Arm may make changes to this document at any time and without notice.

This document may be translated into other languages for convenience, and you agree that if there is any conflict between the English version of this document and any translation, the terms of the English version of the Agreement shall prevail.

Arm Limited. Company 02557590 registered in England.

110 Fulbourn Road, Cambridge, England CB1 9NJ.

(LES-PRE-20349|version 21.0)

Confidentiality Status

This document is Non-Confidential. The right to use, copy and disclose this document may be subject to license restrictions in accordance with the terms of the agreement entered into by Arm and the party that Arm delivered this document to.

Unrestricted Access is an Arm internal classification.

Product Status

The information in this document is Final, that is for a developed product.

Feedback

Arm® welcomes feedback on this product and its documentation. To provide feedback on the product, create a ticket on https://support.developer.arm.com

To provide feedback on the document, fill the following survey: https://developer.arm.com/documentation-feedback-survey.

Inclusive language commitment

Arm values inclusive communities. Arm recognizes that we and our industry have used language that can be offensive. Arm strives to lead the industry and create change.

We believe that this document contains no offensive language. To report offensive language in this document, email terms@arm.com.

Contents

1. Introduction

1.1 Conventions

The following subsections describe conventions used in Arm documents.

Glossary

The Arm Glossary is a list of terms used in Arm documentation, together with definitions for those terms. The Arm Glossary does not contain terms that are industry standard unless the Arm meaning differs from the generally accepted meaning.

See the Arm® Glossary for more information: developer.arm.com/glossary.

Typographic conventions

Arm documentation uses typographical conventions to convey specific meaning.

Convention	Use
italic	Citations.
bold	Interface elements, such as menu names. Terms in descriptive lists, where appropriate.
`monospace`	Text that you can enter at the keyboard, such as commands, file and program names, and source code.
`monospace underline`	A permitted abbreviation for a command or option. You can enter the underlined text instead of the full command or option name.
`<and>`	Encloses replaceable terms for assembler syntax where they appear in code or code fragments. For example: `MRC p15, 0, <Rd>, <CRn>, <CRm>, <Opcode_2>`
SMALL CAPITALS	Terms that have specific technical meanings as defined in the *Arm® Glossary*. For example, **IMPLEMENTATION DEFINED**, **IMPLEMENTATION SPECIFIC**, **UNKNOWN**, and **UNPREDICTABLE**.
Caution	Recommendations. Not following these recommendations might lead to system failure or damage.
Warning	Requirements for the system. Not following these requirements might result in system failure or damage.
Danger	Requirements for the system. Not following these requirements will result in system failure or damage.
Note	An important piece of information that needs your attention.

Convention	Use
Tip	A useful tip that might make it easier, better or faster to perform a task.
Remember	A reminder of something important that relates to the information you are reading.

1.2 Useful resources

This document contains information that is specific to this product. See the following resources for other useful information.

Access to Arm documents depends on their confidentiality:

- Non-Confidential documents are available at developer.arm.com/documentation. Each document link in the following tables goes to the online version of the document.
- Confidential documents are available to licensees only through the product package.

Note

Arm tests its PDFs only in Adobe Acrobat and Acrobat Reader. Arm cannot guarantee the quality of its documents when used with any other PDF reader.

Adobe PDF reader products can be downloaded at http://www.adobe.com

1.3 Other information

See the Arm website for other relevant information.

- Arm® Developer.
- Arm® Documentation.
- Technical Support.
- Arm® Glossary.

2. Preface

The industry-standard Keil C compilers, macro assemblers, debuggers, and real-time kernels support all 8051 derivatives and help you get your projects completed on schedule.

Supported Operating Systems

Refer to System Requirements for hardware and operating system requirements.

Example Programs

Example programs included in the `\C51\EXAMPLES` folder demonstrate how to use the µVision project manager and debugger.

Device Database

A unique feature of the Keil µVision IDE is the Device Database which contains information about more than 3500 supported microcontrollers. When you create a new µVision project and select the target chip from the database, µVision sets all assembler, compiler, linker, and debugger options for you. The only option you must configure is the memory map.

As new devices become available, they are added to the database along with data sheets and header files. For information about adding your own chips to the database or about creating your own personal databases refer to the following knowledge base articles.

- Adding Custom Parts to the Device Database
- Creating Custom Databases

Peripheral Simulation

The µVision debugger provides complete simulation for the CPU and on-chip peripherals of most embedded devices. To discover which peripherals of a device are supported, in µVision select the simulated peripherals item from the help menu. You may also use the web-based Device Database.

Technical Support

Open a support case for technical problems or inquiries.

You can also search the documentation for application notes, knowledge base articles, user guides, and product information.

In the Keil Forum you may post questions and comments about Keil products.

Contact Details

You may contact us directly at one of the offices listed on the Keil Support page. You may also receive sales and support through your local distributor.

3. C51 Version 9.60a

Release Date: 28th May, 2019

Target Debugging/Device Programmer

Updated: Segger JLink IS2083 debug driver to version 6.44.4.

4. C51 Version 9.60

Release Date: 13rd May, 2019

Cx51 Compiler

Modified: sbit symbol names with more than 40 characters get truncated. This limitation has been removed. Example:

```
#define SFR_P2 0xA0

sbit tested_very_long_compiler_symbol_name_group_a_section_b = SFR_P2^1;        /*
 Definition of a symbol name with 55 characters. */
              |         |         |         |         |
              |         |         |         |         +-----  Character no 50
              |         |         |         +---------------  Character no 40
              |         |         +-------------------------  Character no 30
              |         +-----------------------------------  Character no 20
              +---------------------------------------------  Character no 10

    tested_very_long_compiler_symbol_name_gr                  <--- The generated
 symbol name has only 40 characters.
                                          |             |
                                          o-------------o  Truncated section
...
```

Corrected: A wrong code will be generated for a small while-loop when NOAREGS has been specified. This error has been introduced with compiler version 9.59. Example:

```
Correct code generation without NOAREGS.

0000         ?C0001:
0000 EF                MOV     A,R7     <--- Load of ACC.
 >-----------------------------------------+
0001 1F                DEC     R7
                |
0002 AC06              MOV     R4,AR6
                |
0004 7001              JNZ     ?C0007   o--- The JNZ instruction jumps based on the
 value of ACC. <---+
0006 1E                DEC     R6
0007         ?C0007:
0007 4C                ORL     A,R4
0008 70F6              JNZ     ?C0001

Wrong code generation with NOAREGS.

0000         ?C0001:
0000 EF                MOV     A,R7     <--- Load of ACC.
 >-----------------------------------------+
0001 1F                DEC     R7
                |
0002 EE                MOV     A,R6     <--- The generated code overwrites the ACC
 register. >--------X
0003 FC                MOV     R4,A
                |
0004 7001              JNZ     ?C0007   o--- The JNZ instruction is using the wrong
 value! <----------+
0006 1E                DEC     R6
0007         ?C0007:
```

```
0007 4C                 ORL     A,R4
0008 70F6               JNZ     ?C0001
...
```

New Supported Devices

ABOV Semiconductor MC94F1202A, MC97FG216, MC96F8104, MC96F8216S, MC96F7416S, MC96F6632S, MC96F6432Q, MC96F6432S, MC96F6332S, MC96F6409, A94B114, A97C450, A96R717, MC97F2664A, MC96F8316A, MC96P6608, MC96F8316S, MC96F8208S, MC96F6509, MC96F6432A, and MC94F1102A.

ISSI IS31CS8973, - Megawin MG86Fx508, MG86Fx104, MG84FG516, MG84FL54BD, MG82G5E32, MG82FG5D16, MG82FG5C64, MG82FG5C32, MG82FG5B32, MG82FG5B16, MG82FG5A64, MG82FG5A32, MG82Fx316, MG82Fx308, MG82Fx564, MG82Fx532, MG87Fx04, MG87Fx6051, MG87Fx4051, MG87Fx2051, and M87Fx52.

Microchip IS2083B.

Device Simulation

Corrected: for Atmel AT89C51CC03 the simulation crashes during the startup phase when the project was initialized with the -pATXC3 setting.

Target Debugging/Device Programmer

Added: Segger JLink IS2083 debug driver to support the IS2083B from Microchip.

Updated: NULink driver to version 2.06.6875.

uVision

This C51 release comes with µVision V5.27.1.

The Customize Tools Menu... option is extended with Export/Import for sharing the tools menu setup across PCs.

5. C51 Version 9.59

Release Date: 9th May, 2018

New Supported Devices

Silabs EFM8UB30F40G_QFN20, EFM8UB31F40G_QFN24, EFM8UB31F40G_QSOP24

Weltrend WT51F116, WT51F108, and WT51F104.

AX51 Macro Assembler

Corrected: allow slash `/` in addition to backslash `\` as a directory separator in all places.

Cx51 Compiler

Corrected: sometimes the compiler shows warning C290: missing return value or warning C291: not every path returns a value although a value is returned.

Corrected: in some cases post increment was not applied. Example:

```
unsigned char reader;
unsigned char count;
unsigned int  index;

index = 0;

write_byte(offset);

for (count = 0; count < 10; count++) {
  reader = read_byte();
  pData[index++] = reader;
}
...
```

Wrong code was generated:

```
...
000D 120000      R     LCALL   read_byte
;---- Variable 'reader' assigned to Register 'R5' ----
0010 AD07              MOV     R5,AR7
0012 EB                MOV     A,R3
0013 2500        R     ADD     A,index+01H
0015 F582              MOV     DPL,A
0017 EA                MOV     A,R2
0018 3500        R     ADDC    A,index
001A F583              MOV     DPH,A
001C ED                MOV     A,R5
001D F0                MOVX    @DPTR,A
001E 0C                INC     R4
...
```

Now, the correct code is generated:

```
...
;---- Variable 'reader' assigned to Register 'R5' ----
001A AD07              MOV     R5,AR7
```

```
001C 8B82               MOV     DPL,R3
001E 8A83               MOV     DPH,R2
0020 0500         R     INC     index+01H
0022 E500         R     MOV     A,index+01H
0024 AE00         R     MOV     R6,index
0026 7002               JNZ     ?C0007
0028 0500         R     INC     index
002A           ?C0007:
002A 14                 DEC     A
002B 2582               ADD     A,DPL
002D F582               MOV     DPL,A
002F E583               MOV     A,DPH
0031 3E                 ADDC    A,R6
0032 F583               MOV     DPH,A
0034 ED                 MOV     A,R5
0035 F0                 MOVX    @DPTR,A
0036 0C                 INC     R4
...
```

Corrected: allow slash / in addition to backslash \ as a directory separator in all places.

Corrected: in rare cases a signed compare with unsigned char treated the unsigned char as signed. This happens if the unsigned char value results from a calculated assignment. Example:

```
char i;
unsigned char uc0 = 254;
char c1 = 0;

void main() {
  if (c1 <= (uc0 += c1))    // uc0 is wrongly treated signed => -2 therefore the
 condition (0 <= -2) is false
    i = 1;
  else
    i = 0;
}
```

Wrong code was generated:

```
0000 E500         R     MOV     A,uc0
0002 2500         R     ADD     A,c1
0004 F500         R     MOV     uc0,A
0006 D3                 SETB    C
0007 6480               XRL     A,#080H       \
0009 F8                 MOV     R0,A          |
000A E500         R     MOV     A,c1          |
000C 6480               XRL     A,#080H       |
000E 98                 SUBB    A,R0          |
000F 5004               JNC     ?C0001        -> signed char compare
0011 750001       R     MOV     i,#01H
0014 22                 RET
0015           ?C0001:
0015 E4                 CLR     A
0016 F500         R     MOV     i,A
0018           ?C0003:
0018 22                 RET
```

The correct code is much longer because according to the C standard a cast to int is necessary:

```
0000 E500         R     MOV     A,uc0
0002 2500         R     ADD     A,c1
0004 FF                 MOV     R7,A
0005 F500         R     MOV     uc0,A
```

```
0007 AD00        R     MOV     R5,c1          \
0009 ED                MOV     A,R5           |
000A 33                RLC     A              |
000B 95E0              SUBB    A,ACC          |
000D FC                MOV     R4,A           -> cast of signed char to int
000E D3                SETB    C              \
000F ED                MOV     A,R5           |
0010 9F                SUBB    A,R7           |
0011 7480              MOV     A,#080H        +> implicit cast of unsigned char to
 int
0013 F8                MOV     R0,A           |
0014 6C                XRL     A,R4           |
0015 98                SUBB    A,R0           |
0016 5004              JNC     ?C0001         -> signed int compare
0018 750001      R     MOV     i,#01H
001B 22                RET
001C           ?C0001:
001C E4                CLR     A
001D F500        R     MOV     i,A
001F           ?C0003:
001F 22                RET
```

To generate smaller code the signedness of the values to be compared should be the same:

```
...
    if ((unsigned char)c1 <= (uc0 += c1))
...
0000 E500        R     MOV     A,uc0
0002 2500        R     ADD     A,c1
0004 FF                MOV     R7,A
0005 F500        R     MOV     uc0,A
0007 E500        R     MOV     A,c1
0009 D3                SETB    C              \
000A 9F                SUBB    A,R7           |
000B 5004              JNC     ?C0001         -> unsigned char compare
000D 750001      R     MOV     i,#01H
0010 22                RET
0011           ?C0001:
0011 E4                CLR     A
0012 F500        R     MOV     i,A
0014           ?C0003:
0014 22                RET
```

LX51 Linker/Locater

Corrected: in rare cases the linker crashes if using long function names and Global Register Coloring

Corrected: somehow not only function names were listed in the call tree and warning L48: IGNORED RECURSION, CALL REMOVED appeared

Corrected: sometimes automatic rebuilds are not executed when Global Register Coloring is used.

Corrected: in case of banked applications and under some circumstances the CONST- as well as the CODE-Segments located to the same bank address.

Corrected: under some circumstances the MERGEPUBLICS does not work for sbit variables.

Debug Commands

Added: New debugger command COVTOFILE filespec [\app][][] [DETAILS] [ASM which works like the COVERAGE command but sends the output into a file. This is much faster than into the output window.

uVision

This C51 release comes with µVision V5.25.3.

6. C51 Version 9.57

Release Date: 9th November, 2017

A51 Assembler and AX51 Assembler

Corrected: two line feeds in Macro Processor Language (MPL) error message.

LX51 Linker/Locater

Corrected: in banking mode 8 there were sometimes misplaced segments and warning L30: MEMORY SPACE OVERLAP appeared.

Added: the `Warning L59: REENTRANT CALLS NON REENTRANT`

FUNCTION, COULD LEAD TO WRONG OVERLAY CALCULATION will be generated when a reentrant function calls a non-reentrant one.

Corrected: automatic rebuilds are not executed when 'Global Register Coloring' is used. This problem was introduced with C51 version 9.56.

Corrected: in case of banked applications and under some circumstances the CONST- as well as the CODE-Segments located to the same bank address. This problem was introduced with C51 version 9.56.

Corrected: under some circumstances the MERGEPUBLICS does not work for sbit variables.

Corrected: the LX51 may locate the Stack-Segment to wrong address. As described in the knowledge base article 3842 this problem was introduced with C51 version 9.55.

Corrected: under some circumstances the LX51 erroneously throws the warning L48: IGNORED RECURSIVE CALL. This regression was introduced with C51 version 9.56.

BL51 Linker/Locater

Corrected: erroneously the BL51 throws the ERROR L121:

```
IMPROPER FIXUP for bit variables located in the bdata memory space.
```

OHX51 Object to Hex Converter

Corrected: under some circumstances the OHX51 terminates the OMF51 to Intel HEX conversion by throwing the following message:

```
ERROR: BANKED APPLICATION CANNOT HAVE AN OFFSET VALUE.
```

New Supported Devices

Nuvoton N76E885, N76E616, and N76E003.

uVision

This C51 release comes with µVision V5.24.2.86.

Enhanced: New PC-Lint configuration option to add project target and compiler specific preprocessor symbols.

µVision now offers Japanese localization on Windows PCs with the 'primary language' Japanese. To select the language use the uVision menu item Edit - Configuration - Other - Startup - Language.

A Japanese Getting Started user's guide is available in the uVision Books Window.

Added: new option to limit the Find in Files utility to the "Current Document".

Enhanced: editor now supports Arabic, Baltic, Eastern European, Greek, Hebrew, Russian, Thai, Turkish, and Vietnamese character sets.

Corrected: Bookmark navigation is now working only on the "Current Document".

Corrected: opening struct elements in the Watch Window did not always show up-to-date values.

7. C51 Version 9.56

Release Date: 10th August, 2016

Cx51 Compiler

Improved C90 conformity for ASSERT.H, FLOAT.H, MATH.H, STDARG.H, STDDEF.H, STDLIB.H, and STRING.H header files.

Corrected: reduntant code genration. Under some circumstances the C51 compiler generates code which loads the accumulator register A twice. Example:

```
........
10:
11:       union X {
12:         struct {
13:           unsigned char l8 :8;
14:         } v;
15:       };
16:
17:       union X xdata x  _at_ 0x5800;
18:       unsigned char t;
19:
20:       void MyFunc(void) {
21:         x.v.l8 = t;
22:       }
23:
........

           21:         x.v.l8 = t;
       C:0x088C    90581D   MOV      DPTR,#0x581D     -------+------o Suboptimal
 code generation
       C:0x088F    E0       MOVX     A,@DPTR                 | <----  Superfluous
 register A load
       C:0x0890    ED       MOV      A,R5                    |
       C:0x0891    F0       MOVX     @DPTR,A          -------+

           21:         x.v.l8 = t;
       C:0x13BA    90581D   MOV      DPTR,#0x581D     -------+------o Corrected
 code generation
       C:0x13BD    ED       MOV      A,R5                    |
       C:0x13BE    F0       MOVX     @DPTR,A          -------+
```

Corrected: wrong code generation in case of bit-field computation inside a switch-case statement. Example:

```
#include <REG51F.H>

typedef struct sTest {
  unsigned char b1 : 1;
  unsigned char b2 : 1;
} t_test;

xdata t_test tSt;

void main (void) {

  switch (tSt.b2) {
```

```
    case 1:
      P1 = 1;
      break;
    default:
      P1 = 0;
      break;
  }

```

LX51 Linker/Locater

Corrected: Under some circumstances the LX51 locates the stack segment to a wrong address inside the idata address space. This problem was introduced with C51 version 9.55. Example:

```
+-------------------------------------------------------------------------
Wrong stack location inside the data/idata memory space
+-------------------------------------------------------------------------

MEMORY MAP OF MODULE:  Repro (?C_STARTUP)

New: the warning L48: Ignored Recursive Call Callee: function-name Caller: *function-name* will be issued when a reentrant function calls a non-reentrant function.

A51 Assembler and AX51 Assembler

Removed: a path length limitation of 127 characters.

New Supported Devices

ABOV MC95FG0128, MC95FG6128, MC95FG8128, MC95FG208, MC95FG308, MC95FR332, MC95FR364, MC95FR432, MC95FR464, MC96F1206, MC96F4548, MC96F6332, MC96F6432, MC96F6408A, MC96F6508A, MC96F6632, MC96F6832, MC96F7064, MC96F7416A, MC96F7616A, MC96F7616T, MC96F7816, MC96F7664, MC96F7864, MC96F7848C, MC96F8204, MC96F8208, MC96F8216, MC96F8316, MC96FC664A, MC96FC864A, MC96FD316, MC96FM204, MC96FM214, MC96FM408, MC96FR116C, MC96FR3128, MC96FR4128, MC96FR332A, MC96FR364B, MC96FR364C, MC96FT1616, MC96FT1704, MC96FT241, MC96FT242, MC97F2464, MC97F2664, MC97F60128, MC97F66128, MC97F68128, MC97F68128A, and MC97FG316.

uVision

This C51 release comes with µVision V5.20.0.39.

Supported Operating Systems

µVision and it's dynamically loaded libraries (DLL) have been ported to MSVC 2015. MSVC 2015 does not officially support Windows XP any longer.

8. C51 Version 9.55

Release Date: 14th March, 2016

Cx51 Compiler

Corrected: WARNING C182: pointer to different objects sometimes incorrect. Example:

```
int xxx[6];
int (*ptr)[6];

void main(void) {
  ptr = &xxx;  /* The compiler erroneously throws the WARNING C182: pointer to
 different objects for this assignment. */
}
```

Corrected: constant strings may be stored in the memory class CODE instead of CONST.. For example:

```
code char str1[] = "aaaaa";
code char str2[] = "bbbbb";
char * arC;

void main(void) {
  arC = str1;
  arC = "xxxxx";
}

Wrong storage location for "aaaaa", "bbbbb", and "xxxxx".
 Correct storage location for "aaaaa", "bbbbb", and "xxxxx".

...
...
```

Corrected: When using the SEGMENTS directive to order segments, the order was violated (incorrect size optimization). For example:

```
Assembler source:

C2 SEGMENT ECODE
    RSEG C2
    T2: DB  0x7F

C1 SEGMENT ECODE SEG
    RSEG C1
    T1: DB  0x7F

C3 SEGMENT ECODE SEG
    RSEG C3
    T3: DB  0x7F

                                  defined segment order

                                 |----------------------|
LX51.EXE T1.obj TO T1.abs PRINT CLASSES(CODE(C:0X4000-C:0X8000),ECODE (C:0X4000-
C:0X28000),XDATA (X:0X0000-X:0X09FF)) SEGMENTS (C3, C1, C2)

START     STOP      LENGTH    ALIGN  RELOC    MEMORY CLASS   SEGMENT NAME

```

Corrected: Do not show empty segments as overlapping. For example:

```
START     STOP      LENGTH    ALIGN  RELOC    MEMORY CLASS   SEGMENT NAME
=============================================================================

010000H   010007H   000008H   SEG    UNIT     ECODE          C3
010008H   010008H   000001H   BYTE   UNIT     ECODE          C2
*** OVERLAP ***                                                <--- There is no
 real overlap because the next segment is empty
010008H   ---       000000H   BYTE   UNIT     ECODE          C1
```

uVision

This C51 release comes with µVision V5.14.2.1.

9. C51 Version 9.54

Release Date: 24th April, 2015

LX51 Linker/Locater

Corrected: under some circumstances the LX51 ignores the NOJMPTAB directive and and throws erroneously the following error:

```
* ERROR L210: I/O ERROR ON INPUT FILE:
EXCEPTION 0021H: PATH OR FILE NOT FOUND
FILE: C:\KEIL\C51\LIB\L51_BANK.OBJ
```

A51 Macro Assembler and AX51 Macro Assembler

Corrected: under some circumstances the assembler shows wrong line numbers if an $include file cannot be found. The root cause for this behavior is the erroneous line number generation by the preprocessor. Example:

```
NAME xxx
S       SEGMENT  CODE
        RSEG  S
#line                ; The preprocessor generates wrong line numbers if an $include
 file cannot be found.
PUT:    MOV   A,#x   ; The assembler shows these wrong line numbers inside the
 build output window as part of a warning or error message.
        RET
        END
```

OHX51 Object to Hex Converter

The OHX51 creates hex records that crosses 64Kbyte boundaries which is not allowed. For example: defining a HCONST segment ?HC?UCL with a size of 128Kbyte will cross two times the 64Kbyte boundaries at `0x810000` and `0x820000`. Mapfile entry for this segment.

```
.....
800020H   82000FH   01FFF0H   BYTE   UNIT HCONST ?HC?UCL
.....
```

The resulting hex file is wrong at these 64 KBytes boundaries. One HEX record (equates to one line) must not cross a 64 KBytes boundary:

```
Line   HEX record

.....
00021  :0200000400807A ; switch to segment 0x80
.....
04119  :10FFFC00215E5F5E48656C6C6F204169726F686151 ; starts at 0xFFFC and crosses
 the 64K boundary
        ||||||
        ||AAAA -> Address
        LL------> Record length

04120  :02000004008179                            ; switch to segment 0x81
04121  :10000C00215E5F5E48656C6C6F204169726F686140 ; starts at 0x000C
```

```
.....
.....
.....
08218  :10FFF800726F6861215E5F5E48656C6C6F20416955 ; starts at 0xFFF8 and crosses

uVision

This C51 release comes with µVision V5.14.1.

10. C51 Version 9.53

Release Date: 5th August, 2014

LX51 Linker/Locater

Implemented: the PUBLICSONLY Linker directive. The generated objectfile contains only public symbol information from the input file.

Enhanced: LX51 code optimization now removes common blocks for unused functions. Example:

```
unsigned char a, b, c;
unsigned char darr [0x10];

void FuncA (void) {
  darr[c] = darr[b];
}

void FuncB (void) {
  darr[c] = darr[b];
}

void FuncC (void) {
  darr[c] = darr[a] + darr[b];
}

void FuncD (void) {
  darr[c] = darr[a] + darr[b];
}

void main(void) {
  FuncA ();
  FuncB ();
  while(1);
}

; FUNCTION FuncA (BEGIN)    ; FUNCTION FuncB (BEGIN)        ; FUNCTION FuncC (BEGIN);
        FUNCTION FuncD (BEGIN)
    R MOV A,#LOW darr          R MOV A,#LOW darr               R MOV A,#LOW darr
 ----- + ----- R MOV A,#LOW darr

|          RET
o-> Common code for FuncC and FuncD
```

In the example above the functions FuncC() and FuncD() are removed when the REMOVEUNUSED linker directive is specified. Now, the first part of the common code block (FUNCTION ?L?COM0001) is no longer necessary. In previous versions this was still part of the image. With the new linker enhancement even this code block is removed.

```
----- FUNCTION ?L?COM0001 (BEGIN) -----
000021 7408  MOV  A,#LOW darr  ---+
000023 2519  ADD  A,b             |\

Texas Instruments CC2541F128, CC2541F256, CC2543, CC2544, and CC2545.

Vitesse VSC7388, VSC7389, VSC7390, VSC7391, VSC7395, VSC7420, and VSC7422.

uVision

This C51 release comes with µVision V5.11.2.0.

11. C51 Version 9.52

Release Date: 4th July, 2013

Cx51 Compiler

Modified: the warning C294: unreachable code will be issued instead of a compiler error for unreachable code statements. Example:

```
int foo = 1 ;
int bar ;

int main( void )
{
  switch( foo )
  {
bar = 0 ;   // warning C294: unreachable code
case 1:
  bar = 1 ;
  break ;
case 2:
  bar = 2 ;
  break ;
  }
  return( 0 ) ;
}
```

Corrected: wrong `XDATA` address calculation which may occurs with combined pointer and int arithmetic. Example:

```
unsigned char xdata b[256];  // Problem does not exist when array size > 256
void xdata *p;
unsigned int i = 256;

void main (void) {
  p = &b[256-i];     // Correct result.
  p = b + 256 - i;   // Incorrect result. Only the LOW BYTE of i has been used for
 the calculation.
}
```

Corrected: an ignored pointer cast which occurs under some circumstances with far and generic pointers. Example:

```
unsigned short foo (char far *farPtr) {

  return (unsigned char) farPtr;  // Explicit cast is ignored.
}
```

LX51 Linker/Locater

Corrected: a wrong address calculation which occurs when const in code banks combined with linker code packing.

Added: `Error 144: OVERLAY GROUP SEGMENT CANNOT HAVE 'LAST' ADDRESS ASSIGNMENT` message. The LAST attribute cannot be used to locate segments that collect overlayable segments.

AX51 Assembler

Corrected: an erroneously issued `Error A57 'REGISTER USAGE' REQUIRES A PUBLIC CODE SYMBOL` which occurs when REGUSE directive is used by mixed-case (composed by upper and lower case characters) symbols.

New Supported Devices

Texas Instruments CC2541F128 and CC2541F256.

ULINK2

With this release the firmware of the ULINK2 target debugger will be updated to version 2 which will not work with older C51 installations. The `.\C51\ULINK\Utilities\UL2_Configure.exe` tool allows to switch back to an older firmware version when backward compatibility is needed.

uVision

This C51 release comes with µVision V4.72.9.0.

12. C51 Version 9.51a

Release Date: 25th February, 2013

uVision

This C51 release comes with µVision V4.60.6.10.

Corrected: synchronization of settings between tabs in “Options for Target” dialog.

13. C51 Version 9.51

Release Date: 21st January, 2013

New Supported Devices

Silicon Laboratories Inc. C8051F370, C8051F371, C8051F374, C8051F375, C8051F390, C8051F391, C8051F392, C8051F393, C8051F394, C8051F395, C8051F396, C8051F397, C8051F398, C8051F399, C8051T620, C8051T621, C8051T622, C8051T623, C8051T626, and C8051T627 devices.

Cx51 Compiler

Corrected: calculation of negative constants within nested calls may create incorrect results (this problem was introduced in C51 V9.50a). For example:

```
#define TDO  5
#define GET_TDO()   (Arr[TDO])
unsigned char xdata Arr[10];

unsigned char TestTDO() {
  unsigned char ret;
  ret = (unsigned char)(((GET_TDO()-1)*2)-1);   // Incorrect result. For the
 negative constant a subtraction has been used instead of an addition.
  return ret;
}
```

Corrected: incorrect pointer arithmetic with subtract of unsigned int variables for XDATA arrays with sizeof < 256 bytes. For example:

```
unsigned char xdata b[256];  /* Problem does not exist when array size > 256  */
void xdata *p;
unsigned int i = 256;        /* Problem only appears for unsigned int variables */

void main (void)  {
  p = &b[256-i];     /* Works no problem when array index is used */
  p = b + 256 - i;   /* Failed on pointer arithmetic when uint variable is
 subtracted */
}
```

LX51 Linker/Locater

Corrected: a potential DPTR corruption which may occurs in code-banking applications when Global Register Coloring is enabled.

uVision

This C51 release comes with µVision V4.60.6.8.

Enhanced: the Logic Analyzer allows rearranging signals through a simple drag&drop of the signal name. Signals can be scaled in width and height.

Corrected: under certain circumstances the Source Browser incorrectly reported several definitions of an `enum`.

14. C51 Version 9.50a

Release Date: 15th June, 2012

New Supported Devices

Cypress CY8C3244AXI-153, CY8C3244LTI-123, CY8C3244LTI-130, CY8C3244PVI-133, CY8C3245AXI-158, CY8C3245AXI-166, CY8C3245LTI-129, CY8C3245LTI-139, CY8C3245LTI-144, CY8C3245LTI-163, CY8C3245PVI-134, CY8C3245PVI-150, CY8C3246AXI-131, CY8C3246AXI-138, CY8C3246LTI-125, CY8C3246LTI-128, CY8C3246LTI-149, CY8C3246LTI-162, CY8C3246PVI-122, CY8C3246PVI-147, CY8C3444AXI-116, CY8C3444LTI-110, CY8C3444LTI-119, CY8C3444PVI-100, CY8C3445AXI-104, CY8C3445AXI-108, CY8C3445LTI-078, CY8C3445LTI-079, CY8C3445LTI-081, CY8C3445LTI-089, CY8C3445PVI-090, CY8C3445PVI-094, CY8C3446AXI-099, CY8C3446AXI-105, CY8C3446LTI-073, CY8C3446LTI-074, CY8C3446LTI-083, CY8C3446LTI-085, CY8C3446PVI-076, CY8C3446PVI-091, CY8C3446PVI-102, CY8C3665AXI-010, CY8C3665AXI-016, CY8C3665LTI-006, CY8C3665LTI-044, CY8C3665PVI-007, CY8C3665PVI-008, CY8C3665PVI-080, CY8C3666AXI-036, CY8C3666AXI-037, CY8C3666AXI-052, CY8C3666LTI-027, CY8C3666LTI-050, CY8C3865AXI-019, CY8C3865LTI-014, CY8C3865LTI-062, CY8C3865PVI-060, CY8C3865PVI-063, CY8C3866AXI-035, CY8C3866AXI-039, CY8C3866AXI-040, CY8C3866LTI-030, CY8C3866LTI-067, CY8C3866LTI-068, CY8C3866PVI-021, and CY8C3866PVI-070.

Zilog Z51F0410, Z51F3220, Z51F3221, Z51F6412, and Z51F811.

uVision

This C51 release comes with µVision V4.53.0.6. which includes the new Scintilla based editor.

The new editor includes the following enhancements:

- Encoding for UTF-8 Unicode, DBCS Korean, DBCS Japanese, and DBCS Chinese languages. Unicode and Asian ANSI encoding is recognized automatically when a file is opened.
- Monospaced fonts and proportional fonts are supported.
- Syntax coloring has been extended.
- Unprintable characters, such as End-Of-Line, can be visualized in the editor.
- The Outlining menu has been simplified. Outlining information is saved and restored for each file.
- Search and replace utilities (Incremental Find, Find-in-Files, and Replace) have been reworked.
- Text can be zoomed with Ctrl+mouse wheel. The information is saved and restored for each file.
- In case device-specific books are not found in the local installation, then www.keil.com is scanned for a matching document.

Corrections: Scrolling quickly through large files with Page Up or Page Down works smoothly. The editor's context menu can be closed by pressing ESC. Breakpoints can be set now with a simple

click into the editor margin. Under some circumstances the Debugger showed wrong values of arrays or structures in the Watch window.

Refer to Revision History for a complete list.

15. C51 Version 9.06

Release Date: 15th February, 2012

New Supported Devices

Atmel AT89LP51RB2, AT89LP51RC2, AT89LP51IC2, AT89LP51RD2, AT89LP51ED2, and AT89LP51ID2 devices.

Infineon TLE9831, TLE9832, TLE9833, TLE9834, and TLE9835 devices.

Maxim 71M6531D, 71M6531F, 71M6532D, 71M6532F, 71M6534H, 71M6541D, 71M6541F, 71M6542F, 71M6543F, and 71M6543G devices.

Silabs C8051F969, C8051F968, C8051F967, C8051F966, C8051F965, C8051F964, C8051F963, C8051F962, C8051F961, C8051F960, Si1037, Si1036, Si1035, Si1034, Si1033, Si1032, Si1031, Si1030, Si1027, Si1026, Si1025, Si1024, Si1023, Si1022, Si1021, and Si1020 devices.

Device Support

Added: Quick_Test example for Infineon TLE983x based devices in folder `..\C51\Examples\Infineon TLE983x\`.

Added: banking example for Maxim 71M6543G device in folder `..\C51\Examples\Maxim\BankEx1\`.

Added: banking example for Maxim 71M6534H device in folder `..\C51\Examples\Maxim\BankEx2\`.

uVision

This C51 release comes with µVision V4.24.00.

16. C51 Version 9.05

Release Date: 8th August, 2011

C51 Compiler

Improved: access to bit-field members with size 1 bit. The compiler uses bit instructions to access such bit-field members objects that are defined with the `bdata` memory type. This is now extended also to structs that are defined with the extern attribute.

Corrected: Common sub-expression elimination can deliver incorrect values when array pointers are used. Example:

```
int foo (unsigned char dat[]) {
int len1, len2, ofs;

  ofs = 5;
  len1 = dat[ofs];
  if(len1 > 0x10)  return -1;
  ofs += len1 + 1; // modify 'ofs'
  len2 = dat[ofs]; // 'dat[ofs]' not reloaded, instead value of 'len1' is used
  return len2;
}
```

Corrected: Wrong code with pointer arithmetic and conversions to long. Example:

```
unsigned char *p;
unsigned int code a1[10];
unsigned char xdata a2[500;

void foo (void) {
  unsigned long r1 = (unsigned long)(p - (a2 + a1[0]));  // wrong
  unsigned long r2 = (unsigned long)(p - (unsigned long)(a2 + a1[0]));   // work
 around
}
```

Corrected: Pointer arithmetic with conversion to ‘unsigned long’ rejected. Example:

```
unsigned char xdata *ptr1;
unsigned char xdata *ptr2;
unsigned long i4;

void foo (void) {
  i4 = (ptr1 - ptr2); // pointer conversion rejected, instead an error was issued
}
```

Lx51 Linker/LOcater

Corrected: When Linker Code Packing is used with a banking application,segments or the content of segments may get lost. This problem was introduced with C51 Version 9.03.

New Supported Devices

CoreRiver ADCore200, ADCore210, ADCore220, AmpCore100, ChargerCore2.0, GC230, GC400, GC410, GC81L541A0, GC81L581A0, GC81L591A0, GC89L541A0, GC89L581A0, GC89L591A0, and HallCore110 devices.

Nordic nRF8200 device.

Nuvoton N78E055A, N78E059A, N78E366A, N78E517A, N79E234, N79E235, N79E342, N79E352, N79E822, N79E823, N79E824, N79E825, N79E843, N79E844, N79E845, N79E853, N79E854, N79E855, N79E875, W78E051D, W78E052D, W78E054D, W78E058D, and W78E516D devices.

Silabs C8051T620, C8051T621, C8051T622, C8051T623, C8051T320, C8051T321, C8051T322, C8051T323, C8051T326, C8051T327, C8051F380, C8051F381, C8051F382, C8051F383, C8051F384, C8051F385, C8051F386, and C8051F387 devices.

uVision

This C51 release comes with µVision V4.22.00.

17. C51 Version 9.03

Release Date: 14th February, 2011

Cx51 Compiler

Improved: Evatronix R8051XC2 core now uses the MDU for signed long divisions.

Corrected: With OPTIMIZE(8, SIZE) or higher optimization levels there is a potential problem with common code generation of long/float store operations that store constants with different memory types. Example:

```
int flag;

long xdata l;

long *pl;

void main (void)  {

  if (flag)  {   l = 0; flag = 1; }   // store with identical constant value but
 different space
  else       { *pl = 0; flag = 1; }   // may create incorrect common blocks }
```

LX51 Compiler

Improved: When using Linker Code Packing the gaps in the BANKAREA are not optimized.

Corrected: Potential SEGMENT OVERLAPS when using Linker Code Packing on a banking application.

New Device Support

Atmel AT80C51RD2, AT89LP213, AT89LP216, AT89LP52, and AT89LP6440 devices.

Infineon XC878LM-13F, XC878CLM-13F, XC878LM-16F, XC878CLM-16F, XC874-13F, XC874LM-13F, XC874CM-13F XC874CLM-13F, XC874-16F, XC874LM-16F, XC874CM-16F, XC874CLM-16F, and XC836MT-1F devices.

NXP P87C51FA, P87C51FB, P89CV51RB2, P89CV51RC2, P89CV51RD2, P89LPC779, andP87V660X2 devices.

Silabs C8051F348, C8051F349, C8051T606, C8051T630, C8051T631, C8051T632, C8051T633, C8051T634, C8051T635, C8051F540, C8051F541, C8051F542, C8051F543, C8051F544, C8051F545, C8051F546, C8051F547, C8051F550, C8051F551, C8051F552, C8051F553, C8051F554, C8051F555, C8051F556, C8051F557, C8051F560, C8051F561, C8051F562, C8051F563, C8051F564, C8051F565, C8051F566, C8051F567, C8051F568, C8051F569, C8051F570, C8051F571, C8051F572, C8051F573, C8051F574, C8051F575, C8051F34A, C8051F34B, C8051F34C, C8051F34D, C8051F716, C8051F717, C8051F980, C8051F981, C8051F982, C8051F983, C8051F985, C8051F986, C8051F987, C8051F988, C8051F989, C8051F990, C8051F991, C8051F996, C8051F997, C8051F800, C8051F801, C8051F802, C8051F803, C8051F804, C8051F805, C8051F806, C8051F807, C8051F808,

C8051F809, C8051F810, C8051F811, C8051F812, C8051F813, C8051F814, C8051F815, C8051F816, C8051F817, C8051F818, C8051F819, C8051F820, C8051F821, C8051F822, C8051F823, C8051F824, C8051F825, C8051F826, C8051F827, C8051F828, C8051F829, C8051F830, C8051F831, C8051F832, C8051F833, C8051F834, C8051F835, C8051F901, C8051F902, C8051F911, C8051F912, Si1000, Si1001, Si1002, Si1003, Si1004, Si1005, Si1010, Si1011, Si1012, Si1013, Si1014, Si1015, C8051F520A, C8051F521A, C8051F523A, C8051F524A, C8051F526A, C8051F527A, C8051F530A, C8051F531A, C8051F533A, C8051F534A, C8051F536A, and C8051F537A devices.

Teridian Semiconductors 78M6612, 78M6618, and 71M6543 devices.

Texas Instruments CC2530F32, CC2530F64, CC2530F128, CC2530F256, CC2531F128, CC2531F256, CC2533F32, CC2533F64, CC2533F96, CC2540F128, and CC2540F256 devices.

uVision IDE

This C51 release comes with µVision V4.14.16.

18. C51 Version 9.02a

Release Date: 12th July, 2010

Cx51 Compiler

Improved: access to bit-field members with size 1 bit. The compiler uses bit instructions to access such bit-field members. When objects are defined with the `bdata` memory type, direct bit addressing is used. Example:

```
struct bf { unsigned char b0:1; unsigned char b1:1; };
struct bf   a;
struct bf bdata b;
  :
if (a.b0 && b.b1)  b.b1 = 0;
```

Corrected: multiplication `long = int * int` is potentially incorrect in Dallas 390 mode.

Corrected: explicit cast to unsigned char was ignored with complex address arithmetic. Example:

```
unsigned char far table[256];
unsigned char i, v;
  :
v = table[(unsigned char)(16+i+20)];  // index now truncated to 8-bit
```

Corrected: when using conditional operators (`? :`) in complex parameter lists, there is a potential for unbalanced PUSH/POP instructions. This typically creates a application program crash at the function call.

C Run-Time Library

Corrected: the function *toint* did not detect the value range `0x59` - `0x40` as invalid. Now the function returns -1 for these values.

Corrected: timing of Multiplication Division Unit (MDU) in Evatronix R8051XC2 device is faster and now reflected in the C Library. The MDU timing for int/long multiplication and long division is adjusted.

New Supported Devices

Infineon XC835MT-2F, XC836-2F, XC836M-1F, XC836M-2F, XC836MT-2F, and XC836T-2F devices.

Device Simulation

Corrected: SiLabs C8051F41x devices: SMBus simulation when using I^2C generator.

Corrected: SiLabs C8051F12x devices: automatic page switch for interrupts and timing of timer 2/3/4.

Corrected: SiLabs C8051F12x devices: on IÂ²C the receive of more than 256 bytes now generates a stop.

Corrected: SiLabs C8051F36x devices: crossbar did not connect the right I/O signals under some circumstances.

Corrected: Evatronix T8051: CPU instruction timing.

19. C51 Version 9.01

Release Date: 24th February, 2010

uVision IDE

C51 now includes the new µVision4 IDE.

New Supported Devices

Infineon XC822T-0F, XC822M-1F, XC822MT-1F, XC824MT-1F, and XC824M-1F devices.

Device Support

Added: debug support for Infineon XC82X devices.

Cx51 Compiler

Corrected: when MODDA is used and *int* numbers are multiplied and assigned to *long*, the result was potentially incorrect.

20. C51 Version 9.00

Release Date: 26th October, 2009

uVision IDE

C51 now includes the new µVision4 IDE.

New Supported Devices

Evatronix R8051XC(1DPTR), R8051XC2(1 DPTR), R8051XC2(2 DPTR), R8051XC2(8 DPTR), R8051XC2-A(1 DPTR), R8051XC2-A(2 DPTR), R8051XC2-A(8 DPTR), R8051XC2-AF, R8051XC2-B(1 DPTR), R8051XC2-B(2 DPTR), R8051XC2-B(8 DPTR), and R8051XC2-BF devices.

Nordic nRFLU1P-F16 and nRFLU1P-F32 devices.

NXP P89LPC9361 device.

Silabs C8051F580, C8051F581, C8051F582, C8051F583, C8051F584, C8051F585, C8051F586, C8051F587, C8051F588, C8051F589, C8051F590, and C8051F591 devices.

Device Support

Corrected device settings for Infineon XC888-6FF, XC888CM-8FF, XC888LM-6FF, XC886-6FF, XC866L-1FR, XC866L-2FR, XC866L-4FR, and XC864-1FRI devices.

Corrected: device settings for Nordic Semiconductor nRF24E1, nRF24E2, nRF9E5, nRF24LU1, and nRF24LE1 devices.

Cx51 Compiler

Corrected: constant folding of two negative array index values. For example:

```
unsigned char arr[512];
unsigned int i;

i = arr[i-1-5];// incorrect in C51 V8: arr[i-4] instead of arr[i-6]
```

Corrected: when using the NOAREGS directive, complex arithmetic with nested calls may create incorrect results. For example:

```
#pragma NOAREGS

int result;
extern char f(unsigned char idx);

result = (f(1)*0x100+f(0)) - (f(3)*0x100+f(2));  // incorrect result. POP destroys
 value in ACC
```

Lx51 Linker

Corrected: when using OPTIMIZE(10) or above, there was a potential that common code blocks are called incorrectly. Therefore programs may have operated incorrectly.

BL51 Linker/Locater

Corrected: when using RTX51 user interrupt functions were overlapping with RTX ISR vectors which resulted in a linker warning.

Corrected: data overlaying may not work when the last input module contains an interrupt function; the linker incorrectly issues WARNING 16: main uncalled.

21. C51 Version 8.18

Release Date: 30th March, 2009

Device Support

Added debug support for the NXP P89LPC9408 in the LPC900 EPM Emulator/Programmer.

New Supported Device

Nuvoton W681308 device.

NXP:

- C8051F500
- C8051F501
- C8051F504
- C8051F505
- C8051F506
- C8051F507
- C8051F508
- C8051F509
- C8051F510
- C8051F511
- C8051F700
- C8051F701
- C8051F702
- C8051F703
- C8051F704
- C8051F705
- C8051F706
- C8051F707
- C8051F708
- C8051F709
- C8051F710
- C8051F711
- C8051F712
- C8051F713
- C8051F714

- C8051F715

ULINK2 Support

Corrected potential deadlock on ST uPSD targets.

Device Simulation

Corrected simulation of Infineon XC800 MDU.

Corrected behaviour of EXFn and TOGn on SiLabs C8051F12x/F13x devices.

Added simulation for Atmel AT89C51RE2, including simulation of second UART.

Cx51 Compiler

Corrected failed initialization on far addresses when the object is located with `_at_`.

22. C51 Version 8.17a

Release Date: 22nd December, 2008

Device Support

Added debug support in the ADI Monitor Driver for the following devices from Analog Devices:

- ADE5166
- ADE5169
- ADE5566
- ADE5569
- ADE7166F16
- ADE7166F8
- ADE169F16
- ADE7566F16
- ADE7566F8

Added debug support for NXPP89LPC9321 and P89LPC9351 devices in the LPC900 EPM Emulator/Programmer.

Added Nuvoton devices in the Device Database.

Corrected NXP P89LPC917 peripheral dialog to show pin P2.2 is available (instead of P2.5).

Corrected UART0 baudrate display when Timer 2/3/4 is used as baudrate generator on SiLabs C8051F13x.

Device Simulation

Added support for V: user-defined memory area for NXP 80C51MX devices.

Corrected simulation of Reset Source Register (RSTSRC) and SFR Page Control Register (SFRPGCN) for SiLabs C8051Fxxx devices.

Corrected handling of Automatic Page Control Enable (SFRPGCN) and Reset Source Register (RSTSRC) for SiLabs C8051Fxxx devices.

Corrected simulation of PLLLCK (PLL Lock Flag) for SiLabs C8051F12x/13x devices. PLLLCK is now set when PLL is configured correctly and frequency is locked.

Corrected simulation issues with the Evatronix R8051XC peripherals DMA and interrupt.

Cx51 Compiler

Corrected issue with operations where two long operands are loaded from complex arrays. There was a potential R0 register overwrite and the result of the long operation was in such cases incorrect.

Ax51 Macro Assembler

Corrected issue with NXP 80C51MX mode. DATA, IDATA, and EDATA can now be placed to absolute addresses `0x7F0000` and above.

Added ECRM directive that allows the expansion of generic `CALL` instructions to `ECALL` for NXP 80C51MX devices.

23. C51 Version 8.16a

Release Date: 26th August, 2008

Cx51 Compiler

Corrected a problem introduced in V8.15. When int numbers are multiplied and assigned to long, the result may be incorrect.

Corrected `_at_` problem with linker code packing fixed.

AX51 Macro Assembler

Added enhancement for the NXP i.MX devices, `CALL/JMP` instructions are encoded to `ECALL/JMP` when needed.

Device Support

Added ULINK and Infineon DAS (Device Access Server) support for the XC864 device.

Optimization for Evatronix R8051XC XDATA Banking example.

Enhanced Infineon XC800 startup code.

Added support for Infineon XC864 including a Blinky example.

Added Syntek Semiconductors STK6031 and STK6032 devices to device database.

Device Simulation

Added support for SiLABSC8051F360/1/2/3/4/5/6/7/8/9 and C8051F410/1/2/3.

24. C51 Version 8.15

Release Date: 30th May, 2008

Cx51 Compiler

Corrected a problem where interrupt functions combined with NOINTVECTOR were not detected by the linker as a new root, this reported an incorrect linker warning.

Corrected, when using Dallas 390 mode with ROM(D512K) or ROM(D16M), pdata arrays could not be located anywhere in memory.

Corrected, when using the XCROM directive in combination with function pointers, constant initializations where omitted.

Long multiplication performance with two unsigned int/char arguments has been improved.

Device Support

Support for the Infineon USCALE XC800 hardware via the Infineon DAS Client for XC800 has been added.

Device Simulation

Access to MACACC for SiLAB C8051F12x and C8051F13x devices has been corrected.

Device support and simulation for Infineon XC878 has been added.

Lx51 Linker/LOcater

Corrected a Linker Code Packing issue which may have incorrectly combined blocks from several code banks into common areas.

ULINK2 Support

Added support for Debug and Flash-Programming support of NXP P89LPC952 and P89LPC954.

25. C51 Version 8.12

Release Date: 31st January, 2008

Device Support

Added: device support and simulation for SiLABS C8051T600/1/2/3/4/5 and C8051T610/1/2/3/4/5/6/7.

Cx51 Compiler

Corrected a problem where nested calls with struct pointer arguments were incorrectly processed.

Lx51 Linker/Locater

Corrected: sfr16 definitions in assembly code and C source file may generate Warning L46: SFR SYMBOL HAS DIFFERENT VALUE.

uVision IDE

Corrected PORTx and PCA output pins on SiLABS C8051F12x did not correctly update in simulation.

26. C51 Version 8.11a

Release Date: 15th January, 2008

Device Support

Added support for Ramtron VRS51L3072 and VRS51L3174 devices.

Added support for Nordic Semiconductor nRF24LU1.

Added support and simulation for SiLABS C8051F336, C8051F337, C8051F338, and C8051F339.

uVision IDE

Corrected PORTx and PCA output pins on SiLABS C8051F12x did not correctly update in simulation.

27. C51 Version 8.10

Release Date: 19th November, 2007

Device Support

Added support for new Megawin MPC82G516A and MPC82L54A devices.

Corrected startup code for Infineon XC88x AC step devices, this requires the device to be set to VCO bypass mode before PLL switching.

NXP P89V52X2 device support added.

uVision IDE

Corrected: simulation of MULRDY and OSCICL for SiLABS C8051F3xx series.

Enhanced simulation support for Evatronix R8051XC watchdog timer with optional prescaler. For details refer to Application Note 191: Toolchain Extensions for R8051XC Core.

Corrected the DPTR simulation of Evatronix R8051XC; when 2 DPTR were selected the auto-increment feature (DPC register) did not work. Two R8051XC devices are now in the device database:R8051XC (8 DPTR) with simulation for 8 DPTR's, R8051XC (2 DPTR) with simulation for 2 DPTR's.

SiLABS simulation for UART #1 had a problem with the transmit interrupt bit (TI) when SFR page was set to 1. This is now corrected.

Cx51 Compiler

Corrected the `MODC2` directive which did not correctly save and restore multiple DPTR registers on interrupt entry/exit.

Assembler instructions inserted with #pragma ASM trigger now register usage of all CPU registers and therefore avoids register clashes.

Improved the detection of conflicting memory types when used in combination with typedef's, for example:

```
typedef char   code CCHAR;
typedef CCHAR xdata XCHAR;  // generates now WARNING C185: different memory space
CCHAR   idata var2;         // generates now WARNING C185: different memory space
```

Lx51 Linker/LOcater

Corrected a problem where REMOVEDUNUSED did not correctly work with SROM symbols and linker code packing.

Corrected a problem where debug symbols of absolute bits generated in AX51 had the wrong offset.

Segment locating with the LAST keyword generated unnecessary memory gaps when used with code banking. This is now corrected.

BL51 Linker/Locater

Corrected a problem where segments with a AJMP instruction as last instruction where located at the end of a 2KB block which generated a linker error.

ULINK and ULINK2

Corrected a problem where verify failed on µPSD devices when common segments where located to code banks, but no bank 0 exists.

28. C51 Version 8.09a

Release Date: 30th July, 2007

uVision IDE

Added support for the Megawin MPC82G516A and MPC82L54A.

Corrected a problem with the simulated timing of Timer 1 on Infineon XC800 devices.

Corrected a problem with the clock calculation for Infineon XC88x devices.

Corrected a problem with Dallas D80C400 simulation that prevented correctly switching to contiguous mode.

Added simulation for the Atmel AT89C51AC3.

Corrected a problem with displaying data/idata variable values that occurred when debugging Infineon XC800 Devices with the DAS interface.

Enhanced the ADI Monitor Driver to support the 1-Pin Pod interface and new ADE7xxx devices. This driver may be selected under “Options - Project - Debug - Use: ADI Monitor Driver” to provide target driver support for Analog Devices ADuC834, ADuC84x, and ADE7xxx devices.

Cx51 Compiler

Corrected a code generation problem with bit-field arrays when the array index was the return value of a function.

MON51 Monitor

Corrected a potential communications problem with low-cost USB to COM-Port adapters.

MON390 Monitor

Corrected a potential communications problem with low-cost USB to COM-Port adapters.

29. C51 Version 8.08a

Release Date: 25th March, 2007

uVision IDE

Corrected a problem that caused a delay when starting signal functions. This delay has been removed and the startup behavior is identical to releases prior to version 8.06.

Corrected a problem with JBC instructions with regards to I/O ports. JBC instructions now read the SFR register (Px) instead of the I/O port value (PORTx).

Corrected a problem that could cause the IDE to crash when the mouse was right-clicked in the project window when no item was selected.

Added peripheral display dialogs for Port 4 and Port 5 of the NXP 89LPC952.

Added a new debugging options for Infineon XC800 devices. Under “Project - Options - Debug - ULINK Settings”, “Disable interrupts during steps” has been implemented. This option disables interrupts during single-stepping which has the effect of executing instructions only from the current function.

Added support for Infineon TLE78xx devices.

Corrected problems with simulating the external interrupt inputs EINT0 and EINT1 on Infineon XC800 devices.

Corrected debugger startup problems with the Infineon DAS server.

Cx51 Compiler

Corrected a problem that neglected to perform integer promotion on complex arithmetic with char/unsigned char and multiplication or division.

AX51 Macro Assembler

Added definition for the `_DATE2_` macro for the A51 and AX51 Macro Assemblers.

30. C51 Version 8.06

Release Date: 15th January, 2007

uVision IDE

Added debugging and Flash programming support for new Infineon XC800 Devices (XC866-1FR and XC856). Support was added for ULINK and the Infineon DAS Server.

Enhanced XC800 startup code (`START_XC.A51`) to support pdata addressing (C51: USING PDATA VARIABLES ON INFINEON XC800).

Added core feature simulation for SST SmartCards.

Corrected a problem with the interrupt vector for the second UART on the NXP (Philips) P89LPC952. This had been incorrectly configured in the simulator and target dialog.

Initialized the PPAGE VTREG to 0 for all NXP (Philips) LPC900 devices. This allows you to simulate `MOVX @Ri` instructions without any configuration changes.

Corrected a problem with AT89S8252 EEPROM simulation.

Corrected a problem with the baudrate generator simulation on Atmel devices that have the X2 feature. Previously, the baudrate displayed incorrectly.

Corrected a problem with code banking on Mentor M8051EW cores.

Cx51 Compiler

Corrected a problem that removed unused code (i.e. with macros) even when it created side-effects.

Corrected a problem that generated a syntax error for a syntactically correct statement. For example:

```
struct st2 { unsigned char uc1; unsigned char uc2; };
struct st1 { struct st2 st2;unsigned char u1; unsigned char u2; };
struct st1 st;

void main (void) {
  (&st.st2)->uc1 = 0; // incorrectly generated an error
}
```

Corrected a problem with the `toint` library routine that flagged values `0x3A` - `0x40` incorrectly.

ULINK/ULINK2

Added ULINK2 support for Infineon XC800 and STMicroelectronics uPSD Devices.

Added device support for Infineon XC886, XC888, and XC856 devices.

31. C51 Version 8.05

Release Date: 26th July, 2006

Cx51 Compiler

Corrected a semantic interpretation problem that prevented the compiler from issuing an error when accessing struct members with `s->member` rather than `s.member`.

Corrected a problem that may cause registers to be overwritten when using multiple dummy assignments to avoid unused variable warnings.

Corrected a potential code problem with incrementing far pointers using long constants. For example:

```
void func (void) {
  unsigned int i;
  long far* entry;

  while(i)  {
    i--;          // increment missing
    entry += 1L; // due to 'far' pointer increment with 1L
  }
}
```

Corrected a potential problem on SmartMX devices when using Optimize level 8 or 9 without OBJECTADVANCED. For example:

```
#pragma MXP

int  xdata x;
char xdata * xdata p;

void f1 (char *);
void f2 (char *);

void main (void)  {          // uses CMPW instruction that affects 'Z' flag
  if (x == 0xFFFF) f1 (p);  // MOVX A,Rx,@DPTR destroys 'Z' flag
  else f2 (p);              // and cannot be combined
}
```

uVision IDE

Added device simulation support for Infineon XC886 and Infineon XC888 devices.

Corrected simulation problems with two serial windows for Philips P89LPC952/954 devices.

Added several excluded simulation features for the Mentor M8051EW and corrected a problem with debugging non-banking applications.

Added several excluded simulation features for the Cast R8051XC and added simulation for peripheral timing and write operations into code memory.

Lx51 Linker/Locator

Corrected a linker optimization problem when using interbank call tables (?B_RST_BANK != `0xFF`).

ULINK

Corrected a flash programming problem with the driver for STMicroelectronics uPSD3422 devices.

32. C51 Version 8.04

Release Date: 24th May, 2006

Cx51 Compiler

Enhanced *Warning C259: Pointer: Different MSpace*. This warning message is now used to indicate problems in situations where an address value is assigned.

Added *Warning C289: Converting Non-Pointer to Pointer* which is issued when an integer value is assigned to a pointer.

Corrected a problem with SRC file output having to do with optimized address values.

Corrected a problem with a missing dummy read to MD3 for `int*int` multiplication when using the Infineon/Evatronix MDU.

Added support for the Silicon Labs Arithmetic Accelerator (available in C8051F12x and F13x devices) in the far banking library.

uVision IDE

Added complete simulation and compiler support for the features of the Evatronix/Cast R8051XC core. Detailed information is provided in Application Note 191: Toolchain Extensions for the R8051XC Core.

Enhanced simulation support for the Mentor M8051EW memory extension features. It is now possible to simulate code banking and far memory applications and the core features of the R8051XC. Detailed information is provided in Application Note 171: Using M8051EW Memory Extension.

Added ULINK debugging support and DAS driver for new Infineon XC800 devices (XC886, XC888).

BL51 & LX51 Linker/Locator

Corrected a problem that may cause incorrect *WARNING L15: MULTIPLE CALL TO FUNCTION* messages when using `OVERLAY (* ! (func1, func2,func3,...))` to group more than two functions.

33. C51 Version 8.02a

Release Date: 17th February, 2006

uVision IDE

Added peripheral simulation support and target debugging dialogs for the following devices:

- Atmel AT89C51CC03,
- Atmel AT89C51IE2,
- Atmel AT89C51RE2,
- Atmel AT89LP2052,
- Atmel AT89LP4052,
- Atmel AT89S8253,
- Atmel AT8xC51SND1,
- Philips P89LPC9102,
- Philips P89LPC9103,
- Philips P89LPC9107,
- Philips P89LPC9221,
- Philips P89LPC9311,
- Philips P89LPC932A1,
- Philips P89LPC938,
- Philips P89LPC9401,
- P89LPC9408 (without LCD Driver),
- Philips P89LPC952,
- Philips P89LPC964,
- Philips P89LPC966,
- Philips P89V660,
- Philips P90V662,
- Philips P89V664.

Revised peripheral simulation support and target debugging dialogs for the following devices:

- AT89C5131/AT89C5131A (added TWI),
- AT8xC5132 (added TWI, ADC).

Added ULINK debugging support and DAS driver for new Infineon XC800 devices (XC886, XC888).

Lx51 Linker/Locator

Corrected a problem with code banking that caused the linker to incorrectly report Error L124: BANK SWITCH MODULE INCORRECT.

Cx51 Compiler

Corrected macro expansion problems with array index calculations with negative offset and far access to absolute memory locations.

ULINK

Added new JTAG device ID's for ST uPSD3212, uPSD3312, and uPSD3422.

34. C51 Version 8.01

Release date: 16th November, 2005.

uVision IDE

Added peripheral simulation support and target debugging dialogs for the following devices:

- Silicon Labs C8051F120,
- Silicon Labs C8051F121,
- Silicon Labs C8051F122,
- Silicon Labs C8051F123,
- Silicon Labs C8051F124,
- Silicon Labs C8051F125,
- Silicon Labs C8051F126,
- Silicon Labs C8051F127,
- Silicon Labs C8051F130,
- Silicon Labs C8051F131,
- Silicon Labs C8051F132,
- Silicon Labs C8051F133.

Support for Philips P89LPC952 Devices

Added support for the Philips P89LPC95x device series and the MCB950 Evaluation Board.

AX51 Macro Assembler

Corrected a problem that generated an error for forward references in symbols.

C51 Version 8 now includes the µVision3 IDE.

Corrected device simulation timing for Dallas DS89C420, DS89C430, DS89C440, and DS89C450 devices. Previously, the timer simulation was based on an older data book which was incorrect.

Support for Analog Devices ADuC83x and ADuC84x

Added support for a new debug driver for parts from Analog Devices. This driver connects the PC's COM port to the serial interface of the ADuC83x and ADuC84x. The on-chip Download/Debug Kernel may be used for program download and debugging. No additional monitor or firmware is required. Options — Project — Debug — Use: ADI Monitor Driver selects the target driver for the ADuC834 and ADuC84x devices. Detailed documentation is available in the Analog Devices ADuC83x/84x Download/Debug Driver User's Guide.

Support for Infineon XC866

Added support for the new Infineon XC800 Device series including simulation, ULINK driver, and MCBXC866 Evaluation Board support.

- Example projects are provided in the `\KEIL\C51\EXAMPLES\INFINEON XC866\` folder.
- Complete documentation (including details about the ULINK driver) is available in the MCBXC866 User's Guide.

Support for ST uPSD34xx Series

Added ULINK support for the new ST uPSD34xx device series.

Lx51 Linker/Locator

Corrected a potential problem with code packing when modules are translated with different optimization levels (less than 8) and the OBJECTADVANCED directive is used.

Cx51 Compiler

Changed the behavior of the L51_BANK.A51 configuration file to avoid glitches when using the RTX51 or RTX51 Tiny operating system together with code banking. This change has to do with the ?B_RESTORE_BANK entry when ?B_MODE=0.

Version number changed for logistic reasons. No other changes compared to V8.00.

C51 Compiler

Corrected a problem with the tan library routine (with INF values) that caused incorrect results for Dallas 390, 400, 5240, and 5250 devices.

Corrected a problem that caused the printf routine to output incorrect results for INF and NaN.

Corrected a problem with the scan and sscanf routines that caused an invalid return value of `0xFF` instead of -1 when no arguments where processed.

Corrected library routines to properly handle updated behavior of the Memory Accelerator on the Dallas DS80C390 Rev C Devices.

Corrected a problem that caused the memmove routine to fail when copying overlapping xdata memory areas on Dallas 390, 400, 5240, and 5250 devices.

35. C51 Version 7.50a

Release date: 8th November, 2004.

Lx51 Linker/Locator

Corrected a potential problem with Linker Code Packing that might cause inefficient operation or a MEMORY SPACE OVERLAY warning.

Corrected a program that caused fixup error messages when using the new REMOVEUNUSED directive.

BL51 Linker/Locator

Incorporated a new BL51 Linker/Locator.

uVision IDE

Added extended memory simulation for the Mentor M8051EW. Refer to Application Note 171: Using M8051EW Memory Extension for more information.

Added peripheral simulation support and target debugging dialogs for the following devices:

- Dallas Semiconductor DS89C420,
- Dallas Semiconductor DS89C430,
- Dallas Semiconductor DS89C440,
- Dallas Semiconductor DS89C450,
- Silicon Labs C8051F000,
- Silicon Labs C8051F001,
- Silicon Labs C8051F002,
- Silicon Labs C8051F005,
- Silicon Labs C8051F006,
- Silicon Labs C8051F007,
- Silicon Labs C8051F010,
- Silicon Labs C8051F011,
- Silicon Labs C8051F012,
- Silicon Labs C8051F015,
- Silicon Labs C8051F016,
- Silicon Labs C8051F017,
- Silicon Labs C8051F350,
- Silicon Labs C8051F351,
- Silicon Labs C8051F352,

- Silicon Labs C8051F353,
- SST SST89E554RC,
- SST SST89E564RD,
- SST SST89V554RC,
- SST SST89V564RD.

ISD51 In-System Debugger

Added example configuration for Dallas DS89C420, 430, 440, and 450 devices.

C51 Compiler

Corrected a code generation issue for negative array index values. For example:

```
signed int i = v1 - v2;
value = table [i + 4];  // code works for 'signed char' index
                        // but fails with 'signed int' index
```

Added a new compiler directive (MODC2) that enables dual data pointer support on Cast and Evatronix R80515 cores.

Added a new compiler directive (MODH2) that enables dual data pointer support on Hynix, ST uPSD 33xx, and ST uPSD 34xx devices.

Cx51 Compiler

Corrected the following problems for the SmartMX instruction set:

- Switch/case with long types and ROM(HUGE).
- Over optimization with CMPW instruction.
- Stack adjustment failure with setjmp/longjmp library routines.

C Library

Corrected several library problems including:

- Corrected a problem on Dallas 390, 400, 5240, and 5250 devices with asin, acos, and atan when const data is not in stored in segment 0 (C:`0x0000`-C:`0xFFFF`).
- The labs function has been optimized and is now fully reentrant.
- Added a configuration symbol ?C?DPSEL that defines the DPSEL SFR address for MOD517(NOAU) multiple DPTR support. This may be used for Mentor M8051EW-based devices with multiple DPTRs similar to the Infineon 517 but with a different DPSEL SFR address. The following ?C?DPSEL definition may be included in a chip-specific STARTUP.A51 file.

```
PUBLIC ?C?DPSEL
?C?DPSEL DATA 0A2H   ; DPSEL address for Mentor M8051EW
```

Note

If this definition is not included, the DPSEL SFR is defined at the default address `0x92`.

Lx51 Linker

Added the REMOVEUNUSED (abbreviation RU) directive which removes unused program and data segments provided that Data Overlaying is enabled.

ULINK

Added instruction trace support to the STMicroelectronics uPSD ULINK Driver. Refer to Application Note 177: Using ULINK with STMicroelectronics Turbo µPSD 3300/3400 Devices and the example projects in the `\KEIL\C51\EXAMPLES\ST uPSD` folder.

BL51/LX51 Linker

Improved the OVERLAY directive. Now, using `OVERLAY (* !(func1, func2))`, you may combine the segments of several function call trees. This is useful for interrupt functions that have overlayable data but use the same interrupt level. Such interrupt functions cannot interrupt each other. Therefore, data overlaying of both call trees is possible. For example:

```
void irq0 (void) interrupt 0 {
  unsigned char arr[10];
  arr[0] = 0;
}

void irq1 (void) interrupt 1 {
  unsigned char arr[10];
  arr[0] = 0;
  }
```

If irq0 and irq1 are set to the same priority level their data areas may be overlaid. The OVERLAY directive may be specified to do that as follows:

```
BL51 ... OVERLAY (* ! (irq0, irq1))
```

The linker map file shows the following OVERLAY MAP.

```
SEGMENT   DATA_GROUP
  +--> CALLED SEGMENT   START LENGTH
-----------------------------------------------
 ?PR?IRQ1?I 0008H 000AH
* NEW ROOT *
 ?PR?IRQ0?I 0008H 000AH
```

Note that both functions' call trees are overlaid.

36. C51 Version 7.20

Release date: 5th July, 2004.

uVision IDE

Added peripheral simulation support for the following devices:

- Analog Devices ADuC841,
- Analog Devices ADuC842,
- Analog Devices ADuC843,
- Analog Devices ADuC845,
- Analog Devices ADuC847,
- Analog Devices ADuC848,
- Altium Nexar TSK51x MCU Core,
- Cast/Evatronix R8051 MCU Core,
- Cast/Evatronix R80515 MCU core,
- DCD DR8051 MCU core,
- DCD DR80390 MCU core,
- DCD DR8051XP MCU core,
- DCD DR80390XP MCU core,
- Mentor M8051EW MCU core,
- TI MSC1200Y2,
- TI MSC1200Y3.

CPU core simulation may be expanded with user peripherals using the AGSI Interface.

ISD51 Configuration Examples

Added ISD51 configuration for the TI MSC1200. Refer to Application Note 193: Use ISD51 on TI MSC1200 for more information.

Revised the configuration for Philips LPC900 to match the current Philips LPC900 device versions.

FlashMonitor

Added a new configuration for the Atmel AT8xC5122. Current configurations support almost all new Atmel device variants and are summarized in the `\KEIL\C51\FlashMon\ReadMe.txt` file.

C51 Compiler

Added intrinsic functions `_push_` and `_pop_` that may be used to save and restore sfr registers in interrupt functions.

Added support for the Silicon Labs C8051F12x multiply and accumulate unit (MAC0). The MDU_F120 directive enables use of MAC0 for int and long multiplication and long shift operations.

Cx51 Compiler

Corrected a problem with far pointers and long arithmetic.

ULINK Driver for ST uPSD series

Corrected a problem while programming Flash memory that caused the microcontroller to execute random instructions. The MCU is now forced into RESET while programming the Flash.

37. C51 Version 7.10

Release date: 18th March, 2004.

uVision IDE

Added simulation support for the following devices:

- Philips P89LPC935 and other downgraded LPC900 devices
- Philips P89C669
- ST µPSD33xx

Corrected A/D converter simulation of the ADuC831.

Lx51 Linker Code Packing

Corrected a problem with code packing and JMP optimizations.

ULINK Driver for ST uPSD series

Merged the Flash and Debug Setup Dialog. The ST Merge Utility (UTLADRM.EXE) may be called automatically. Additionally, a problem with lock-ups was corrected.

C51 Compiler

Corrected a problem with unbalanced PUSH/POP sequences in complex indirect function calls.

38. C51 Version 7.09

Release date: 2nd February, 2004.

uVision IDE - ULINK Support for STMicroelectronics uPSD3300/3400

Added final release of the ULINK debugging and Flash programming support for the new STMicroelectronis µPSD3300/3400 devices. Program examples and an Application Note are provided are in the `\KEIL\C51\EXAMPLES\ST uPSD` folder.

Lx51 Linker Code Packing

Corrected a potential problem with linker code packing which may cause the linker/locater to hang.

39. C51 Version 7.08

Release date: 20th November, 2003.

C51 Compiler

Corrected a potential problem with the CSTXPTR function of the EEPROM program examples for the Atmel parts (`\KEIL\C51\EXAMPLES\FarMemory\E2PROM on T89C51RD2` and `\KEIL\C51\EXAMPLES\FarMemory\3 XData Areas on T89C51RD2`).

Cx51 Compiler

When the setjmp and longjmp library routines are used in a code banking application, you must include the source file `\KEIL\C51\LIB\SETJMP.A51` in your project. This file contains versions of these routines that support code banking. The routines in the standard library do not support code banking applications.

Corrected a problem passing complex function parameters when far variables are used as function arguments.

A51/AX51 Macro Assembler

Modified the assembler so that core SFR register symbols (ACC, B, DPL, DPH, PSW, SP) are automatically defined even when the NOMOD51 directive is used. This avoids error messages when generating assembler source (SRC) files from C modules that do not include a register definition file.

AX51 Macro Assembler

Added the EVEN directive which is described in the Ax51 User's Guide. Previously, this directive was available only in the A251 Assembler.

Lx51 Linker

Corrected a problem with the memory allocation strategy that was introduced in Version 7.07. This problem caused incorrect address calculations for constant segments that were located after packed code segments.

Corrected a problem with wildcards in the SEGMENTS directive. For example, SEGMENTS (?PR?*? module (C:`0x4000`)) did not locate all segments above `0x4000`. Instead only the first segment was located at C:`0x4000` and other segments were located within the CLASS definition.

ISD51 In-System Debugger

Corrected a problem with flash breakpoints when the flash block size (CBLK_SZ) was configured for 1 byte.

Cx51 Run-Time Library

Improved the rand library routine to deliver better distributed pseudo-random numbers. The new algorithm is based on a galois LFSR generator.

uVision IDE/Simulator

Added simulation for the following IP Cores:

- Actel Core8051
- Cast C8051 Core
- Cast D80530 Core
- Cast R8051 Core,
- Cast R80515 Core
- Dolphin Flip8051 Breeze
- Dolphin Flip8051 Cyclone
- Dolphin Flip8051 Thunder
- Dolphin Flip8051 Wind.

Added ULINK debugging and Flash programming support for the new STMicroelectronics µPSD3300/3400 series of devices. Also added Flash programming support for the µPSD3200 series of devices. Program examples and an Application Note are provided in the `\KEIL \C51\EXAMPLES\ST uPSD` folder.

Corrected a problem with menu and shortcut configuration on Windows NT machines.

Corrected simulation and target display problems with the Philips LPC900 series (i.e. the DIVM factor).

40. C51 Version 7.07a

Release date: 1st August, 2003.

uVision IDE

Added a new dialog for project component management under Project - Components, Environment and Books. This dialog allows you to change the order of project targets and file groups.

Added simulation for the following devices:

- Atmel AT89C5131 (except USB)
- Atmel AT89C5132 (except A/D Converter, USB, Audio Interface, MMC Controller, and IDE/ATAPI Interface)
- Cygnal C8051F300
- Cygnal C8051F301
- Cygnal C8051F302
- Cygnal C8051F303
- Cygnal C8051F304
- Cygnal C8051F305
- Cygnal C8051F310
- Cygnal C8051F311
- Cygnal C8051F320
- Cygnal C8051F321
- Cygnal C8051F330
- Cygnal C8051F331
- TI MSC1210 (I#C Simulation)
- TI MSC1211
- TI MSC1212

Corrected the following simulation problems:

- Analog Devices ADuC831: The internal RC clock (32768 Hz) is used for the watchdog timer. This was incorrectly documented in the first datasheets.
- Dallas Semiconductor Devices: The Watchdog EWT reset is now performed only on power-up reset and not on every reset.
- Winbond Devices: The Watchdog EWT reset is now performed only on power-up reset and not on every reset.

Corrected problems viewing local variables in projects linked with the LX51 Extended Linker/Locator.

Cx51 Compiler

Corrected problems for Philips MX when far/generic pointer assignments are reused in the subsequent statements. For example:

```
unsigned char far * far pbMemory;
unsigned long volatile ulAddress;

pbMemory += 1L;       // uses ?C?PSTPTR to save the result
ulAddress = pbMemory; // uses wrong result of the previous
                      // ?C?PSTPTR library function
```

C51 Compiler

Corrected problems in Dallas Contiguous Mode with `*(*ptr++)` type constructs and far pointer initialization at file level.

Corrected problems with SRC output on extended 8051 platforms like Dallas Contiguous Mode and Philips 51MX.

Added the ability to locate far memory variables in HDATA memory using the `_at_` keyword.

Lx51 Linker

Improved memory allocation in linker code packing to reduce the size of segment gaps when the SEGMENTS directive is used with assembler segments.

Ax51 Macro Assembler

Added the DEFINE command line directive. This directive allows you to supply C preprocessor on the command line. The syntax is identical to that of the Cx51 Compiler.

Monitor-390

Corrected problems with xdata memory updates and added support for Dallas 400 and Dallas 5240 devices.

ISD51 In-System Debugger - Version 2

Corrected a problem that caused serial break to fail when configured for non-Flash breakpoints. Added example for TI MSC121x devices in the `\KEIL\C51\EXAMPLES\TI MSC121X` folder.

41. C51 Version 7.06a

Release date: 17th May, 2003.

ISD51 In-System Debugger - Version 2

Corrected a problem that caused serial break to fail on ISD51 when configured for non-Flash breakpoints.

Flash Monitor-51 Version 4

Added configurations for Atmel AT89C51RD2 and AT89C51SND1.

Corrected a problem that caused Break on Serial Interrupt to fail when the monitor was generated using older versions of the tools.

uVision IDE/Simulator

Added simulation for the following devices:

- Atmel AT89C51RD2
- Atmel AT89C51ED2
- Atmel AT89C51ID2
- Dallas Semiconductor 80C530
- Philips 8xC652
- Philips 8xC654

Corrected simulation problems with the CCU Timer on the Philips P89LPC932.

Added context menu commands in the Source Window and Disassembly Window for Set Program Counter, Show Disassembly, and Show Source Code.

Cx51 Compiler

Corrected a problem that caused far pointer comparisons to NULL to fail when the statement immediately following re-used the same pointer.

Corrected a problem with the NOINTPROMOTE directive that caused the compiler to generate incorrect code. This problem was introduced in C51 V7.04 in an effort to correct another integer promotion problem.

42. C51 Version 7.05

Release date: 31st March, 2003.

ISD51 In-System Debugger - Version 2

Added several new features including:

- Real-Time Flash Breakpoints using In-System Application Programming (IAP),
- User I/O via serial debugging interface,
- Address range support in the memory verify function.

Flash Monitor-51 - Version 4

A new variant of Monitor-51 is included in the PK51 Professional Developers Kit. The new Monitor runs on unmodified Flash Devices that provide IAP programming. It requires no von-Neumann memory and can run from the on-chip resources of standard 8051 Flash Devices. The Flash Monitor includes Flash download and real-time breakpoint support. Currently the Monitor is pre-configured for the Atmel T89C51CC01, T89C51RC2, and T89C51RD2 but it can easily be configured for other devices.

uVision IDE/Simulator

Added simulation support for the Atmel T89C51CC02, T8xC5115, AT89C1051, AT89C1051U, AT89C2051, and AT89C4051 devices.

Added simulation support for the Philips P8xC51Rx2, P8xC51RB2H/RC2H/RD2H, and P8xC3xX2 devices.

Corrected a simulation problem with the AT89S8252 EEPROM and Dual DPTR access.

Corrected a simulation problem with the ADuC832 ADC DMA Stop.

Corrected a problem with local variables not displaying in the watch window - locals tab.

LX51 Extended Linker

Corrected a potential problem with linker code packing on optimize level 10 and 11.

C51 Compiler

Corrected erroneous combining of identical end sequences of `while (1)` loops.

43. C51 Version 7.04

Release date: 7th February, 2003.

Philips MX Device Support

Changed INIT_MX.A51. Now, initialization is enabled for far variables by default. far variables may now be absolutely located with `_at_`.

MON390 Monitor for Dallas Contiguous Mode

Corrected problems with breakpoints above 64KB code. Corrected a problem with single-stepping in switch/case statements.

uVision IDE

Added call stack display and step out command for classic 8051 devices. Added EPM900 Emulator/Programmer support for Philips 89LPC9xx Devices.

C51 Compiler

Corrected integer promotion problems with combined pointer and char arithmetic. For example:

```
int xdata *Test (int xdata * adr, unsigned char a, unsigned char b)  {
  return adr+(a+b);   // did not promote 'a+b' to int
}
```

A51 Assembler, AX51 Assembler

Added support for C-style bitwise operators (`| (OR)`, `& (AND)`, `~ (NOT)`) to the A51 Assembler and AX51 assembler. These operators are useful for common C and assembler header files that use `#define` statements.

44. C51 Version 7.03a

Release date: 9th December, 2002.

RTX51 Tiny2

Corrected os_wait problems on K_IVL, K_TMO+K_SIG events. Refer to `\C51\RTX51TINY2\README.TXT` for details.

uVision IDE

Added Cygnal 80C51F02x device simulation.

C51 Compiler

Corrected incorrect warnings on enum mismatches.

Lx51 Linker

Corrected fixup error messages on Dallas 390 target.

45. C51 Version 7.02b

Release date: 7th November, 2002.

Lx51 Linker

Corrected problems with linker code packing and code banking and a potential problem with the bank switch table location in banking mode 4.

Added the SPEEDOVL directive to makes LX51 and BL51 compatible for data overlaying. Detailed information on SPEEDOVL is available in the Assembler/Utilities User's Guide, Chapter 9, Control Summary.

BL51 Linker, LX51 Linker, Libraries

Added support for Mentor M8051EW Memory Extension that provides access to 1MB ROM and 1MB RAM. The IBANKING directive supports the on-chip banking hardware on M8051EW-based devices and is available in both the BL51 Linker and the LX51 Linker. Additionally, LX51 may be configured with the L51IBANK.A51 file that supports a 64KB bank for constants and 16 x 64KB banks for far variables. Refer to the `\C51\EXAMPLES\M8051EW` folder for example code and additional information.

C51 Compiler, CX51 Compiler

Corrected a potential problem with generic and far pointer comparisons to a NULL pointer constant.

Enhanced warning messages for enum and memory-typed pointer assignments.

Monitor for Dallas Contiguous Mode

Released MON390 which provides a target monitor for the Dallas Contiguous Mode. Detailed information, pre-configured Monitor versions, and example programs may be found in the `\C51\MON390` folder.

uVision IDE

Added simulation for several new devices (Atmel 89C51Ix and the Cygnal 80C51F02x). The Cygnal 80C51F02x devices are currently in beta status.

Added Flash menu to µVision2. This menu provides a direct interface to external Flash programming tools like Philips FlashMagic. Flash programming commands are configured under Options for Target - Utilities.

RTX51 Tiny Version 2

Released RTX51 Tiny Version 2. This release contains several new enhancements like code banking support and cooperative task switching.

46. C51 Version 7.01

Release date: 1st July, 2002.

C51 Compiler

Added support for Extended Call Return Mode (ECRM) available in the new Philips 51MX devices. This mode is configured in START_MX.A51. It enhances the code density of the ROM(HUGE) memory model. This optimization requires that Linker Code Packing is enabled. Once enabled, ACALL, LCALL, and ECALL instructions are optimized.

Corrected minor problems in the ROM(HUGE) memory model.

Corrected problems in L51_BANK.A51 with regards to variable code banking on classic 8051 devices that used standard banking hardware.

Corrected a syntax problem (that was introduced in Version 7.00) in the setjmp.h header file.

uVision IDE

Added several new devices to the µVision2 device database.

Added peripheral simulation for the new Philips 89LPC932.

Added peripheral simulation for the second UART in Winbond devices.

Added peripheral simulation for the four priority levels in the new version of the Philips 8xC552 device.

Lx51 Linker

Validated LX51 Linker Code Packing for Philips 51MX and Dallas 390/400 devices.

BETA RELEASE

Released RTX51 Tiny Version 2 BETA with the following new features and enhancements:

- Code Banking Support
- Explicit Task Switch Function
- RUN Status Flag
- CPU IDLE Mode Support
- Hooks for Adding User Code to the RTX51 Tiny Hardware Timer Interrupt
- Improved Handling for Interval Events
- Reduced Code and Data Size
- Improved Performance

Released MON390 BETA which provides a target monitor for the Dallas Contiguous Mode. Detailed information, pre-configured Monitor versions, and example programs may be found in the `\C51\MON390` folder.

47. C51 Version 7.00

Release date: 22nd April, 2002.

C51 Compiler

Added the ROM(HUGE) directive which provides support for the Philips 51MX Linear Programming Model. Select this option in µVision2 using Options for Target-Code Rom Size: Huge: 8MB program. More information is available in Application Note 160: Programming the Philips 51MX Architecture with the Keil PK51.

Added the ability to perform 24-bit arithmetic calculations using far pointers. For more information, refer to Application Note 160: Programming the Philips 51MX Architecture with the Keil PK51.

ISD51

Released ISD51 (In-System Debugger): a new target debugger that may be linked to user applications. Refer to `\C51\ISD51` for more information.

Added two new optimizations to the C51 Compiler that reduce program code size. In µVision2, enable these optimization in Options for Target - C51: Code Optimization: Level.

Lx51 Linker

Added a new LX51 Linker-Level Optimization called Linker Code Packing. This optimization analyzes and reduces total program size. In µVision2, enable this optimization in Options for Target - C51: Code Optimization: Linker Code Packing. This optimization is available for all projects even those that use code banking. Note that this optimization is still a BETA RELEASE for the Philips 51MX and Dallas 390/400 devices.

Added Linker Disassembly Output File. This output file contains the complete disassembly of your application complete with intermixed high-level source and all addresses. In µVision2, enable this option in Options for Target - Listing - Linker Code Listing.

48. C51 Version 6.23

Release date: 15th February, 2002.

C51 Compiler

Corrected problems with register optimizations in while loops.

Corrected problems implicitly casting types in ternary statements.

Enhanced performance of the run-time library and pointer operations for the Dallas Semiconductor 80C390 Contiguous Mode.

Added ability to locate XDATA and CODE in regions other than 00:xxxx for the Dallas Semiconductor 80C390.

Corrected various problems with initializations with Lx51 and bit objects.

A51 Assembler

Corrected problems synchronizing MPL Macros while debugging.

OHx51 Object File Converter

Added the MERGE32K directive which generates merged HEX files for hardware with 32K common areas. Refer to the Ax51 User's Guide, Chapter 9, Bank Switch Configuration for more information. In µVision2, select this option in Options for Target - Output - Merge32K HEX File.

Corrected problems with Lx51 HEX file generation.

uVision IDE

Added simulation support for Analog Devices MicroConverters.

BETA RELEASE

ISD51 In-System Debugger is a new target debugger that may be linked to user applications. Refer to `\C51\ISD51` for more information.

Added a new LX51 Linker-Level Optimization called Linker Code Packing. This optimization analyzes and reduces total program size. In µVision2, enable this optimization in Options for Target - C51: Code Optimization: Linker Code Packing.

Added two new optimizations to the C51 Compiler that reduce program code size. In µVision2, enable these optimization in Options for Target - C51: Code Optimization: Level.

Added Linker Disassembly Output File. This output file contains the complete disassembly of your application complete with intermixed high-level source and all addresses. In µVision2, enable this option in Options for Target - Listing - Linker Code Listing.

49. C51 Version 6.22

Release date: 15th December, 2001.

C51 Compiler

Corrected several problems that were introduced with Dynamic Register Allocation in Version 6.21.

Added new examples for the const far memory type.

Added support for the extended stack in the Analog Devices MicroConverters.

Lx51 Linker

Added examples for far const memory with classic 8051 devices in `\C51\EXAMPLES\FARMEMORY\1MB CONSTANTS ON CLASSIC 8051`. These examples show how to use memory banking with text constants.

50. C51 Version 6.21

Release date: 15th November, 2001.

C51 Compiler

Corrected several minor problems.

Added the MODDA directive and library support for the Dallas 390 Math Accelerator.

Added dynamic register allocation optimization which reduces program size and data usage.

Added switch/if path combination optimization.

Added optimization for long 0 comparisons.

Corrected several optimizer problems that were introduced in C51 V6.20.

BL51 Linker

Corrected several minor problems.

uVision IDE

Added simulation support for the Dallas Semiconductor 80C390 peripherals.

51. C51 Version 6.20

Release date: 9th January, 2001.

C51 Compiler

Enhanced the L51_BANK.A51 file to support even larger code banking programs (up to 4MB).

Added enhanced optimization for register variables.

Added variable banking support for classic 8051 devices.

uVision IDE

Added debug dialogs for classic 8051 devices.

Added four 64KB user memory areas (S:, T:, U:, and V:) that may be used when debugging.

Added functions or for special simulation capabilities (EEPROM, I^2C communication, and so on).

Improved the Version Control (SVCS) Connection and corrected several problems with environment variables.

Added several new items to the Help Menu.

Added several project management enhancements.

Added numerous chips to the Device Database.

Added simulation support for the on-chip peripherals of the following devices (complete information is available in the µVision Help Menu - Simulated Peripherals item.):

- Infineon C504.
- Infineon C505C.
- Infineon C508.
- Infineon C515A.

Added new debugging dialogs for MON51.

52. C51 Version 6.14

Release date: 5th January, 2001.

C51 Compiler

Added examples to demonstrate the Dallas 390 contiguous mode (`\C51\EXAMPLES\DALLAS 390`).

Added examples to demonstrate the Philips 51MX architecture 16MB support (`\C51\EXAMPLES\PHILIPS 80C51MX`).

Added far memory (above 64K) support using the `\C51\LIB\XBANKING.A51` configuration file.

Added far memory examples for the 16MB memory space of the Analog Devices ADuC812 and for the Atmel 89C51RD E2PROM area (`\C51\EXAMPLES\FARMEMORY`).

Added macros for absolute far memory access in `ABSACC.H`.

Added the INCDIR directive where you may specify include paths.

Ax51 Assembler

Added the INCDIR directive where you may specify include paths.

uVision IDE

Added simulation support for the on-chip peripherals of the following devices:

- Infineon C509.
- Infineon C517A.
- Infineon C515C.

53. C51 Version 6.12

Release date: 3rd January, 2001.

C51 Compiler

Removed the 256-symbol limit from OMF51 object files.

Extended the length of C variable names to 256 characters.

uVision IDE

Added simulation support for the on-chip peripherals of the following devices:

- Atmel WM T87C5111.
- Atmel WM T87C5112.

54. C51 Version 6.10a

Release date: 1th January, 2001.

C51 Compiler

Finalized support for the Philips 80C51MX.

Finalized support for the Dallas Semiconductor 80C390.

Added banking mode 4 to L51_BANK.A51 for user-provided bank switching macros.

55. C51 Version 6.02

Release date: 8th January, 1999.

C51 Compiler

Corrected several minor problems with Optimizer Level 9.

uVision IDE

Added simulation support for the on-chip peripherals of the following devices:

- Analog Devices ADuC812.
- Philips LPC Devices.

Added simulation support for multiple DPTR registers.

56. C51 Version 6.01

Release date: 7th January, 1999.

C51 Compiler

Added the RET_ISTK, RET_PSTK, and RET_XSTK directives which unload the on-chip stack and use the reentrant stack for storing return addresses. Refer to The RET_ISTK Directive, The RET_PSTK Directive, or The RET_XSTK Directive for more information.

Added ANSI library routines modf, strtod, strtol, and strtoul. Refer to the on-line compiler manual for more information.

BL51 Linker

Modified the CODE and XDATA directives to allow address ranges. For example:

```
BL51 my_prog.obj CODE(0x0000-0x3FFF, 0x8000-0xFFFF)
```

Modified segment control directives to allow wildcards in segment names. For example:

```
BL51 my_file.obj (CODE (?PR?*?my_file (0x100))
```

Locates all program code segments in the module my_file to address `0x100` and up.

uVision2 IDE

Added debugger support for MON51.

Added simulation support for almost all 40-pin DIP devices (8051FC, RD, RD+, 8052, and so on).

Added support for syntax coloring in assembler code.

Added item in the context menu to insert the CPU register definition file.

Added context-sensitive help for library routines and error messages. To get help for a library routine, position the cursor on the function and press the F1 key. To get help for an error or warning message, select the message and press the F1 key.

57. C51 Version 6.00

Release date: 1st January, 1999.

C51 Compiler

Added 3 new optimizer levels which shrink program size up to 15%:

- Optimize Level 7 (Extended Access Optimization) uses DPTR for register variables. Pointer and array accesses have been optimized for both speed and code size.
- Optimize Level 8 (Reuse of Common Entry Code) moves common function entry code to the beginning of a function which saves code memory. Optimize (8) is the new default optimization level for C51 Version 6.xx.
- Optimize Level 9 (Common Block Subroutines) detects and packs multiple-instruction sequences into subroutines. This optimization is most efficient on large source files.

Added specific header file support for almost all devices.

Added configuration file (`\C51\LIB\CONF151.A51`) for the Intel 151.

Updated the enum type to automatically adjust to 8 or 16 bits.

Added dual data pointer support for Atmel devices (AT89S8252). Use the MODA2 directive to enable dual data pointer support. Use the NOMODA2 directive to disable support.

Added dual data pointer support for Philips devices. Use the MODP2 directive to enable dual data pointer support. Use the NOMODP2 directive to disable support.

Added dual data pointer support for Temic devices. Use the MODP2 directive to enable dual data pointer support. Use the NOMODP2 directive to disable support.

C51 now ensures that register bank 0 is selected for interrupts declared without the using attribute. The instruction MOV PSW, #0 is added to these routines. Previously, you were required to added the using 0 attribute to high-priority interrupts when low-priority interrupts used a different register bank. This was the case for RTX51 Full and RTX51 Tiny applications. If your application uses only register bank 0, you may use the ONEREGBANK directive to specify that the C51 compiler does not generate the additional MOV PSW, #0 instruction.

A51 Assembler

Added C preprocessor support that expands text before the source file is assembled. Directives like `#if`, `#else`, `#endif`, and `#include` are supported in assembly source code (refer to the C51 User's Guide, Chapter 4). The `#include` file path is obtained from the C51INC environment variable.

Added the following predefined Macros:

- `__FILE__`: Name of the file being assembled.
- `__LINE__`: Current line number in the file being assembled.
- `__TIME__`: Time when the assembly was started.

- __DATE__: Date when the assembly was started.
- __STDC__: Defined to 1.
- __A51__: Version number of the A51 Assembler (for example 600 for V6.00).
- __KEIL__: Defined to 1.

Added support for C-style sfr and sbit declarations. The A51 Assembler now accepts standard C-style register definition files. This allows you to use the same header files for your C and assembler source files. The following sfr and sbit declarations were added:

```
sfr P0 = 0x80;
sbit P0_1 = P0^1;
```

Added error output using the __ERROR__ directive. For example:

```
IF CVAR1LEN > 10
__ERROR__ "CVAR1 LEN EXCEEDS 10 BYTES"
ENDIF
```

Or using the C-style preprocessor.

```
#ifdef TESTVERS && RELEASE
#error TESTVERS GENERATED IN RELEASE MODE
#endif
```

Added the INCDIR (abbreviation ID) directive where you may specify the paths to assembler include files. You may specify one or more paths to search when a $INCLUDE directive is processed. The search order for $INCLUDE is:

- Current directory (typically, the folder of the µVision2 project file).
- Paths specified with $INCDIR.
- Path derived from the bin folder using ..\ASM (\C51\ASM). For example:

```
$INCDIR (C:\C51\ASM) A51 STARTUP.A51
INCDIR (C:\C51\INC,C:\MYDIR)
```

The search order for #include is identical to that used by the C51 Compiler.

BL51 Linker

Added the DISABLEWARNING directive (abbreviation DW) which allows you to selectively disable linker warning messages. For example (disables warnings 1 and 5):

```
BL51 myfile.obj DISABLEWARNING (1,5)
```

BL51 now sorts and locates segments according to their length. This ensures fewer gaps in memory. Use the NOSORTSIZE directive (abbreviation NOSO) to disable this feature.

Added the SPEEDOVL directive (abbreviation SP) which causes the linker to ignore references to constant segments that start with ?CO?. This speeds up the overlay process but may result in a lack of warnings with regard to constant segments. This could lead to problems if you use pointers to functions and do not manually specify the call tree references to the linker. Refer to SPEEDOVL Directive and Application Note 129: Function Pointers in C51 for more details. This directive may be useful for applications with complex pointer to function tables.

Added the RECURSIONS directive (abbreviation RC) which allows you to specify the maximum number of recursive calls allowed before the linker aborts. The default number of recursions allowed is 10. A recursive call generates the following linker warning:

```
* WARNING L13: RECURSIVE CALL TO SEGMENT
```

When the maximum number of recursions is exceeded, the linker responds with the following error:

```
FATAL ERROR 232: APPLICATION CONTAINS TOO MANY RECURSIONS.
```

To use this directive, enter the following on the linker command line or in the Misc box in µVision2:

```
BL51 test.obj RECURSIONS (100)
```

The linker may run a long time to detect all recursions and remove the references. Unless you have specific reasons to change this setting, you should leave it at the default level of 10.

Added the NOAJMP directive (abbreviation NOAJ) which disables use of the AJMP instruction in the inter-bank jump table in code banking programs. This option is required for 8051 derivatives which do not support the AJMP instruction.

BL51 Linker - Code Banking

Added the NOINDIRECTCALL directive (abbreviation NOIC) which specifies that function pointers do not access functions outside the current code bank (in code banking programs). By default, in code banking programs the BL51 Linker inserts inter-bank calls into the call table for functions called through a function pointer. If your application uses function pointers and if you can ensure that indirect calls never cross a code bank you may use the NOINDIRECTCALL directive to save space in the call table. Refer to The Code Banking Mechanism for more information about the scheme used by the BL51 Linker for code banking.

Added the NOJMPTAB directive (abbreviation NOJT) which specifies that the call tree is not created for code banking applications. This feature is provided for developers who will create their own code banking scheme. This directive modifies the behavior of the BL51 Linker as follows: - The L51_BANK.A51 code banking logic file is not required. - The jump and call instructions are not modified for banked functions. - No warnings are generated if a jump or call is made to another code bank. If you use this directive you must ensure that the proper bank is selected before a call is performed. The BL51 Linker no longer selects the code bank.
