional instruction.

CORE_NUM **unsigned int**

Core number in a multi processor.

PC **unsigned int**

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND **enum**

The condition of the conditional instruction.

CORE_NUM **unsigned int**

Core number in a multi processor.

PC **unsigned int**

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND **enum**

The condition of the conditional instruction.

CORE_NUM **unsigned int**

Core number in a multi processor.

PC **unsigned int**

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND **enum**

The condition of the conditional instruction.

CORE_NUM **unsigned int**

Core number in a multi processor.

PC **unsigned int**

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL **unsigned int**

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED **bool**

Was the walk successful.

DATA_HIGH **unsigned int**

The data upper bits read.

DATA_LOW **unsigned int**

The data lower bits read.

IPA **unsigned int**

For stage 1, the IPA of the read.

LEVEL **unsigned int**

Translation table level.

MECID **unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID **unsigned int**

MPAM Partition ID.

MPAM_PMG **unsigned int**

MPAM Performance Monitoring Group.

MPAM_SP **unsigned int**

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.13 ARM_Cortex-A320

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDEExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDEExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPERn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPER<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.
Fields:

ACCESS_TYPE **enum**

The type of instruction performing the access.

ATTR **unsigned int**

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 **unsigned int**

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC **unsigned int**

The physical address non-secure bit.

NSDESC2 **unsigned int**

The second page physical address non-secure bit.

NUM_GRANULES **unsigned int**

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR **unsigned int**

The output physical address.

PADDR **unsigned int**

The physical address of the read.

PASmem **enum**

Physical Address Space of the accessed memory.

PASreq **enum**

Physical Address Space of the requested lookup.

REGIME_EL **enum**

Entry matches in this translation regime.

REQUESTER **enum**

The requester of this table walk.

SIDE **enum**

Inst / Data.

STAGE **unsigned int**

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED **bool**

Was the walk successful.

DATA **unsigned int**

The data written.

DESC_KIND **enum**

The encoding scheme of the descriptors used for this walk.

IPA **unsigned int**

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS **bool**

If the access was due to HACDBS_CLEAN.

LEVEL **unsigned int**

Translation table level.

LPAAE **bool**

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID **unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID **unsigned int**

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT **unsigned int**

Ticks count at point of transition.

NEW **enum**

New run state.

OLD **enum**

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC **unsigned int**

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 **bool**

Use EL2 translation regime.

NS **bool**

Is Non-Secure.

REG_WIDTH **unsigned int**

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL **enum**

Signal that changed.

STATE **bool**

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE **enum**

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REGNUM enum
Internal register number.

REGNUM_OPERAND enum
Register number corresponding to the instruction operand.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at
%{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISSET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.14 ARM_Cortex-A34

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZTO. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}.

Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_frachitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS UNPREDICTABLE DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS UNPREDICTABLE DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPERn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPER<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int
Core number in a multi processor.

OLD_VALUE unsigned int
The old CPSR value.

UNKNOWN unsigned int
Bits within the register that have unknown value.

VALUE unsigned int
The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR **unsigned int**

The physical address of the access.

PADDR_TAG **unsigned int**

If tag checked, the physical address tag for the access.

PAS **enum**

The physical address space of the page.

RESPONSE **enum**

0=Aborted, 1=OK.

SIZE **unsigned int**

The size of zero'd memory in bytes.

TAG_CHECKED **bool**

Is this access tag checked.

VADDR **unsigned int**

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT **enum**

Description of event.

VALUE **unsigned int**

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET **enum**

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION **enum**

READ / WRITE.

PADDR **unsigned int**

The physical address of the DMI.

PTR **unsigned int**

DMI range pointer.

SIDE **enum**

DSIDE / ISIDE.

SIZE **unsigned int**

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC **unsigned int**

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int
Value written to the register.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

REGNUM enum
Internal register number.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISSET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.15 ARM_Cortex-A35

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. **DISPLAY** %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcmvac_matches_watchpoint

TAGS **UNPREDICTABLE** **DISPLAY** Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** **DISPLAY** Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** **DISPLAY** VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** **DISPLAY** Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** **DISPLAY** Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** **DISPLAY** Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int
vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int
reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int
Exception level of translation regime.

INVALIDITY unsigned int
Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool
Whether the translation regime is non-secure.

PAS unsigned int
Physical address space of translation regime.

VMID unsigned int
Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int
Possible FAR address 1.

ADDR2 unsigned int
Possible FAR address 2.

FSTATUS1 unsigned int
Possible fault status value 1.

FSTATUS2 unsigned int
Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS.

Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page. Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode. Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPERn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPER<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int
Core number in a multi processor.

OLD_VALUE unsigned int
The old CPSR value.

UNKNOWN unsigned int
Bits within the register that have unknown value.

VALUE unsigned int
The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC **unsigned int**

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE **unsigned int**

Size of the page.

VADDR **unsigned int**

Base virtual address of page.

VMID **unsigned int**

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE unsigned int

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM *unsigned int*

Core number in a multi processor.

MODE *enum*

The new mode.

NON_SECURE *enum*

The core's new non-secure bit.

OLD_MODE *enum*

The old mode.

SECURITY_STATE *enum*

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM *unsigned int*

Core number in a multi processor.

INST_COUNT *unsigned int*

The instruction count of this CPU.

PC *unsigned int*

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP *enum*

Counter group.

COUNTER_RANGE *enum*

Counter range.

EVENT_ID *unsigned int*

Event Identifier, field is valid only for Event counter group.

INDEX *unsigned int*

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT *bool*

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int
Value written to the register.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

REGNUM enum
Internal register number.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISSET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.16 ARM_Cortex-A510

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has been read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}.
Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content.
DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content
%{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_frachitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS UNPREDICTABLE DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS UNPREDICTABLE DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS UNPREDICTABLE DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
 DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS UNPREDICTABLE DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS UNPREDICTABLE DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS UNPREDICTABLE DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS UNPREDICTABLE DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS UNPREDICTABLE DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}.
Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS **IMP_DEF**. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS **UNPREDICTABLE** DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}K not implemented - using %{{SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS **UNPREDICTABLE** DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{{ATTR}} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS **UNPREDICTABLE** DISPLAY %{{IS_BREAKPOINT:(Watchpoint|Breakpoint)}} programmed with a reserved combination of HMC, SSC and %{{IS_BREAKPOINT:(PAC|PMC)}}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS **UNPREDICTABLE** DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS **UNPREDICTABLE** DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS UNPREDICTABLE DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SL0=%{SL0:d} is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.
Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE **unsigned int**

Integer representation of DEVPACTIVE[] signals.

NEW_STATE **enum**

Operating mode after the transition.

OLD_STATE **enum**

Operating mode before the transition.

REASON **string**

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE **unsigned int**

Integer representation of DEVPACTIVE[] signals.

NEW_STATE **enum**

Power mode after the transition.

OLD_STATE **enum**

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE **unsigned int**

Integer representation of DEVPACTIVE[] signals.

NEW_STATE **enum**

Power mode after the transition.

OLD_STATE **enum**

Power mode before the transition.

REASON **string**

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE **unsigned int**

Integer representation of DEVPACTIVE[] signals.

NEW_STATE **enum**

Operating mode after the transition.

OLD_STATE **enum**

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL *enum*

Signal that changed.

STATE *bool*

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE *enum*

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM *unsigned int*

Core number in a multi processor.

MODE *enum*

Which of the banked SPSR registers is written.

OLD_VALUE *unsigned int*

The old SPSR value.

VALUE *unsigned int*

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR *unsigned int*

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END *unsigned int*

Final address.

ADDR_START *unsigned int*

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END *unsigned int*

Final address.

ADDR_START *unsigned int*

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int
Value written to the register.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG enum
Register number.

UNKNOWN unsigned int
Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at `%{BUFFER_ADDRESS}` with size `%{SIZE}` and data `%{DATA}`. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is `ACCESS_SIZE * NUMBER_OF_BEATS`).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR **unsigned int**

Virtual tag virtual address.

VADDR **unsigned int**

Data Virtual address.

VIRTUAL_TAG **unsigned int**

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

ISET **enum**

Origin instruction set.

IS_COND **bool**

Indicates if this is a conditional waypoint.

PC **unsigned int**

Origin address (or 0 if unavailable).

TAKEN **bool**

Indicates if this waypoint was taken.

TARGET **unsigned int**

Destination address.

TARGET_ISET **enum**

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT **unsigned int**

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT **unsigned int**

Ticks count.

REASON **enum**

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.17 ARM_Cortex-A520

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS UNPREDICTABLE DISPLAY AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

TAGS UNPREDICTABLE DISPLAY SMC instruction has UNPREDICTABLE effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS UNPREDICTABLE DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPERn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEPER<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR **unsigned int**

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS **string**

Disassembly of the instruction.

ISET **enum**

The instruction set of this instruction.

ITSTATE **unsigned int**

The ITSTATE current for the instruction.

OPCODE **unsigned int**

The opcode of the instruction.

PC **unsigned int**

The address of the instruction.

SIZE **unsigned int**

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

NS **bool**

Secure or nonsecure banked register is accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE **bool**

Architectural Context Synchronization Event.

PC **unsigned int**

The address of the synchronization instruction.

SYSREG_SYNC **bool**

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as \log_2 (size in bytes).

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.
Fields:

ACCESS_TYPE **enum**

The type of instruction performing the access.

ATTR **unsigned int**

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 **unsigned int**

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC **unsigned int**

The physical address non-secure bit.

NSDESC2 **unsigned int**

The second page physical address non-secure bit.

NUM_GRANULES **unsigned int**

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR **unsigned int**

The output physical address.

PADDR **unsigned int**

The physical address of the read.

PASmem **enum**

Physical Address Space of the accessed memory.

PASreq **enum**

Physical Address Space of the requested lookup.

REGIME_EL **enum**

Entry matches in this translation regime.

REQUESTER **enum**

The requester of this table walk.

SIDE **enum**

Inst / Data.

STAGE **unsigned int**

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED **bool**

Was the walk successful.

DATA **unsigned int**

The data written.

DESC_KIND **enum**

The encoding scheme of the descriptors used for this walk.

IPA **unsigned int**

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS **bool**

If the access was due to HACDBS_CLEAN.

LEVEL **unsigned int**

Translation table level.

LPAE **bool**

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID **unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID **unsigned int**

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT **unsigned int**

Ticks count at point of transition.

NEW **enum**

New run state.

OLD **enum**

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC **unsigned int**

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 **bool**

Use EL2 translation regime.

NS **bool**

Is Non-Secure.

REG_WIDTH **unsigned int**

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL **enum**

Signal that changed.

STATE **bool**

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE **enum**

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned intPage size as $\log_2(\text{size in bytes})$.**PAS enum**

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REGNUM enum
Internal register number.

REGNUM_OPERAND enum
Register number corresponding to the instruction operand.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at %{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISSET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.18 ARM_Cortex-A520AE

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_frachitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS UNPREDICTABLE DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS UNPREDICTABLE DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=

{VMID:x}) without invalidating {INVALIDITY:(|d-side |i-side |)} entries since power-on: {INVALIDITY:(|D||I)} TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at {ADDR1} with FSTATUS {FSTATUS1} or {ADDR2} with FSTATUS {FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at {ADDR1} Offset {OFFSET} BAS {BAS} for a {IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number {N:d} Breakpoint address {ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS.
Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS UNPREDICTABLE DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS UNPREDICTABLE DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}.
Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED **UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}K not implemented - using %{{SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{{ATTR}} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{{IS_BREAKPOINT:(Watchpoint|Breakpoint)}} programmed with a reserved combination of HMC, SSC and %{{IS_BREAKPOINT:(PAC|PMC)}}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEN<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int
unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback
TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib
TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int
texcb value.

TEX_REMAP bool
use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0
TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int
VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int
VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR
TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int
data attempted to be written.

OLD unsigned int
previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR
TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register
TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access
TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas
TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCRn_EL1.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCRn_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc={PC}, target opcode={OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: {MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND **enum**

The condition of the conditional instruction.

CORE_NUM **unsigned int**

Core number in a multi processor.

PC **unsigned int**

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL **unsigned int**

Inclusive end address for VA or PA requests.

NS **bool**

Non-secure world for PA.

START **unsigned int**

Start address for VA or PA requests.

TYPE **enum**

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR **unsigned int**

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR **unsigned int**

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS **string**

Disassembly of the instruction.

ISSET **enum**

The instruction set of this instruction.

ITSTATE **unsigned int**

The ITSTATE current for the instruction.

OPCODE **unsigned int**

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int
Core number in a multi processor.

OLD_VALUE unsigned int
The old CPSR value.

UNKNOWN unsigned int
Bits within the register that have unknown value.

VALUE unsigned int
The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC **unsigned int**

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL *enum*

Signal that changed.

STATE *bool*

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE *enum*

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM *unsigned int*

Core number in a multi processor.

MODE *enum*

Which of the banked SPSR registers is written.

OLD_VALUE *unsigned int*

The old SPSR value.

VALUE *unsigned int*

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR *unsigned int*

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END *unsigned int*

Final address.

ADDR_START *unsigned int*

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END *unsigned int*

Final address.

ADDR_START *unsigned int*

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at `{BUFFER_ADDRESS}` with size `{SIZE}` and data `{DATA}`. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is `ACCESS_SIZE * NUMBER_OF_BEATS`).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR **unsigned int**

Virtual tag virtual address.

VADDR **unsigned int**

Data Virtual address.

VIRTUAL_TAG **unsigned int**

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

ISET **enum**

Origin instruction set.

IS_COND **bool**

Indicates if this is a conditional waypoint.

PC **unsigned int**

Origin address (or 0 if unavailable).

TAKEN **bool**

Indicates if this waypoint was taken.

TARGET **unsigned int**

Destination address.

TARGET_ISET **enum**

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT **unsigned int**

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT **unsigned int**

Ticks count.

REASON **enum**

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.19 ARM_Cortex-A53

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL
%{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or
CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only
%{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing
%{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode ({NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode ({MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS **IMP_DEF**. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS **IMP_DEF** DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY {%TTBR}[{%MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEN<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int

VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED **bool**

Was the walk successful.

DATA_HIGH **unsigned int**

The data upper bits read.

DATA_LOW **unsigned int**

The data lower bits read.

IPA **unsigned int**

For stage 1, the IPA of the read.

LEVEL **unsigned int**

Translation table level.

MECID **unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID **unsigned int**

MPAM Partition ID.

MPAM_PMG **unsigned int**

MPAM Performance Monitoring Group.

MPAM_SP **unsigned int**

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR **unsigned int**

The output physical address.

PADDR **unsigned int**

The physical address of the write.

PASmem **enum**

Physical Address Space of the accessed memory.

PASreq **enum**

Physical Address Space of the requested lookup.

REGIME_EL **enum**

Entry matches in this translation regime.

SIDE **enum**

Inst / Data.

STAGE **unsigned int**

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

The new mode.

NON_SECURE **enum**

The core's new non-secure bit.

OLD_MODE **enum**

The old mode.

SECURITY_STATE **enum**

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

INST_COUNT **unsigned int**

The instruction count of this CPU.

PC **unsigned int**

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.20 ARM_Cortex-A55

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at **%{ADDR}** Offset **%{OFFSET}**. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range **%{LOWER_BOUND}** to **%{UPPER_BOUND}**. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range **%{LOWER_BOUND}** to **%{UPPER_BOUND}**. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDEExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDEExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory
%{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h})
to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS
instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS
IMP_DEF. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory
and contain an SG instruction is CONSTRAINED **UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this
instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is
IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{{ATTR}} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{{IS_BREAKPOINT:(Watchpoint|Breakpoint)}} programmed with a reserved combination of HMC, SSC and %{{IS_BREAKPOINT:(PAC|PMC)}}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY `%{TTBR}[%{MSB:d}:0]` should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdttrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address `%{ADDR}` in X0/R0 when DBGDTTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdttrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address `%{ADDR}` in X0/R0 when DBGDTTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory `%{ADDR}`. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Strongly Ordered Memory `%{ADDR}`. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS UNPREDICTABLE DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS UNPREDICTABLE DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS UNPREDICTABLE DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int

VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP14 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc1 unsigned int
opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace active and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied active and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace active and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied active and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 **bool**

Use EL2 translation regime.

NS **bool**

Is Non-Secure.

REG_WIDTH **unsigned int**

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL **enum**

Signal that changed.

STATE **bool**

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE **enum**

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

Which of the banked SPSR registers is written.

OLD_VALUE **unsigned int**

The old SPSR value.

VALUE **unsigned int**

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR **unsigned int**

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END **unsigned int**

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

REGNUM enum
Internal register number.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.21 ARM_Cortex-A57

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID `enum`

The register identifier.

MASK `unsigned int`

Bitmask of the register to signal the modified bits in the VALUE field.

SM `bool`

Whether the PE is in Streaming Mode.

VALUE `unsigned int`

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT `unsigned int`

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR `unsigned int`

Physical Address (or 0 if unavailable).

VADDR `signed int`

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL `bool`

Memory access failed.

ADDR `unsigned int`

The virtual address of the access.

ATTR `unsigned int`

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE `unsigned int`

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE: (Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL
%{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or
CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only
%{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing
%{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode ({NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode ({MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS **IMP_DEF**. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS **IMP_DEF** DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY {%TTBR}[{%MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEN<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int

VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED **bool**

Was the walk successful.

DATA_HIGH **unsigned int**

The data upper bits read.

DATA_LOW **unsigned int**

The data lower bits read.

IPA **unsigned int**

For stage 1, the IPA of the read.

LEVEL **unsigned int**

Translation table level.

MECID **unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID **unsigned int**

MPAM Partition ID.

MPAM_PMG **unsigned int**

MPAM Performance Monitoring Group.

MPAM_SP **unsigned int**

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.22 ARM_Cortex-A65

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSm:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSm unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at **%{ADDR}** Offset **%{OFFSET}**. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range **%{LOWER_BOUND}** to **%{UPPER_BOUND}**. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range **%{LOWER_BOUND}** to **%{UPPER_BOUND}**. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDEExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDEExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page. Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory
%{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h})
to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS
instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS
IMP_DEF. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory
and contain an SG instruction is CONSTRAINED **UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this
instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is
IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdttrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in XO/RO when DBGDTTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdttrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in XO/RO when DBGDTTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS UNPREDICTABLE DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS UNPREDICTABLE DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int

VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP14 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc1 unsigned int
opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 **bool**

Use EL2 translation regime.

NS **bool**

Is Non-Secure.

REG_WIDTH **unsigned int**

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL **enum**

Signal that changed.

STATE **bool**

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE **enum**

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

Which of the banked SPSR registers is written.

OLD_VALUE **unsigned int**

The old SPSR value.

VALUE **unsigned int**

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR **unsigned int**

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END **unsigned int**

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

REGNUM enum
Internal register number.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.23 ARM_Cortex-A65AE

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDEExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDEExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory
%{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h})
to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS
instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS
IMP_DEF. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory
and contain an SG instruction is CONSTRAINED **UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this
instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is
IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdttrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in XO/RO when DBGDTTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdttrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in XO/RO when DBGDTTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS UNPREDICTABLE DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS UNPREDICTABLE DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SL0=%{SL0:d} is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc={PC}, target opcode={OPCODE}. PRIMARY KEY PC. Fields:

BTTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: {MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP14 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc1 unsigned int
opcode 1.

opc2 unsigned int
opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace active and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied active and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace active and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied active and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 **bool**

Use EL2 translation regime.

NS **bool**

Is Non-Secure.

REG_WIDTH **unsigned int**

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL **enum**

Signal that changed.

STATE **bool**

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE **enum**

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

Which of the banked SPSR registers is written.

OLD_VALUE **unsigned int**

The old SPSR value.

VALUE **unsigned int**

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR **unsigned int**

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END **unsigned int**

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

REGNUM enum
Internal register number.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.24 ARM_Cortex-A710

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS UNPREDICTABLE DISPLAY AdvSIMDExpandImm may treat this immediate value as UNPREDICTABLE.

ArchMsg.Warning.warning_ConditionalSMC

TAGS UNPREDICTABLE DISPLAY SMC instruction has UNPREDICTABLE effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS UNPREDICTABLE DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPERn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPER<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSize signed int

Value of TSize.

TSize_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned intPage size as $\log_2(\text{size in bytes})$.**PAS enum**

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE **enum**

The type of instruction performing the access.

ATTR **unsigned int**

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 **unsigned int**

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC **unsigned int**

The physical address non-secure bit.

NSDESC2 **unsigned int**

The second page physical address non-secure bit.

NUM_GRANULES **unsigned int**

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAAE boolIs this for an LPAAE translation (*DEPRECATED*, use DESC_KIND).**MECID unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT **unsigned int**

Ticks count at point of transition.

NEW **enum**

New run state.

OLD **enum**

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC **unsigned int**

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 **bool**

Use EL2 translation regime.

NS **bool**

Is Non-Secure.

REG_WIDTH **unsigned int**

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL **enum**

Signal that changed.

STATE **bool**

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE **enum**

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

CRn unsigned int
CRn.

NS bool
Secure or nonsecure banked register is accessed.

REGNUM enum
Internal register number.

REGNUM_OPERAND enum
Register number corresponding to the instruction operand.

REGNUM_PHYS enum
Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

opc0 unsigned int
opcode 0.

opc2 unsigned int
opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at
%{BUFFER_ADDRESS} with size %{SIZE} and data %{DATA}. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISSET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.25 ARM_Cortex-A715

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID enum

The register identifier.

MASK unsigned int

Bitmask of the register to signal the modified bits in the VALUE field.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT unsigned int

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR unsigned int

Physical Address (or 0 if unavailable).

VADDR signed int

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL bool

Memory access failed.

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_frachitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}. PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS UNPREDICTABLE DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS UNPREDICTABLE DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=

{VMID:x}) without invalidating {INVALIDITY:(|d-side |i-side |)} entries since power-on: {INVALIDITY:(|D||)} TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at {ADDR1} with FSTATUS {FSTATUS1} or {ADDR2} with FSTATUS {FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at {ADDR1} Offset {OFFSET} BAS {BAS} for a {IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number {N:d} Breakpoint address {ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS.
Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS UNPREDICTABLE DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS UNPREDICTABLE DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS UNPREDICTABLE DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}.
Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only %{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS UNPREDICTABLE DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing %{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS UNPREDICTABLE DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS UNPREDICTABLE DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS UNPREDICTABLE DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS UNPREDICTABLE DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS UNPREDICTABLE DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS UNPREDICTABLE DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED **UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}K not implemented - using %{{SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{{ATTR}} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{{IS_BREAKPOINT:(Watchpoint|Breakpoint)}} programmed with a reserved combination of HMC, SSC and %{{IS_BREAKPOINT:(PAC|PMC)}}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS UNPREDICTABLE DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS UNPREDICTABLE DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEN<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int
unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback
TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib
TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int
texcb value.

TEX_REMAP bool
use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0
TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int
VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int
VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR
TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int
data attempted to be written.

OLD unsigned int
previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR
TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register
TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access
TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas
TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND **enum**

The condition of the conditional instruction.

CORE_NUM **unsigned int**

Core number in a multi processor.

PC **unsigned int**

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL **unsigned int**

Inclusive end address for VA or PA requests.

NS **bool**

Non-secure world for PA.

START **unsigned int**

Start address for VA or PA requests.

TYPE **enum**

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR **unsigned int**

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR **unsigned int**

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS **string**

Disassembly of the instruction.

ISSET **enum**

The instruction set of this instruction.

ITSTATE **unsigned int**

The ITSTATE current for the instruction.

OPCODE **unsigned int**

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int
opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int
Core number in a multi processor.

CRm unsigned int
CRm.

NS bool
Secure or nonsecure banked register is accessed.

REG_NAME string
Name of the CP15 register accessed.

SECURITY_STATE enum
The current security state.

UNDEF bool
The register accessed is undefined.

UPDATED_VALUE unsigned int
Updated value of the register now it has been written.

VALUE unsigned int
The new value written.

opc unsigned int
opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int
Core number in a multi processor.

OLD_VALUE unsigned int
The old CPSR value.

UNKNOWN unsigned int
Bits within the register that have unknown value.

VALUE unsigned int
The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:{up|down}}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE **bool**

The instruction is executed in debug state.

ISET **enum**

The current instruction set.

MODE **enum**

The mode the core is in.

NS **enum**

The current Secure State.

PC **unsigned int**

The address of the conditional instruction.

SECURITY_STATE **enum**

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC **unsigned int**

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as $\log_2(\text{size})$.

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

TRBU_BUFFER_WRAP

DISPLAY Trace buffer current write pointer wrapped.

TRBU_TRIGGER_EVENT

DISPLAY Trace buffer Trigger Event.

TRBU_WRITE

DISPLAY PETU trace data has been written to the TRBU memory buffer at `%{BUFFER_ADDRESS}` with size `%{SIZE}` and data `%{DATA}`. Fields:

BUFFER_ADDRESS unsigned int

Virtual Address of start of buffer write.

DATA unsigned int

Data written to the buffer.

SIZE unsigned int

Size of sample written to buffer, in bytes.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is `ACCESS_SIZE * NUMBER_OF_BEATS`).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR **unsigned int**

Virtual tag virtual address.

VADDR **unsigned int**

Data Virtual address.

VIRTUAL_TAG **unsigned int**

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

ISET **enum**

Origin instruction set.

IS_COND **bool**

Indicates if this is a conditional waypoint.

PC **unsigned int**

Origin address (or 0 if unavailable).

TAKEN **bool**

Indicates if this waypoint was taken.

TARGET **unsigned int**

Destination address.

TARGET_ISET **enum**

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT **unsigned int**

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT **unsigned int**

Ticks count.

REASON **enum**

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.26 ARM_Cortex-A72

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS **UNPREDICTABLE** DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective. DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D||I)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accesses
DISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.
Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.
Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL
%{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 (%{CP10}) or
CP11 (%{CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value %{LEVEL} with only
%{IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for %{REGISTER} were not obeyed, causing
%{ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable %{IS_WRITE:(read|write)} access to debug register offset %{OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode ({NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode ({MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is **CONSTRAINED UNPREDICTABLE** TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is **IMPLEMENTATION DEFINED** whether stack pointer limit checking is performed for this instruction TAGS **IMP_DEF**. Fields:

ADDRESS unsigned int

Address of instruction.

OPCODE unsigned int

instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS **IMP_DEF** DISPLAY Memory attribute has Tagged, non shared memory type; it is **IMPLEMENTATION DEFINED** whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is **IMPLEMENTATION DEFINED** TAGS **IMP_DEF**. Fields:

DATA unsigned int

data attempted to be written.

PPB_OFFSET unsigned int

debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG{%TG_ID:(0|1)} bits have been set to a granule size {%REQUEST:d}K not implemented - using {%SUBSTITUTE:d}K. Fields:

REQUEST signed int

page size requested (or 0 for reserved).

SUBSTITUTE signed int

best guess available page size.

TG_ID bool

bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute {%ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY {%IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and {%IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY {%TTBR}[{%MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS **UNPREDICTABLE** DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPEn<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS **UNPREDICTABLE** DISPLAY Changing the priority of an active exception is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS **UNPREDICTABLE** DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS **UNPREDICTABLE** DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS **UNPREDICTABLE** DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS **UNPREDICTABLE** DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is **UNPREDICTABLE** when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS **UNPREDICTABLE** DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS **UNPREDICTABLE** DISPLAY Access to PMU counters from non-secure EL0 or EL1 is **UNPREDICTABLE** with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS **UNPREDICTABLE** DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame %{FRAME_ADDR:x} in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to %{TEXCB} when tex remap is %{TEX_REMAP}. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=%{TOSZ:d} and VTCR.SLO=%{SLO:d} is unpredictable. Fields:

SLO signed int

VTCR.SLO, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** setting a pending bit to 1 for an exception with priority >= execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS **UNPREDICTABLE** DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS **UNPREDICTABLE** DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int

access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS **UNPREDICTABLE** DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int

pstate.BTYPE at time branch taken.

OPCODE unsigned int

opcode at branch target.

PC unsigned int

Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string

The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int

Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISSET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED **bool**

Was the walk successful.

DATA_HIGH **unsigned int**

The data upper bits read.

DATA_LOW **unsigned int**

The data lower bits read.

IPA **unsigned int**

For stage 1, the IPA of the read.

LEVEL **unsigned int**

Translation table level.

MECID **unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID **unsigned int**

MPAM Partition ID.

MPAM_PMG **unsigned int**

MPAM Performance Monitoring Group.

MPAM_SP **unsigned int**

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data written.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT unsigned int

Ticks count at point of transition.

NEW enum

New run state.

OLD enum

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC unsigned int

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 bool

Use EL2 translation regime.

NS bool

Is Non-Secure.

REG_WIDTH unsigned int

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL enum

Signal that changed.

STATE bool

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE enum

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

UNALIGNED_LDST_RETIRED

Processor unaligned load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1=>half-word, 2->word ...).

NUMBER_OF_BEATS unsigned int

Number of accesses (beats) in this burst (Total size in bytes is ACCESS_SIZE * NUMBER_OF_BEATS).

VADDR unsigned int

The virtual address of the access.

VFP_D_REGS

VFP/NEON D 64 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_D_REGS_READ

VFP/NEON D 64 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VFP_Q_REGS

VFP/NEON Q 128 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding byte in the register. For example, 0x1 would indicate a write to VALUE[7:0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_Q_REGS_READ

VFP/NEON Q 128 bit register read. Fields:

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a read to the corresponding byte in the register. For example, 0x1 would indicate a read to VALUE[7:0].

VALUE unsigned int

The current value of the register.

VFP_SYS_REGS

Writes to the VFP/NEON units system registers. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

Which VFP system register is written.

MASK unsigned int

The mask indicating updated cumulative bits.

OLD_VALUE unsigned int

The register's old value overwritten.

VALUE unsigned int

The new value written to the VFP system register.

VFP_S_REGS

VFP/NEON S 32 bit register write. Fields:

ALIASING enum

Type of register aliasing used.

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number.

MASK unsigned int

Each bit indicates a write to the corresponding bit in the register. For example, 0x1 would indicate a write to VALUE[0].

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

VFP_S_REGS_READ

VFP/NEON S 32 bit register read. Fields:

ID unsigned int

The register number.

VALUE unsigned int

The current value of the register.

VIRTUAL_TAG_ALLOCATED

Virtual tag information when allocated. Fields:

TAG_VADDR unsigned int

Virtual tag virtual address.

VADDR unsigned int

Data Virtual address.

VIRTUAL_TAG unsigned int

Virtual tag value.

WAYPOINT

Signals end of basic block execution. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ISET enum

Origin instruction set.

IS_COND bool

Indicates if this is a conditional waypoint.

PC unsigned int

Origin address (or 0 if unavailable).

TAKEN bool

Indicates if this waypoint was taken.

TARGET unsigned int

Destination address.

TARGET_ISET enum

Destination instruction set.

WFE_END

WFE ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFE.

WFE_EVENT_REGISTER

WFE event register status: set/clear, reason. Fields:

INST_COUNT unsigned int

Ticks count.

REASON enum

Reason for set/clear. Only REASON==0 (Cleared by WFE) clears the bit, all other reasons set it.

WFE_IGNORED

WFE ignored. Fields:

EVENT bool

This WFE was ignored because the event register was set.

INST_COUNT unsigned int

Ticks count when ignoring WFE.

TRAPPED bool

This WFE was trapped.

WFE_START

WFE entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFE.

WFI_END

WFI ended. Fields:

INST_COUNT unsigned int

Ticks count when leaving WFI.

WFI_IGNORED

WFI ignored. Fields:

DISABLED bool

This WFI was ignored because WFI is disabled.

INST_COUNT unsigned int

Ticks count when ignoring WFI.

REASON enum

specifies reason why WFI trace was ignored.

TRAPPED bool

This WFI was trapped.

WFI_START

WFI entered. Fields:

INST_COUNT unsigned int

Ticks count when entering WFI.

WFI_WAKEUP

WFI wakeup. Fields:

INST_COUNT unsigned int

Ticks count when WFI wakeup occurred.

REASON enum

Reason for wakeup.

2.27 ARM_Cortex-A720

This section describes the trace sources.

AA64_ASE_SVE_REGS

Modification of AArch64 Advanced SIMD or SVE Vector Registers (via SIMD or Scalar operations), SVE Predicate Registers and ZT0. Fields:

ID **enum**

The register identifier.

MASK **unsigned int**

Bitmask of the register to signal the modified bits in the VALUE field.

SM **bool**

Whether the PE is in Streaming Mode.

VALUE **unsigned int**

Value of AArch64 vector register.

ASYNC_MEMORY_FAULT

Context ID Register write. Fields:

FAULT **unsigned int**

Fault status present in ESR.ISS encoding for Serror in ARCH64 and present in DFSR encoding for external abort format in ARCH32.

PADDR **unsigned int**

Physical Address (or 0 if unavailable).

VADDR **signed int**

Virtual Address (or 0 if unavailable).

ATOMIC_END_ACCESS

Bus trace access for atomics. Fields:

ACCESS_FAIL **bool**

Memory access failed.

ADDR **unsigned int**

The virtual address of the access.

ATTR **unsigned int**

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE **unsigned int**

Compare value for CAS.

LOAD_VALUE unsigned int

Loaded values.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ATOMIC_START_ACCESS

Bus trace access for atomics. Fields:

ADDR unsigned int

The virtual address of the access.

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

COMPARE_VALUE unsigned int

Compare value for CAS.

NSDESC unsigned int

The security state of the access.

OPERAND_VALUE unsigned int

Operation's operand.

OPERATION enum

Operation type.

PADDR unsigned int

The physical address of the access.

PRIV bool

Is this a privileged access?.

ArchMsg.Error.exit_code

DISPLAY exit code: %{EXITCODE} component kind: %{KIND} reason: %{REASON}. Fields:

EXITCODE signed int

Exit code to be returned.

KIND string

Component kind that invoked the exit code trace.

REASON string

Reason why the exit code trace was invoked (optional).

ArchMsg.Warning.IgnoredWarmResetRequest

Event fires when software attempts to request warm reset through write to deprecated DBGPRCR.CWRR.

ArchMsg.Warning.RAS_ErrselrUnpredictableState

DISPLAY ERRSELR is in unpredictable state due to value greater than number_of_error_records written to it.

ArchMsg.Warning.RAS_UnpredictableStateWrite

DISPLAY %{REG_NAME} write ignored due to unpredictable ERRSELR state. Fields:

REG_NAME string

Name of register being written.

ArchMsg.Warning.ReportedRevisionRegisterRead

DISPLAY Reported revision and patch do not match that of the cpu. Fields:

ORIGINAL_VALUE unsigned int

The value the register would have based on the modelled revision.

REGISTER string

The name of the register that has ben read.

REPORTED_VALUE unsigned int

The value the register has been overridden to.

ArchMsg.Warning.Unpredictably Indexed PM Event Register

TAGS UNPREDICTABLE DISPLAY Event %{IsDirect:(Selector value|Register)} %{SEL} is >= %{N}. Fields:

IsDirect unsigned int

Direct Access rather than indirect.

N unsigned int

Number of Accessible Registers.

SEL unsigned int

Selector.

ArchMsg.Warning.cache_contents_unknown

A cache has been activated without being invalidated and may contain **UNKNOWN** content. DISPLAY %{SIDE:(D|I)}-Cache was enabled in %{REGIME:(SECURE|NON_SECURE|HYP)} regime but was not invalidated since power-on: cache lines could contain **UNKNOWN** content %{SIDE:(Note: D-side caches must invalidate SECURE lines even if the cache is only used by NON_SECURE code in order to ensure that unexpected dirty lines tagged SECURE are not naturally evicted)}. Fields:

REGIME unsigned int

Current translation regime.

SIDE unsigned int

0 d-side cache or unified cache, 1 i-side.

ArchMsg.Warning.dcimvac_matches_watchpoint

TAGS **UNPREDICTABLE** DISPLAY Watchpoints matching an AArch32 DCIMVA are implementation defined.

ArchMsg.Warning.decode_fieldmismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with different fields %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_fracbitsnegative

TAGS **UNPREDICTABLE** DISPLAY VCVT Instruction is unpredictable with a negative number of fraction bits.

ArchMsg.Warning.decode_initblock

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block.

ArchMsg.Warning.decode_initblocknotlast

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in an IT block when not the last.

ArchMsg.Warning.decode_invalid_condition

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when the condition is not AL.

ArchMsg.Warning.decode_invalidfieldcombination

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the values in %{FIELD1} and %{FIELD2}. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_invalidvalue

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with the value in %{FIELD}. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_mem_hint_unallocated

TAGS **UNPREDICTABLE** DISPLAY There is no memory hint allocated to this bit pattern.

ArchMsg.Warning.decode_registermatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as the same register. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registermismatch

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with %{FIELD1} and %{FIELD2} as different registers. Fields:

FIELD1 enum

Field name.

FIELD2 enum

Field name.

ArchMsg.Warning.decode_registeroutofrange

TAGS **UNPREDICTABLE** DISPLAY Floating-point instruction is unpredictable indexing beyond the end of the register bank.

ArchMsg.Warning.decode_sbzsbo

TAGS **UNPREDICTABLE** DISPLAY Reserved bits in the instruction are not canonical.

ArchMsg.Warning.decode_transactiontoobig

TAGS **UNPREDICTABLE** DISPLAY Attempt to perform a memory transaction of more than 128 bytes.

ArchMsg.Warning.decode_unpred_other

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable.

ArchMsg.Warning.decode_unpreduseofpc

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is PC. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when %{FIELD} is R13. Fields:

FIELD enum

Field name.

ArchMsg.Warning.decode_unpreduseofr13inreglist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with R13 in register-list.

ArchMsg.Warning.decode_useofd16orhigher

TAGS **UNPREDICTABLE** DISPLAY Attempt to use register D16 or higher where it is not allowed.

ArchMsg.Warning.decode_writebackandbaseinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable with write back when the base register is in the transfer list.

ArchMsg.Warning.decode_zeroregistersinlist

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable when no registers are to be transferred.

ArchMsg.Warning.misaligned_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) or TRBTRG_EL1(%{TRBTRG_EL1}) are not aligned as per TRBIDR_EL1.Align(%{TRBIDR_EL1}). Fields:

TRBIDR_EL1 unsigned int

TRBIDR_EL1.Align value.

TRBPTR_EL1 unsigned int

Current write pointer.

TRBTRG_EL1 unsigned int

Trigger pointer.

ArchMsg.Warning.out_of_range_ptrs

DISPLAY TRBPTR_EL1(%{TRBPTR_EL1}) is out of range as per TRBBASER_EL1(%{TRBBASER_EL1}) or TRBLIMITR_EL1.LIMIT(%{TRBLIMITR_EL1}). Fields:

TRBBASER_EL1 unsigned int

Base pointer.

TRBLIMITR_EL1 unsigned int

Limit pointer.

TRBPTR_EL1 unsigned int

Current write pointer.

ArchMsg.Warning.recursive_branch

An instruction is performing a branch that targets the same instruction. If this was intended then a WFI might be more effective DISPLAY recursive branch detected at PC=%{PC}.

PRIMARY KEY PC. Fields:

PC unsigned int

Address of instruction causing the branch.

ArchMsg.Warning.recursive_exception

An instruction has generated an exception that targets the same instruction. DISPLAY recursive %{TYPE} exception detected at PC=%{PC} (CPSR=%{CPSR}). PRIMARY KEY PC. Fields:

CPSR unsigned int

Processor state.

PC unsigned int

Address of instruction causing the exception.

TYPE enum

Type of exception.

ArchMsg.Warning.reentrant_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Vector catch debug event on Prefetch or Data abort vector %{ADDR}. Fields:

ADDR unsigned int

vector address.

ArchMsg.Warning.reserved_it_state

TAGS **UNPREDICTABLE** DISPLAY Execution with reserved IT state %{ITSTATE}. Fields:

ITSTATE unsigned int

reserved IT state.

ArchMsg.Warning.tlb_contents_unknown

Translation has been enabled without invalidating the TLB. DISPLAY Translation was enabled in the %{PAS:(Secure|Non-secure|Root|Realm)} EL%{EL:d} translation regime (vmid=%{VMID:x}) without invalidating %{INVALIDITY:(|d-side |i-side |)}entries since power-on: %{INVALIDITY:(|D|I|)}TLB could contain **UNKNOWN** content. Fields:

EL unsigned int

Exception level of translation regime.

INVALIDITY unsigned int

Which TLB may be invalid (if TLBs are separate).

NON_SECURE bool

Whether the translation regime is non-secure.

PAS unsigned int

Physical address space of translation regime.

VMID unsigned int

Current VMID, if applicable.

ArchMsg.Warning.unknown_DLR_DSPSR

Exiting debug state with unknown DLR or DSPSR.

ArchMsg.Warning.unknown_ELR_SPSR

Returning from debug exception with unknown ELR or SPSR.

ArchMsg.Warning.unpred_FAR_on_LRCPC3_non_atomic_mem_access

TAGS **UNPREDICTABLE** Unpredictable FAR/FSTATUS on LRCPC3 pair instructions resulting in two separate memory accessesDISPLAY Unpredictable FAR on LRCPC3 non atomic memory access at %{ADDR1} with FSTATUS %{FSTATUS1} or %{ADDR2} with FSTATUS %{FSTATUS2}. Fields:

ADDR1 unsigned int

Possible FAR address 1.

ADDR2 unsigned int

Possible FAR address 2.

FSTATUS1 unsigned int

Possible fault status value 1.

FSTATUS2 unsigned int

Possible fault status value 2.

ArchMsg.Warning.unpred_async_tag_check_fail_on_sve_speculative_load_do_update_ffr

Unpredictable set to FALSE of the FFR element associated to SVE speculative load with an async tag check fail TAGS **UNPREDICTABLE**.

ArchMsg.Warning.unpredictable_a32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a A32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Always has a value of zero.

ArchMsg.Warning.unpredictable_banked_register_access

TAGS **UNPREDICTABLE** DISPLAY Access to banked register (R=%{R:d} SYSm=%{SYSM:2x}) is unpredictable. Fields:

R unsigned int

R bit.

SYSM unsigned int

SYSm.

ArchMsg.Warning.unpredictable_ccfail_undef

TAGS **UNPREDICTABLE** DISPLAY An instruction %{OPCODE} at VA=%{VADDR} failed its condition codes check but would otherwise have caused a non-data-dependent trap or undefined exception. Behaviour is implementation-defined choice of exception or nop. Fields:

OPCODE unsigned int

opcode of the instruction.

VADDR unsigned int

Virtual address of the instruction being executed.

ArchMsg.Warning.unpredictable_ici_bits

TAGS **UNPREDICTABLE** DISPLAY ICI bits do not apply or are architecturally unpredictable for instruction.

ArchMsg.Warning.unpredictable_t32_breakpoint

TAGS **UNPREDICTABLE** DISPLAY Unpredictable breakpoint on a T32 instruction at %{ADDR1} Offset %{OFFSET} BAS %{BAS} for a %{IS_ADDRESS_MISMATCH_BREAKPOINT:(Mismatch|Match)} Breakpoint number %{N:d} Breakpoint address %{ADDR2}. Fields:

ADDR1 unsigned int

Address.

ADDR2 unsigned int

Breakpoint address.

BAS unsigned int

BAS field.

IS_ADDRESS_MISMATCH_BREAKPOINT bool

Is a Mismatch breakpoint, not a Match breakpoint.

N unsigned int

Breakpoint number.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the breakpoint is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_t32_vector_catch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable Vector catch exception on a T32 instruction at %{ADDR} Offset %{OFFSET}. Fields:

ADDR unsigned int

Address.

OFFSET unsigned int

Indicates which halfword of a 32-bit Thumb instruction the vector catch exception is set on. 0 for the first halfword or if the instruction is 16 bits wide, or 1 for the second halfword.

ArchMsg.Warning.unpredictable_watchpoint_far

TAGS **UNPREDICTABLE** DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.unpredictable_watchpoint_far_isscmp

DISPLAY The value for FAR/EDWAR for hitting this watchpoint may be anywhere in the range %{LOWER_BOUND} to %{UPPER_BOUND}. Fields:

LOWER_BOUND unsigned int

the lowest address accessed by the instruction that triggered the watchpoint.

UPPER_BOUND unsigned int

the highest watchpointed address accessed by that instruction.

ArchMsg.Warning.warning_AdvSIMDExpandImmUnexpectedZero

TAGS **UNPREDICTABLE** DISPLAY AdvSIMDExpandImm may treat this immediate value as **UNPREDICTABLE**.

ArchMsg.Warning.warning_ConditionalSMC

TAGS **UNPREDICTABLE** DISPLAY SMC instruction has **UNPREDICTABLE** effects when conditional and when combined with traps.

ArchMsg.Warning.warning_TLBID_out_of_range

TLBID out of range in TLBI according to the configuration of NIS, NVIS, NOS and NVOS. Fields:

NIS unsigned int

NIS.

NOS unsigned int

NOS.

NVIS unsigned int

NVIS.

NVOS unsigned int

NVOS.

TLBID unsigned int

The TLBID value used in the TLBI instruction.

ArchMsg.Warning.warning_TTL_or_TG_mismatches_current_translation_granule

TTL or TG mismatches current translation granule in TLBI VA/RVA/IPA/RIPA. Fields:

CURRENT_TG unsigned int

Current TG as indicated by TCR_ELx or VTCR_EL2.

TLBI_TG unsigned int

TG (or TTL[3:2]) used in TLBI instruction.

ArchMsg.Warning.warning_access_crosses_page_boundary

TAGS **UNPREDICTABLE** DISPLAY Access crosses page boundary.

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has fault(s).

ArchMsg.Warning.warning_access_crosses_page_boundary_has_fault_on_both_pages

TAGS **UNPREDICTABLE** DISPLAY Access that crosses page boundary has a fault on each page.

Fields:

ADDR1 unsigned int

FAR address on first page.

ADDR2 unsigned int

FAR address on second page.

FSTATUS1 unsigned int

Fault status on first page.

FSTATUS2 unsigned int

Fault status on second page.

ArchMsg.Warning.warning_access_crosses_page_boundary_spanning_different_memory

TAGS **UNPREDICTABLE** DISPLAY Access at address %{ADDR} crosses page from MEM_TYPE %{MEMTYPE_PAGE1} to %{MEMTYPE_PAGE2}. Fields:

ADDR unsigned int

address of access crossing page.

MEMTYPE_PAGE1 signed int

First Page's memory type (0-Normal, 1-Non-Normal).

MEMTYPE_PAGE2 signed int

Second Page's memory type (0-Normal, 1-Non-Normal).

ArchMsg.Warning.warning_access_wraps_around_memory

TAGS **UNPREDICTABLE** DISPLAY Access wraps around memory in %{WIDTH:d}bit mode.

Fields:

WIDTH unsigned int

Address width.

ArchMsg.Warning.warning_bcr_linking_status

TAGS **UNPREDICTABLE** DISPLAY DBGBCR.{BT2,BT} combination gives unpredictable behaviour.

ArchMsg.Warning.warning_bcr_mask_reserved

TAGS **UNPREDICTABLE** DISPLAY DBGBCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_bvr_masked_bit_not_zero

TAGS **UNPREDICTABLE** DISPLAY DBGBVRn_EL1.VA contains a bit masked by DBGBCRn_EL1.MASK that is not zero.

ArchMsg.Warning.warning_ccsidr_unimplemented_level

TAGS **UNPREDICTABLE** DISPLAY CCSIDR read while CSSELR %{CSSELR:x} points to an unimplemented cache level. Fields:

CSSELR unsigned int

current effective value of CSSELR.

ArchMsg.Warning.warning_change_to_ns_when_tge_set

TAGS **UNPREDICTABLE** DISPLAY Attempting to change NS to 1 when HCR.TGE = 1.

ArchMsg.Warning.warning_contiguous_bit_check_abort

TAGS **UNPREDICTABLE** DISPLAY An abort occurred whilst attempting to check TLB entry is contiguous at %{ENTRY_ADDR}. Fields:

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA unsigned int

contents of conflicting TLB entry.

ArchMsg.Warning.warning_contiguous_bit_error_D128

TAGS **UNPREDICTABLE** DISPLAY TLB entry at %{ENTRY_ADDR} was not contiguous with entry at %{CONTIG_ADDR} Contents are %{ENTRY_DATA_HI} %{ENTRY_DATA_LO} but expected %{CONTIG_DATA}. Fields:

CONTIG_ADDR unsigned int

address of the TLB first read, with which this entry is expected to be contiguous.

CONTIG_DATA unsigned int

expected contents based on the entry at CONTIG_ADDR.

ENTRY_ADDR unsigned int

address of conflicting TLB entry.

ENTRY_DATA_HI unsigned int

Higher bit contents of conflicting TLB entry.

ENTRY_DATA_LO unsigned int

Lower bit contents of conflicting TLB entry.

ArchMsg.Warning.warning_cp10_cp11_mismatch

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CP10 and CP11 controls at EL %{EL:d}. Fields:

EL unsigned int

EL owning the control.

ArchMsg.Warning.warning_cp10_cp11_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable configuration of CPACR CP10 ({CP10}) or CP11 ({CP11}). Fields:

CP10 unsigned int

CP10 access.

CP11 unsigned int

CP11 access.

ArchMsg.Warning.warning_csselr_level_out_of_range

TAGS **UNPREDICTABLE** DISPLAY CSSELR.Level out of range, written value {LEVEL} with only {IMPLEMENTED:d} levels implemented. Fields:

IMPLEMENTED unsigned int

number of cache levels implemented.

LEVEL unsigned int

written value of CSSELR.Level.

TYPE enum

The type of cache selected by CSSELR.InD and TnD.

ArchMsg.Warning.warning_debug_flow_control_bits_not_obeyed

TAGS **UNPREDICTABLE** DISPLAY Flow control bits for {REGISTER} were not obeyed, causing {ERROR}. Fields:

ERROR enum

type of error resulting.

REGISTER enum

register under consideration.

ArchMsg.Warning.warning_debug_register_access_during_reset

TAGS **UNPREDICTABLE** DISPLAY Unpredictable {IS_WRITE:(read|write)} access to debug register offset {OFFSET} during reset. Fields:

IS_WRITE unsigned int

Write Not Read.

OFFSET unsigned int

Register Offset.

ArchMsg.Warning.warning_decode_cps_inconsistent_fields

TAGS **UNPREDICTABLE** DISPLAY The mode setting fields in the CPS instruction are inconsistent.

ArchMsg.Warning.warning_decode_invalid_state

TAGS **UNPREDICTABLE** DISPLAY Instruction is unpredictable in current exception-level/security state.

ArchMsg.Warning.warning_default_cacheable_mmu_on

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while MMU is enabled.

ArchMsg.Warning.warning_default_cacheable_vmmu_off

TAGS **UNPREDICTABLE** DISPLAY Default cacheable is enabled (HCR.DC = 1) while HCR.VM = 0.

ArchMsg.Warning.warning_deprecated_wvr_bit_2_set

TAGS **UNPREDICTABLE** DISPLAY DBGWVR%{N:d}_EL1=%{WVR:h} has bit 2 set, deprecated in ARMv8. Fields:

N unsigned int

index.

WVR unsigned int

DBGWVR.

ArchMsg.Warning.warning_eret_while_software_step_active_pending

Missing ISB between setting MDSCR_EL1.SS and ERET TAGS **UNPREDICTABLE**.

ArchMsg.Warning.warning_exclusive_to_non_normal

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Normal Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_exclusive_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Exclusive Access to Non-Writeback-Cacheable Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_execute_from_device_memory

TAGS **UNPREDICTABLE** DISPLAY An attempt was made to execute from Device memory.

ArchMsg.Warning.warning_illegal_cpsr_mode

TAGS **UNPREDICTABLE** DISPLAY Writing an illegal or unimplement mode (%{NEW_MODE:h}) to CPSR was unpredictable. Fields:

NEW_MODE unsigned int

New value of CPSR.M.

ArchMsg.Warning.warning_illegal_srs_mode

TAGS **UNPREDICTABLE** DISPLAY Illegal or **UNPREDICTABLE** mode (%{MODE:h}) used for SRS instruction. Fields:

MODE unsigned int

mode for Banked SP.

ArchMsg.Warning.warning_implementation_defined_read_debug_register_in_SCS

Read Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_implementation_defined_sequential_security_transitions_supported

The behavior of sequential instruction fetches that cross from non-secure to secure memory and contain an SG instruction is CONSTRAINED UNPREDICTABLE TAGS UNPREDICTABLE.

ArchMsg.Warning.warning_implementation_defined_stack_limit_check_supported

It is IMPLEMENTATION DEFINED whether stack pointer limit checking is performed for this instruction TAGS IMP_DEF. Fields:

ADDRESS unsigned int
Address of instruction.

OPCODE unsigned int
instruction opcode.

ArchMsg.Warning.warning_implementation_defined_taggednonsharedmemorytype

TAGS IMP_DEF DISPLAY Memory attribute has Tagged, non shared memory type; it is IMPLEMENTATION DEFINED whether the memory location is treated as Tagged or non-Tagged.

ArchMsg.Warning.warning_implementation_defined_write_debug_register_in_SCS

Write Access to Debug registers from the processor is IMPLEMENTATION DEFINED TAGS IMP_DEF. Fields:

DATA unsigned int
data attempted to be written.

PPB_OFFSET unsigned int
debug register offset.

ArchMsg.Warning.warning_invalid_tcr_granule

TAGS UNPREDICTABLE DISPLAY TCR.TG%{TG_ID:(0|1)} bits have been set to a granule size %{{REQUEST:d}}K not implemented - using %{{SUBSTITUTE:d}}K. Fields:

REQUEST signed int
page size requested (or 0 for reserved).

SUBSTITUTE signed int
best guess available page size.

TG_ID bool
bits TG0 or TG1.

ArchMsg.Warning.warning_load_multiple_user_registers_from_user_mode

TAGS UNPREDICTABLE DISPLAY An LDM(user registers) instruction executed from user mode.

ArchMsg.Warning.warning_mte_in_mem_attr_not_supported

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has Tagged memory type but Armv8.5-MTE is not implemented. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_reserved_breakpoint_state_match

TAGS UNPREDICTABLE DISPLAY %{IS_BREAKPOINT:(Watchpoint|Breakpoint)} programmed with a reserved combination of HMC, SSC and %{IS_BREAKPOINT:(PAC|PMC)}. Fields:

IS_BREAKPOINT unsigned int

Is a breakpoint, not a watchpoint.

ArchMsg.Warning.warning_shareability

TAGS UNPREDICTABLE DISPLAY Unpredictable: combination of the 1st and 2nd stages of translation is Normal Inner Non-Cacheable, Outer Non-Cacheable.

ArchMsg.Warning.warning_software_step_set_while_enabled

TAGS UNPREDICTABLE DISPLAY MDSCR_EL1.SS set to 1 while software step debug exceptions are enabled.

ArchMsg.Warning.warning_thumb_instruction_wraps_around_memory

TAGS UNPREDICTABLE DISPLAY Thumb instruction wraps around memory.

ArchMsg.Warning.warning_ttbr_sbz_bits_are_not_zero

TAGS UNPREDICTABLE DISPLAY %{TTBR}[%{MSB:d}:0] should be zero, but are not. Fields:

MSB unsigned int

x-1.

TTBR enum

which TTBR register.

ArchMsg.Warning.warning_unaligned_address_dbgdtrrx_write

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRRX written in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_address_dbgdtrtx_read

TAGS UNPREDICTABLE DISPLAY Unaligned address %{ADDR} in X0/R0 when DBGDTRTX read in memory access mode. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_device

TAGS UNPREDICTABLE DISPLAY Unaligned Access to Device Memory %{ADDR}. Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unaligned_to_strongly_ordered

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Strongly Ordered Memory %{ADDR}.

Fields:

ADDR unsigned int

Address.

ArchMsg.Warning.warning_unknown_sau_rnr

TAGS **UNPREDICTABLE** DISPLAY SAU_RNR was set to an unsupported value.

ArchMsg.Warning.warning_unpredictable_AIRCR_PRIS_and_BFHFNMINs

TAGS **UNPREDICTABLE** DISPLAY The effect of setting both AIRCR.BFHFNMINs and AIRCR.PRIS to 1 is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTCLRACTIVE_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTCLRACTIVE if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_and_SYSRESETREQ

TAGS **UNPREDICTABLE** DISPLAY When the processor is halted in Debug state, if a write to the register writes a 1 to both VECTRESET and SYSRESETREQ, the behavior is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_VECTRESET_when_not_in_debug

TAGS **UNPREDICTABLE** DISPLAY The effect of writing a 1 to AIRCR.VECTRESET if the processor is not halted in Debug state is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_AIRCR_incorrect_VKEY

TAGS **UNPREDICTABLE** DISPLAY The value 0x05FA must be written to AIRCR.VKEY, otherwise the register write is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_EXC_RETURN_Reserved_Bit

EXC_RETURN[23:7] are reserved with the special condition that all bits should be written as one. Values other than all 1s are **UNPREDICTABLE**. TAGS **UNPREDICTABLE**. Fields:

EXC_RETURN unsigned int

Special PC value.

SBO_MASK unsigned int

Which bits Should Be One to not UNPRED.

ArchMsg.Warning.warning_unpredictable_PMEVTYPEPERn_ELO_VS_reserved_value

TAGS **UNPREDICTABLE** DISPLAY Unpredictable reserved value of PMEVTYPER<n>_ELO.VS.

ArchMsg.Warning.warning_unpredictable_change_to_DEMCR_MON_STEP_at_insufficient_priority

TAGS **UNPREDICTABLE** DISPLAY The effect of changing DEMCR.MON_STEP at an execution priority that is lower than the priority of the DebugMonitor exception is **CONSTRAINED UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_change_to_priority_of_active_exception

TAGS UNPREDICTABLE DISPLAY Changing the priority of an active exception is UNPREDICTABLE.

ArchMsg.Warning.warning_unpredictable_clear_lspact

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch. Fields:

DRVEXC_TAKEN unsigned int

Derived exception taken, not pended.

REACHED_LAST_STORE unsigned int

Only the last faulted.

ArchMsg.Warning.warning_unpredictable_dbg_exit_unaligned_dlr

TAGS UNPREDICTABLE DISPLAY Debug exit to AArch32 with DLR[0] set to 1. PC[0] can be set to 0 or to DLR[0].

ArchMsg.Warning.warning_unpredictable_exception_catch

TAGS UNPREDICTABLE DISPLAY Generation of an exception catch event is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_inconsistent_state

TAGS UNPREDICTABLE DISPLAY state on exception return is unpredictable.

ArchMsg.Warning.warning_unpredictable_exception_return_instruction

TAGS UNPREDICTABLE DISPLAY exception return instruction is unpredictable.

ArchMsg.Warning.warning_unpredictable_in_debug_state

TAGS UNPREDICTABLE DISPLAY Instruction is UNPREDICTABLE when executed in debug state.

ArchMsg.Warning.warning_unpredictable_mair_encoding

TAGS UNPREDICTABLE DISPLAY Memory attribute %{ATTR} has invalid MAIR encoding; this may lead to unpredictable results. Fields:

ATTR unsigned int

Memory attribute.

ArchMsg.Warning.warning_unpredictable_pmu_counter_access

TAGS UNPREDICTABLE DISPLAY Access to PMU counters from non-secure EL0 or EL1 is UNPREDICTABLE with MDCR_EL2.HPMN set to 0.

ArchMsg.Warning.warning_unpredictable_prioritization_breakpoint_match_vector_catch

TAGS UNPREDICTABLE DISPLAY Two events with the same priority occurred at the same instruction: Address Matching Vector Catch debug event, and Breakpoint debug event. It is constrained unpredictable which is taken.

ArchMsg.Warning.warning_unpredictable_stack_selection

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE state on context switch.

ArchMsg.Warning.warning_unpredictable_tsize_out_of_range

TAGS UNPREDICTABLE DISPLAY %{TCR}.T%{TTBR:d}SZ (%{TSIZE:d} bits) is out of range. Must be between 25 and %{TSIZE_MAX:d}. Fields:

TCR enum

Which TCR.

TSIZE signed int

Value of TSize.

TSIZE_MAX signed int

The maximum allowed value.

TTBR unsigned int

Which TTBR region.

ArchMsg.Warning.warning_unpredictable_unaligned_pc_as_base_register

TAGS **UNPREDICTABLE** DISPLAY The PC value must be word-aligned, otherwise the behavior of the instruction is **UNPREDICTABLE**.

ArchMsg.Warning.warning_unpredictable_unaligned_pop_stack

TAGS **UNPREDICTABLE** DISPLAY **CONSTRAINED UNPREDICTABLE** unaligned stack frame `%{FRAME_ADDR:x}` in exception-return. Fields:

FRAME_ADDR unsigned int

unaligned stack frame address.

ArchMsg.Warning.warning_unpredictable_unaligned_to_non_writeback

TAGS **UNPREDICTABLE** DISPLAY Unaligned Access to Non-Writeback-Cacheable Memory.

ArchMsg.Warning.warning_unpredictable_vmsa_memattrib

TAGS **UNPREDICTABLE** DISPLAY Unpredictable vmsa memory attribute with texcb value programmed to `%{TEXCB}` when tex remap is `%{TEX_REMAP}`. Fields:

TEXCB unsigned int

texcb value.

TEX_REMAP bool

use tex remap.

ArchMsg.Warning.warning_unpredictable_vtcr_t0sz_sl0

TAGS **UNPREDICTABLE** DISPLAY The combination of VTCR.TOSZ=`%{TOSZ:d}` and VTCR.SL0=`%{SL0:d}` is unpredictable. Fields:

SL0 signed int

VTCR.SL0, starting level for stage 2 translation table walks.

TOSZ signed int

VTCR.TOSZ, required input address range.

ArchMsg.Warning.warning_unpredictable_write_DHCSR

TAGS **UNPREDICTABLE** DISPLAY **UNPREDICTABLE** set of bit-changes in DHCSR. Fields:

NEW unsigned int

data attempted to be written.

OLD unsigned int

previous value.

ArchMsg.Warning.warning_unpredictable_write_SHCSR

TAGS UNPREDICTABLE DISPLAY UNPREDICTABLE setting a pending bit to 1 for an exception with priority \geq execution priority.

ArchMsg.Warning.warning_unsupported_access_to_memory_mapped_register

TAGS UNPREDICTABLE DISPLAY Access to memory mapped register is unsupported.

ArchMsg.Warning.warning_user_jmcr_access

TAGS UNPREDICTABLE DISPLAY User %{WRITE:(write|read)} access to JMCR is unpredictable. Fields:

WRITE unsigned int
access is write.

ArchMsg.Warning.warning_wcr_mask_and_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.MASK is non-zero and BAS is not 0xff.

ArchMsg.Warning.warning_wcr_mask_reserved

TAGS UNPREDICTABLE DISPLAY DBGWCR_ELn.MASK is set to a reserved value.

ArchMsg.Warning.warning_wcr_non_configuous_bas

TAGS UNPREDICTABLE DISPLAY DBGWCR_EL1.BAS has non-contiguous set of ones.

ArchMsg.Warning.warning_wvr_masked_bit_not_zero

TAGS UNPREDICTABLE DISPLAY DBGWVRn_EL1.VA contains a bit masked by DBGWCRn_EL1.MASK that is not zero.

ArchMsg.Why.why_branch_target_exception

A branch target exception has occurred. DISPLAY branch target exception: target pc=%{PC}, target opcode=%{OPCODE}. PRIMARY KEY PC. Fields:

BTYPE unsigned int
pstate.BTYPE at time branch taken.

OPCODE unsigned int
opcode at branch target.

PC unsigned int
Virtual Address of branch target.

ArchMsg.Why.why_illegal_state

An illegal mode change has occurred. DISPLAY illegal mode change: %{MESSAGE}. Fields:

MESSAGE string
The message.

BRANCH_MISPREDICT

Simulating branch mispredict. Fields:

PC unsigned int
Origin address (or 0 if unavailable).

BRA_DIR

Direct branches, to immediate address. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR

Indirect branches, perhaps to a register. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

BRA_INDIR_CCFAIL

Indirect branches fail, perhaps to a register.

BRA_RET_CCFAIL

Branch return fail, perhaps to a register.

CACHE_MAINTENANCE_OP

Cache Maintenance Operation. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

DATA unsigned int

Specified MVA or Set/way.

FUNCTION enum

Clean / Invalidate.

SCOPE enum

Affected region.

SIDE enum

Inst / Data.

CCFAIL

Conditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCFAIL_UNC

Unconditional instruction condition check fail. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS

Conditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CCPASS_UNC

Unconditional instruction condition check pass. Fields:

COND enum

The condition of the conditional instruction.

CORE_NUM unsigned int

Core number in a multi processor.

PC unsigned int

The address of the conditional instruction.

CODE_CACHE_MAINT

Code cache maintenance. Fields:

END_INCL unsigned int

Inclusive end address for VA or PA requests.

NS bool

Non-secure world for PA.

START unsigned int

Start address for VA or PA requests.

TYPE enum

Request type.

COMPILE_BLOCK_END

Last instruction of basic block translated. Fields:

VADDR unsigned int

Address of next instruction after this basic block.

COMPILE_BLOCK_START

First instruction of basic block translated. Fields:

VADDR unsigned int

Address of first instruction in basic block.

COMPILE_INST

ARM instruction compiled. Fields:

DISASS string

Disassembly of the instruction.

ISET enum

The instruction set of this instruction.

ITSTATE unsigned int

The ITSTATE current for the instruction.

OPCODE unsigned int

The opcode of the instruction.

PC unsigned int

The address of the instruction.

SIZE unsigned int

The size of the instruction in bytes.

CONTEXTIDR

Context ID Register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

NS bool

Secure or nonsecure banked register is accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The new value written.

CONTEXT_SYNC

Called for every context synchronization event. Fields:

ARCH_CSE bool

Architectural Context Synchronization Event.

PC unsigned int

The address of the synchronization instruction.

SYSREG_SYNC bool

System register synchronization event.

CORE_ENDIAN

Core BE8 Big-Endian state changed. Fields:

BE8 bool

Core BE8 Big-Endian state.

CORE_INFO

Static processor attributes. Only triggered by a call to DumpState(). Fields:

ARCH_PROFILE enum

The architecture profile of the core.

CLUSTER_ID unsigned int

The cluster ID of this processor.

CORE_NUM unsigned int

The number of this core in an MP processor.

DETAILED_CORE_FEATURES enum

Detailed core features as a bitfield. Enum values are bitmasks to extract the info from the field.

FPU_VERSION enum

The VFP version implemented by the core.

MEM_ARCH enum

The memory architecture of the core.

MIDR_EL1 unsigned int

MIDR_EL1 value.

NUM_CORES unsigned int

The number of cores in this MP processor.

QUANTUM_SIZE unsigned int

The default quantum size of the core (in ticks).

SECURITY_FEATURES bool

Does the core have security features?.

CORE_LOADS

Processor load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CORE_REGS

Changes of the core registers R0 to R14. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID unsigned int

The register number, 0 to 14.

MODE enum

Bank of the register accessed.

OLD_VALUE unsigned int

The old value overwritten.

PHYS_ID enum

The physical register accessed.

VALUE unsigned int

The new value written to the register.

CORE_REGS64

Changes of the core registers X0..X30, SP_ELn. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

OLD_VALUE unsigned int

The old value overwritten.

VALUE unsigned int

The new value written to the register.

CORE_REGS64_READ

General purpose AArch64 register has been read X0..X30, SP_ELn. Fields:

ID enum

The register number, 0-30 for X0-X30, >=32 for SP_ELn.

VALUE unsigned int

The value read from the register.

CORE_STALLED_TRANSITION

Detect when a core is prevented from progressing PChannel states. Fields:

CURRENT_STATE enum

Current power mode of core.

REASON string

The reason a transition was stalled, and what must be done to unblock it.

TARGET_STATE enum

Desired power mode of core after transition.

CORE_STORES

Processor store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

CP14_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP14_WRITE

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP14 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

CP15_WRITE

System Control Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc1 unsigned int

opcode 1.

opc2 unsigned int

opcode 2.

CP15_WRITE64

System Coprocessor register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

NS bool

Secure or nonsecure banked register is accessed.

REG_NAME string

Name of the CP15 register accessed.

SECURITY_STATE enum

The current security state.

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

CPSR

CPSR change. (In AArch64 PSTATE represented in SPSR format). Fields:

CORE_NUM unsigned int

Core number in a multi processor.

OLD_VALUE unsigned int

The old CPSR value.

UNKNOWN unsigned int

Bits within the register that have unknown value.

VALUE unsigned int

The new CPSR value.

CRYPTO_SPEC

Every crypto instruction speculatively executed.

CorePowerStateChange

Core power-up state has changed. DISPLAY Core powered %{PU:(up|down)}. Fields:

PU bool

Whether the core powered up.

DATA_CACHE_SET_ALLOC_TAGS

Set allocation tags from DC GVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of memory in bytes.

TAG unsigned int

The value of the tag being set.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

Virtual address used for setting allocation tags.

DATA_CACHE_ZERO

Zero and invalidate cache line from DC ZVA instruction. Fields:

ATTR unsigned int

Transaction Attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The security state of the access.

PADDR unsigned int

The physical address of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAS enum

The physical address space of the page.

RESPONSE enum

0=Aborted, 1=OK.

SIZE unsigned int

The size of zero'd memory in bytes.

TAG_CHECKED bool

Is this access tag checked.

VADDR unsigned int

Virtual address of the zero'd cache line.

DEBUG_EVENT

Hardware debug support event. Fields:

EVENT enum

Description of event.

VALUE unsigned int

data value.

DEBUG_TARGET_ISET

Hardware debug target ISA. Fields:

TARGET_ISET enum

The target instruction set of the debug state.

DMI_ALLOCATE

DMI allocated. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

PTR unsigned int

DMI range pointer.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_HIT

DMI hit, access used DMI (only fire for small DMI regions i.e. less than a full page). Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of the DMI.

VADDR unsigned int

The virtual address of the DMI..

DMI_REVOKE

DMI revoked. Fields:

ACCESS_DIRECTION enum

READ / WRITE.

PADDR unsigned int

The physical address of the DMI.

SIDE enum

DSIDE / ISIDE.

SIZE unsigned int

The size of DMI.

VADDR unsigned int

The virtual address of the DMI..

END_COMPILE

Compilation end. Fields:

END_OF_PAGE_COUNT unsigned int

Number of basic blocks exited due to page boundary since START_COMPILE.

FETCHFAIL_COUNT unsigned int

Number of basic blocks exited due to ifetch failure START_COMPILE.

INST_COUNT unsigned int

Number of instructions compiled since START_COMPILE.

NONSEQ_COUNT unsigned int

Number of basic blocks exited due to non-sequential instructions since START_COMPILE.

PAGE_STRADDLE_COUNT unsigned int

Number of basic blocks exited due to unaligned instructions crossing page since START_COMPILE.

ESB

Error Synchronization Barrier hit. Fields:

ASYNC bool

ESB is async.

IMPLICIT bool

ESB is implicit.

EXCEPTION

Exception taken. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

ESR unsigned int

The value assigned to ESR when exception is taken.

ESR_EC unsigned int

The Value assigned to ESR.EC when exception is taken.

IS_PHYSICAL bool

Physical or Virtual exception.

IS_TRAP bool

Exception coming from a trap.

LR unsigned int

The value assigned to the link register.

PC unsigned int

The location where the exception occurred.

PREFERRED_RETURN unsigned int

The preferred return address for the exception.

TAKEN_LOCALLY bool

Whether exception is taken locally(same exception level).

TARGET_ISET enum

The instruction set of the exception handler code.

TARGET_PC unsigned int

The address the exception branches to.

VECTOR enum

The exception vector.

VECTOR_OFFSET unsigned int

The offset of an exception vector from the base address.

EXCEPTION_END

Every exception completed.

EXCEPTION_INFO

Trace human-readable reason of the current exception for data/instruction aborts, floating point exceptions and unknown exceptions. Fields:

DESCRIPTION string

Reason for current exception.

ESR_EC unsigned int

The value of ESR.EC when exception is taken.

EXCEPTION_RAISE

Every exception raised.

EXCEPTION_RETURN

Branches on leaving exception. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISET enum

The instruction set of the branch instruction.

IS_COND bool

Indicates if this is a conditional branch.

IS_HINTED bool

Whether the conditional instruction is hinted.

IS_ISB bool

Whether the instruction is ISB.

IS_LINK bool

Indicates if this is a branch with link.

PC unsigned int

The address of the branch instruction.

TARGET_ISET enum

The instruction set after the branch.

TARGET_PC unsigned int

The address the instruction branches to.

EXCEPTION_RETURN_PREBRANCH

Exception return event that must occur before PC and processor state have updated.

EXCEPTION_START

Every exception started.

FIQ_TAKEN

FIQ taken exception.

FP_EXCEPTIONS_SIGNALLED

Trace which FP exceptions were signalled as a part of the FP operations performed by an instruction. Fields:

FP_EXCEPTIONS_SIGNALLED_MASK unsigned int

Indicates which FP exceptions were signalled by an instruction. This uses the same encoding as the cumulative floating-point exception bitfields in FPSR.

FP_STATE

Floating point state. Fields:

FPSR unsigned int

FPSR register value.

MASK unsigned int

The mask indicating updated cumulative bits.

FREQ_CHANGED

Core frequency changed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this core.

NEW_FREQ signed int

The new frequency of this core (expressed in Hz).

OLD_FREQ signed int

The old frequency of this core (expressed in Hz).

HLT

HLT instruction occurred. Fields:

IMM16 unsigned int

The 16-bit immediate value encoded in HLT instruction.

INST

Every instruction executed. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DEBUG_STATE bool

The instruction is executed in debug state.

DISASS string

Disassembly of instruction.

INST_COUNT unsigned int

The core's instruction counter, starting at 1 for the first instruction.

ISSET enum

The current instruction set.

ITSTATE unsigned int

The current ITSTATE.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

MODE enum

The mode the core is in.

NS unsigned int

The core's non-secure bit.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

OPCODE unsigned int

The opcode of the instruction.

PADDR unsigned int

The physical address of the instruction.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the instruction.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the page.

PC unsigned int

The address of the instruction.

SECURITY_STATE enum

The core's security state.

SIZE unsigned int

The size of the instruction in bytes.

INST_END

Every instruction completed.

INST_START

Every instruction started. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

INST_STRADDLE

Instruction straddles boundary. Fields:

DEBUG_STATE bool

The instruction is executed in debug state.

ISSET enum

The current instruction set.

MODE enum

The mode the core is in.

NS enum

The current Secure State.

PC unsigned int

The address of the conditional instruction.

SECURITY_STATE enum

The current Security State.

IRQ_TAKEN

IRQ taken exception.

ISB

ISB instruction occurred. Fields:

PC unsigned int

The address of the ISB instruction.

LOAD_MULTIPLE_REGS_LIST

List of destination registers (not source) of a multiple registers load instruction. Fields:

REG string

Register to add into the list.

LOCAL_MONITOR

Local monitor activity. Fields:

PADDR unsigned int

Local Monitor Address.

State enum

State of the monitor (Open/Exclusive).

MAPPING_CREATE

A memory mapping has been created. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation, or 0 if no ASID was used.

IS_VALID bool

Whether the mapping is valid or not.

PADDR unsigned int

Base physical address of region, or 0 if not known.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page, or 0 if not known.

VADDR unsigned int

Base virtual address of region.

VMID unsigned int

The VMID used during translation, or 0 if no VMID was used.

MAPPING_DESTROY

A memory mapping has been destroyed. This is an implementation detail of the model and so may change without notice. Fields:

ASID unsigned int

The ASID used during translation.

CAUSE enum

The cause of invalidation.

PADDR unsigned int

Base physical address of page.

SIDE enum

I-side or D-side.

SIZE unsigned int

Size of the page.

VADDR unsigned int

Base virtual address of page.

VMID unsigned int

The VMID used during translation.

MEMMAP_DEBUG_READ

Memory mapped reads to the debug registers. Fields:

ADDR unsigned int

address.

CORE_NUM unsigned int

Core number in a multi processor.

EXT bool

Whether access is from an external device (such as the DAP).

NS enum

Secure state of the access.

REG_NAME string

Name of the debug register accessed.

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

MEMMAP_DEBUG_WRITE

Memory mapped writes to the debug registers. Fields:

ADDR **unsigned int**

address.

CORE_NUM **unsigned int**

Core number in a multi processor.

EXT **bool**

Whether access is from an external device (such as the DAP).

NS **enum**

Secure state of the access.

REG_NAME **string**

Name of the debug register accessed.

UNDEF **bool**

The register accessed is undefined.

VALUE **unsigned int**

The new value written.

MEMTAG_LOADS

Allocation tag memory read; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE **enum**

The type of instruction performing the access.

ATTR **unsigned int**

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 **unsigned int**

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC **unsigned int**

The physical address non-secure bit.

NSDESC2 **unsigned int**

The second page physical address non-secure bit.

NUM_GRANULES **unsigned int**

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MENTAG_LOAD_INST

Allocation tag load instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORES

Allocation tag memory write; when attributes and system configuration allow tag accesses.

Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MEMTAG_STORE_INST

Allocation tag store instruction; regardless of tags being actually accessed. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

NUM_GRANULES unsigned int

Number of tags to be Loaded/stored.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK.

TAGGING_TYPE enum

Type of Memory tagging (Physical or Virtual).

TAGS unsigned int

The tags read or written. Tags for subsequent granules would be found at subsequent bytes in this field (One byte for each tag).

TAG_VADDR unsigned int

The virtual address of the Virtual Tag if Virtual tagging is used; otherwise 0.

VADDR unsigned int

The virtual address of the access.

MMU_D128_TTB_READ

This event is triggered by reads caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits read.

DATA_LOW unsigned int

The data lower bits read.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the read.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

REQUESTER enum

The requester of this table walk.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_D128_TTB_WRITE

This event is triggered by writes caused by a D128 translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA_HIGH unsigned int

The data upper bits written.

DATA_LOW unsigned int

The data lower bits written.

IPA unsigned int

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS bool

If the access was due to HACDBS_CLEAN.

LEVEL unsigned int

Translation table level.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MMU_TRANS

Address translation information. Fields:

ASID unsigned int

Address space identifier.

CORE_NUM unsigned int

Core number in a multi processor.

Hyp bool

Entry matches in Hyp state only.

INNERCACHE_RA bool

Is the inner cache allocate on read.

INNERCACHE_TRANSIENT bool

Is the inner write-through transient.

INNERCACHE_TYPE enum

Inner Caching scheme (NC/MB/WA).

INNERCACHE_WA bool

Is the inner cache allocate on write.

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MEMTYPE enum

Memory type.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC enum

Is secure side supposed to access secure or nonsecure memory.

OUTERCACHE_RA bool

Is the outer cache allocate on read.

OUTERCACHE_TRANSIENT bool

Is the outer write-through transient.

OUTERCACHE_TYPE enum

Outer Caching scheme (NC/MB/WA).

OUTERCACHE_WA bool

Is the outer cache allocate on write.

PADDR unsigned int

Physical address of the access.

PAGESIZE unsigned int

Page size as log2(size).

PAS enum

PAS supposed to be accessed is secure or nonsecure memory or Root/Realm if RME is implemented.

SH enum

Shareability.

SIDE enum

Inst / Data.

STAGE1_PERM unsigned int

Stage 1 permissions, [5:3] Privileged access (XWR) [2:0] User access (XWR).

STAGE2_PERM unsigned int

Stage 2 permission mask [5:3] Privileged access (XWR) [2:0] User access (XWR).

VADDR unsigned int

Virtual address of the access.

VMID unsigned int

Virtual machine identifier.

XS bool

XS Attribute.

nG enum

Flag indicating whether ASID will be matched.

MMU_TTB_READ

This event is triggered by reads caused by a translation table walk. Fields:

ABORTED bool

Was the walk successful.

DATA unsigned int

The data read.

DESC_KIND enum

The encoding scheme of the descriptors used for this walk.

IPA unsigned int

For stage 1, the IPA of the read.

LEVEL unsigned int

Translation table level.

LPAE bool

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID unsigned int

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR **unsigned int**

The output physical address.

PADDR **unsigned int**

The physical address of the read.

PASmem **enum**

Physical Address Space of the accessed memory.

PASreq **enum**

Physical Address Space of the requested lookup.

REGIME_EL **enum**

Entry matches in this translation regime.

REQUESTER **enum**

The requester of this table walk.

SIDE **enum**

Inst / Data.

STAGE **unsigned int**

Translation stage.

MMU_TTB_WRITE

This event is triggered by writes caused by a translation table walk. Fields:

ABORTED **bool**

Was the walk successful.

DATA **unsigned int**

The data written.

DESC_KIND **enum**

The encoding scheme of the descriptors used for this walk.

IPA **unsigned int**

For stage 1, the IPA of the write.

IS_HACDBS_ACCESS **bool**

If the access was due to HACDBS_CLEAN.

LEVEL **unsigned int**

Translation table level.

LPAAE **bool**

Is this for an LPAE translation (*DEPRECATED*, use DESC_KIND).

MECID **unsigned int**

Memory Encryption Context(MEC) ID, if applicable.

MPAM_PARTID **unsigned int**

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSmem bool

Non secure memory access.

NSreq bool

Non secure request.

OUTADDR unsigned int

The output physical address.

PADDR unsigned int

The physical address of the write.

PASmem enum

Physical Address Space of the accessed memory.

PASreq enum

Physical Address Space of the requested lookup.

REGIME_EL enum

Entry matches in this translation regime.

SIDE enum

Inst / Data.

STAGE unsigned int

Translation stage.

MODE_CHANGE

Mode change. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

MODE enum

The new mode.

NON_SECURE enum

The core's new non-secure bit.

OLD_MODE enum

The old mode.

SECURITY_STATE enum

The new security state.

NOT_TAG_CHECKED_INST

MTE Tag not checked for current instruction.

PERIODIC

Called for every quantum. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

PC unsigned int

The address of the next instruction to be executed on this CPU.

PMU_COUNTER_OVERFLOW

PMU counter overflow. Fields:

COUNTER_GROUP enum

Counter group.

COUNTER_RANGE enum

Counter range.

EVENT_ID unsigned int

Event Identifier, field is valid only for Event counter group.

INDEX unsigned int

Counter index (as selected by PMSELR), field is valid only for Event/Cycle counter groups.

INTERRUPT bool

Is interrupt enabled on overflow for this counter.

POINTER_AUTH

Called when execution hits a pointer authentication check. Fields:

AUTH_STATE bool

Authentication result.

KEY_USED enum

Pointer authentication key.

POTINDEX_UPDATE

Value of POT index for current pc changed. Fields:

NEW_POTINDEX unsigned int

New POTIndex.

OLD_POTINDEX unsigned int

Old POTIndex.

PREFETCH_MEMORY64

Prefetch from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD64_REQUEST

Preload requests from PRFM or PRFUM instructions. Fields:

PRFOP enum

Prefetch hint.

VADDR unsigned int

Virtual address of the location that should be prefetched.

PRELOAD_DATA

Data preload from PLD instruction. Fields:

VADDR unsigned int

Virtual address of the data that should be preloaded.

PRELOAD_INST

Instruction preload from PLI instruction. Fields:

VADDR unsigned int

Virtual address of the instruction that should be preloaded.

PRE_CORE_LOAD

Trace just before a core load. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_CORE_STORE

Trace just before a core store. Fields:

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

PRE_TTB_READ

This event is triggered before reads caused by a translation table walk. Fields:

ADDR unsigned int

The physical address of the read.

PSTATE

PSTATE fields update. Fields:

ALLINT unsigned int

All interrupt mask bit.

BTYPE unsigned int

Branch target identification bit.

CORE_NUM unsigned int

Core number in a multi processor.

DAIF unsigned int

Exception mask bits.

DIT unsigned int

Data Independent Timing bit.

EL unsigned int

Current Exception level field.

EXLOCK unsigned int

Exception return state lock bit.

IL unsigned int

Illegal Execution state bit.

NZCV unsigned int

Condition flags.

PACM unsigned int

PACM bit.

PAN unsigned int

Privileged Access Never state bit.

PM unsigned int

PMU exception mask bit.

PPEND unsigned int

PMU exception pending bit.

SM unsigned int

StreamingMode status bit.

SP unsigned int

Stack pointer register selection bit.

SS unsigned int

Software Step bit.

SSBS unsigned int

Speculative Store Bypass Safe bit.

TCO unsigned int

Tag Check Override bit.

TOUCHED unsigned int

Mask of the fields that have been touched since this trace has last been emitted. Note that touched does not necessarily mean the value changed. The index of the field is the bit index in the mask plus the index of this field plus one.

UAO unsigned int

User Access Override bit.

UINJ unsigned int

Undefined Instruction exceptions bit.

ZA unsigned int

ZA storage and ZT0 register enable bit.

nRW unsigned int

Current Execution state bit.

PSTATE_PACTIVE_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

PSTATE_PACTIVE_OPMODE_TRANSITION_DENIED

Trace the denied pactive and Opmode mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_POWER_TRANSITION

Trace pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

PSTATE_PACTIVE_POWER_TRANSITION_DENIED

Trace the denied pactive and power mode transitions on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Power mode after the transition.

OLD_STATE enum

Power mode before the transition.

REASON string

Reason for the transition being denied.

PSTATE_PACTIVE_THREAD_OPMODE_TRANSITION

Trace pactive and Opmode mode transitions for threads on PChannel. Fields:

DEVPACTIVE unsigned int

Integer representation of DEVPACTIVE[] signals.

NEW_STATE enum

Operating mode after the transition.

OLD_STATE enum

Operating mode before the transition.

QUANTUM_START

Called at the start of every quantum.

RANGE_PRELOAD_REQUEST

Preload requests from RPRFM. Fields:

COUNT unsigned int

Number of blocks of data to access.

LENGTH unsigned int

Number of contiguous bytes to be accessed in each block.

OP unsigned int

Range prefetch operation .

REUSE unsigned int

Maximum number of bytes to be accessed before next RPRFM .

STRIDE signed int

Stride to advance after accessing LENGTH bytes.

VADDR unsigned int

Base virtual address of range prefetch request.

RUN_STATE

Run state transition. Fields:

INST_COUNT **unsigned int**

Ticks count at point of transition.

NEW **enum**

New run state.

OLD **enum**

Old run state.

SEMIHOSTING_CALL

Call of a semihost function occurred. Fields:

PC **unsigned int**

The program counter after the semihosting call.

SEMIHOSTING_PRECALL

About to call semihost. Fields:

EL2 **bool**

Use EL2 translation regime.

NS **bool**

Is Non-Secure.

REG_WIDTH **unsigned int**

The current register width in bytes.

SIGNAL

External signal state change. Fields:

SIGNAL **enum**

Signal that changed.

STATE **bool**

Signal asserted state.

SOFTWARE_STEP

Return the Debug Software Step state. Fields:

STATE **enum**

Software Step state.

SPSR

SPSR change. Fields:

CORE_NUM **unsigned int**

Core number in a multi processor.

MODE **enum**

Which of the banked SPSR registers is written.

OLD_VALUE unsigned int

The old SPSR value.

VALUE unsigned int

The new SPSR value.

START_COMPILE

Compilation started. Fields:

VADDR unsigned int

Instruction where compilation begins.

STG_MULTIPLE_MICRO_OPS_ADDRESS_RANGE

Address range for MTE stores with multiple uops. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

STORE_MULTIPLE_REGS_ADDRESS_RANGE

Address range for stores with multiple registers. Fields:

ADDR_END unsigned int

Final address.

ADDR_START unsigned int

Starting address.

SUBOPTIMAL_LDST_RETIRED

suboptimal load/store. Fields:

ACCESS_SIZE unsigned int

Log2 of the access width in bytes used for alignment checking (1: half-word, 2: word ...).

OPTIMAL_ALIGN_SELECTOR unsigned int

Selector to decide the optimal alignment size (1: access width, 2: 4-bytes, 3: 8-bytes, ..., 12: 4-kbytes).

VADDR unsigned int

The virtual address of the access.

SVE_INST_SPEC

SVE operations speculatively executed.

SVE_LD_RETIRED

SVE load instructions architecturally executed.

SVE_LOADS

SVE load accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_MEM_PREFETCH

Scalable Vector Extension memory prefetch. Fields:

CACHE_LEVEL enum

The preferred cache level.

HINT enum

What the memory is expected to be used for.

SIZE unsigned int

The prefetch size in bytes.

TEMPORAL bool

Whether the data is temporal.

VADDR unsigned int

The virtual address of the prefetch.

SVE_REG_READ

Scalable Vector Extension register read. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The read data.

SVE_REG_UPDATE

Scalable Vector Extension register update. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_REG_WRITE

Scalable Vector Extension register write. Fields:

ID enum

The register identifier.

SM bool

Whether the PE is in Streaming Mode.

VALUE unsigned int

The written data.

SVE_STORES

SVE store accesses. Fields:

ACCESS_TYPE enum

The type of instruction performing the access.

ACQREL enum

Is this an acquire/release.

ATTR unsigned int

Memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

ATTR2 unsigned int

Second page memory attributes: [11] Non-secure, [10] Privileged, [9:8] shareability domain (0=nsh, 1=ish, 2=osh, 3=system), [7:4] outer memory attributes, [3:0] inner memory attributes ([7]/[3] Allocate (Other Allocate when read), [6]/[2] Allocate (Other Allocate when write), [5]/[1] Modifiable, [4]/[0] Bufferable). All other bits are implementation defined.

CURRENT_TIME unsigned int

The core's current time, as simulated time plus local time.

DATA unsigned int

The data read or written.

ELEMENT_SIZE unsigned int

Width of each element.

ENDIANNESS enum

Byte ordering of this access.

LOCAL_TIME unsigned int

The core's local time, relative to the current quantum.

LOCK enum

Normal, exclusive or locked access.

MECID unsigned int

Memory Encryption Context ID, if applicable.

MECID2 unsigned int

Memory Encryption Context ID of the second page, if applicable.

MPAM_PARTID unsigned int

MPAM Partition ID.

MPAM_PMG unsigned int

MPAM Performance Monitoring Group.

MPAM_SP unsigned int

MPAM Partition ID Space.

NSDESC unsigned int

The physical address non-secure bit.

NSDESC2 unsigned int

The second page physical address non-secure bit.

PADDR unsigned int

The physical (translated) address.

PADDR2 unsigned int

If different from PADDR, the physical address of the second page of the access.

PADDR_TAG unsigned int

If tag checked, the physical address tag for the access.

PAGE_SIZE unsigned int

Page size as $\log_2(\text{size in bytes})$.

PAS enum

The physical address space of the page.

PAS2 enum

The physical address space of the second page.

RESPONSE enum

0=Aborted, 1=OK, 2=Exclusive Failed, 3=Unsupported.

SIZE unsigned int

Width of the access in bytes. Only required if DATA is not traced.

TAG_CHECKED bool

Is this access tag checked.

TAG_CHECKED2 bool

Is the second page access tag checked.

TRANS bool

Is this a translated access.

VADDR unsigned int

The virtual address of the access.

SVE_ST_RETIRED

SVE store instructions architecturally executed.

SVE_UNALIGNED_LDST_RETIRED

SVE load or store instructions architecturally executed that would cause alignment fault if A bit is set.

SVE_Z_PRED_MEM_ACCESS_INFO

Information about SVE/SME predicated accesses to Z registers (non Gather/Scatter). Fields:

MEM_ELEM_SIZE unsigned int

Width of elements accessed in memory (in bytes).

RnW bool

Whether this is a Read not a Write.

VA unsigned int

Virtual base address computed for accesses.

SYNC

Called for every synchronization, that is every quantum break. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

INST_COUNT unsigned int

The instruction count of this CPU.

LOCAL_QUANTUM unsigned int

The local quantum of this CPU.

LOCAL_TIME unsigned int

The local time of this CPU.

SYNC_REASON enum

Reason for sync.

SYSCALL

System call instruction executed. Fields:

IMM unsigned int

Immediate value of the system call instruction.

TYPE enum

System call type.

VADDR unsigned int

Instruction that caused the system call.

SYSREG_READ128

System Coprocessor 128 bit register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_READ64

System Coprocessor register read. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REGNUM enum

Internal register number.

REGNUM_OPERAND enum

Register number corresponding to the instruction operand.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

VALUE unsigned int

The value read.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE128

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE32

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_UPDATE64

Triggers when the system updates a register. Fields:

CRm unsigned int

CRm.

CRn unsigned int

CRn.

NS bool

Secure or nonsecure banked register is accessed.

REG enum

Register number.

UNKNOWN unsigned int

Bits of the register which became unknown.

VALUE unsigned int

Value written to the register.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int

opcode 2.

SYSREG_WRITE128

System Coprocessor 128 bit register write. Fields:

CORE_NUM unsigned int

Core number in a multi processor.

CRm unsigned int

CRm.

CRn unsigned int

CRn.

REGNUM enum

Internal register number.

REGNUM_PHYS enum

Internal register number physically accessed (e.g. in presense of VHE redirection).

UNDEF bool

The register accessed is undefined.

UPDATED_VALUE unsigned int

Updated value of the register now it has been written.

VALUE unsigned int

The new value written.

opc unsigned int

opcode 1.

opc0 unsigned int

opcode 0.

opc2 unsigned int
opcode 2.

SYSREG_WRITE64
