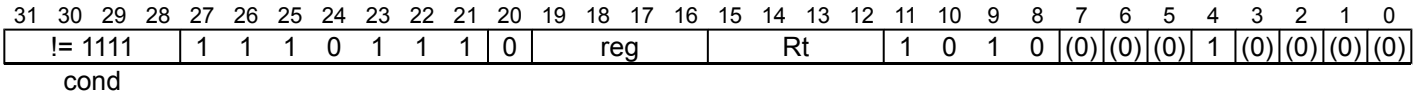
When these settings permit the execution of Advanced SIMD and floating-point instructions:

- If the specified floating-point System register is *FPSID* or *FPEXC*, the instruction is UNDEFINED if executed in User mode.
- If the specified floating-point System register is the *FPSID* and the instruction is executed in a mode other than User mode, the instruction is ignored.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the A1 variant

```
VMSR{<c>}{<q>} <spec_reg>, <Rt>
```

Decode for this encoding

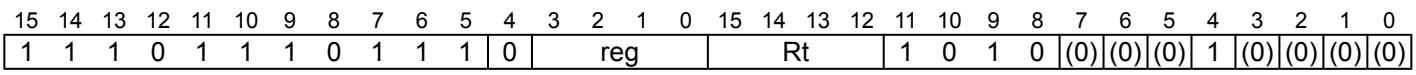
```
constant t = UInt(Rt);
if reg != '000x' && reg != '1000' then
    constant Constraint c = ConstrainUnpredictable(Unpredictable_VMSR);
    assert c IN {Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNDEF
            UNDEFINED;
        when Constraint_NOP
            ExecuteAsNOP();
// Armv8-A removes UNPREDICTABLE for R13
if t == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `reg != '000x' && reg != '1000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using VMSR at the same Exception level.

T1



Encoding for the T1 variant

```
VMSR{<c>}{<q>} <spec_reg>, <Rt>
```

Decode for this encoding

```
constant t = UInt(Rt);
if reg != '000x' && reg != '1000' then
    constant Constraint c = ConstrainUnpredictable(Unpredictable_VMSR);
    assert c IN {Constraint_UNDEF, Constraint_NOP};
    case c of
        when Constraint_UNDEF
            UNDEFINED;
        when Constraint_NOP
            ExecuteAsNOP();
// Armv8-A removes UNPREDICTABLE for R13
if t == 15 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `reg != '000x' && reg != '1000'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using VMSR at the same Exception level.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> See *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<spec_reg> Is the destination Advanced SIMD and floating-point System register, encoded in “reg”:

reg	<spec_reg>
0000	FPSID
0001	FPSCR
001x	UNPREDICTABLE
01xx	UNPREDICTABLE
1000	FPEXC
1001	UNPREDICTABLE
101x	UNPREDICTABLE
11xx	UNPREDICTABLE

<Rt> Is the general-purpose source register, encoded in the "Rt" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    if reg == '0001' then                   // FPSCR
        CheckVFPEnabled(TRUE);
        FPSCR = R[t];
    elsif PSTATE.EL == EL0 then
        UNDEFINED;                          // Non-FPSCR registers accessible only at PL1 or above
    else
        CheckVFPEnabled(FALSE);             // Non-FPSCR registers are not affected by FPEXC.EN
        case reg of
            when '0000'                     // VMSR access to FPSID is ignored
            when '1000'
                FPEXC = R[t];
            otherwise
                Unreachable();   // Dealt with above or in encoding-specific pseudocode
```

VMUL (by scalar)

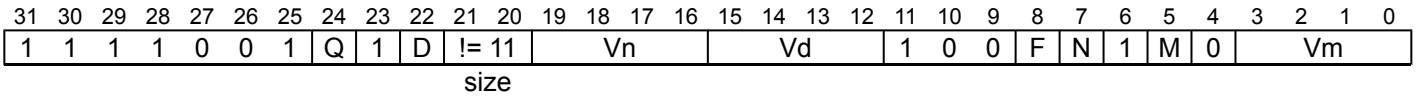
Vector Multiply multiplies each element in a vector by a scalar, and places the results in a second vector.

For more information about scalars see *Advanced SIMD scalars*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMUL{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>[<index>]
```

Encoding for the 128-bit SIMD vector variant

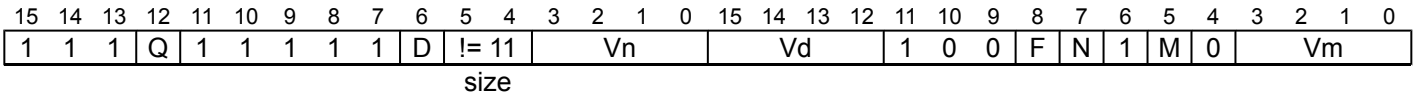
Applies when `(Q == 1)`

```
VMUL{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Dm>[<index>]
```

Decode for all variants of this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || (F == '1' && size == '01' && !IsFeatureImplemented(FEAT_FP16)) then
    UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
constant floating_point = (F == '1');  constant long_destination = FALSE;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant regs = if Q == '0' then 1 else 2;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant integer     m = if size == '01' then UInt(Vm<2:0>) else UInt(Vm);
constant integer index = if size == '01' then UInt(M:Vm<3>) else UInt(M);
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMUL{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>[<index>]
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VMUL{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Dm>[<index>]
```

Decode for all variants of this encoding

```
if size == '11' then SEE "Related encodings";
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;
if size == '00' || (F == '1' && size == '01' && !IsFeatureImplemented(FEAT_FP16)) then
    UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
constant floating_point = (F == '1');  constant long_destination = FALSE;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant regs = if Q == '0' then 1 else 2;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant integer     m = if size == '01' then UInt(Vm<2:0>) else UInt(Vm);
constant integer index = if size == '01' then UInt(M:Vm<3>) else UInt(M);
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the scalar and the elements of the operand vector, encoded in “F:size”:

F	size	<dt>
0	01	I16
0	10	I32
1	01	F16
1	10	F32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register. When <dt> is I16 or F16, this is encoded in the "Vm<2:0>" field. Otherwise it is encoded in the "Vm" field.

<index> Is the element index. When <dt> is I16 or F16, this is in the range 0 to 3 and is encoded in the "M:Vm<3>" field. Otherwise it is in the range 0 to 1 and is encoded in the "M" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant FPCR_Type fpcr = StandardFPCR();
    constant op2 = Elem[Din[m],index,esize];  constant op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant op1 = Elem[Din[n+r],e,esize];  constant op1val = Int(op1, unsigned);
            if floating_point then
                Elem[D[d+r],e,esize] = FPMul(op1, op2, fpcr);
            else
                if long_destination then
                    Elem[Q[d>>1],e,2*esize] = (op1val*op2val)<2*esize-1:0>;
                else
                    Elem[D[d+r],e,esize] = (op1val*op2val)<esize-1:0>;
```

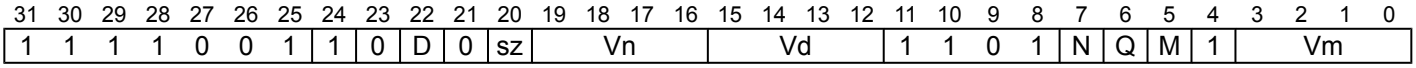
VMUL (floating-point)

Vector Multiply multiplies corresponding elements in two vectors, and places the results in the destination vector.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMUL{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

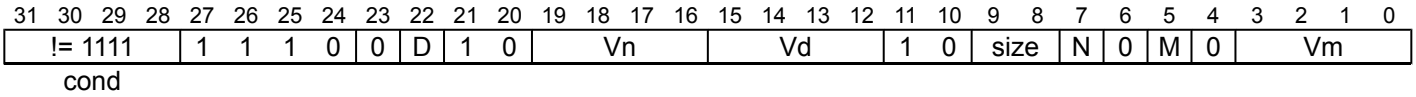
Applies when `(Q == 1)`

```
VMUL{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
constant advsimd = TRUE;
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

A2



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VMUL{<c>}{<q>}.F16 {<Sd>,} <Sn>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VMUL{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VMUL{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>
```

Decode for all variants of this encoding

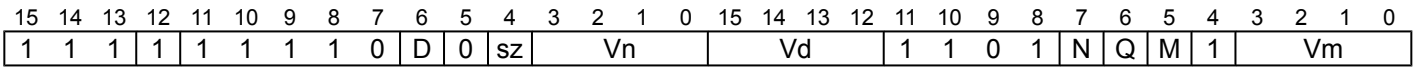
```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
constant advsimd = FALSE;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer n = if size == '11' then UInt(N:Vn) else UInt(Vn:N);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
constant boolean floating_point = boolean UNKNOWN;
constant integer regs = integer UNKNOWN; constant integer elements = integer UNKNOWN;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMUL{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VMUL{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if sz == '1' && InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
constant advsimd = TRUE;
constant integer esize = 32 >> UInt(sz);

VMUL (integer and polynomial)

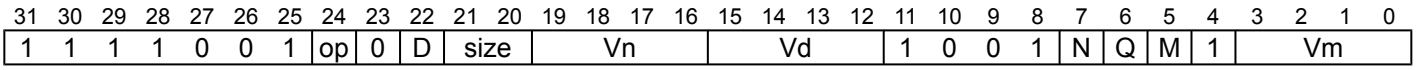
Vector Multiply multiplies corresponding elements in two vectors.

For information about multiplying polynomials, see *Polynomial arithmetic over {0, 1}*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMUL{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

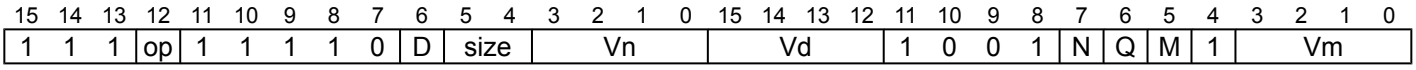
Applies when `(Q == 1)`

```
VMUL{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' || (op == '1' && size != '00') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
constant polynomial = (op == '1');  constant long_destination = FALSE;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMUL{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VMUL{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' || (op == '1' && size != '00') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant unsigned = FALSE;  // "Don't care" value: TRUE produces same functionality
constant polynomial = (op == '1');  constant long_destination = FALSE;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “op:size”:

op	size	<dt>
0	00	I8
0	01	I16
0	10	I32
1	00	P8

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant op1 = Elem[Din[n+r],e,esize];  constant op1val = Int(op1, unsigned);
            constant op2 = Elem[Din[m+r],e,esize];  constant op2val = Int(op2, unsigned);
            bits(2 * esize) product;
            if polynomial then
                product = PolynomialMult(op1,op2);
            else
                product = (op1val*op2val)<2*esize-1:0>;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = product;
            else
                Elem[D[d+r],e,esize] = product<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

VMULL (by scalar)

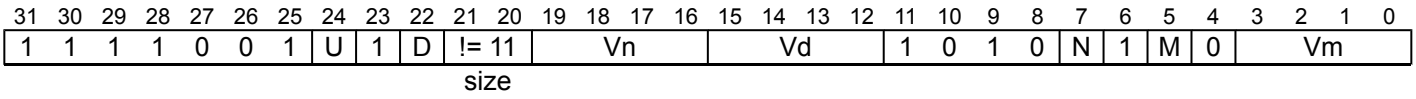
Vector Multiply Long multiplies each element in a vector by a scalar, and places the results in a second vector. The destination vector elements are twice as long as the elements that are multiplied.

For more information about scalars see *Advanced SIMD scalars*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



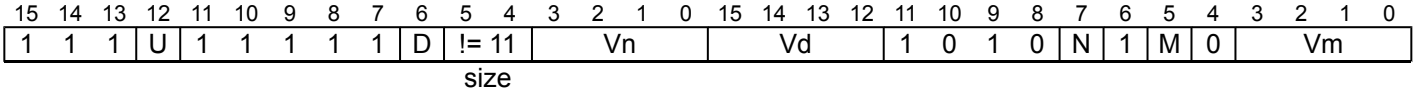
Encoding for the A1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>[<index>]
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
constant unsigned = (U == '1');  constant long_destination = TRUE;  constant floating_point = FALSE;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant regs = 1;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant integer     m = if size == '01' then UInt(Vm<2:0>) else UInt(Vm);
constant integer index = if size == '01' then UInt(M:Vm<3>) else UInt(M);
```

T1



Encoding for the T1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>[<index>]
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if size == '00' || Vd<0> == '1' then UNDEFINED;
constant unsigned = (U == '1');  constant long_destination = TRUE;  constant floating_point = FALSE;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant regs = 1;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant integer     m = if size == '01' then UInt(Vm<2:0>) else UInt(Vm);
constant integer index = if size == '01' then UInt(M:Vm<3>) else UInt(M);
```

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

<dt> Is the data type for the scalar and the elements of the operand vector, encoded in “U:size”:

U	size	<dt>
0	01	S16
0	10	S32
1	01	U16
1	10	U32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm<2:0>" field when <dt> is S16 or U16, otherwise the "Vm" field.

<index> Is the element index in the range 0 to 3, encoded in the "M:Vm<3>" field when <dt> is S16 or U16, otherwise in range 0 to 1, encoded in the "M" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant FPCR_Type fpcr = StandardFPCR();
    constant op2 = Elem[Din[m],index,esize];  constant op2val = Int(op2, unsigned);
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant op1 = Elem[Din[n+r],e,esize];  constant op1val = Int(op1, unsigned);
            if floating_point then
                Elem[D[d+r],e,esize] = FPMul(op1, op2, fpcr);
            else
                if long_destination then
                    Elem[Q[d>>1],e,2*esize] = (op1val*op2val)<2*esize-1:0>;
                else
                    Elem[D[d+r],e,esize] = (op1val*op2val)<esize-1:0>;
```

VMULL (integer and polynomial)

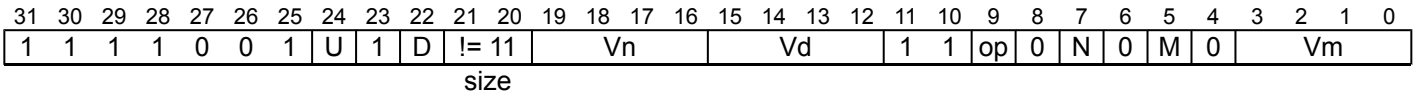
Vector Multiply Long multiplies corresponding elements in two vectors. The destination vector elements are twice as long as the elements that are multiplied.

For information about multiplying polynomials see *Polynomial arithmetic over {0, 1}*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



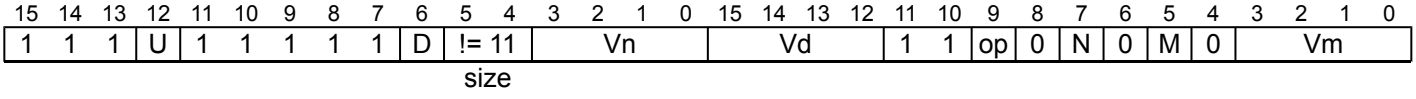
Encoding for the A1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if op == '1' && (U == '1' || size == '01') then UNDEFINED;
if op == '1' && size =='10' && !IsFeatureImplemented(FEAT_PMULL) then UNDEFINED;
if Vd<0> == '1' then UNDEFINED;
constant unsigned = (U == '1'); constant polynomial = (op == '1'); constant long_destination = TRUE;
constant integer esize = if polynomial && size == '10' then 64 else 8 << UInt(size);
constant d = UInt(D:Vd); constant n = UInt(N:Vn); constant m = UInt(M:Vm);
constant elements = 64 DIV esize; constant regs = 1;
```

T1



Encoding for the T1 variant

```
VMULL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if op == '1' && (U == '1' || size == '01') then UNDEFINED;
if op == '1' && size == '10' && InITBlock() then UNPREDICTABLE;
if op == '1' && size == '10' && !IsFeatureImplemented(FEAT_PMULL) then UNPREDICTABLE;
if Vd<0> == '1' then UNDEFINED;
constant unsigned = (U == '1'); constant polynomial = (op == '1'); constant long_destination = TRUE;
constant integer esize = if polynomial && size == '10' then 64 else 8 << UInt(size);
constant d = UInt(D:Vd); constant n = UInt(N:Vn); constant m = UInt(M:Vm);
constant elements = 64 DIV esize;  constant regs = 1;
```

CONSTRAINED UNPREDICTABLE behavior

If `op == '1' && size == '10' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “op:U:size”:

op	U	size	<dt>
0	0	00	S8
0	0	01	S16
0	0	10	S32
0	1	00	U8
0	1	01	U16
0	1	10	U32
1	0	00	P8
1	0	10	P64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant op1 = Elem[Din[n+r],e,esize];  constant op1val = Int(op1, unsigned);
            constant op2 = Elem[Din[m+r],e,esize];  constant op2val = Int(op2, unsigned);
            bits(2 * esize) product;
            if polynomial then
                product = PolynomialMult(op1,op2);
            else
                product = (op1val*op2val)<2*esize-1:0>;
            if long_destination then
                Elem[Q[d>>1],e,2*esize] = product;
            else
                Elem[D[d+r],e,esize] = product<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

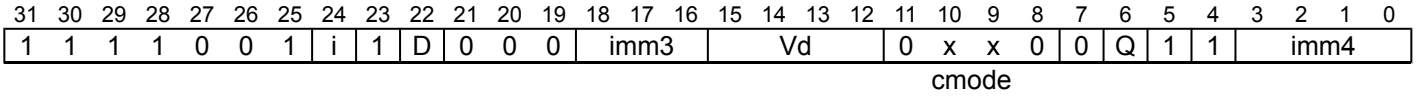
VMVN (immediate)

Vector Bitwise NOT (immediate) places the bitwise inverse of an immediate integer constant into every element of the destination register.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 , A2 and A3) and T32 (T1 , T2 and T3) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}.I32 <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

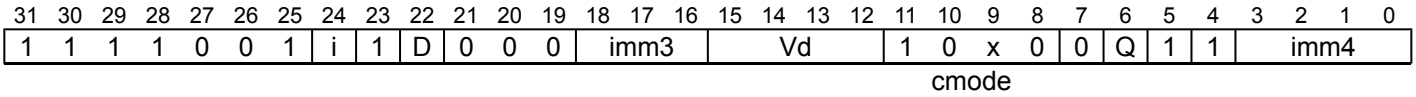
Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}.I32 <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if (cmode<0> == '1' && cmode<3:2> != '11') || cmode<3:1> == '111' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

A2



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}.I16 <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

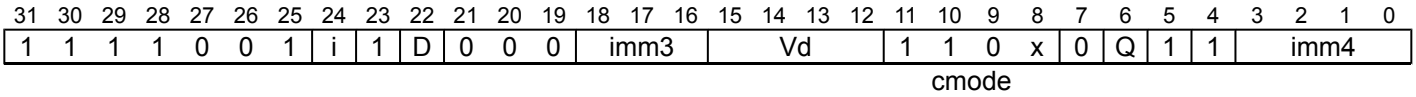
Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}.I16 <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if (cmode<0> == '1' && cmode<3:2> != '11') || cmode<3:1> == '111' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

A3



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}.I32 <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

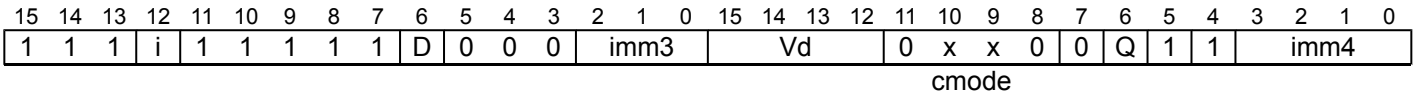
Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}.I32 <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if (cmode<0> == '1' && cmode<3:2> != '11') || cmode<3:1> == '111' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}.I32 <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

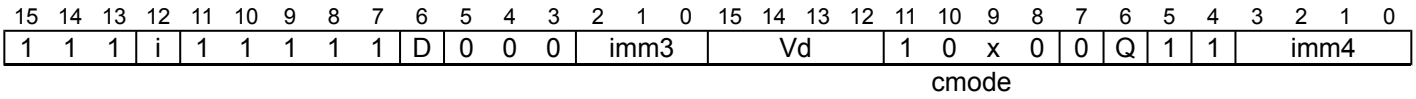
Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}.I32 <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if (cmode<0> == '1' && cmode<3:2> != '11') || cmode<3:1> == '111' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

T2



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}.I16 <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}.I16 <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if (cmode<0> == '1' && cmode<3:2> != '11') || cmode<3:1> == '111' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

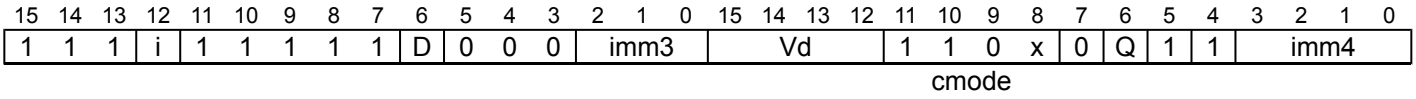
T3



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}.I32 <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}.I32 <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if (cmode<0> == '1' && cmode<3:2> != '11') || cmode<3:1> == '111' then SEE "Related encodings";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('1', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c>	For encoding A1, A2 and A3: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1, T2 and T3: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<imm>	Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = NOT(imm64);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.

VMVN (register)

Vector Bitwise NOT (register) takes a value from a register, inverts the value of each bit, and places the result in the destination register. The registers can be either doubleword or quadword.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	D	1	1	size		0	0	Vd				0	1	0	1	1	Q	M	0	Vm			

Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	1	1	1	1	D	1	1	size		0	0	Vd				0	1	0	1	1	Q	M	0	Vm			

Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VMVN{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VMVN{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> An optional data type. It is ignored by assemblers, and does not affect the encoding.

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = NOT(D[m+r]);
```

Operational information

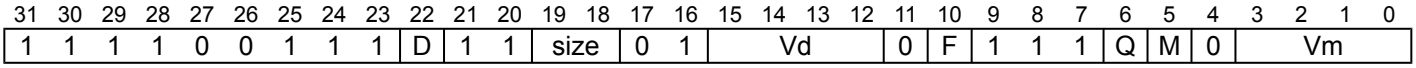
VNEG

Vector Negate negates each element in a vector, and places the results in a second vector. The floating-point version only inverts the sign bit.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VNEG{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

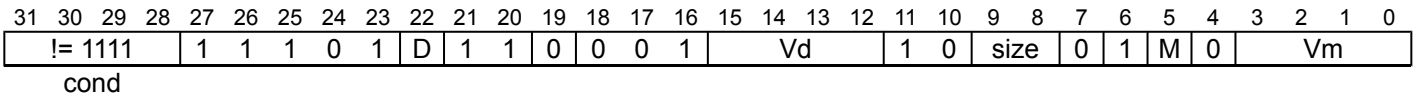
Applies when `(Q == 1)`

```
VNEG{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if F == '1' && ((size == '01' && !IsFeatureImplemented(FEAT_FP16)) || size == '00') then
    UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant advsimd = TRUE;  constant floating_point = (F == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

A2



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VNEG{<c>}{<q>}.F16 <Sd>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VNEG{<c>}{<q>}.F32 <Sd>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VNEG{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

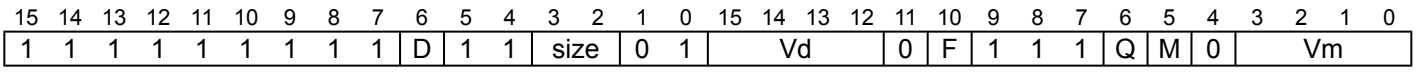
```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
constant advsimd = FALSE;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
constant boolean floating_point = boolean UNKNOWN;
constant integer regs = integer UNKNOWN; constant integer elements = integer UNKNOWN;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VNEG{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VNEG{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

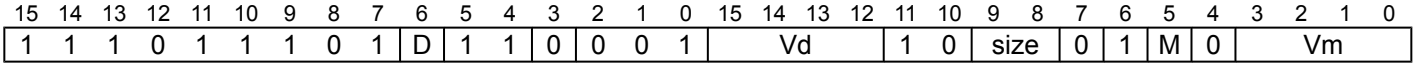
```
if size == '11' then UNDEFINED;
if F == '1' && ((size == '01' && !IsFeatureImplemented(FEAT_FP16)) || size == '00') then
    UNDEFINED;
if F == '1' && size == '01' && InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant advsimd = TRUE;  constant floating_point = (F == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `F == '1' && size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VNEG{<c>}{<q>}.F16 <Sd>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VNEG{<c>}{<q>}.F32 <Sd>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VNEG{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
constant advsimd = FALSE;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
constant boolean floating_point = boolean UNKNOWN;
constant integer regs = integer UNKNOWN; constant integer elements = integer UNKNOWN;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “F:size”:

F	size	<dt>
0	00	S8
0	01	S16
0	10	S32
1	01	F16
1	10	F32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sm> Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        constant FPCR_Type fpcr = StandardFPCR();
        for r = 0 to regs-1
            for e = 0 to elements-1
                if floating_point then
                    Elem[D[d+r],e,esize] = FPNeg(Elem[D[m+r],e,esize], fpcr);
                else
                    constant result = -SInt(Elem[D[m+r],e,esize]);
                    Elem[D[d+r],e,esize] = result<esize-1:0>;
    else             // VFP instruction
        constant FPCR_Type fpcr = EffectiveFPCR();

            when 16 H[d] = FPNeg(H[m], fpcr);
            when 32 S[d] = FPNeg(S[m], fpcr);
            when 64 D[d] = FPNeg(D[m], fpcr);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check and is operating only on integer vector elements, then the following apply:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

VNMLA

Vector Negate Multiply Accumulate multiplies together two floating-point register values, adds the negation of the floating-point value in the destination register to the negation of the product, and writes the result back to the destination register.

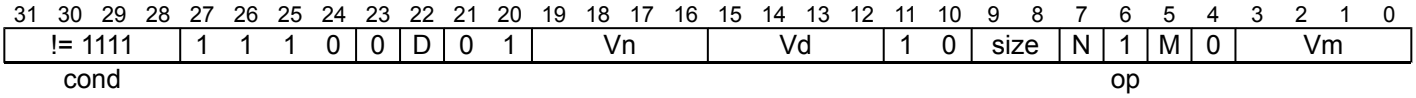
Note

Arm recommends that software does not use the VNMLA instruction in the Round towards Plus Infinity and Round towards Minus Infinity rounding modes, because the rounding of the product and of the sum can change the result of the instruction in opposite directions, defeating the purpose of these rounding modes.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VNMLA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VNMLA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VNMLA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

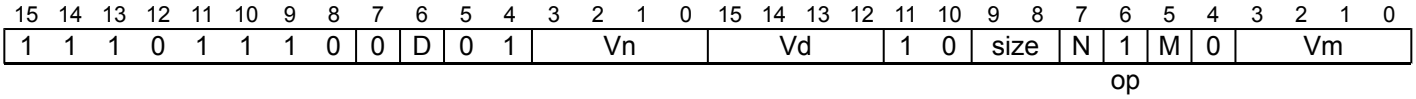
```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
constant vtype = if op == '1' then VFPNegMul_VNMLA else VFPNegMul_VNMLS;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer n = if size == '11' then UInt(N:Vn) else UInt(Vn:N);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VNMLA{<c>}{<q>}.F16 <Sd>, <Sn>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VNMLA{<c>}{<q>}.F32 <Sd>, <Sn>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VNMLA{<c>}{<q>}.F64 <Dd>, <Dn>, <Dm>
```

Decode for all variants of this encoding

```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
constant vtype = if op == '1' then VFPNegMul_VNMLA else VFPNegMul_VNMLS;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer n = if size == '11' then UInt(N:Vn) else UInt(Vn:N);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

VORN (immediate)

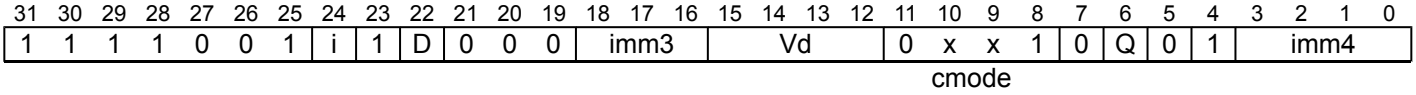
Vector Bitwise OR NOT (immediate) performs a bitwise OR between a register value and the complement of an immediate value, and returns the result into the destination vector.

This is a pseudo-instruction of VORR (immediate). This means:

- The encodings in this description are named to match the encodings of VORR (immediate).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (immediate) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORN{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I16 <Dd>, #~<imm>
```

Encoding for the 128-bit SIMD vector variant

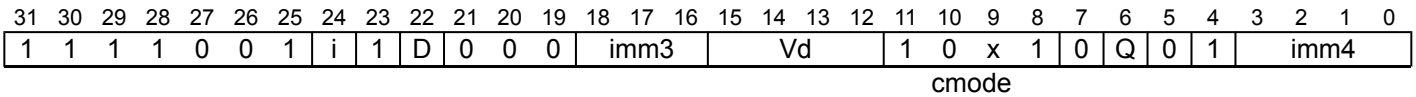
Applies when `(Q == 1)`

```
VORN{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I16 <Qd>, #~<imm>
```

A2



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORN{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I32 <Dd>, #~<imm>
```

Encoding for the 128-bit SIMD vector variant

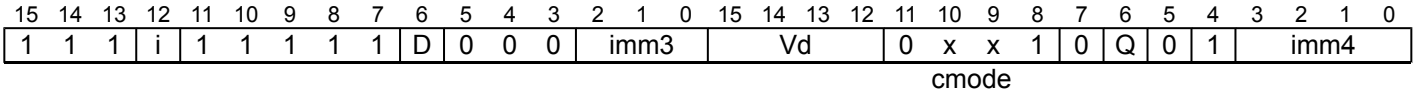
Applies when `(Q == 1)`

```
VORN{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I32 <Qd>, #~<imm>
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORN{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I16 <Dd>, #~<imm>
```

Encoding for the 128-bit SIMD vector variant

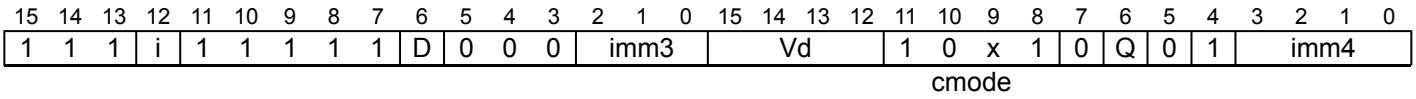
Applies when `(Q == 1)`

```
VORN{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I16 <Qd>, #~<imm>
```

T2



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORN{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I32 <Dd>, #~<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VORN{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

is equivalent to

```
VORR{<c>}{<q>}.I32 <Qd>, #~<imm>
```

Assembler Symbols

<c>	For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1 and T2: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions*.

Operation

The description of VORR (immediate) gives the operational pseudocode for this instruction.

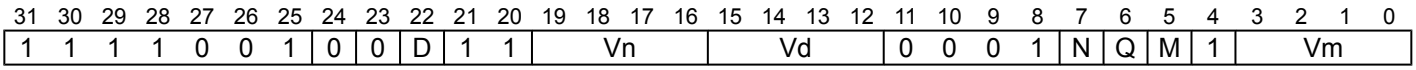
VORN (register)

Vector bitwise OR NOT (register) performs a bitwise OR NOT operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORN{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

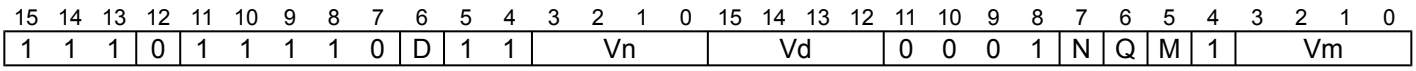
Applies when `(Q == 1)`

```
VORN{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORN{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VORN{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

	For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR NOT(D[m+r]);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

VORR (immediate)

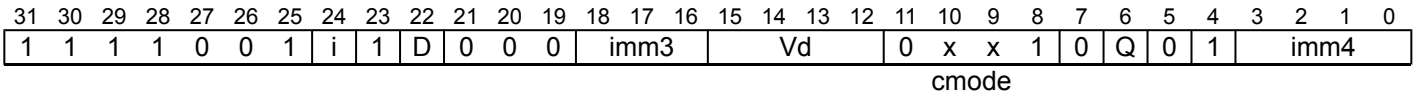
Vector Bitwise OR (immediate) performs a bitwise OR between a register value and an immediate value, and returns the result into the destination vector.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

This instruction is used by the pseudo-instruction VORN (immediate).

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORR{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

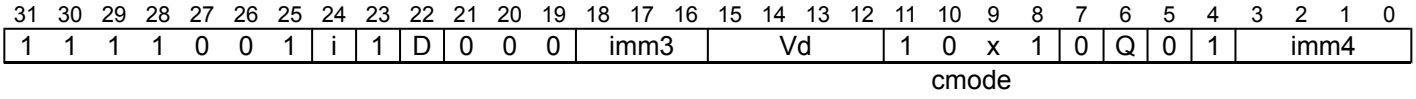
Applies when `(Q == 1)`

```
VORR{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

A2



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORR{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

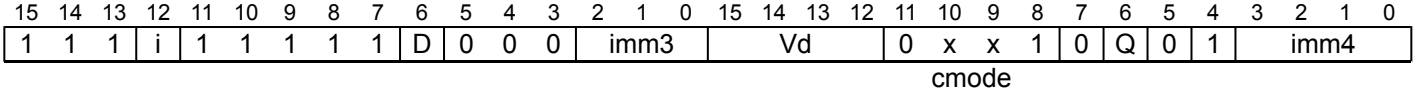
Applies when `(Q == 1)`

```
VORR{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORR{<c>}{<q>}.I32 {<Dd>,} <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

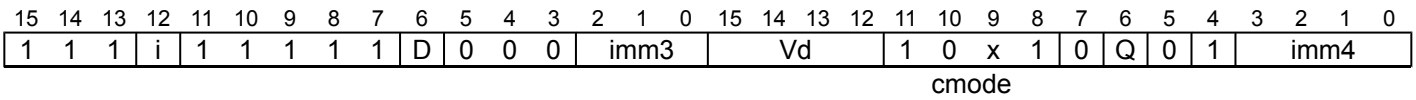
Applies when `(Q == 1)`

```
VORR{<c>}{<q>}.I32 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

T2



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORR{<c>}{<q>}.I16 {<Dd>,} <Dd>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VORR{<c>}{<q>}.I16 {<Qd>,} <Qd>, #<imm>
```

Decode for all variants of this encoding

```
if cmode<0> == '0' || cmode<3:2> == '11' then SEE "VMOV (immediate)";
if Q == '1' && Vd<0> == '1' then UNDEFINED;
constant imm64 = AdvSIMDExpandImm('0', cmode, i:imm3:imm4);
constant d = UInt(D:Vd);  constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c>	For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1 and T2: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<imm> Is a constant of the specified type that is replicated to fill the destination register. For details of the range of constants available and the encoding of <imm>, see *Modified immediate constants in T32 and A32 Advanced SIMD instructions*.

The I8, I64, and F32 data types are permitted as pseudo-instructions, if the immediate can be represented by this instruction, and are encoded using a permitted encoding of the I16 or I32 data type.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[d+r] OR imm64;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VORR (register)

Vector bitwise OR (register) performs a bitwise OR operation between two registers, and places the result in the destination register. The operand and result registers can be quadword or doubleword. They must all be the same size.

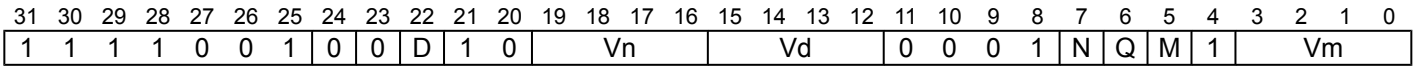
Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

This instruction is used by the alias VMOV (register, SIMD).

This instruction is used by the pseudo-instructions VRSHR (zero), and VSHR (zero).

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

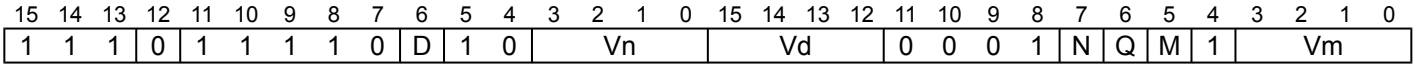
Applies when `(Q == 1)`

```
VORR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VORR{<c>}{<q>}{.<dt>} {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VORR{<c>}{<q>}{.<dt>} {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Alias Conditions

Alias	Is preferred when
VMOV (register, SIMD)	`N:Vn == M:Vm`
VRSHR (zero)	`Never`
VSHR (zero)	`Never`

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        D[d+r] = D[n+r] OR D[m+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:

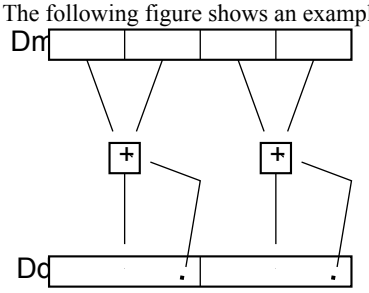
VPADAL

Vector Pairwise Add and Accumulate Long adds adjacent pairs of elements of a vector, and accumulates the results into the elements of the destination vector.

The vectors can be doubleword or quadword. The operand elements can be 8-bit, 16-bit, or 32-bit integers. The result elements are twice the length of the operand elements.

The following figure shows an example of the operation of VPADAL doubleword operation for data type S16.



Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “op:size”:

op	size	<dt>
0	00	S8
0	01	S16
0	10	S32
0	11	RESERVED
1	00	U8
1	01	U16
1	10	U32
1	11	RESERVED

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant h = elements DIV 2;

    for r = 0 to regs-1
        for e = 0 to h-1
            constant op1 = Elem[D[m+r],2*e,esize];
            constant op2 = Elem[D[m+r],2*e+1,esize];
            constant result = Int(op1, unsigned) + Int(op2, unsigned);
            Elem[D[d+r],e,2*esize] = Elem[D[d+r],e,2*esize] + result;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

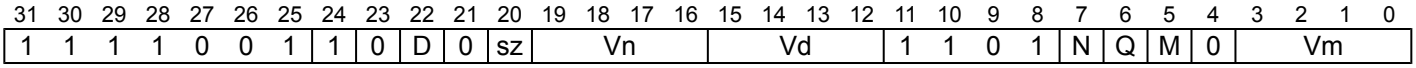
- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VPADD (floating-point)

Vector Pairwise Add (floating-point) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.
The operands and result are doubleword vectors.
The operand and result elements are floating-point numbers.
Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.
It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



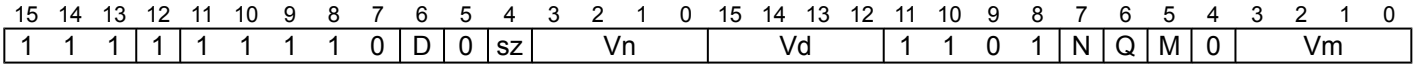
Encoding for the A1 variant

```
VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if Q == '1' then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

```
VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if Q == '1' then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.
For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “sz”:

sz	<dt>
0	F32
1	F16

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant FPCR_Type fpcr = StandardFPCR();
    bits(64) dest;
    constant h = elements DIV 2;

    for e = 0 to h-1
        Elem[dest,e,esize]   = FPAdd(Elem[D[n],2*e,esize], Elem[D[n],2*e+1,esize], fpcr);
        Elem[dest,e+h,esize] = FPAdd(Elem[D[m],2*e,esize], Elem[D[m],2*e+1,esize], fpcr);

    D[d] = dest;
```

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

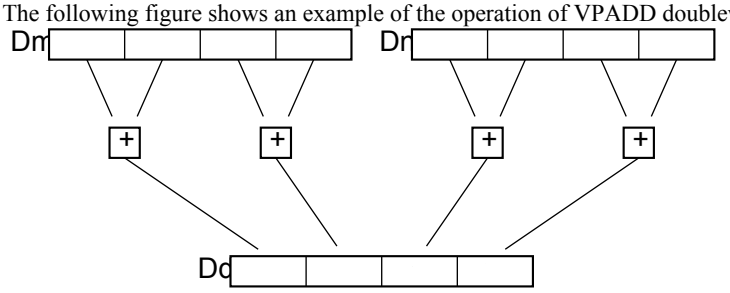
VPADD (integer)

Vector Pairwise Add (integer) adds adjacent pairs of elements of two vectors, and places the results in the destination vector.

The operands and result are doubleword vectors.

The operand and result elements must all be the same type, and can be 8-bit, 16-bit, or 32-bit integers. There is no distinction between signed and unsigned integers.

The following figure shows an example of the operation of VPADD doubleword operation for data type I16.



Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	0	0	D	size		Vn				Vd				1	0	1	1	N	Q	M	1	Vm			

Encoding for the A1 variant

```
VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' || Q == '1' then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	0	1	1	1	1	0	D	size		Vn				Vd				1	0	1	1	N	Q	M	1	Vm			

Encoding for the T1 variant

```
VPADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' || Q == '1' then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “size”:

size	<dt>
00	I8
01	I16
10	I32

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(64) dest;
    constant h = elements DIV 2;

    for e = 0 to h-1
        Elem[dest,e,esize]   = Elem[D[n],2*e,esize] + Elem[D[n],2*e+1,esize];
        Elem[dest,e+h,esize] = Elem[D[m],2*e,esize] + Elem[D[m],2*e+1,esize];

    D[d] = dest;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “op:size”:

op	size	<dt>
0	00	S8
0	01	S16
0	10	S32
0	11	RESERVED
1	00	U8
1	01	U16
1	10	U32
1	11	RESERVED

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant h = elements DIV 2;

    for r = 0 to regs-1
        for e = 0 to h-1
            constant op1 = Elem[D[m+r],2*e,esize];
            constant op2 = Elem[D[m+r],2*e+1,esize];
            constant result = Int(op1, unsigned) + Int(op2, unsigned);
            Elem[D[d+r],e,2*esize] = result<2*esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

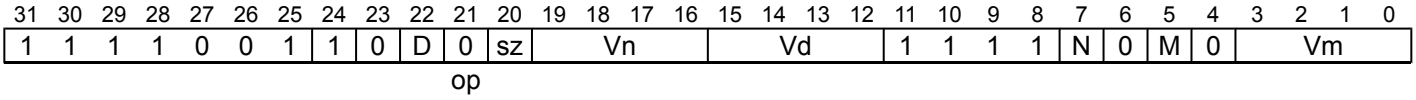
VPMAX (floating-point)

Vector Pairwise Maximum compares adjacent pairs of elements in two doubleword vectors, and copies the larger of each pair into the corresponding element in the destination doubleword vector.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



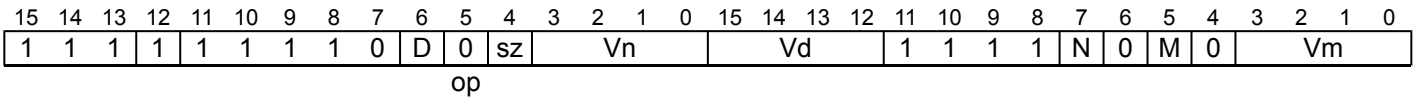
Encoding for the A1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
constant maximum = (op == '0');
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
constant maximum = (op == '0');
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “sz”:

sz	<dt>
0	F32
1	F16

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(64) dest;
    constant FPCR_Type fpcr = StandardFPCR();
    constant h = elements DIV 2;

    for e = 0 to h-1
        op1 = Elem[D[n],2*e,esize];  op2 = Elem[D[n],2*e+1,esize];
        Elem[dest,e,esize] = (if maximum then FPMax(op1,op2,fpcr)
                              else FPMin(op1,op2,fpcr));
        op1 = Elem[D[m],2*e,esize];  op2 = Elem[D[m],2*e+1,esize];
        Elem[dest,e+h,esize] = (if maximum then FPMax(op1,op2,fpcr)
                                else FPMin(op1,op2,fpcr));

    D[d] = dest;
```

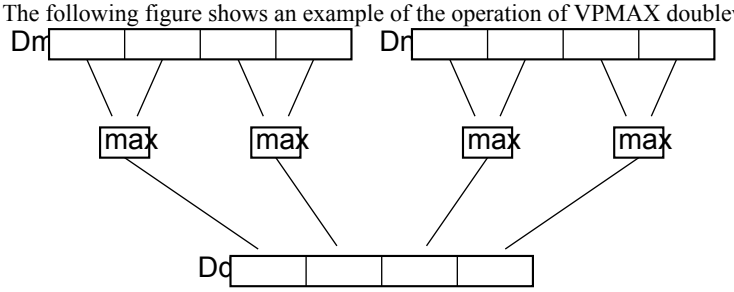
VPMAX (integer)

Vector Pairwise Maximum compares adjacent pairs of elements in two doubleword vectors, and copies the larger of each pair into the corresponding element in the destination doubleword vector.

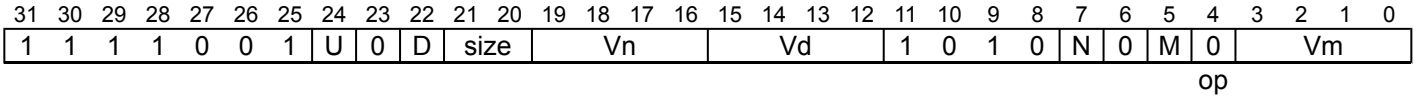
The following figure shows an example of the operation of VPMAX doubleword operation for data type S16 or U16.



Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



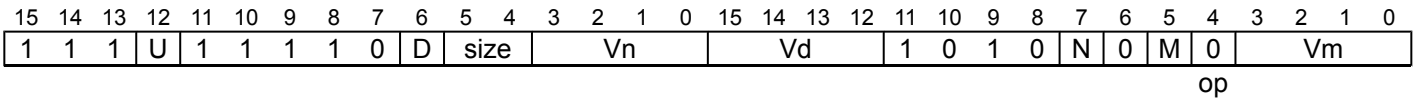
Encoding for the A1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then UNDEFINED;
constant maximum = (op == '0');  constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

```
VPMAX{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then UNDEFINED;
constant maximum = (op == '0');  constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “U:size”:

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
1	00	U8
1	01	U16
1	10	U32

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(64) dest;
    constant h = elements DIV 2;

    for e = 0 to h-1
        op1 = Int(Elem[D[n],2*e,esize], unsigned);
        op2 = Int(Elem[D[n],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e,esize] = result<esize-1:0>;
        op1 = Int(Elem[D[m],2*e,esize], unsigned);
        op2 = Int(Elem[D[m],2*e+1,esize], unsigned);
        result = if maximum then Max(op1,op2) else Min(op1,op2);
        Elem[dest,e+h,esize] = result<esize-1:0>;

    D[d] = dest;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

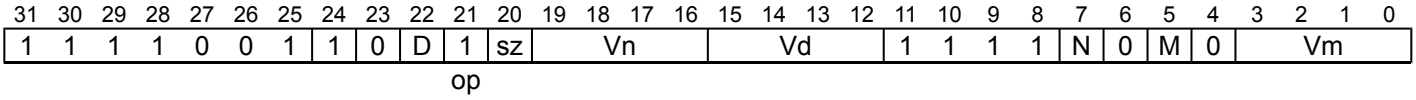
VPMIN (floating-point)

Vector Pairwise Minimum compares adjacent pairs of elements in two doubleword vectors, and copies the smaller of each pair into the corresponding element in the destination doubleword vector.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



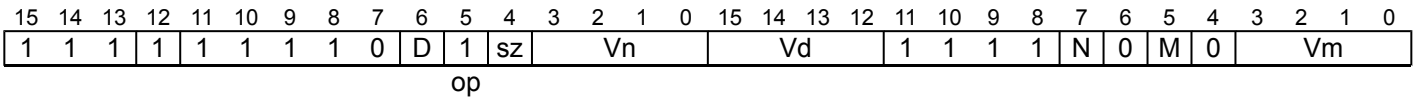
Encoding for the A1 variant

```
VPMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
constant maximum = (op == '0');
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

```
VPMIN{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Decode for this encoding

```
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
constant maximum = (op == '0');
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

VPOP

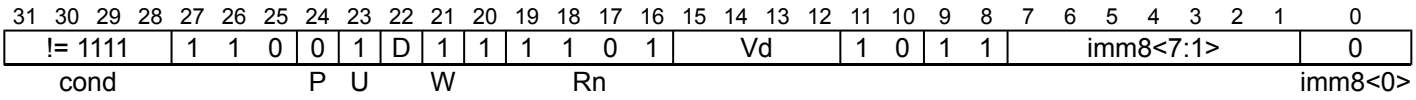
Pop SIMD&FP registers from stack loads multiple consecutive Advanced SIMD and floating-point register file registers from the stack.

This is an alias of VLDM, VLDMDB, VLDMIA. This means:

- The encodings in this description are named to match the encodings of VLDM, VLDMDB, VLDMIA.
- The description of VLDM, VLDMDB, VLDMIA gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the Increment After variant

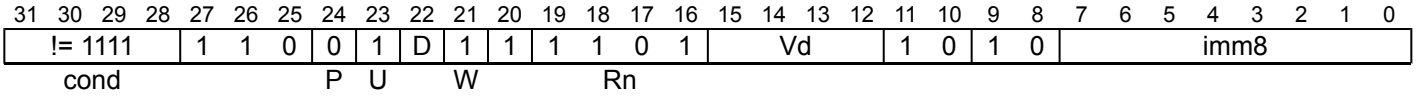
```
VPOP{<c>}{<q>}{.<size>} <dreglist>
```

is equivalent to

```
VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

A2



Encoding for the Increment After variant

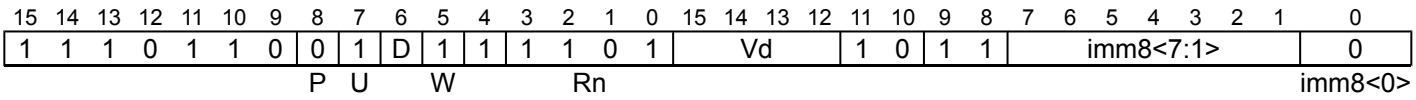
```
VPOP{<c>}{<q>}{.<size>} <sreglist>
```

is equivalent to

```
VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>
```

and is always the preferred disassembly.

T1



Encoding for the Increment After variant

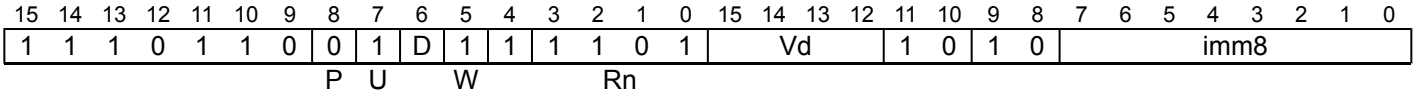
```
VPOP{<c>}{<q>}{.<size>} <dreglist>
```

is equivalent to

```
VLDM{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

T2



Encoding for the Increment After variant

```
VPOP{<c>}{<q>}{.<size>} <sreglist>
```

is equivalent to

```
VLDM{<c>}{<q>}{.<size>} SP!, <sreglist>
```

and is always the preferred disassembly.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<size>	An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
<sreglist>	Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
<dreglist>	Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation

The description of VLDM, VLDMDB, VLDMIA gives the operational pseudocode for this instruction.

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VPUSH

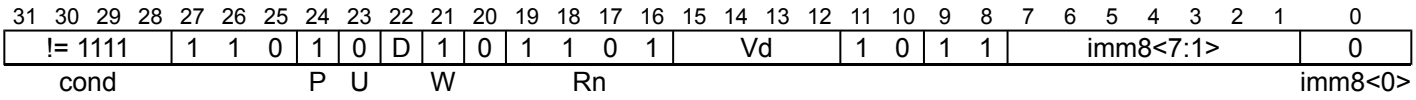
Push SIMD&FP registers to stack stores multiple consecutive registers from the Advanced SIMD and floating-point register file to the stack.

This is an alias of VSTM, VSTMDB, VSTMIA. This means:

- The encodings in this description are named to match the encodings of VSTM, VSTMDB, VSTMIA.
- The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the Decrement Before variant

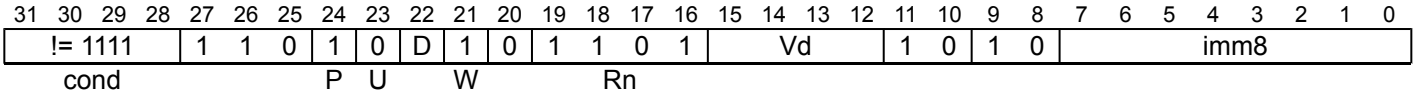
```
VPUSH{<c>}{<q>}{.<size>} <dreglist>
```

is equivalent to

```
VSTMDB{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

A2



Encoding for the Decrement Before variant

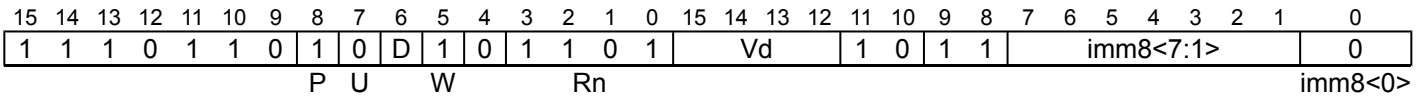
```
VPUSH{<c>}{<q>}{.<size>} <sreglist>
```

is equivalent to

```
VSTMDB{<c>}{<q>}{.<size>} SP!, <sreglist>
```

and is always the preferred disassembly.

T1



Encoding for the Decrement Before variant

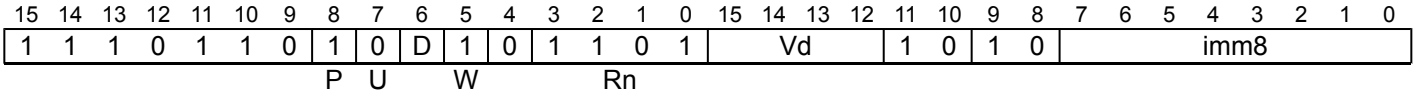
```
VPUSH{<c>}{<q>}{.<size>} <dreglist>
```

is equivalent to

```
VSTMDB{<c>}{<q>}{.<size>} SP!, <dreglist>
```

and is always the preferred disassembly.

T2



Encoding for the Decrement Before variant

```
VPUSH{<c>}{<q>}{.<size>} <sreglist>
```

is equivalent to

```
VSTMDB{<c>}{<q>}{.<size>} SP!, <sreglist>
```

and is always the preferred disassembly.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<size>	An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
<sreglist>	Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
<dreglist>	Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Operation

The description of VSTM, VSTMDB, VSTMIA gives the operational pseudocode for this instruction.

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VQABS

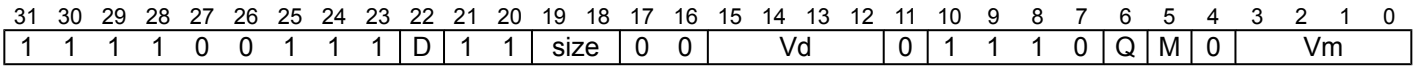
Vector Saturating Absolute takes the absolute value of each element in a vector, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQABS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

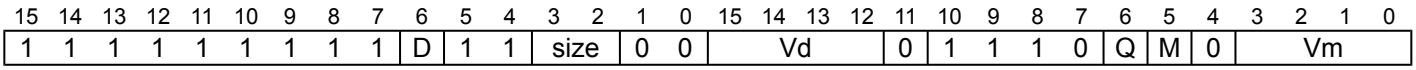
Applies when `(Q == 1)`

```
VQABS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQABS{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VQABS{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;

VQADD

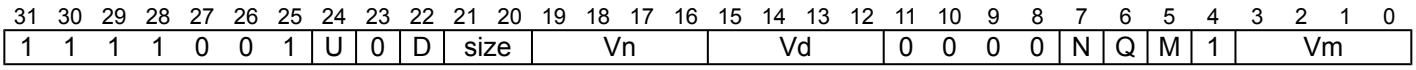
Vector Saturating Add adds the values of corresponding elements of two vectors, and places the results in the destination vector.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQADD{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

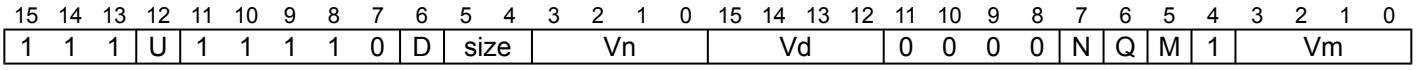
Applies when `(Q == 1)`

```
VQADD{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQADD{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VQADD{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

```

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
01	S16
10	S32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm[x]> Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is S16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>", and x is encoded in "M:Vm<3>". If <dt> is S32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    integer op2;
    if scalar_form then op2 = SInt(Elem[Din[m],index,esize]);
    for e = 0 to elements-1
        if !scalar_form then op2 = SInt(Elem[Din[m],e,esize]);
        constant op1 = SInt(Elem[Din[n],e,esize]);
        // The following only saturates if both op1 and op2 equal -(2^(esize-1))
        constant (product, sat) = SignedSatQ(2*op1*op2, 2*esize);
        Elem[Q[d>>1],e,2*esize] = product;
        if sat then FPSCR.QC = '1';
```

VQMOVN, VQMOVUN

Vector Saturating Move and Narrow copies each element of the operand vector to the corresponding element of the destination vector.

The operand is a quadword vector. The elements can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

The result is a doubleword vector. The elements are half the length of the operand vector elements. If the operand is unsigned, the results are unsigned. If the operand is signed, the results can be signed or unsigned.

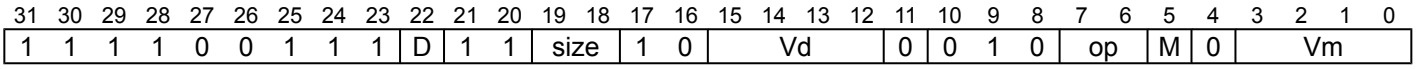
If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

This instruction is used by the pseudo-instructions VQRSHRN (zero), VQRSHRUN (zero), VQSHRN (zero), and VQSHRUN (zero).

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Signed result variant

Applies when `(op == 1x)`

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Encoding for the Unsigned result variant

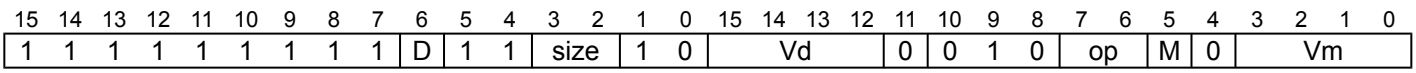
Applies when `(op == 01)`

```
VQMOVUN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Decode for all variants of this encoding

```
if op == '00' then SEE "VMOVN";
if size == '11' || Vm<0> == '1' then UNDEFINED;
constant src_unsigned = (op == '11');  constant dest_unsigned = (op<0> == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T1



Encoding for the Signed result variant

Applies when `(op == 1x)`

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Encoding for the Unsigned result variant

Applies when `(op == 01)`

```
VQMOVUN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Decode for all variants of this encoding

```
if op == '00' then SEE "VMOVN";
if size == '11' || Vm<0> == '1' then UNDEFINED;
constant src_unsigned = (op == '11');  constant dest_unsigned = (op<0> == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> For the signed result variant: is the data type for the elements of the operand, encoded in “op<0>:size”:

op<0>	size	<dt>
0	00	S16
0	01	S32
0	10	S64
0	11	RESERVED
1	00	U16
1	01	U32
1	10	U64

VQRDMLAH

Vector Saturating Rounding Doubling Multiply Accumulate Returning High Half. This instruction multiplies the vector elements of the first source SIMD&FP register with either the corresponding vector elements of the second source SIMD&FP register or the value of a vector element of the second source SIMD&FP register, without saturating the multiply results, doubles the results, and accumulates the most significant half of the final results with the vector elements of the destination SIMD&FP register. The results are rounded.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1

Assembler Symbols

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
01	S16
10	S32

<Qd> Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm[x]> Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is S16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>", and x is encoded in "M:Vm<3>". If <dt> is S32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
EncodingSpecificOperations();  CheckAdvSIMDEnabled();
integer op2;
constant boolean round = TRUE;
if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
for r = 0 to regs-1
    for e = 0 to elements-1
        constant op1 = SInt(Elem[D[n+r],e,esize]);
        constant op3 = SInt(Elem[D[d+r],e,esize]) << esize;
        if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
        constant integer rdmlah = RShr(op3 + 2*(op1*op2), esize, round);
        constant (result, sat) = SignedSatQ(rdmlah, esize);
        Elem[D[d+r],e,esize] = result;
        if sat then FPSCR.QC = '1';
```

VQRDMLSH

Vector Saturating Rounding Doubling Multiply Subtract Returning High Half. This instruction multiplies the vector elements of the first source SIMD&FP register with either the corresponding vector elements of the second source SIMD&FP register or the value of a vector element of the second source SIMD&FP register, without saturating the multiply results, doubles the results, and subtracts the most significant half of the final results from the vector elements of the destination SIMD&FP register. The results are rounded.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VQRDMLSH{<q>}.<dt> <Qd>, <Qn>, <Dm[x]>
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_RDM) then UNDEFINED;
if InITBlock() then UNPREDICTABLE;
if size == '11' then SEE "Related encodings";
if size == '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant add = FALSE;  constant scalar_form = TRUE;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant integer     m = if size == '01' then UInt(Vm<2:0>) else UInt(Vm);
constant integer index = if size == '01' then UInt(M:Vm<3>) else UInt(M);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
01	S16
10	S32

<Qd> Is the 128-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP register holding the accumulate vector, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm[x]> Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is S16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>", and x is encoded in "M:Vm<3>". If <dt> is S32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
EncodingSpecificOperations();  CheckAdvSIMDEnabled();
integer op2;
constant boolean round = TRUE;
if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
for r = 0 to regs-1
    for e = 0 to elements-1
        constant op1 = SInt(Elem[D[n+r],e,esize]);
        constant op3 = SInt(Elem[D[d+r],e,esize]) << esize;
        if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
        constant integer rdmlsh = RShr(op3 - 2*(op1*op2), esize, round);
        constant (result, sat) = SignedSatQ(rdmlsh, esize);
        Elem[D[d+r],e,esize] = result;
        if sat then FPSCR.QC = '1';
```

VQRDMULH

Vector Saturating Rounding Doubling Multiply Returning High Half multiplies corresponding elements in two vectors, doubles the results, and places the most significant half of the final results in the destination vector. The results are rounded. For truncated results see *VQDMULH*.

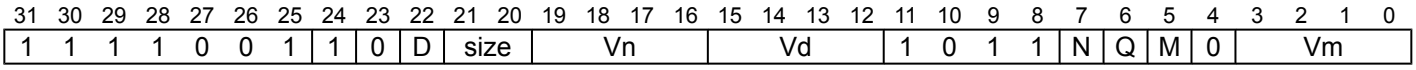
The second operand can be a scalar instead of a vector. For more information about scalars see *Advanced SIMD scalars*.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQRDMULH{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

Assembler Symbols

<c> For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
01	S16
10	S32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm[x]> Is the 64-bit name of the second SIMD&FP source register holding the scalar. If <dt> is S16, Dm is restricted to D0-D7. Dm is encoded in "Vm<2:0>", and x is encoded in "M:Vm<3>". If <dt> is S32, Dm is restricted to D0-D15. Dm is encoded in "Vm", and x is encoded in "M".

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    integer op2;
    constant boolean round = TRUE;
    if scalar_form then op2 = SInt(Elem[D[m],index,esize]);
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant op1 = SInt(Elem[D[n+r],e,esize]);
            if !scalar_form then op2 = SInt(Elem[D[m+r],e,esize]);
            constant integer rdmulh = RShr(2*op1*op2, esize, round);
            constant (result, sat) = SignedSatQ(rdmulh, esize);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';
```

VQRSHL

Vector Saturating Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

For truncated results see *VQSHL (register)*.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

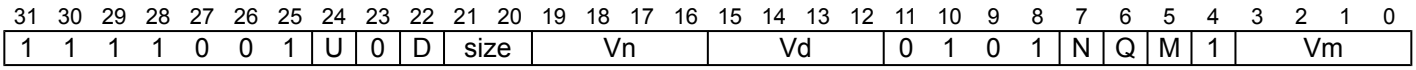
The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

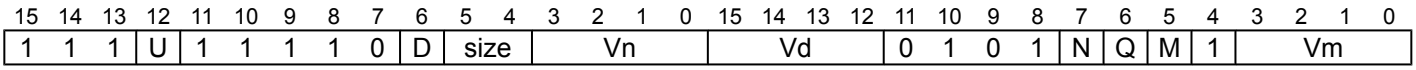
Applies when `(Q == 1)`

```
VQRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VQRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    bits(esize) result;
    boolean sat;
    for r = 0 to regs-1
        for e = 0 to elements-1
            integer element = Int(Elem[D[m+r], e, esize], unsigned);
            integer shift = SInt(Elem[D[n+r], e, esize]<7:0>);
            if shift >= 0 then // left shift
                element = element << shift;
            else               // rounding right shift
                shift = -shift;
                element = (element + (1 << (shift - 1))) >> shift;
            (result, sat) = SatQ(element, esize, unsigned);
            Elem[D[d+r], e, esize] = result;
            if sat then FPSCR.QC = '1';
```

VQRSHRN (zero)

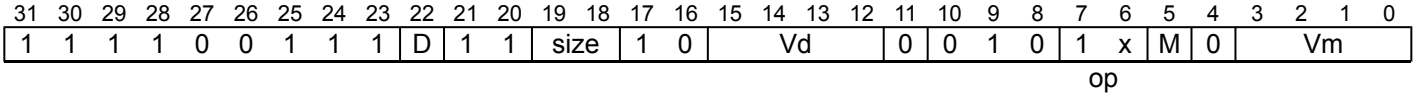
Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the signed rounded results in a doubleword vector.

This is a pseudo-instruction of VQMOVN, VQMOVUN. This means:

- The encodings in this description are named to match the encodings of VQMOVN, VQMOVUN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VQMOVN, VQMOVUN gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



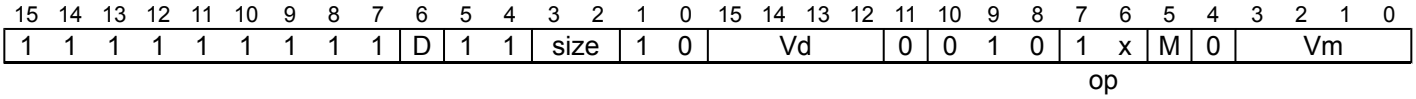
Encoding for the Signed result variant

```
VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

T1



Encoding for the Signed result variant

```
VQRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operand, encoded in “op<0>:size”:

op<0>	size	<dt>
0	00	S16
0	01	S32
0	10	S64
0	11	RESERVED
1	00	U16
1	01	U32
1	10	U64
1	11	RESERVED

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.

VQRSHRN, VQRSHRUN

Vector Saturating Rounding Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the rounded results in a doubleword vector.

For truncated results, see *VQSHRN and VQSHRUN*.

The operand elements must all be the same size, and can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

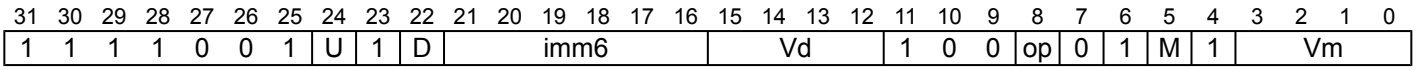
The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Signed result variant

Applies when `(!(imm6 == 000xxx) && op == 1)`

```
VQRSHRN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Encoding for the Unsigned result variant

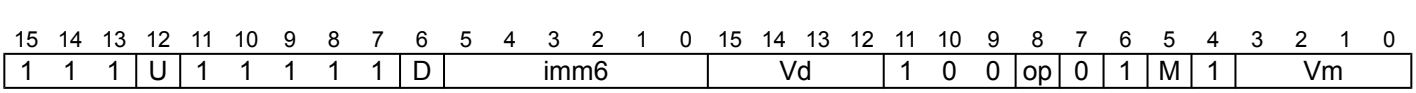
Applies when `(U == 1 && !(imm6 == 000xxx) && op == 0)`

```
VQRSHRUN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then SEE "VRSHRN";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize << 1) - UInt(imm6);
constant src_unsigned = (U == '1' && op == '1');  constant dest_unsigned = (U == '1');
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T1



Encoding for the Signed result variant

Applies when `(!(imm6 == 000xxx) && op == 1)`

```
VQRSHRN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Encoding for the Unsigned result variant

Applies when `(U == 1 && !(imm6 == 000xxx) && op == 0)`

```
VQRSHRUN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then SEE "VRSHRN";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize << 1) - UInt(imm6);
constant src_unsigned = (U == '1' && op == '1');  constant dest_unsigned = (U == '1');
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

11	RESERVED

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VQSHL (register)

Vector Saturating Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. Otherwise, it is a right shift.

The results are truncated. For rounded results, see *VQRSHL*.

The first operand and result elements are the same data type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

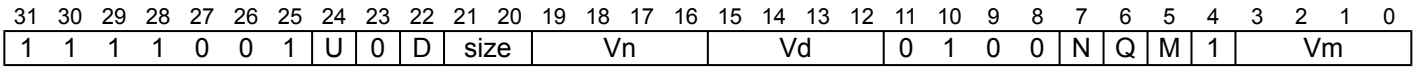
The second operand is a signed integer of the same size.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

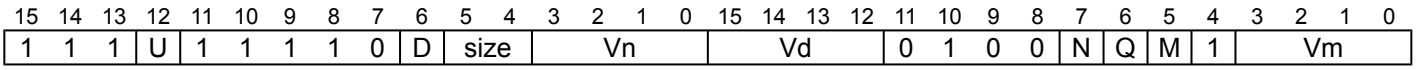
Applies when `(Q == 1)`

```
VQSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VQSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “U:size”:

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
0	11	S64
1	00	U8
1	01	U16
1	10	U32
1	11	U64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant shift = SInt(Elem[D[n+r],e,esize]<7:0>);
            constant operand = Int(Elem[D[m+r],e,esize], unsigned);
            boolean sat;
            bits(esize) result;
            if shift >= 0 then
                (result,sat) = SatQ(operand << shift, esize, unsigned);
            else
                (result,sat) = SatQ(operand >> -shift, esize, unsigned);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';
```

VQSHL, VQSHLU (immediate)

Vector Saturating Shift Left (immediate) takes each element in a vector of integers, left shifts them by an immediate value, and places the results in a second vector.

The operand elements must all be the same size, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

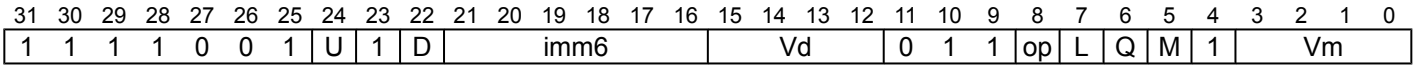
The result elements are the same size as the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector, signed result variant

Applies when `(!(imm6 == 000xxx && L == 0) && op == 1 && Q == 0)`

```
VQSHL{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 64-bit SIMD vector, unsigned result variant

Applies when `(U == 1 && !(imm6 == 000xxx && L == 0) && op == 0 && Q == 0)`

```
VQSHLU{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector, signed result variant

Applies when `(!(imm6 == 000xxx && L == 0) && op == 1 && Q == 1)`

```
VQSHL{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Encoding for the 128-bit SIMD vector, unsigned result variant

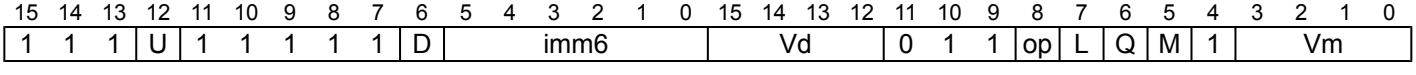
Applies when `(U == 1 && !(imm6 == 000xxx && L == 0) && op == 0 && Q == 1)`

```
VQSHLU{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(L:imm6) - esize;
constant src_unsigned = (U == '1' && op == '1');  constant dest_unsigned = (U == '1');
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector, signed result variant

Applies when `(!(imm6 == 000xxx && L == 0) && op == 1 && Q == 0)`

```
VQSHL{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 64-bit SIMD vector, unsigned result variant

Applies when `(U == 1 && !(imm6 == 000xxx && L == 0) && op == 0 && Q == 0)`

```
VQSHLU{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector, signed result variant

Applies when `(!(imm6 == 000xxx && L == 0) && op == 1 && Q == 1)`

```
VQSHL{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Encoding for the 128-bit SIMD vector, unsigned result variant

Applies when `(U == 1 && !(imm6 == 000xxx && L == 0) && op == 0 && Q == 1)`

```
VQSHLU{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(L:imm6) - esize;
constant src_unsigned = (U == '1' && op == '1');  constant dest_unsigned = (U == '1');
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<type> Is the data type for the elements of the vectors, encoded in “U”:

U	<type>
0	S
1	U

<size> Is the data size for the elements of the vectors, encoded in “L:imm6<5:3>”:

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant operand = Int(Elem[D[m+r],e,esize], src_unsigned);
            constant (result, sat) = SatQ(operand << shift_amount, esize, dest_unsigned);
            Elem[D[d+r],e,esize] = result;
            if sat then FPSCR.QC = '1';
```

VQSHRN (zero)

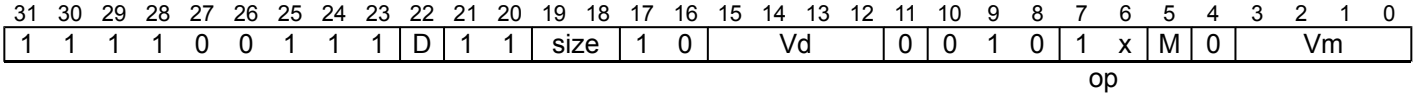
Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the signed truncated results in a doubleword vector.

This is a pseudo-instruction of VQMOVN, VQMOVUN. This means:

- The encodings in this description are named to match the encodings of VQMOVN, VQMOVUN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VQMOVN, VQMOVUN gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



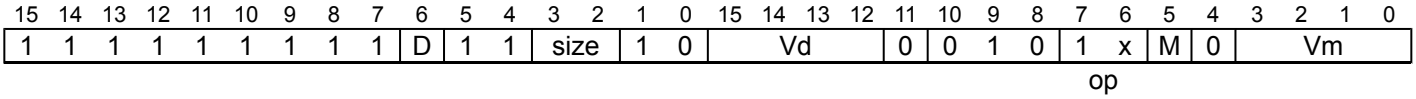
Encoding for the Signed result variant

```
VQSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

T1



Encoding for the Signed result variant

```
VQSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VQMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operand, encoded in “op<0>:size”:

op<0>	size	<dt>
0	00	S16
0	01	S32
0	10	S64
0	11	RESERVED
1	00	U16
1	01	U32
1	10	U64
1	11	RESERVED

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

The description of VQMOVN, VQMOVUN gives the operational pseudocode for this instruction.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VQSHRN, VQSHRUN

Vector Saturating Shift Right, Narrow takes each element in a quadword vector of integers, right shifts them by an immediate value, and places the truncated results in a doubleword vector.

For rounded results, see *VQRSHRN and VQRSHRUN*.

The operand elements must all be the same size, and can be any one of:

- 16-bit, 32-bit, or 64-bit signed integers.
- 16-bit, 32-bit, or 64-bit unsigned integers.

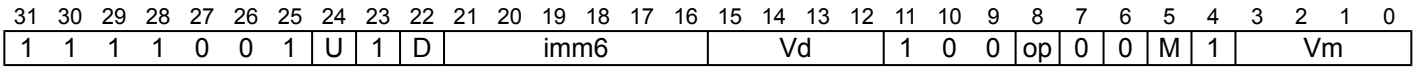
The result elements are half the width of the operand elements. If the operand elements are signed, the results can be either signed or unsigned. If the operand elements are unsigned, the result elements must also be unsigned.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Signed result variant

Applies when `(!(imm6 == 000xxx) && op == 1)`

```
VQSHRN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Encoding for the Unsigned result variant

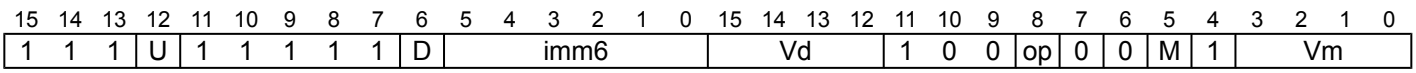
Applies when `(U == 1 && !(imm6 == 000xxx) && op == 0)`

```
VQSHRUN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then SEE "VSHRN";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (2 * esize) - UInt(imm6);
constant src_unsigned = (U == '1' && op == '1');  constant dest_unsigned = (U == '1');
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T1



Encoding for the Signed result variant

Applies when `(!(imm6 == 000xxx) && op == 1)`

```
VQSHRN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Encoding for the Unsigned result variant

Applies when `(U == 1 && !(imm6 == 000xxx) && op == 0)`

```
VQSHRUN{<c>}{<q>}.<type><size> <Dd>, <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if U == '0' && op == '0' then SEE "VSHRN";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (2 * esize) - UInt(imm6);
constant src_unsigned = (U == '1' && op == '1');  constant dest_unsigned = (U == '1');
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

VQSUB

Vector Saturating Subtract subtracts the elements of the second operand vector from the corresponding elements of the first operand vector, and places the results in the destination vector. Signed and unsigned operations are distinct.

The operand and result elements must all be the same type, and can be any one of:

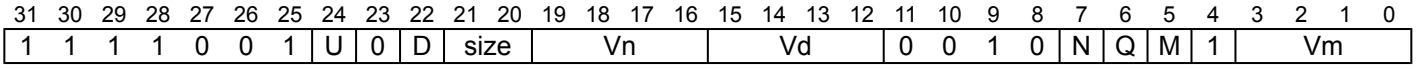
- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

If any of the results overflow, they are saturated. The cumulative saturation bit, *FPSCR*.QC, is set if saturation occurs. For details see *Pseudocode details of saturation*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQSUB{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

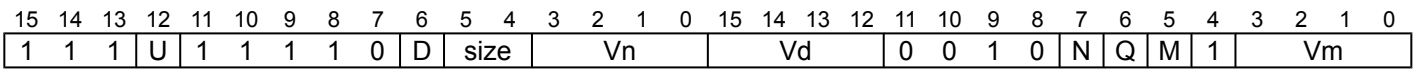
Applies when `(Q == 1)`

```
VQSUB{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VQSUB{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VQSUB{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

            constant diff = (Int(Elem[D[n+r],e,esize], unsigned) -
                             Int(Elem[D[m+r],e,esize], unsigned));
            boolean sat;
            (Elem[D[d+r],e,esize], sat) = SatQ(diff, esize, unsigned);
            if sat then FPSCR.QC = '1';
```

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VRADDHN

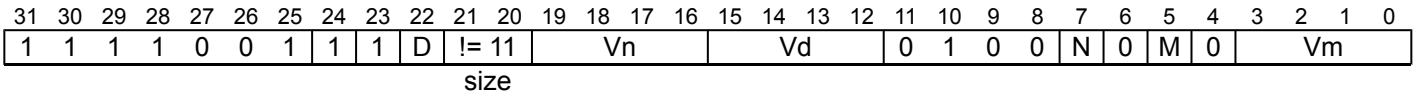
Vector Rounding Add and Narrow, returning High Half adds corresponding elements in two quadword vectors, and places the most significant half of each result in a doubleword vector. The results are rounded. For truncated results, see *VADDHN*.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



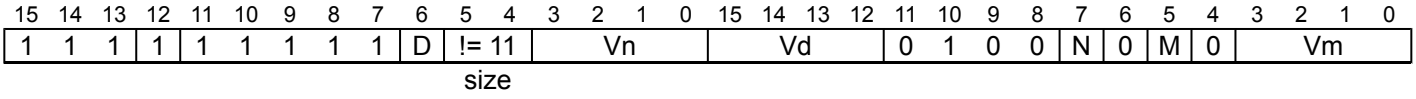
Encoding for the A1 variant

```
VRADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

```
VRADDHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
00	I16
01	I32
10	I64

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant boolean round = TRUE;
    for e = 0 to elements-1
        constant result = (RShr(UInt(Elem[Qin[n>>1],e,2*esize] +
                                Elem[Qin[m>>1],e,2*esize]), esize, round));
        Elem[D[d],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

VRECPE

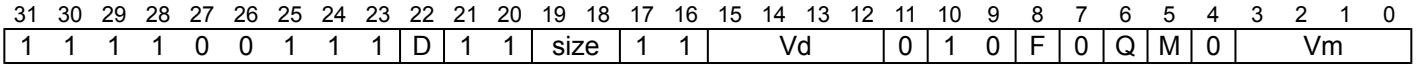
Vector Reciprocal Estimate finds an approximate reciprocal of each element in the operand vector, and places the results in the destination vector. The operand and result elements are the same type, and can be floating-point numbers or unsigned integers.

For details of the operation performed by this instruction see *Floating-point reciprocal square root estimate and step*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRECPE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

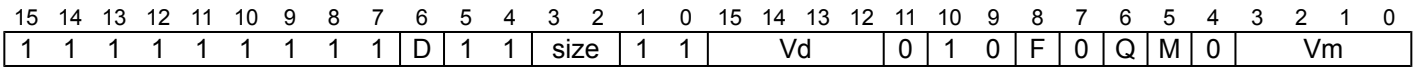
Applies when `(Q == 1)`

```
VRECPE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && (!IsFeatureImplemented(FEAT_FP16) || F == '0')) || size IN {'00', '11'} then
    UNDEFINED;
constant floating_point = (F == '1');
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRECPE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRECPE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && (!IsFeatureImplemented(FEAT_FP16) || F == '0')) || size IN {'00', '11'} then
    UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
constant floating_point = (F == '1');
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

VRHADD

Vector Rounding Halving Add adds corresponding elements in two vectors of integers, shifts each result right one bit, and places the final results in the destination vector.

The operand and result elements are all the same type, and can be any one of:

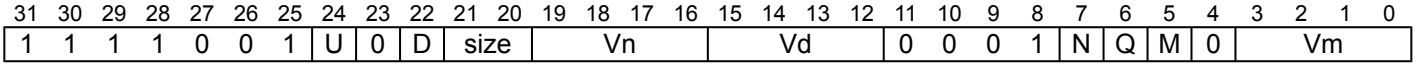
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.

The results of the halving operations are rounded. For truncated results, see *VHADD*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRHADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

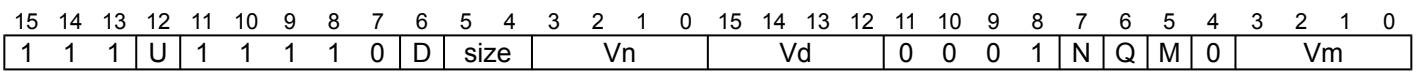
Applies when `(Q == 1)`

```
VRHADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRHADD{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRHADD{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “U:size”:

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
1	00	U8
1	01	U16
1	10	U32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant op1 = Int(Elem[D[n+r],e,esize], unsigned);
            constant op2 = Int(Elem[D[m+r],e,esize], unsigned);
            constant result = (op1 + op2 + 1) >> 1;
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.

    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

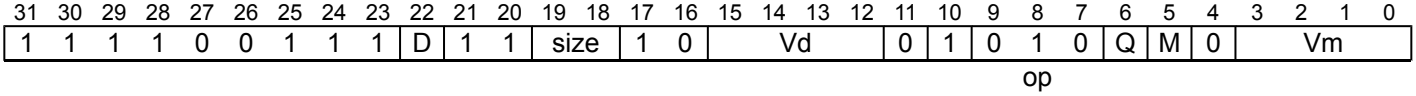
VRINTA (Advanced SIMD)

Vector Round floating-point to integer towards Nearest with Ties to Away rounds a vector of floating-point values to integral floating-point values of the same size using the Round to Nearest with Ties to Away rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRINTA{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

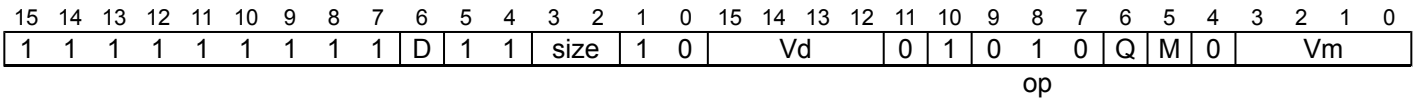
Applies when `(Q == 1)`

```
VRINTA{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if op<2> != op<0> then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !IsFeatureImplemented(FEAT_FP16)) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
constant rounding = FPDecodeRM(op<2>:NOT(op<1>));  constant exact = FALSE;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRINTA{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRINTA{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if op<2> != op<0> then SEE "Related encodings";
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !IsFeatureImplemented(FEAT_FP16)) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
constant rounding = FPDecodeRM(op<2>:NOT(op<1>));  constant exact = FALSE;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Related encodings: See *Advanced SIMD two registers misc* for the T32 instruction set, or *Advanced SIMD two registers misc* for the A32 instruction set.

Assembler Symbols

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “size”:

size	<dt>
01	F16
10	F32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
EncodingSpecificOperations(); CheckAdvSIMDEnabled();
constant FPCR_Type fpcr = StandardFPCR();
for r = 0 to regs-1
    for e = 0 to elements-1
        constant op1 = Elem[D[m+r],e,esize];
        constant result = FPRoundInt(op1, fpcr, rounding, exact);
        Elem[D[d+r],e,esize] = result;
```

constant rounding = FPDecodeRM(RM);  constant exact = FALSE;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<q>	See *Standard assembler syntax fields*.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
constant FPCR_Type fpcr = EffectiveFPCR();
case esize of
    when 16
        H[d] = FPRoundInt(H[m], fpcr, rounding, exact);
    when 32
        S[d] = FPRoundInt(S[m], fpcr, rounding, exact);
    when 64
        D[d] = FPRoundInt(D[m], fpcr, rounding, exact);
```

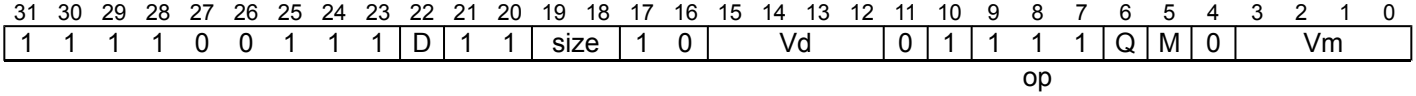
VRINTP (Advanced SIMD)

Vector Round floating-point to integer towards +Infinity rounds a vector of floating-point values to integral floating-point values of the same size using the Round towards +Infinity rounding mode. A zero input gives a zero result with the same sign, an infinite input gives an infinite result with the same sign, and a NaN is propagated as for normal arithmetic.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRINTP{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

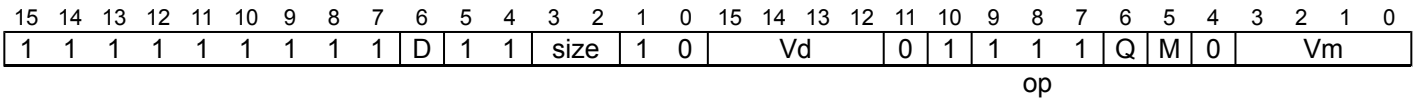
Applies when `(Q == 1)`

```
VRINTP{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if op<2> != op<0> then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !IsFeatureImplemented(FEAT_FP16)) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
constant rounding = FPDecodeRM(op<2>:NOT(op<1>));  constant exact = FALSE;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRINTP{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRINTP{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if op<2> != op<0> then SEE "Related encodings";
if InITBlock() then UNPREDICTABLE;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && !IsFeatureImplemented(FEAT_FP16)) || size IN {'00', '11'} then UNDEFINED;
// Rounding encoded differently from other VCVT and VRINT instructions
constant rounding = FPDecodeRM(op<2>:NOT(op<1>));  constant exact = FALSE;
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Related encodings: See *Advanced SIMD two registers misc* for the T32 instruction set, or *Advanced SIMD two registers misc* for the A32 instruction set.

constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
```

T1

Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VRINTZ{<c>}{<q>}.F16 <Sd>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VRINTZ{<c>}{<q>}.F32 <Sd>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VRINTZ{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
constant boolean zero_rounding = op == '1';
constant exact = FALSE;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
    constant FPCR_Type fpcr = EffectiveFPCR();
    constant rounding = if zero_rounding then FPRounding_ZERO else FPRoundingMode(fpcr);
    case esize of
        when 16
            H[d] = FPRoundInt(H[m], fpcr, rounding, exact);
        when 32
            S[d] = FPRoundInt(S[m], fpcr, rounding, exact);
        when 64
            D[d] = FPRoundInt(D[m], fpcr, rounding, exact);
```

VRSHL

Vector Rounding Shift Left takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a rounding right shift. For a truncating shift, see VSHL.

The first operand and result elements are the same data type, and can be any one of:

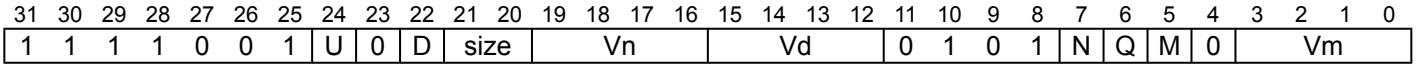
- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when (Q == 0)

```
VRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

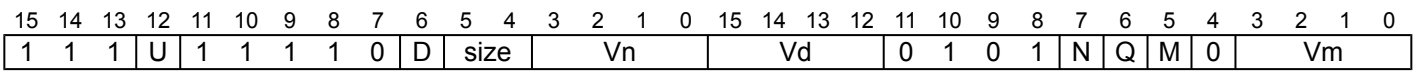
Applies when (Q == 1)

```
VRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “U:size”:

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
0	11	S64
1	00	U8
1	01	U16
1	10	U32
1	11	U64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    integer result;
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant integer element = Int(Elem[D[m+r], e, esize], unsigned);
            integer shift = SInt(Elem[D[n+r], e, esize]<7:0>);
            if shift >= 0 then  // left shift
                result = element << shift;
            else                // rounding right shift
                shift = -shift;
                result = (element + (1 << (shift - 1))) >> shift;
            Elem[D[d+r], e, esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

VRSHR

Vector Rounding Shift Right takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector. For truncated results, see *VSHR*.

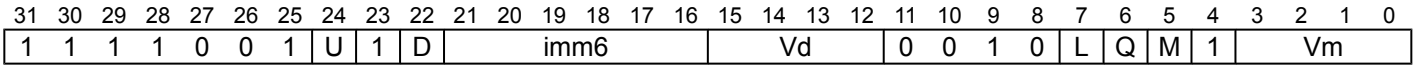
The operand and result elements must be the same size, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VRSHR{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

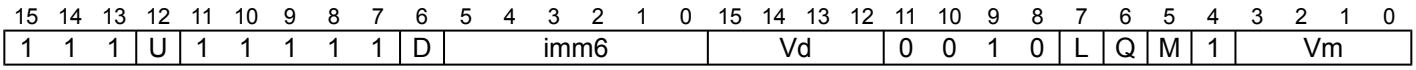
Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VRSHR{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VRSHR{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VRSHR{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<type> Is the data type for the elements of the vectors, encoded in “U”:

U	<type>
0	S
1	U

<size> Is the data size for the elements of the vectors, encoded in “L:imm6<5:3>”:

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant boolean round = TRUE;
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant result = RShr(Int(Elem[D[m+r],e,esize], unsigned), shift_amount, round);
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

VRSHR (zero)

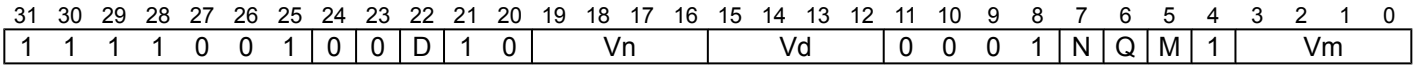
Vector Rounding Shift Right copies the contents of one SIMD register to another.

This is a pseudo-instruction of VORR (register). This means:

- The encodings in this description are named to match the encodings of VORR (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (register) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

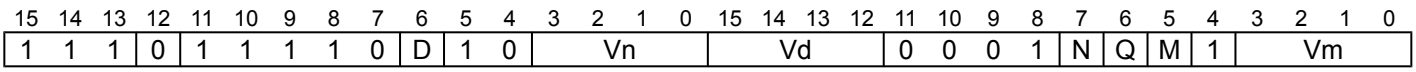
Applies when `(Q == 1)`

```
VRSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<dt>	Is the data type for the elements of the vectors, and must be one of: S8, S16, S32, S64, U8, U16, U32 or U64.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qm>	Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation

The description of VORR (register) gives the operational pseudocode for this instruction.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VRSHRN

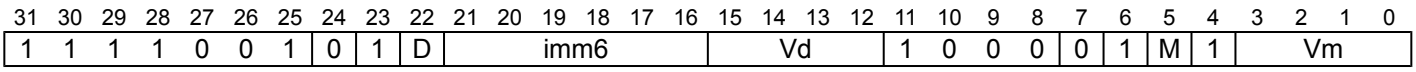
Vector Rounding Shift Right and Narrow takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector. For truncated results, see *VSHRN*.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers. The destination elements are half the size of the source elements.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the A1 variant

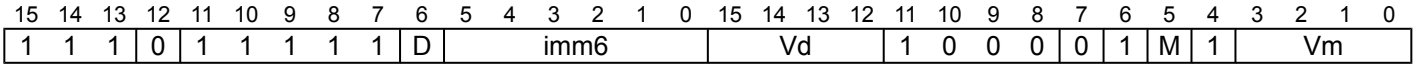
Applies when `(imm6 != 000xxx)`

```
VRSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize << 1) - UInt(imm6);
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

Applies when `(imm6 != 000xxx)`

```
VRSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize << 1) - UInt(imm6);
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

<size> Is the data size for the elements of the vectors, encoded in “imm6<5:3>”:

imm6<5:3>	<size>
001	16
01x	32
1xx	64

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<imm> Is an immediate value, in the range 1 to <size>/2, encoded in the "imm6" field as <size>/2 - <imm>.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant boolean round = TRUE;
    for e = 0 to elements-1
        constant result = RShr(UInt(Elem[Qin[m>>1],e,2*esize]), shift_amount, round);
        Elem[D[d],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VRSHRN (zero)

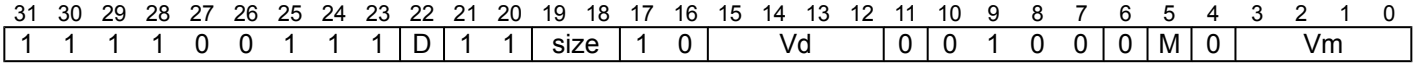
Vector Rounding Shift Right and Narrow takes each element in a vector, right shifts them by an immediate value, and places the rounded results in the destination vector.

This is a pseudo-instruction of VMOVN. This means:

- The encodings in this description are named to match the encodings of VMOVN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VMOVN gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



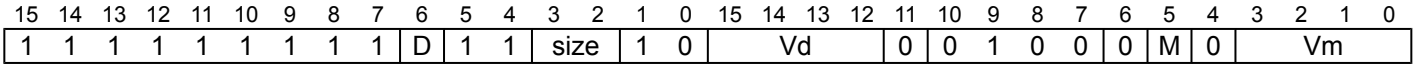
Encoding for the A1 variant

```
VRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

T1



Encoding for the T1 variant

```
VRSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operand, encoded in “size”:

size	<dt>
00	I16
01	I32
10	I64
11	RESERVED

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

The description of VMOVN gives the operational pseudocode for this instruction.

VRSQRTE

Vector Reciprocal Square Root Estimate finds an approximate reciprocal square root of each element in a vector, and places the results in a second vector.

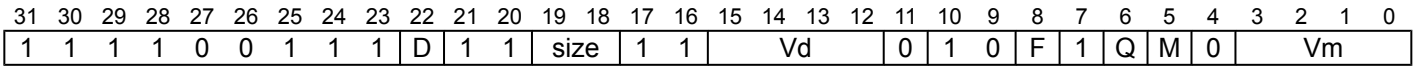
The operand and result elements are the same type, and can be floating-point numbers or unsigned integers.

For details of the operation performed by this instruction see *Floating-point reciprocal estimate and step*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRSQRTE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

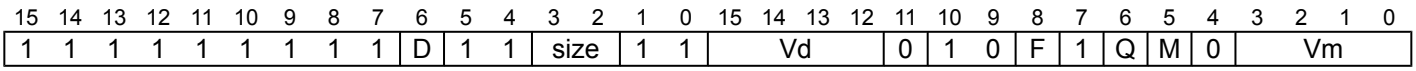
Applies when `(Q == 1)`

```
VRSQRTE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if (size == '01' && (!IsFeatureImplemented(FEAT_FP16) || F == '0')) || size IN {'00', '11'} then
    UNDEFINED;
constant floating_point = (F == '1');
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRSQRTE{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRSQRTE{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '01' && (!IsFeatureImplemented(FEAT_FP16) || F == '0') then UNDEFINED;
if size IN {'00', '11'} then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
constant floating_point = (F == '1');
constant integer esize = 8 << UInt(size);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “F:size”:

F	size	<dt>
0	10	U32
1	01	F16
1	10	F32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Newton-Raphson iteration

For details of the operation performed and how it can be used in a Newton-Raphson iteration to calculate the reciprocal of the square root of a number, see *Floating-point reciprocal estimate and step*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant FPCR_Type fpcr = StandardFPCR();
    for r = 0 to regs-1
        for e = 0 to elements-1
            if floating_point then
                Elem[D[d+r],e,esize] = FPRSqrtEstimate(Elem[D[m+r],e,esize], fpcr);
            else
                Elem[D[d+r],e,esize] = UnsignedRSqrtEstimate(Elem[D[m+r],e,esize]);
```

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VRSQRTS

Vector Reciprocal Square Root Step multiplies the elements of one vector by the corresponding elements of another vector, subtracts each of the products from 3.0, divides these results by 2.0, and places the results into the elements of the destination vector.

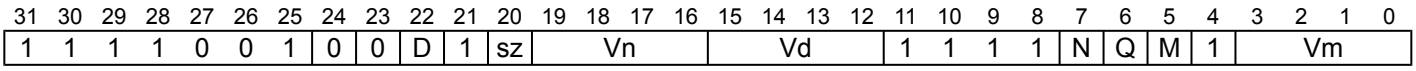
The operand and result elements are floating-point numbers.

For details of the operation performed by this instruction see *Floating-point reciprocal estimate and step*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRSQRTS{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

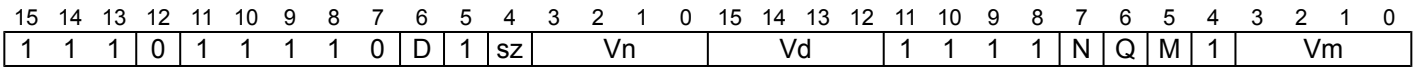
Applies when `(Q == 1)`

```
VRSQRTS{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VRSQRTS{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VRSQRTS{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “sz”:

sz	<dt>
0	F32
1	F16

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Newton-Raphson iteration

For details of the operation performed and how it can be used in a Newton-Raphson iteration to calculate the reciprocal of the square root of a number, see *Floating-point reciprocal estimate and step*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = FPRSqrtStep(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize]);
```

VRSRA

Vector Rounding Shift Right and Accumulate takes each element in a vector, right shifts them by an immediate value, and accumulates the rounded results into the destination vector. For truncated results, see *VSRA*.

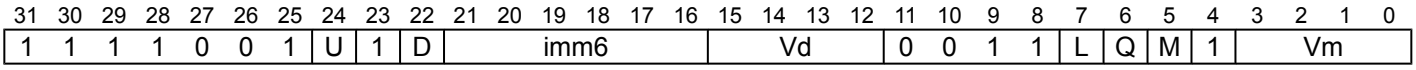
The operand and result elements must all be the same type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VRSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

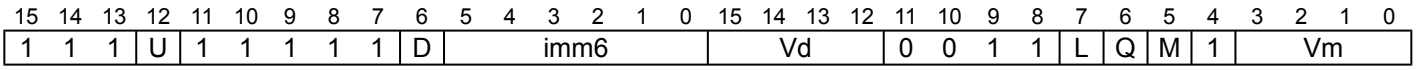
Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VRSRA{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VRSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VRSRA{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<type> Is the data type for the elements of the vectors, encoded in “U”:

U	<type>
0	S
1	U

<size> Is the data size for the elements of the vectors, encoded in “L:imm6<5:3>”:

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant boolean round = TRUE;
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant result = RShr(Int(Elem[D[m+r],e,esize], unsigned), shift_amount, round);
            Elem[D[d+r],e,esize] = Elem[D[d+r],e,esize] + result;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

VRSUBHN

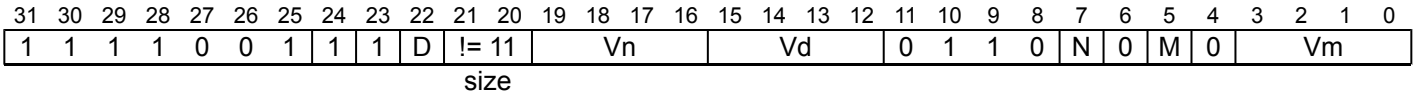
Vector Rounding Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are rounded. For truncated results, see *VSUBHN*.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



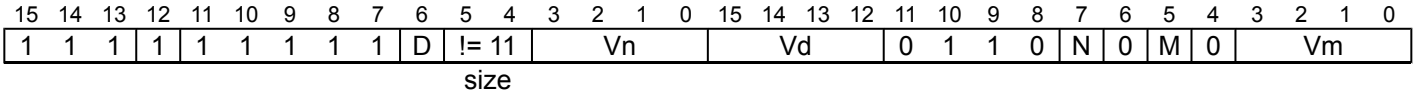
Encoding for the A1 variant

```
VRSUBHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

```
VRSUBHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
00	I16
01	I32
10	I64

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant boolean round = TRUE;
    for e = 0 to elements-1
        constant result = (RShr(UInt(Elem[Qin[n>>1],e,2*esize] -
                                Elem[Qin[m>>1],e,2*esize]), esize, round));
        Elem[D[d],e,esize] = result<esize-1:0>;
```

Operational information

VSDOT (by element)

Dot Product index form with signed integers. This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

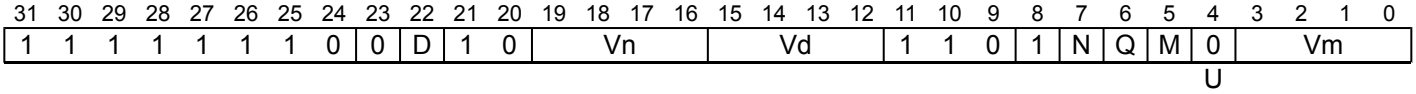
Note

ID_ISAR6.DP indicates whether this instruction is supported.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

(FEAT_DotProd)



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSDOT{<q>}.S8 <Dd>, <Dn>, <Dm>[<index>]

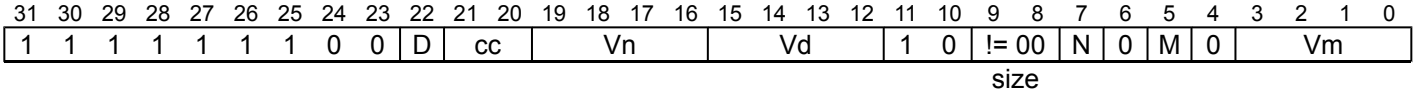
VSELEQ, VSELGE, VSELGT, VSELVS

Floating-point conditional select allows the destination register to take the value in either one or the other source register according to the condition codes in the *APSR*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Equal, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 00 && size == 01)`

```
VSELEQ.F16 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Equal, single-precision scalar variant

Applies when `(cc == 00 && size == 10)`

```
VSELEQ.F32 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Equal, double-precision scalar variant

Applies when `(cc == 00 && size == 11)`

```
VSELEQ.F64 <Dd>, <Dn>, <Dm> // (Cannot be conditional)
```

Encoding for the Greater than or Equal, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 10 && size == 01)`

```
VSELGE.F16 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Greater than or Equal, single-precision scalar variant

Applies when `(cc == 10 && size == 10)`

```
VSELGE.F32 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Greater than or Equal, double-precision scalar variant

Applies when `(cc == 10 && size == 11)`

```
VSELGE.F64 <Dd>, <Dn>, <Dm> // (Cannot be conditional)
```

Encoding for the Greater than, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 11 && size == 01)`

```
VSELGT.F16 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Greater than, single-precision scalar variant

Applies when `(cc == 11 && size == 10)`

```
VSELGT.F32 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Greater than, double-precision scalar variant

Applies when `(cc == 11 && size == 11)`

```
VSELGT.F64 <Dd>, <Dn>, <Dm> // (Cannot be conditional)
```

Encoding for the Unordered, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 01 && size == 01)`

```
VSELVS.F16 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Unordered, single-precision scalar variant

Applies when `(cc == 01 && size == 10)`

```
VSELVS.F32 <Sd>, <Sn>, <Sm> // (Cannot be conditional)
```

Encoding for the Unordered, double-precision scalar variant

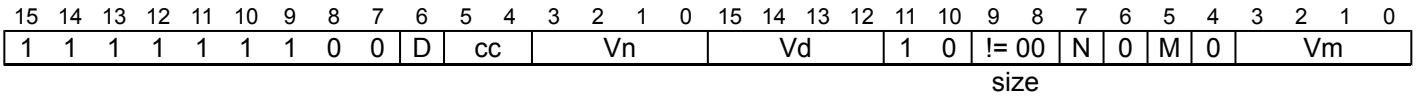
Applies when `(cc == 01 && size == 11)`

```
VSELVS.F64 <Dd>, <Dn>, <Dm> // (Cannot be conditional)
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer n = if size == '11' then UInt(N:Vn) else UInt(Vn:N);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
constant bits(4) condition = cc:(cc<1> EOR cc<0>):'0';
```

T1



Encoding for the Equal, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 00 && size == 01)`

```
VSELEQ.F16 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Equal, single-precision scalar variant

Applies when `(cc == 00 && size == 10)`

```
VSELEQ.F32 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Equal, double-precision scalar variant

Applies when `(cc == 00 && size == 11)`

```
VSELEQ.F64 <Dd>, <Dn>, <Dm> // (Not permitted in IT block)
```

Encoding for the Greater than or Equal, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 10 && size == 01)`

```
VSELGE.F16 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Greater than or Equal, single-precision scalar variant

Applies when `(cc == 10 && size == 10)`

```
VSELGE.F32 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Greater than or Equal, double-precision scalar variant

Applies when `(cc == 10 && size == 11)`

```
VSELGE.F64 <Dd>, <Dn>, <Dm> // (Not permitted in IT block)
```

Encoding for the Greater than, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 11 && size == 01)`

```
VSELGT.F16 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Greater than, single-precision scalar variant

Applies when `(cc == 11 && size == 10)`

```
VSELGT.F32 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Greater than, double-precision scalar variant

Applies when `(cc == 11 && size == 11)`

```
VSELGT.F64 <Dd>, <Dn>, <Dm> // (Not permitted in IT block)
```

Encoding for the Unordered, half-precision scalar variant
(FEAT_FP16)

Applies when `(cc == 01 && size == 01)`

```
VSELVS.F16 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Unordered, single-precision scalar variant

Applies when `(cc == 01 && size == 10)`

```
VSELVS.F32 <Sd>, <Sn>, <Sm> // (Not permitted in IT block)
```

Encoding for the Unordered, double-precision scalar variant

Applies when `(cc == 01 && size == 11)`

```
VSELVS.F64 <Dd>, <Dn>, <Dm> // (Not permitted in IT block)
```

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer n = if size == '11' then UInt(N:Vn) else UInt(Vn:N);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
constant bits(4) condition = cc:(cc<1> EOR cc<0>):'0';
```

CONSTRAINED UNPREDICTABLE behavior

If `InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sn>	Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.
<Sm>	Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation

```
EncodingSpecificOperations(); CheckVFPEnabled(TRUE);
case esize of
    when 16
        H[d] = if ConditionHolds(condition) then H[n] else H[m];
    when 32
        S[d] = if ConditionHolds(condition) then S[n] else S[m];
    when 64
        D[d] = if ConditionHolds(condition) then D[n] else D[m];
```

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VSHL (immediate)

Vector Shift Left (immediate) takes each element in a vector of integers, left shifts them by an immediate value, and places the results in the destination vector.

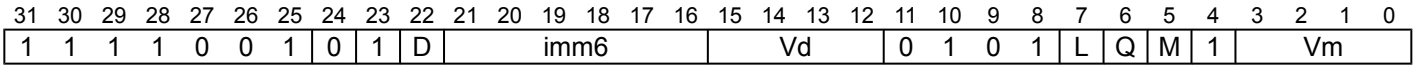
Bits shifted out of the left of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSHL{<c>}{<q>}.I<size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

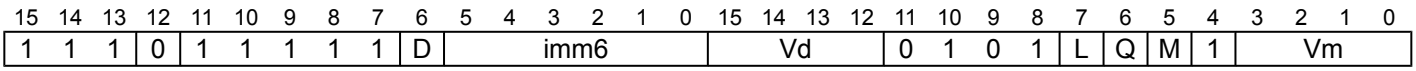
Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSHL{<c>}{<q>}.I<size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(L:imm6) - esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSHL{<c>}{<q>}.I<size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSHL{<c>}{<q>}.I<size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(L:imm6) - esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size for the elements of the vectors, encoded in "L:imm6<5:3>":

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = LSL(Elem[D[m+r],e,esize], shift_amount);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

VSHL (register)

Vector Shift Left (register) takes each element in a vector, shifts them by a value from the least significant byte of the corresponding element of a second vector, and places the results in the destination vector. If the shift value is positive, the operation is a left shift. If the shift value is negative, it is a truncating right shift.

For a rounding shift, see *VRSHL*.

The first operand and result elements are the same data type, and can be any one of:

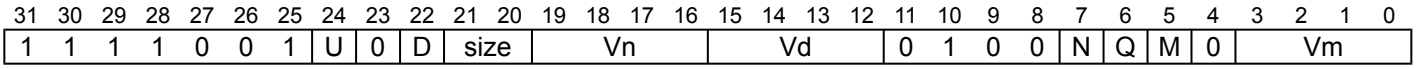
- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

The second operand is always a signed integer of the same size.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

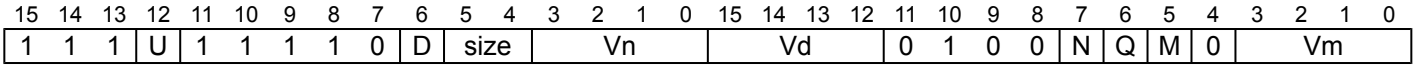
Applies when `(Q == 1)`

```
VSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSHL{<c>}{<q>}.<dt> {<Dd>,} <Dm>, <Dn>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VSHL{<c>}{<q>}.<dt> {<Qd>,} <Qm>, <Qn>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1');
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant n = UInt(N:Vn);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “U:size”:

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
0	11	S64
1	00	U8
1	01	U16
1	10	U32
1	11	U64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant shift = SInt(Elem[D[n+r],e,esize]<7:0>);
            integer result;
            if shift >= 0 then
                result = Int(Elem[D[m+r],e,esize], unsigned) << shift;
            else
                result = Int(Elem[D[m+r],e,esize], unsigned) >> -shift;
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

VSHLL

Vector Shift Left Long takes each element in a doubleword vector, left shifts them by an immediate value, and places the results in a quadword vector. The operand elements can be:

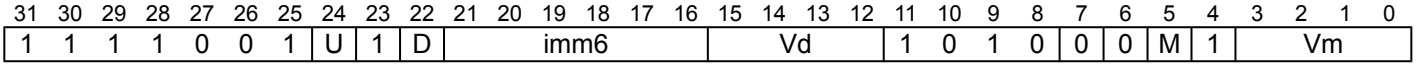
- 8-bit, 16-bit, or 32-bit signed integers.
- 8-bit, 16-bit, or 32-bit unsigned integers.
- 8-bit, 16-bit, or 32-bit untyped integers, maximum shift only.

The result elements are twice the length of the operand elements.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the A1 variant

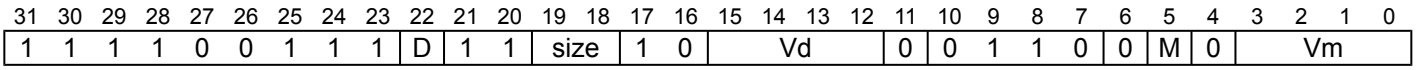
Applies when `(imm6 != 000xxx)`

```
VSHLL{<c>}{<q>}.<type><size> <Qd>, <Dm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if imm6 IN {'001000', '010000', '100000'} then SEE "VMOVL";
if Vd<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(imm6) - esize;
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

A2



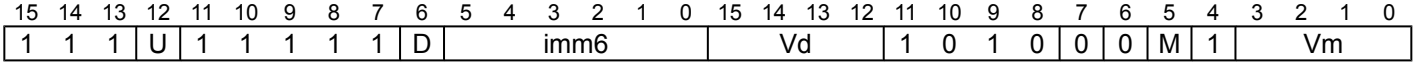
Encoding for the A2 variant

```
VSHLL{<c>}{<q>}.<type><size> <Qd>, <Dm>, #<imm>
```

Decode for this encoding

```
if size == '11' || Vd<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant shift_amount = esize;
constant unsigned = FALSE;  // Or TRUE without change of functionality
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

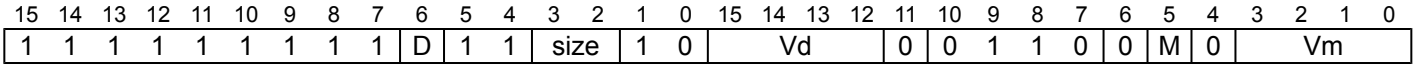
Applies when `(imm6 != 000xxx)`

```
VSHLL{<c>}{<q>}.<type><size> <Qd>, <Dm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if imm6 IN {'001000', '010000', '100000'} then SEE "VMOVL";
if Vd<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(imm6) - esize;
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T2



Encoding for the T2 variant

```
VSHLL{<c>}{<q>}.<type><size> <Qd>, <Dm>, #<imm>
```

Decode for this encoding

```
if size == '11' || Vd<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant shift_amount = esize;
constant unsigned = FALSE;  // Or TRUE without change of functionality
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<type> The data type for the elements of the operand. It must be one of:

S
Signed. In encoding T1/A1, encoded as U = 0.

U
Unsigned. In encoding T1/A1, encoded as U = 1.

I
Untyped integer, Available only in encoding T2/A2.

<size> The data size for the elements of the operand. The following table shows the permitted values and their encodings:

<size>	Encoding T1/A1	Encoding T2/A2
8	Encoded as imm6<5:3> = 0b001	Encoded as size = 0b00
16	Encoded as imm6<5:4> = 0b01	Encoded as size = 0b01
32	Encoded as imm6<5> = 1	Encoded as size = 0b10

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> The immediate value. <imm> must lie in the range 1 to <size>, and:

- If <size> == <imm>, the encoding is T2/A2.
- Otherwise, the encoding is T1/A1, and:
  - If <size> == 8, <imm> is encoded in imm6<2:0>.
  - If <size> == 16, <imm> is encoded in imm6<3:0>.
  - If <size> == 32, <imm> is encoded in imm6<4:0>.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        constant result = Int(Elem[Din[m],e,esize], unsigned) << shift_amount;
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

VSHR

Vector Shift Right takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector. For rounded results, see *VRSHR*.

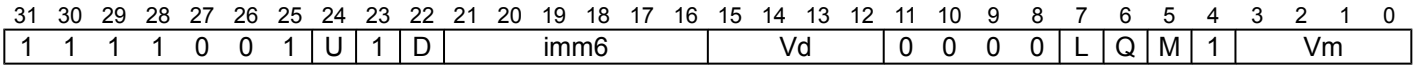
The operand and result elements must be the same size, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSHR{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

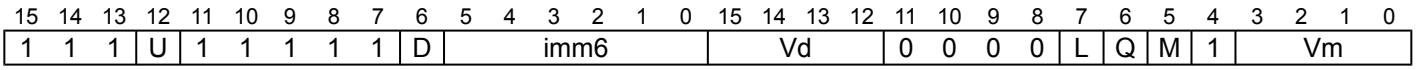
Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSHR{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSHR{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSHR{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<type> Is the data type for the elements of the vectors, encoded in “U”:

U	<type>
0	S
1	U

<size> Is the data size for the elements of the vectors, encoded in “L:imm6<5:3>”:

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant result = Int(Elem[D[m+r],e,esize], unsigned) >> shift_amount;
            Elem[D[d+r],e,esize] = result<esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

VSHR (zero)

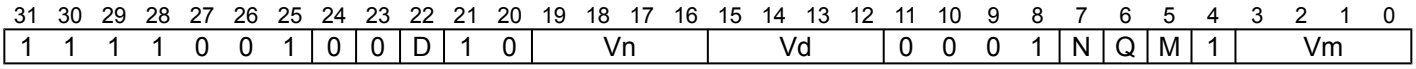
Vector Shift Right copies the contents of one SIMD register to another.

This is a pseudo-instruction of VORR (register). This means:

- The encodings in this description are named to match the encodings of VORR (register).
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VORR (register) gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

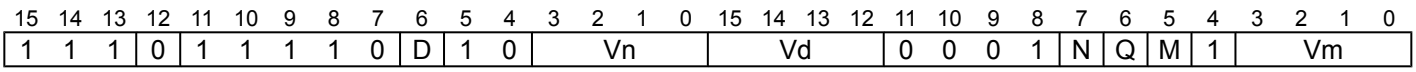
Applies when `(Q == 1)`

```
VSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSHR{<c>}{<q>}.<dt> <Dd>, <Dm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Dd>, <Dm>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VSHR{<c>}{<q>}.<dt> <Qd>, <Qm>, #0
```

is equivalent to

```
VORR{<c>}{<q>}{.<dt>} <Qd>, <Qm>, <Qm>
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<dt>	Is the data type for the elements of the vectors, and must be one of: S8, S16, S32, S64, U8, U16, U32 or U64.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qm>	Is the 128-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "N:Vn" and "M:Vm" field.

Operation

The description of VORR (register) gives the operational pseudocode for this instruction.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VSHRN

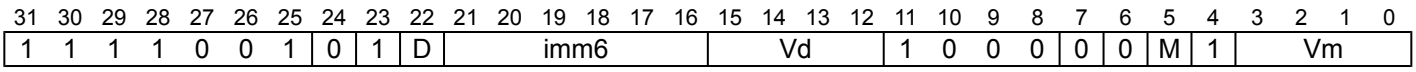
Vector Shift Right Narrow takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector. For rounded results, see *VRSHRN*.

The operand elements can be 16-bit, 32-bit, or 64-bit integers. There is no distinction between signed and unsigned integers. The destination elements are half the size of the source elements.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the A1 variant

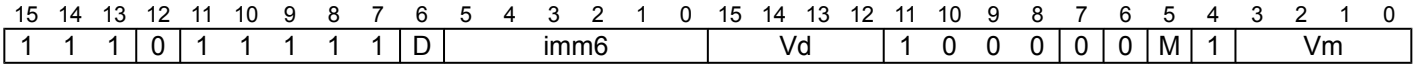
Applies when `(imm6 != 000xxx)`

```
VSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (2 * esize) - UInt(imm6);
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

Applies when `(imm6 != 000xxx)`

```
VSHRN{<c>}{<q>}.I<size> <Dd>, <Qm>, #<imm>
```

Decode for this encoding

```
if imm6 == '000xxx' then SEE "Related encodings";
if Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << HighestSetBit(imm6<5:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (2 * esize) - UInt(imm6);
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

<size> Is the data size for the elements of the vectors, encoded in “imm6<5:3>”:

imm6<5:3>	<size>
001	16
01x	32
1xx	64

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<imm> Is an immediate value, in the range 1 to <size>/2, encoded in the "imm6" field as <size>/2 - <imm>.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        constant result = LSR(Elem[Qin[m>>1],e,2*esize], shift_amount);
        Elem[D[d],e,esize] = result<esize-1:0>;
```

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VSHRN (zero)

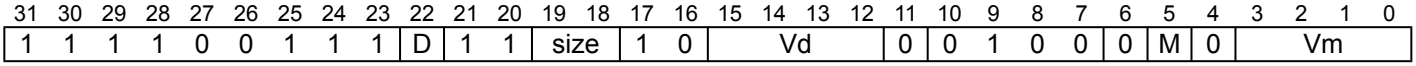
Vector Shift Right Narrow takes each element in a vector, right shifts them by an immediate value, and places the truncated results in the destination vector.

This is a pseudo-instruction of VMOVN. This means:

- The encodings in this description are named to match the encodings of VMOVN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VMOVN gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



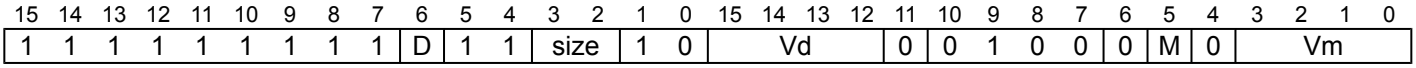
Encoding for the A1 variant

```
VSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

T1



Encoding for the T1 variant

```
VSHRN{<c>}{<q>}.<dt> <Dd>, <Qm>, #0
```

is equivalent to

```
VMOVN{<c>}{<q>}.<dt> <Dd>, <Qm>
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operand, encoded in “size”:

size	<dt>
00	I16
01	I32
10	I64
11	RESERVED

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

The description of VMOVN gives the operational pseudocode for this instruction.

VSLI

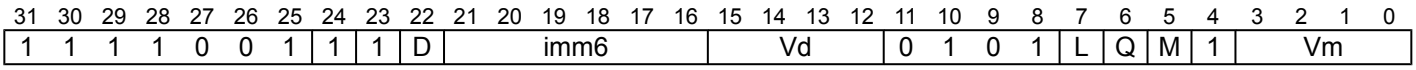
Vector Shift Left and Insert takes each element in the operand vector, left shifts them by an immediate value, and inserts the results in the destination vector. Bits shifted out of the left of each element are lost.

The elements must all be the same size, and can be 8-bit, 16-bit, 32-bit, or 64-bit. There is no distinction between data types.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSLI{<c>}{<q>}.<size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

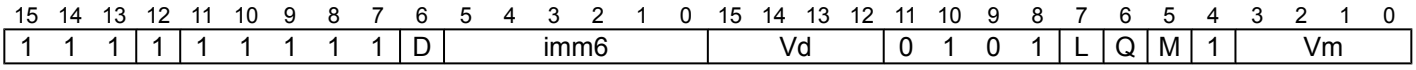
Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSLI{<c>}{<q>}.<size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(L:imm6) - esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSLI{<c>}{<q>}.<size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSLI{<c>}{<q>}.<size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = UInt(L:imm6) - esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size for the elements of the vectors, encoded in “L:imm6<5:3>”:

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 0 to <size>-1, encoded in the "imm6" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant mask = LSL(Ones(esize), shift_amount);
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant shifted_op = LSL(Elem[D[m+r],e,esize], shift_amount);
            Elem[D[d+r],e,esize] = (Elem[D[d+r],e,esize] AND NOT(mask)) OR shifted_op;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:

- The values of the data supplied in any of its registers.
- The values of the NZCV flags.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VSMMLA

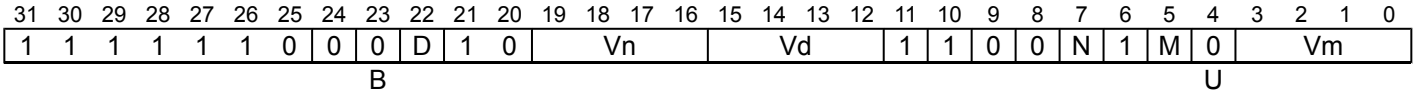
The widening integer matrix multiply-accumulate instruction multiplies the 2x8 matrix of signed 8-bit integer values held in the first source vector by the 8x2 matrix of signed 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator held in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2, this is an OPTIONAL instruction. *ID_ISAR6*.I8MM indicates whether this instruction is supported in the T32 and A32 instruction sets.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

(FEAT_AA32I8MM)



Encoding for the A1 variant

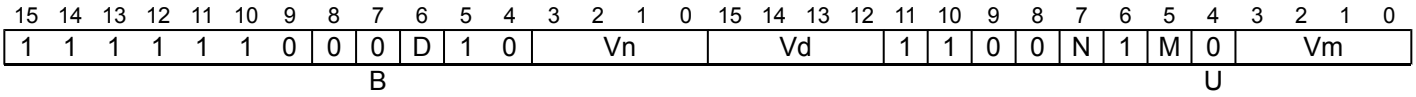
```
VSMMLA{<q>}.S8 <Qd>, <Qn>, <Qm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AA32I8MM) then UNDEFINED;
boolean op1_unsigned;
boolean op2_unsigned;
case B:U of
    when '00' op1_unsigned = FALSE; op2_unsigned = FALSE;
    when '01' op1_unsigned = TRUE;  op2_unsigned = TRUE;
    when '10' op1_unsigned = TRUE;  op2_unsigned = FALSE;
    when '11' UNDEFINED;
if Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer d = UInt(D:Vd);
constant integer n = UInt(N:Vn);
constant integer m = UInt(M:Vm);
```

T1

(FEAT_AA32I8MM)



Encoding for the T1 variant

```
VSMMLA{<q>}.S8 <Qd>, <Qn>, <Qm>
```

Decode for this encoding

```
if InITBlock() then UNPREDICTABLE;
if !IsFeatureImplemented(FEAT_AA32I8MM) then UNDEFINED;
boolean op1_unsigned;
boolean op2_unsigned;
case B:U of
    when '00' op1_unsigned = FALSE; op2_unsigned = FALSE;
    when '01' op1_unsigned = TRUE;  op2_unsigned = TRUE;
    when '10' op1_unsigned = TRUE;  op2_unsigned = FALSE;
    when '11' UNDEFINED;
if Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer d = UInt(D:Vd);
constant integer n = UInt(N:Vn);
constant integer m = UInt(M:Vm);
```

Assembler Symbols

<q>	See *Standard assembler syntax fields*.
<Qd>	Is the 128-bit name of the SIMD&FP third source and destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Qm>	Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

```
CheckAdvSIMDEnabled();
constant bits(128) operand1 = Q[n>>1];
constant bits(128) operand2 = Q[m>>1];
constant bits(128) addend   = Q[d>>1];

Q[d>>1] = MatMulAdd(addend, operand1, operand2, op1_unsigned, op2_unsigned);
```

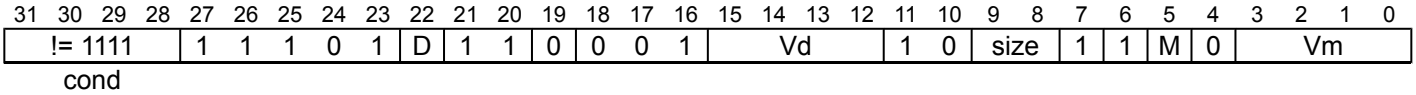
VSQRT

Square Root calculates the square root of the value in a floating-point register and writes the result to another floating-point register.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VSQRT{<c>}{<q>}.F16 <Sd>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VSQRT{<c>}{<q>}.F32 <Sd>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VSQRT{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

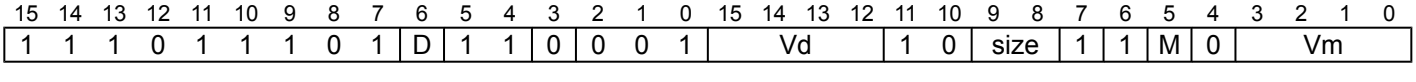
```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VSQRT{<c>}{<q>}.F16 <Sd>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VSQRT{<c>}{<q>}.F32 <Sd>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VSQRT{<c>}{<q>}.F64 <Dd>, <Dm>
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Sd>	Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.
<Sm>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vm:M" field.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    constant FPCR_Type fpcr = EffectiveFPCR();
    case esize of
        when 16 H[d] = FPSqrt(H[m], fpcr);
        when 32 S[d] = FPSqrt(S[m], fpcr);
        when 64 D[d] = FPSqrt(D[m], fpcr);
```

VSRA

Vector Shift Right and Accumulate takes each element in a vector, right shifts them by an immediate value, and accumulates the truncated results into the destination vector. For rounded results, see *VRSRA*.

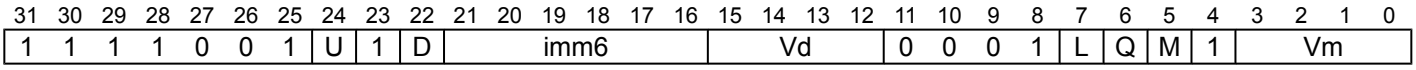
The operand and result elements must all be the same type, and can be any one of:

- 8-bit, 16-bit, 32-bit, or 64-bit signed integers.
- 8-bit, 16-bit, 32-bit, or 64-bit unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

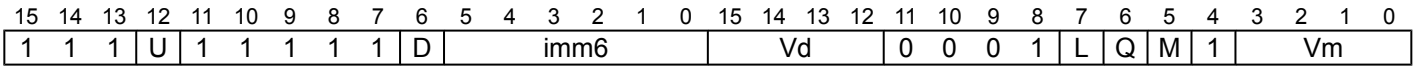
Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSRA{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 0)`

```
VSRA{<c>}{<q>}.<type><size> {<Dd>,} <Dm>, #<imm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(!(imm6 == 000xxx && L == 0) && Q == 1)`

```
VSRA{<c>}{<q>}.<type><size> {<Qd>,} <Qm>, #<imm>
```

Decode for all variants of this encoding

```
if (L:imm6) == '0000xxx' then SEE "Related encodings";
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant integer esize = 8 << HighestSetBitNZ((L:imm6)<6:3>);
constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant unsigned = (U == '1');  constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<type> Is the data type for the elements of the vectors, encoded in “U”:

U	<type>
0	S
1	U

<size> Is the data size for the elements of the vectors, encoded in “L:imm6<5:3>”:

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

constant integer elements = 64 DIV esize;
constant integer shift_amount = (esize * 2) - UInt(L:imm6);
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Related encodings: See *Advanced SIMD one register and modified immediate* for the T32 instruction set, or *Advanced SIMD one register and modified immediate* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size for the elements of the vectors, encoded in “L:imm6<5:3>”:

L	imm6<5:3>	<size>
0	001	8
0	01x	16
0	1xx	32
1	xxx	64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

<imm> Is an immediate value, in the range 1 to <size>, encoded in the "imm6" field as <size> - <imm>.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant mask = LSR(Ones(esize), shift_amount);
    for r = 0 to regs-1
        for e = 0 to elements-1
            constant shifted_op = LSR(Elem[D[m+r],e,esize], shift_amount);
            Elem[D[d+r],e,esize] = (Elem[D[d+r],e,esize] AND NOT(mask)) OR shifted_op;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:

- The values of the data supplied in any of its registers.
- The values of the NZCV flags.

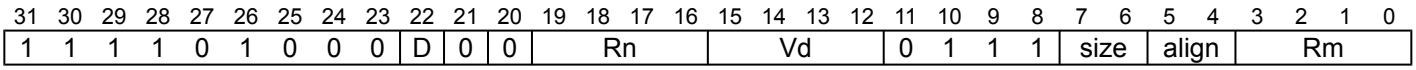
VST1 (multiple single elements)

Store multiple single elements from one, two, three, or four registers stores elements to memory from one, two, three, or four registers, without interleaving. Every element of each register is stored. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 , A2 , A3 and A4) and T32 (T1 , T2 , T3 and T4) .

A1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

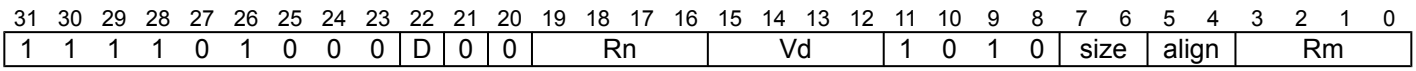
Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
constant regs = 1;  if align<1> == '1' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 then UNPREDICTABLE;
```

A2



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

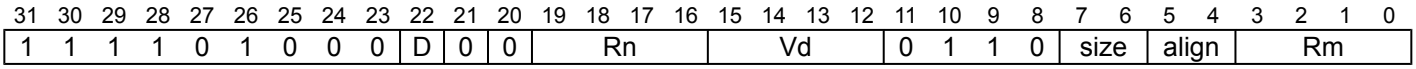
```
constant regs = 2;  if align == '11' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A3



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

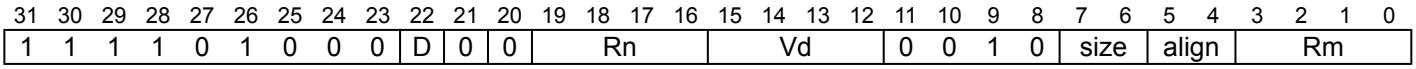
```
constant regs = 3;  if align<1> == '1' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A4



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

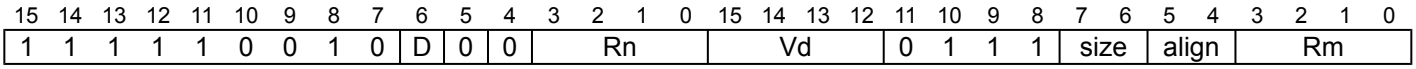
```
constant regs = 4;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
constant regs = 1;  if align<1> == '1' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 then UNPREDICTABLE;
```

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	0	0	1	0	D	0	0	Rn				Vd				1	0	1	0	size		align		Rm			

Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

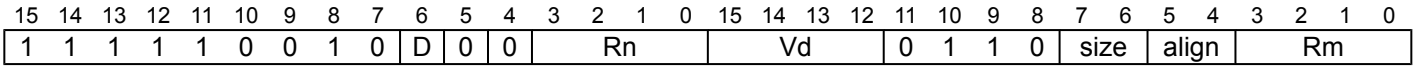
```
constant regs = 2;  if align == '11' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T3



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

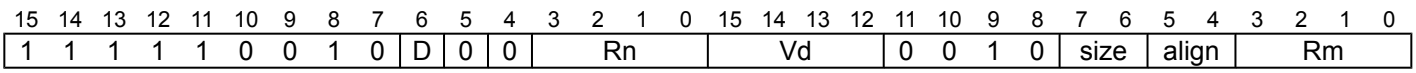
```
constant regs = 3;  if align<1> == '1' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T4



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
constant regs = 4;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d+regs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d+regs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST1 (multiple single elements)*.

Related encodings: See *Advanced SIMD element or structure load/store* for the T32 instruction set, or *Advanced SIMD element or structure load/store* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1, A2, A3 and A4: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1, T2, T3 and T4: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32
11	64

<list> Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

{ <Dd> }

Single register. Selects the A1 and T1 encodings of the instruction.

{ <Dd>, <Dd+1> }

Two single-spaced registers. Selects the A2 and T2 encodings of the instruction.

{ <Dd>, <Dd+1>, <Dd+2> }
Three single-spaced registers. Selects the A3 and T3 encodings of the instruction.

{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Four single-spaced registers. Selects the A4 and T4 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and is encoded in the "align" field as 0b00.
Whenever <align> is present, the permitted values are:

64
64-bit alignment, encoded in the "align" field as 0b01.

128
128-bit alignment, encoded in the "align" field as 0b10. Available only if <list> contains two or four registers.

256
256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about <Rn>, !, and <Rm>, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckAdvSIMDEnabled();

    address = R[n];

    constant boolean nontemporal = FALSE;
    constant boolean privileged  = PSTATE.EL != EL0;
    constant boolean tagchecked  = FALSE;
    constant AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                        tagchecked, privileged);
    if !IsAligned(address, alignment) then
        constant FaultRecord fault = AlignmentFault(accdesc, ZeroExtend(address, 64));
        AArch32.Abort(fault);

    for r = 0 to regs-1
        for e = 0 to elements-1
            if ebytes != 8 then
                MemU[address,ebytes] = Elem[D[d+r],e,8*ebytes];
            else
                if !IsAligned(address, ebytes) && AlignmentEnforced() then
                    constant FaultRecord fault = AlignmentFault(accdesc, ZeroExtend(address, 64));
                    AArch32.Abort(fault);

                constant bits(64) data = Elem[D[d+r],e,64];
                if BigEndian(AccessType_ASIMD) then
                    MemU[address,4] = data<63:32>;
                    MemU[address+4,4] = data<31:0>;
                else
                    MemU[address,4] = data<31:0>;
                    MemU[address+4,4] = data<63:32>;

            address = address + ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 8*regs;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

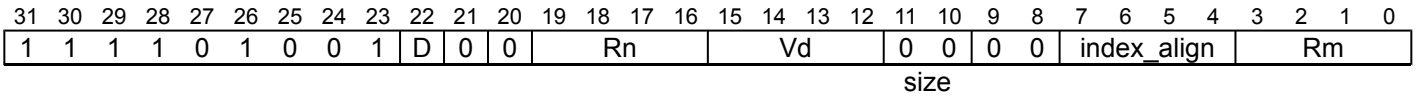
VST1 (single element from one lane)

Store single element from one lane of one register stores one element to memory from one element of a register. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 , A2 and A3) and T32 (T1 , T2 and T3) .

A1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

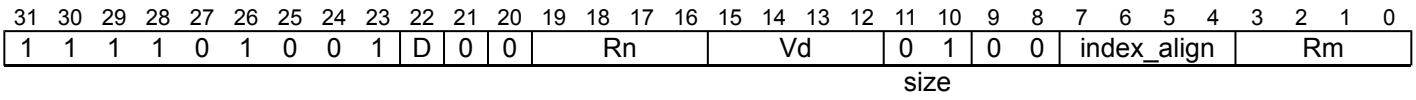
Applies when `(Rm != 11x1)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if index_align<0> != '0' then UNDEFINED;
constant ebytes = 1;  constant index = UInt(index_align<3:1>);  constant alignment = 1;
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 then UNPREDICTABLE;
```

A2



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST1{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32

<list> Is a list containing the single 64-bit name of the SIMD&FP register holding the element.
The list must be { <Dd>[<index>] }.
The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:

<size> == 8
<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16
<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32
<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> When <size> == 8, <align> must be omitted, otherwise it is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and the encoding depends on <size>:

<size> == 8
Encoded in the "index_align<0>" field as 0.

<size> == 16
Encoded in the "index_align<1:0>" field as 0b00.

<size> == 32
Encoded in the "index_align<2:0>" field as 0b000.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 16
<align> is 16, meaning 16-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

<size> == 32
<align> is 32, meaning 32-bit alignment, encoded in the "index_align<2:0>" field as 0b011.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckAdvSIMDEnabled();

    constant address = R[n];

    constant boolean nontemporal = FALSE;
    constant boolean privileged  = PSTATE.EL != EL0;
    constant boolean tagchecked  = FALSE;
    constant AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                        tagchecked, privileged);
    if !IsAligned(address, alignment) then
        constant FaultRecord fault = AlignmentFault(accdesc, ZeroExtend(address, 64));
        AArch32.Abort(fault);

    MemU[address,ebytes] = Elem[D[d],index,8*ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + ebytes;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

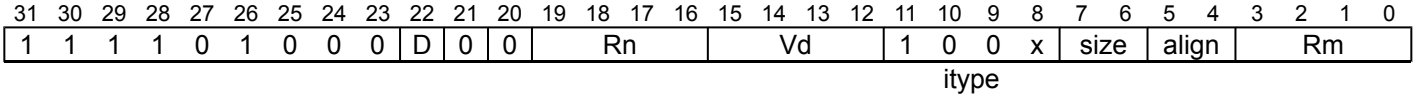
VST2 (multiple 2-element structures)

Store multiple 2-element structures from two or four registers stores multiple 2-element structures from two or four registers to memory, with interleaving. For more information, see *Element and structure load/store instructions*. Every element of each register is saved. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

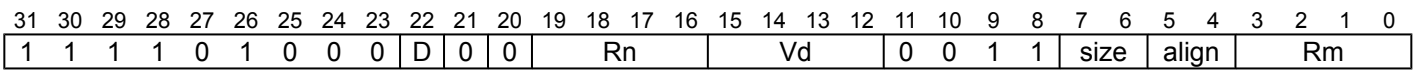
```
constant pairs = 1;  if align == '11' then UNDEFINED;
if size == '11' then UNDEFINED;
constant inc = if itype == '1001' then 2 else 1;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant d2 = d + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d2+pairs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+pairs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A2



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

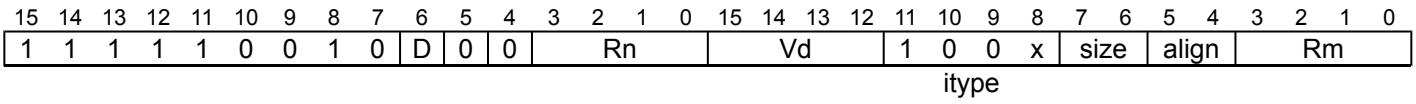
```
constant pairs = 2;  constant inc = 2;
if size == '11' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant d2 = d + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d2+pairs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+pairs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

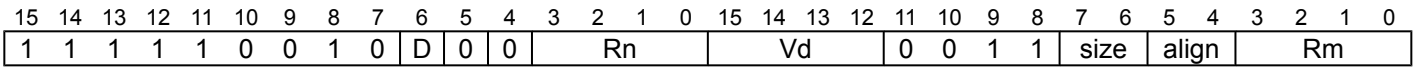
```
constant pairs = 1;  if align == '11' then UNDEFINED;
if size == '11' then UNDEFINED;
constant inc = if itype == '1001' then 2 else 1;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant d2 = d + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d2+pairs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+pairs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T2



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
constant pairs = 2;  constant inc = 2;
if size == '11' then UNDEFINED;
constant alignment = if align == '00' then 1 else 4 << UInt(align);
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant d = UInt(D:Vd);  constant d2 = d + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d2+pairs > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2+pairs > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST2 (multiple 2-element structures)*.

Related encodings: See *Advanced SIMD element or structure load/store* for the T32 instruction set, or *Advanced SIMD element or structure load/store* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1 and A2: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32
11	RESERVED

<list> Is a list containing the 64-bit names of the SIMD&FP registers.

The list must be one of:

{ <Dd>, <Dd+1> }

Two single-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as 0b1000.

{ <Dd>, <Dd+2> }
Two double-spaced registers. Selects the A1 and T1 encodings of the instruction, and encoded in the "itype" field as 0b1001.

{ <Dd>, <Dd+1>, <Dd+2>, <Dd+3> }
Three single-spaced registers. Selects the A2 and T2 encodings of the instruction.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and is encoded in the "align" field as 0b00.
Whenever <align> is present, the permitted values are:

64
64-bit alignment, encoded in the "align" field as 0b01.

128
128-bit alignment, encoded in the "align" field as 0b10.

256
256-bit alignment, encoded in the "align" field as 0b11. Available only if <list> contains four registers.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckAdvSIMDEnabled();

    address = R[n];

    constant boolean nontemporal = FALSE;
    constant boolean privileged  = PSTATE.EL != EL0;
    constant boolean tagchecked  = FALSE;
    constant AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                        tagchecked, privileged);
    if !IsAligned(address, alignment) then
        constant FaultRecord fault = AlignmentFault(accdesc, ZeroExtend(address, 64));
        AArch32.Abort(fault);

    for r = 0 to pairs-1
        for e = 0 to elements-1
            MemU[address,       ebytes] = Elem[D[d+r], e,8*ebytes];
            MemU[address+ebytes,ebytes] = Elem[D[d2+r],e,8*ebytes];
            address = address + 2*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 16*pairs;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

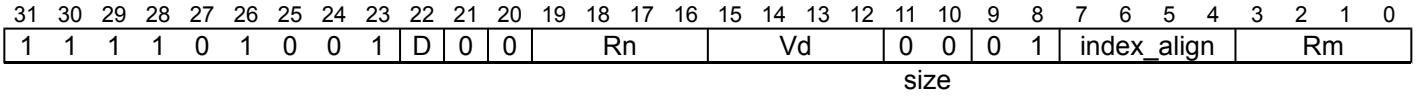
VST2 (single 2-element structure from one lane)

Store single 2-element structure from one lane of two registers stores one 2-element structure to memory from corresponding elements of two registers. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 , A2 and A3) and T32 (T1 , T2 and T3) .

A1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST2{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d2 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d2 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST2 (single 2-element structure from one lane)*.

Assembler Symbols

<c> For encoding A1, A2 and A3: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32

<list> Is a list containing the 64-bit names of the two SIMD&FP registers holding the element.

The list must be one of:

{ <Dd>[<index>], <Dd+1>[<index>] }
Single-spaced registers, encoded as "spacing" = 0.

{ <Dd>[<index>], <Dd+2>[<index>] }
Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

The encoding of "spacing" depends on <size>:

<size> == 16
"spacing" is encoded in the "index_align<1>" field.

<size> == 32
"spacing" is encoded in the "index_align<2>" field.

The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:
<size> == 8
<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16
<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32
<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and the encoding depends on <size>:
<size> == 8
Encoded in the "index_align<0>" field as 0.

<size> == 16
Encoded in the "index_align<0>" field as 0.

<size> == 32
Encoded in the "index_align<1:0>" field as 0b00.

Whenever <align> is present, the permitted values and encoding depend on <size>:
<size> == 8
<align> is 16, meaning 16-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 16
<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 32
<align> is 64, meaning 64-bit alignment, encoded in the "index_align<1:0>" field as 0b01.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckAdvSIMDEnabled();

    constant address = R[n];

    constant boolean nontemporal = FALSE;
    constant boolean privileged  = PSTATE.EL != EL0;
    constant boolean tagchecked  = FALSE;
    constant AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                        tagchecked, privileged);
    if !IsAligned(address, alignment) then

```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

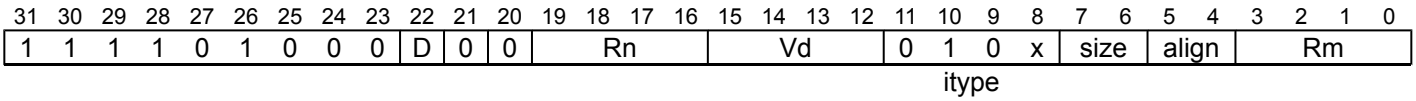
VST3 (multiple 3-element structures)

Store multiple 3-element structures from three registers stores multiple 3-element structures to memory from three registers, with interleaving. For more information, see *Element and structure load/store instructions*. Every element of each register is saved. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

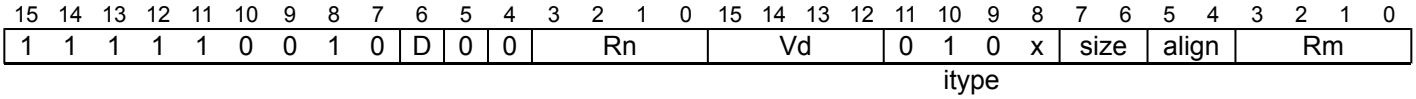
```
if size == '11' || align<1> == '1' then UNDEFINED;
integer inc;
case itype of
    when '0100'
        inc = 1;
    when '0101'
        inc = 2;
    otherwise
        SEE "Related encodings";
constant alignment = if align<0> == '0' then 1 else 8;
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant  d = UInt(D:Vd);  constant d2 = d + inc;
constant d3 = d2 + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST3{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
if size == '11' || align<1> == '1' then UNDEFINED;
integer inc;
case itype of
    when '0100'
        inc = 1;
    when '0101'
        inc = 2;
    otherwise
        SEE "Related encodings";
constant alignment = if align<0> == '0' then 1 else 8;
constant ebytes = 1 << UInt(size);  constant elements = 8 DIV ebytes;
constant  d = UInt(D:Vd);  constant d2 = d + inc;
constant d3 = d2 + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST3 (multiple 3-element structures)*.

Related encodings: See *Advanced SIMD element or structure load/store* for the T32 instruction set, or *Advanced SIMD element or structure load/store* for the A32 instruction set.

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32
11	RESERVED

<list> Is a list containing the 64-bit names of the SIMD&FP registers.
The list must be one of:

{ <Dd>, <Dd+1>, <Dd+2> }
Single-spaced registers, encoded in the "itype" field as 0b0100.

{ <Dd>, <Dd+2>, <Dd+4> }
Double-spaced registers, encoded in the "itype" field as 0b0101.

The register <Dd> is encoded in the "D:Vd" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.
Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and is encoded in the "align" field as 0b00.
Whenever <align> is present, the only permitted values is 64, meaning 64-bit alignment, encoded in the "align" field as 0b01.
: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckAdvSIMDEnabled();

    address = R[n];

    constant boolean nontemporal = FALSE;
    constant boolean privileged  = PSTATE.EL != EL0;
    constant boolean tagchecked  = FALSE;
    constant AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                        tagchecked, privileged);
    if !IsAligned(address, alignment) then
        constant FaultRecord fault = AlignmentFault(accdesc, ZeroExtend(address, 64));
        AArch32.Abort(fault);

    for e = 0 to elements-1
        MemU[address,          ebytes] = Elem[D[d], e,8*ebytes];
        MemU[address+ebytes,   ebytes] = Elem[D[d2],e,8*ebytes];
        MemU[address+2*ebytes,ebytes] = Elem[D[d3],e,8*ebytes];
        address = address + 3*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 24;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VST3 (single 3-element structure from one lane)

Store single 3-element structure from one lane of three registers stores one 3-element structure to memory from corresponding elements of three registers. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. constant inc = if index_align<2> == '0' then 1 else 2;
constant  d = UInt(D:Vd);  constant d2 = d + inc;
constant d3 = d2 + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d3 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d3 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST3 (single 3-element structure from one lane)*.

Assembler Symbols

<c> For encoding A1, A2 and A3: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32

<list> Is a list containing the 64-bit names of the three SIMD&FP registers holding the element.

The list must be one of:

{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>] }
Single-spaced registers, encoded as "spacing" = 0.

{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>] }
Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

The encoding of "spacing" depends on <size>:

<size> == 8
"spacing" is encoded in the "index_align<0>" field.

<size> == 16
"spacing" is encoded in the "index_align<1>" field, and "index_align<0>" is set to 0.

<size> == 32
"spacing" is encoded in the "index_align<2>" field, and "index_align<1:0>" is set to 0b00.

The register <Dd> is encoded in the "D:Vd" field.
The permitted values and encoding of <index> depend on <size>:
<size> == 8
<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16
<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32
<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Alignment

Standard alignment rules apply, see *Alignment support*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant address = R[n];
    MemU[address,         ebytes] = Elem[D[d], index,8*ebytes];
    MemU[address+ebytes,  ebytes] = Elem[D[d2],index,8*ebytes];
    MemU[address+2*ebytes,ebytes] = Elem[D[d3],index,8*ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 3*ebytes;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

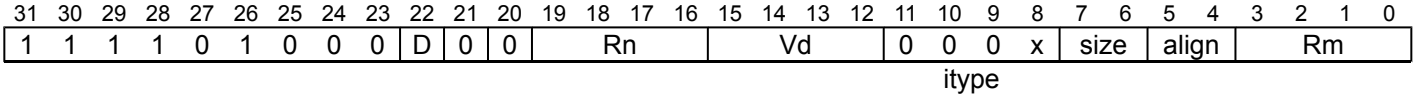
VST4 (multiple 4-element structures)

Store multiple 4-element structures from four registers stores multiple 4-element structures to memory from four registers, with interleaving. For more information, see *Element and structure load/store instructions*. Every element of each register is saved. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if itype != '000x' then SEE "Related encodings";

128-bit alignment, encoded in the "align" field as 0b10.

256
256-bit alignment, encoded in the "align" field as 0b11.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckAdvSIMDEnabled();

    address = R[n];

    constant boolean nontemporal = FALSE;
    constant boolean privileged  = PSTATE.EL != EL0;
    constant boolean tagchecked  = FALSE;
    constant AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                        tagchecked, privileged);
    if !IsAligned(address, alignment) then
        constant FaultRecord fault = AlignmentFault(accdesc, ZeroExtend(address, 64));
        AArch32.Abort(fault);

    for e = 0 to elements-1
        MemU[address,          ebytes] = Elem[D[d], e,8*ebytes];
        MemU[address+ebytes,   ebytes] = Elem[D[d2],e,8*ebytes];
        MemU[address+2*ebytes,ebytes] = Elem[D[d3],e,8*ebytes];
        MemU[address+3*ebytes,ebytes] = Elem[D[d4],e,8*ebytes];
        address = address + 4*ebytes;
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 32;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

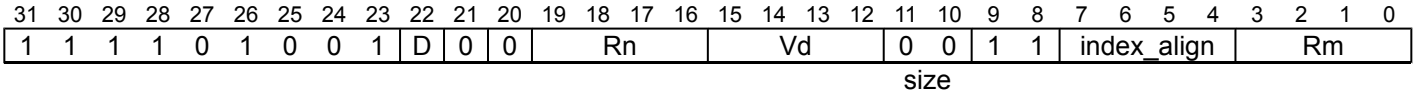
VST4 (single 4-element structure from one lane)

Store single 4-element structure from one lane of four registers stores one 4-element structure to memory from corresponding elements of four registers. For details of the addressing mode, see *Advanced SIMD addressing mode*.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 , A2 and A3) and T32 (T1 , T2 and T3) .

A1



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

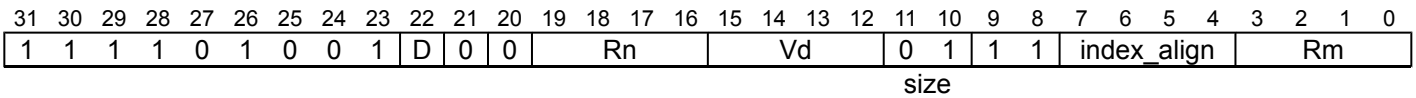
```
if size == '11' then UNDEFINED;
if size != '00' then SEE "Related encodings";
constant ebytes = 1;  constant index = UInt(index_align<3:1>);  constant inc = 1;
constant alignment = if index_align<0> == '0' then 1 else 4;
constant  d = UInt(D:Vd);  constant d2 = d + inc;
constant d3 = d2 + inc;  constant d4 = d3 + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d4 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A2



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

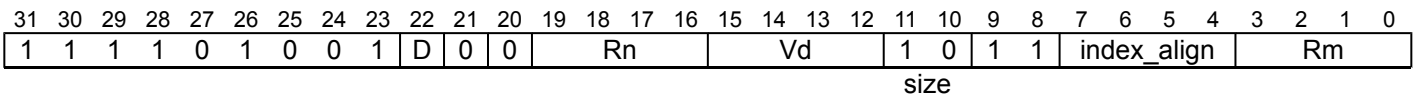
```
if size == '11' then UNDEFINED;
if size != '01' then SEE "Related encodings";
constant ebytes = 2;  constant index = UInt(index_align<3:2>);
constant inc = if index_align<1> == '0' then 1 else 2;
constant alignment = if index_align<0> == '0' then 1 else 8;
constant  d = UInt(D:Vd);  constant d2 = d + inc;
constant d3 = d2 + inc;  constant d4 = d3 + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d4 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A3



Encoding for the Offset variant

Applies when `(Rm == 1111)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]
```

Encoding for the Post-indexed variant

Applies when `(Rm == 1101)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}]!
```

Encoding for the Post-indexed variant

Applies when `(Rm != 11x1)`

```
VST4{<c>}{<q>}.<size> <list>, [<Rn>{:<align>}], <Rm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if size != '10' then SEE "Related encodings";
if index_align<1:0> == '11' then UNDEFINED;
constant ebytes = 4;  constant index = UInt(index_align<3>);
constant inc = if index_align<2> == '0' then 1 else 2;
constant alignment = if index_align<1:0> == '00' then 1 else 4 << UInt(index_align<1:0>);
constant d  = UInt(D:Vd);  constant d2 = d + inc;
constant d3 = d2 + inc;  constant d4 = d3 + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d4 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1

constant d  = UInt(D:Vd);  constant d2 = d + inc;
constant d3 = d2 + inc;  constant d4 = d3 + inc;
constant n = UInt(Rn);  constant m = UInt(Rm);
constant wback = (m != 15);  constant register_index = (m != 15 && m != 13);
if n == 15 || d4 > 31 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `d4 > 31`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VST4 (single 4-element structure from one lane)*.

Assembler Symbols

<c> For encoding A1, A2 and A3: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1, T2 and T3: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<size> Is the data size, encoded in “size”:

size	<size>
00	8
01	16
10	32

<list> Is a list containing the 64-bit names of the four SIMD&FP registers holding the element.

The list must be one of:

{ <Dd>[<index>], <Dd+1>[<index>], <Dd+2>[<index>], <Dd+3>[<index>] }

Single-spaced registers, encoded as "spacing" = 0.

{ <Dd>[<index>], <Dd+2>[<index>], <Dd+4>[<index>], <Dd+6>[<index>] }
Double-spaced registers, encoded as "spacing" = 1. Not permitted when <size> == 8.

The encoding of "spacing" depends on <size>:

<size> == 16
"spacing" is encoded in the "index_align<1>" field.

<size> == 32
"spacing" is encoded in the "index_align<2>" field.

The register <Dd> is encoded in the "D:Vd" field.

The permitted values and encoding of <index> depend on <size>:

<size> == 8
<index> is in the range 0 to 7, encoded in the "index_align<3:1>" field.

<size> == 16
<index> is in the range 0 to 3, encoded in the "index_align<3:2>" field.

<size> == 32
<index> is 0 or 1, encoded in the "index_align<3>" field.

<Rn> Is the general-purpose base register, encoded in the "Rn" field.

<align> Is the optional alignment.

Whenever <align> is omitted, the standard alignment is used, see *Unaligned data access*, and the encoding depends on <size>:

<size> == 8
Encoded in the "index_align<0>" field as 0.

<size> == 16
Encoded in the "index_align<0>" field as 0.

<size> == 32
Encoded in the "index_align<1:0>" field as 0b00.

Whenever <align> is present, the permitted values and encoding depend on <size>:

<size> == 8
<align> is 32, meaning 32-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 16
<align> is 64, meaning 64-bit alignment, encoded in the "index_align<0>" field as 1.

<size> == 32
<align> can be 64 or 128. 64-bit alignment is encoded in the "index_align<1:0>" field as 0b01, and 128-bit alignment is encoded in the "index_align<1:0>" field as 0b10.

: is the preferred separator before the <align> value, but the alignment can be specified as @<align>, see *Advanced SIMD addressing mode*.

<Rm> Is the general-purpose index register containing an offset applied after the access, encoded in the "Rm" field.

For more information about the variants of this instruction, see *Advanced SIMD addressing mode*.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();
    CheckAdvSIMDEnabled();

    constant address = R[n];

    constant boolean nontemporal = FALSE;
    constant boolean privileged  = PSTATE.EL != EL0;
    constant boolean tagchecked  = FALSE;
    constant AccessDescriptor accdesc = CreateAccDescASIMD(MemOp_STORE, nontemporal,
                                        tagchecked, privileged);
    if !IsAligned(address, alignment) then
        constant FaultRecord fault = AlignmentFault(accdesc, ZeroExtend(address, 64));
        AArch32.Abort(fault);

    MemU[address,         ebytes] = Elem[D[d], index,8*ebytes];
    MemU[address+ebytes,  ebytes] = Elem[D[d2],index,8*ebytes];
    MemU[address+2*ebytes,ebytes] = Elem[D[d3],index,8*ebytes];
    MemU[address+3*ebytes,ebytes] = Elem[D[d4],index,8*ebytes];
    if wback then
        if register_index then
            R[n] = R[n] + R[m];
        else
            R[n] = R[n] + 4*ebytes;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VSTM, VSTMDB, VSTMIA

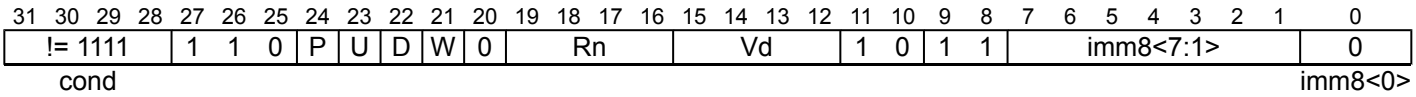
Store multiple SIMD&FP registers stores multiple registers from the Advanced SIMD and floating-point register file to consecutive memory locations using an address from a general-purpose register.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

This instruction is used by the alias VPUSH.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the Decrement Before variant

Applies when `(P == 1 && U == 0 && W == 1)`

```
VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>
```

Encoding for the Increment After variant

Applies when `(P == 0 && U == 1)`

```
VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
constant single_regs = FALSE;  constant add = (U == '1');  constant wback = (W == '1');
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant imm32 = ZeroExtend(imm8:'00', 32);
constant regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FSTDBMX, FSTMIAX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

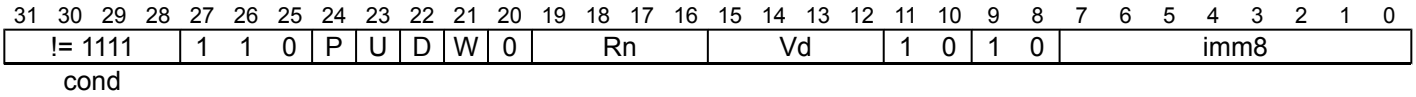
If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VSTM` with the same addressing mode but stores no registers.

If `regs > 16 || (d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

A2



Encoding for the Decrement Before variant

Applies when `(P == 1 && U == 0 && W == 1)`

```
VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <sreglist>
```

Encoding for the Increment After variant

Applies when `(P == 0 && U == 1)`

```
VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>

VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <sreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
constant single_regs = TRUE;  constant add = (U == '1');  constant wback = (W == '1');
constant d = UInt(Vd:D);  constant n = UInt(Rn);

if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

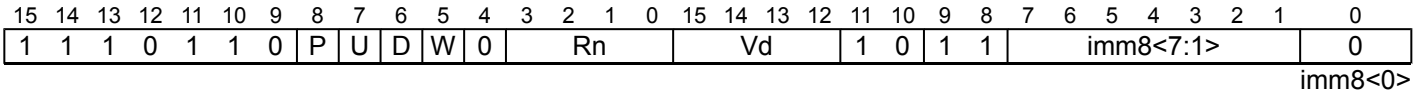
If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VSTM` with the same addressing mode but stores no registers.

If `(d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T1



Encoding for the Decrement Before variant

Applies when `(P == 1 && U == 0 && W == 1)`

```
VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <dreglist>
```

Encoding for the Increment After variant

Applies when `(P == 0 && U == 1)`

```
VSTM{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>

VSTMIA{<c>}{<q>}{.<size>} <Rn>{!}, <dreglist>
```

Decode for all variants of this encoding

```
if P == '0' && U == '0' && W == '0' then SEE "Related encodings";
if P == '1' && W == '0' then SEE "VSTR";
if P == U && W == '1' then UNDEFINED;
// Remaining combinations are PUW = 010 (IA without !), 011 (IA with !), 101 (DB with !)
constant single_regs = FALSE;  constant add = (U == '1');  constant wback = (W == '1');
constant d = UInt(D:Vd);  constant n = UInt(Rn);  constant imm32 = ZeroExtend(imm8:'00', 32);
constant regs = UInt(imm8) DIV 2;  // If UInt(imm8) is odd, see "FSTDBMX, FSTMIAX".
if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || regs > 16 || (d+regs) > 32 then UNPREDICTABLE;
if imm8<0> == '1' && (d+regs) > 16 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

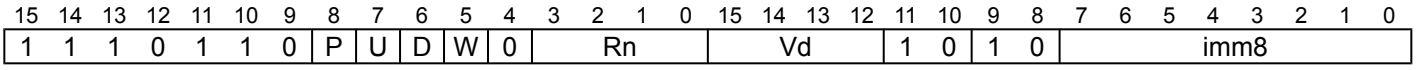
If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The instruction operates as a VSTM with the same addressing mode but stores no registers.

If `regs > 16 || (d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

T2



Encoding for the Decrement Before variant

Applies when `(P == 1 && U == 0 && W == 1)`

```
VSTMDB{<c>}{<q>}{.<size>} <Rn>!, <sreglist>
```

Encoding for the Increment After variant

Applies when `(P == 0 && U == 1)`

```

if n == 15 && (wback || CurrentInstrSet() != InstrSet_A32) then UNPREDICTABLE;
if regs == 0 || (d+regs) > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `regs == 0`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The instruction operates as a `VSTM` with the same addressing mode but stores no registers.

If `(d+regs) > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as `NOP`.
- The memory locations specified by the instruction and the number of registers specified by the instruction become UNKNOWN. If the instruction specifies writeback, then that register becomes UNKNOWN. This behavior does not affect any other memory locations.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*, and particularly *VSTM*.

Related encodings: See *Advanced SIMD and floating-point 64-bit move* for the T32 instruction set, or *Advanced SIMD and floating-point 64-bit move* for the A32 instruction set.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<size>	An optional data size specifier. If present, it must be equal to the size in bits, 32 or 64, of the registers being transferred.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. If writeback is not specified, the PC can be used. However, Arm deprecates use of the PC.
!	Specifies base register writeback. Encoded in the "W" field as 1 if present, otherwise 0.
<sreglist>	Is the list of consecutively numbered 32-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "Vd:D", and "imm8" is set to the number of registers in the list. The list must contain at least one register.
<dreglist>	Is the list of consecutively numbered 64-bit SIMD&FP registers to be transferred. The first register in the list is encoded in "D:Vd", and "imm8" is set to twice the number of registers in the list. The list must contain at least one register, and must not contain more than 16 registers.

Alias Conditions

Alias	Is preferred when
VPUSH	`P == '1' && U == '0' && W == '1' && Rn == '1101'`

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    address = if add then R[n] else R[n]-imm32;
    for r = 0 to regs-1
        if single_regs then
            MemA[address,4] = S[d+r];
            address = address+4;
        else
            // Store as two word-aligned words in the correct order for current endianness.
            if BigEndian(AccessType_ASIMD) then
                MemA[address,4] =  D[d+r]<63:32>;
                MemA[address+4,4] =  D[d+r]<31:0>;
            else
                MemA[address,4] = D[d+r]<31:0>;
                MemA[address+4,4] = D[d+r]<63:32>;

            address = address+8;

    if wback then R[n] = if add then R[n]+imm32 else R[n]-imm32;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

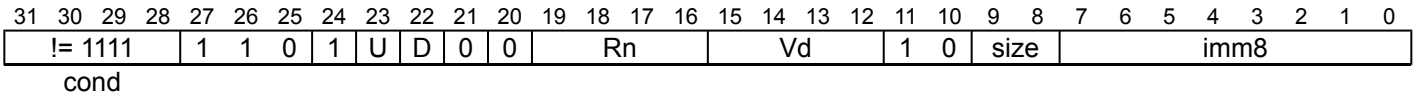
VSTR

Store SIMD&FP register stores a single register from the Advanced SIMD and floating-point register file to memory, using an address from a general-purpose register, with an optional offset.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information, see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VSTR{<c>}{<q>}.16 <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VSTR{<c>}{<q>}{.32} <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VSTR{<c>}{<q>}{.64} <Dd>, [<Rn>{, #{+/-}<imm>}]
```

Decode for all variants of this encoding

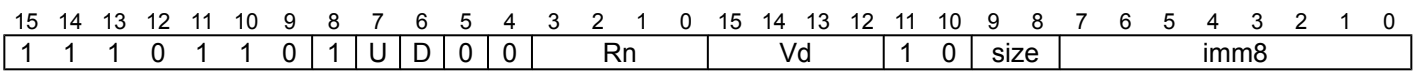
```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
constant esize = 8 << UInt(size);  constant add = (U == '1');
constant imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant n = UInt(Rn);
if n == 15 && CurrentInstrSet() != InstrSet_A32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VSTR{<c>}{<q>}.16 <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VSTR{<c>}{<q>}{.32} <Sd>, [<Rn>{, #{+/-}<imm>}]
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VSTR{<c>}{<q>}{.64} <Dd>, [<Rn>{, #{+/-}<imm>}]
```

Decode for all variants of this encoding

```
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && InITBlock()  then UNPREDICTABLE;
constant esize = 8 << UInt(size);  constant add = (U == '1');
constant imm32 = if esize == 16 then ZeroExtend(imm8:'0', 32) else ZeroExtend(imm8:'00', 32);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant n = UInt(Rn);
if n == 15 && CurrentInstrSet() != InstrSet_A32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c>	See *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
.64	Is an optional data size specifier for 64-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
<Dd>	Is the 64-bit name of the SIMD&FP source register, encoded in the "D:Vd" field.
.32	Is an optional data size specifier for 32-bit memory accesses that can be used in the assembler source code, but is otherwise ignored.
<Sd>	Is the 32-bit name of the SIMD&FP source register, encoded in the "Vd:D" field.
<Rn>	Is the general-purpose base register, encoded in the "Rn" field. The PC can be used, but this is deprecated.
+/-	Specifies the offset is added to or subtracted from the base register, defaulting to + if omitted and encoded in “U”:

U	+/-
0	-
1	+

<imm>	For the single-precision scalar or double-precision scalar variants: is the optional unsigned immediate byte offset, a multiple of 4, in the range 0 to 1020, defaulting to 0, and encoded in the "imm8" field as <imm>/4. For the half-precision scalar variant: is the optional unsigned immediate byte offset, a multiple of 2, in the range 0 to 510, defaulting to 0, and encoded in the "imm8" field as <imm>/2.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckVFPEnabled(TRUE);
    constant address = if add then (R[n] + imm32) else (R[n] - imm32);
    case esize of
        when 16
            MemA[address,2] = H[d];
        when 32
            MemA[address,4] = S[d];
        when 64
            // Store as two word-aligned words in the correct order for current endianness.
            if BigEndian(AccessType_ASIMD) then
                MemA[address,4]   = D[d]<63:32>;
                MemA[address+4,4] = D[d]<31:0>;
            else
                MemA[address,4]   = D[d]<31:0>;
                MemA[address+4,4] = D[d]<63:32>;
```

Operational information

If CPSR.DIT is 1, the timing of this instruction is insensitive to the value of the data being loaded or stored.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

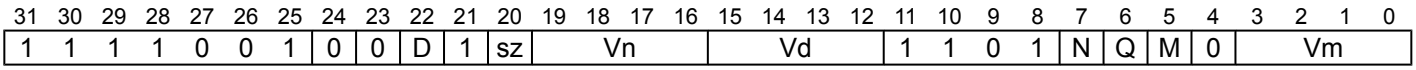
VSUB (floating-point)

Vector Subtract (floating-point) subtracts the elements of one vector from the corresponding elements of another vector, and places the results in the destination vector.

Depending on settings in the *CPACR*, *NSACR*, *HCPTR*, and *FPEXC* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1 and A2) and T32 (T1 and T2) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSUB{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

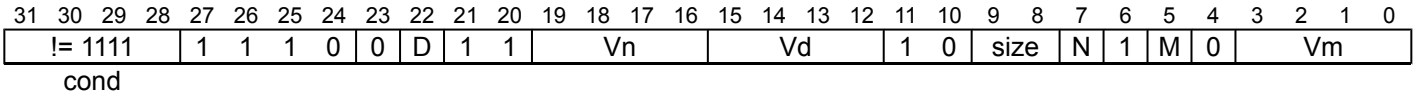
Applies when `(Q == 1)`

```
VSUB{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
constant advsimd = TRUE;
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

A2



Encoding for the Half-precision scalar variant
(FEAT_FP16)

Applies when `(size == 01)`

```
VSUB{<c>}{<q>}.F16 {<Sd>,} <Sn>, <Sm>
```

Encoding for the Single-precision scalar variant

Applies when `(size == 10)`

```
VSUB{<c>}{<q>}.F32 {<Sd>,} <Sn>, <Sm>
```

Encoding for the Double-precision scalar variant

Applies when `(size == 11)`

```
VSUB{<c>}{<q>}.F64 {<Dd>,} <Dn>, <Dm>
```

Decode for all variants of this encoding

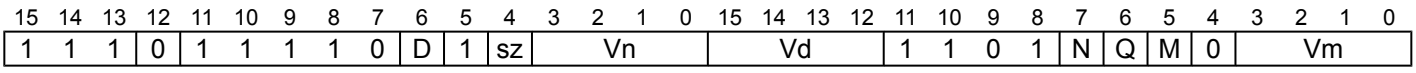
```
if FPSCR.Len != '000' || FPSCR.Stride != '00' then UNDEFINED;
if size == '00' || (size == '01' && !IsFeatureImplemented(FEAT_FP16)) then UNDEFINED;
if size == '01' && cond != '1110' then UNPREDICTABLE;
constant advsimd = FALSE;
constant integer esize = 8 << UInt(size);
constant integer d = if size == '11' then UInt(D:Vd) else UInt(Vd:D);
constant integer n = if size == '11' then UInt(N:Vn) else UInt(Vn:N);
constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
constant integer regs = integer UNKNOWN; constant integer elements = integer UNKNOWN;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && cond != '1110'`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSUB{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VSUB{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if sz == '1' && !IsFeatureImplemented(FEAT_FP16) then UNDEFINED;
if sz == '1' && InITBlock() then UNPREDICTABLE;
constant advsimd = TRUE;
constant integer esize = 32 >> UInt(sz);
constant integer elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

CONSTRAINED UNPREDICTABLE behavior

If `sz == '1' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

T2

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

constant integer m = if size == '11' then UInt(M:Vm) else UInt(Vm:M);
constant integer regs = integer UNKNOWN; constant integer elements = integer UNKNOWN;
```

CONSTRAINED UNPREDICTABLE behavior

If `size == '01' && InITBlock()`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as if it passes the Condition code check.
- The instruction executes as NOP. This means it behaves as if it fails the Condition code check.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding A2, T1 and T2: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “sz”:

sz	<dt>
0	F32
1	F16

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

<Sd> Is the 32-bit name of the SIMD&FP destination register, encoded in the "Vd:D" field.

<Sn> Is the 32-bit name of the first SIMD&FP source register, encoded in the "Vn:N" field.

<Sm> Is the 32-bit name of the second SIMD&FP source register, encoded in the "Vm:M" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDOrVFPEnabled(TRUE, advsimd);
    if advsimd then  // Advanced SIMD instruction
        constant FPCR_Type fpcr = StandardFPCR();
        for r = 0 to regs-1
            for e = 0 to elements-1
                Elem[D[d+r],e,esize] = FPSub(Elem[D[n+r],e,esize], Elem[D[m+r],e,esize], fpcr);
    else             // VFP instruction
        constant FPCR_Type fpcr = EffectiveFPCR();
        case esize of
            when 16
                H[d] = FPSub(H[n], H[m], fpcr);
            when 32
                S[d] = FPSub(S[n], S[m], fpcr);
            when 64
                D[d] = FPSub(D[n], D[m], fpcr);
```

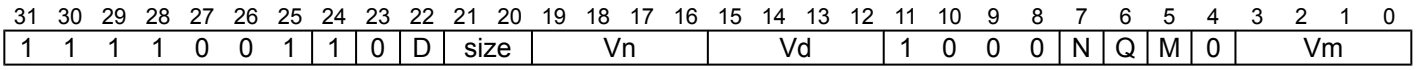
VSUB (integer)

Vector Subtract (integer) subtracts the elements of one vector from the corresponding elements of another vector, and places the results in the destination vector.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSUB{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

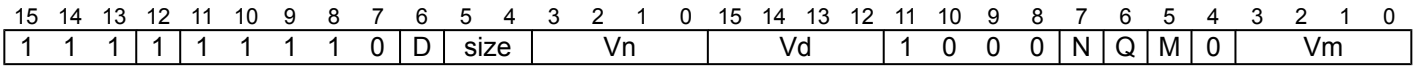
Applies when `(Q == 1)`

```
VSUB{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSUB{<c>}{<q>}.<dt> {<Dd>, }<Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VSUB{<c>}{<q>}.<dt> {<Qd>, }<Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “size”:

size	<dt>
00	I8
01	I16
10	I32
11	I64

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            Elem[D[d+r],e,esize] = Elem[D[n+r],e,esize] - Elem[D[m+r],e,esize];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VSUBHN

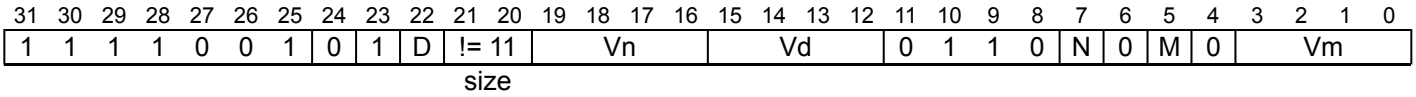
Vector Subtract and Narrow, returning High Half subtracts the elements of one quadword vector from the corresponding elements of another quadword vector, takes the most significant half of each result, and places the final results in a doubleword vector. The results are truncated. For rounded results, see *VRSUBHN*.

There is no distinction between signed and unsigned integers.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



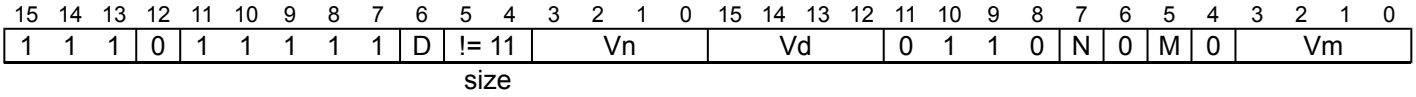
Encoding for the A1 variant

```
VSUBHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

T1



Encoding for the T1 variant

```
VSUBHN{<c>}{<q>}.<dt> <Dd>, <Qn>, <Qm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vn<0> == '1' || Vm<0> == '1' then UNDEFINED;
constant integer esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
```

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
00	I16
01	I32
10	I64

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        constant result = Elem[Qin[n>>1],e,2*esize] - Elem[Qin[m>>1],e,2*esize];
        Elem[D[d],e,esize] = result<2*esize-1:esize>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

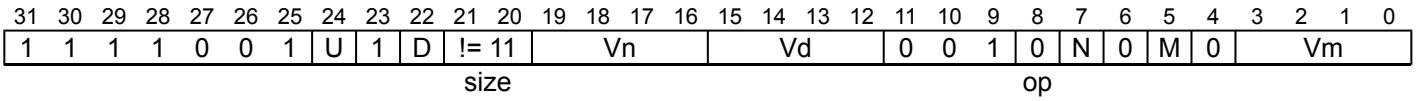
VSUBL

Vector Subtract Long subtracts the elements of one doubleword vector from the corresponding elements of another doubleword vector, and places the results in a quadword vector. Before subtracting, it sign-extends or zero-extends the elements of both operands.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



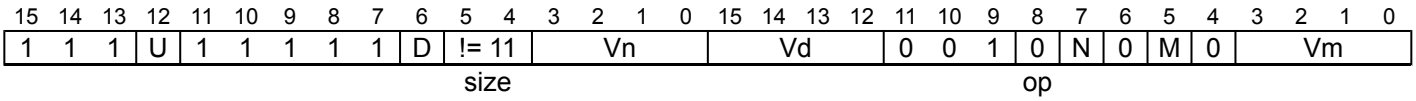
Encoding for the A1 variant

```
VSUBL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1'); constant is_vsubw = (op == '1');
constant integer esize = 8 << UInt(size);
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant elements = 64 DIV esize;
```

T1



Encoding for the T1 variant

```
VSUBL{<c>}{<q>}.<dt> <Qd>, <Dn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1'); constant is_vsubw = (op == '1');
constant integer esize = 8 << UInt(size);
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant elements = 64 DIV esize;
```

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the second operand vector, encoded in “U:size”:

U	size	<dt>
0	00	S8
0	01	S16
0	10	S32
1	00	U8
1	01	U16
1	10	U32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for e = 0 to elements-1
        integer op1;
        if is_vsubw then
            op1 = Int(Elem[Qin[n>>1],e,2*esize], unsigned);
        else
            op1 = Int(Elem[Din[n],e,esize], unsigned);
        constant result = op1 - Int(Elem[Din[m],e,esize], unsigned);
        Elem[Q[d>>1],e,2*esize] = result<2*esize-1:0>;
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

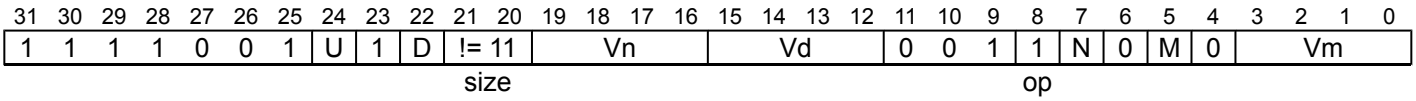
VSUBW

Vector Subtract Wide subtracts the elements of a doubleword vector from the corresponding elements of a quadword vector, and places the results in another quadword vector. Before subtracting, it sign-extends or zero-extends the elements of the doubleword operand.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



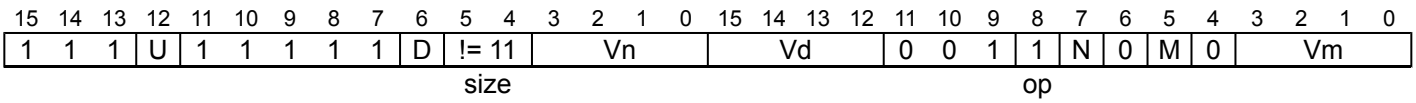
Encoding for the A1 variant

```
VSUBW{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1'); constant is_vsubw = (op == '1');
constant integer esize = 8 << UInt(size);
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant elements = 64 DIV esize;
```

T1



Encoding for the T1 variant

```
VSUBW{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Dm>
```

Decode for this encoding

```
if size == '11' then SEE "Related encodings";
if Vd<0> == '1' || (op == '1' && Vn<0> == '1') then UNDEFINED;
constant unsigned = (U == '1'); constant is_vsubw = (op == '1');
constant integer esize = 8 << UInt(size);
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant elements = 64 DIV esize;
```

Related encodings: See *Advanced SIMD data-processing* for the T32 instruction set, or *Advanced SIMD data-processing* for the A32 instruction set.

VSUDOT (by element)

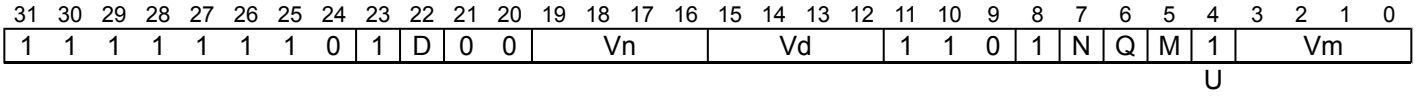
Dot Product index form with signed and unsigned integers. This instruction performs the dot product of the four signed 8-bit integer values in each 32-bit element of the first source register with the four unsigned 8-bit integer values in an indexed 32-bit element of the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

From Armv8.2, this is an OPTIONAL instruction. *ID_ISAR6*.I8MM indicates whether this instruction is supported in the T32 and A32 instruction sets.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

(FEAT_AA32I8MM)



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSUDOT{<q>}.U8 <Dd>, <Dn>, <Dm>[<index>]
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

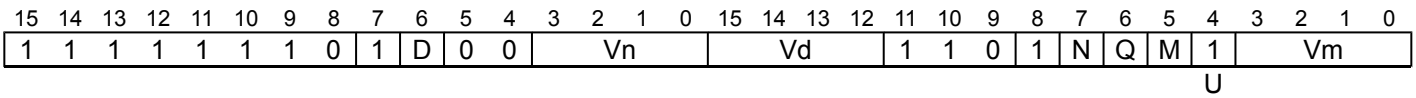
```
VSUDOT{<q>}.U8 <Qd>, <Qn>, <Dm>[<index>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_AA32I8MM) then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant boolean op1_unsigned = (U == '0');
constant boolean op2_unsigned = (U == '1');
constant integer d = UInt(D:Vd);
constant integer n = UInt(N:Vn);
constant integer m = UInt(Vm);
constant integer i = UInt(M);
constant integer regs = if Q == '1' then 2 else 1;
```

T1

(FEAT_AA32I8MM)



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSUDOT{<q>}.U8 <Dd>, <Dn>, <Dm>[<index>]
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VSUDOT{<q>}.U8 <Qd>, <Qn>, <Dm>[<index>]
```

Decode for all variants of this encoding

```
if InITBlock() then UNPREDICTABLE;
if !IsFeatureImplemented(FEAT_AA32I8MM) then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant boolean op1_unsigned = (U == '0');
constant boolean op2_unsigned = (U == '1');
constant integer d = UInt(D:Vd);
constant integer n = UInt(N:Vn);
constant integer m = UInt(Vm);
constant integer i = UInt(M);
constant integer regs = if Q == '1' then 2 else 1;
```

Assembler Symbols

<q>	See *Standard assembler syntax fields*.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qn>	Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dn>	Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.
<Dm>	Is the 64-bit name of the second SIMD&FP source register, encoded in the "Vm" field.
<index>	Is the element index in the range 0 to 1, encoded in the "M" field.

Operation

```
CheckAdvSIMDEnabled();
bits(64) operand1;
bits(64) operand2;
bits(64) result;

operand2 = Din[m];
for r = 0 to regs-1
    operand1 = Din[n+r];
    result = Din[d+r];
    for e = 0 to 1
        bits(32) res = Elem[result, e, 32];
        for b = 0 to 3
            element1 = Int(Elem[operand1, 4 * e + b, 8], op1_unsigned);
            element2 = Int(Elem[operand2, 4 * i + b, 8], op2_unsigned);
            res = res + element1 * element2;
        Elem[result, e, 32] = res;
    D[d+r] = result;
```

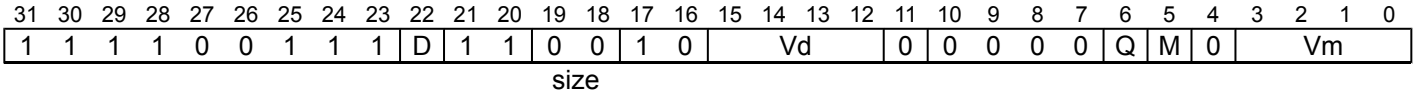
VSWP

Vector Swap exchanges the contents of two vectors. The vectors can be either doubleword or quadword. There is no distinction between data types.
Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.
It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSWP{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

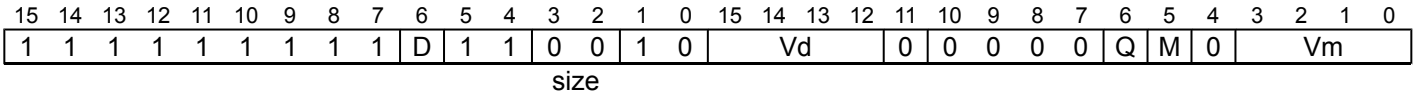
Applies when `(Q == 1)`

```
VSWP{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VSWP{<c>}{<q>}{.<dt>} <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VSWP{<c>}{<q>}{.<dt>} <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size != '00' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<dt>	An optional data type. It is ignored by assemblers, and does not affect the encoding.
<Qd>	Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.
<Qm>	Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        if d == m then
            D[d+r] = bits(64) UNKNOWN;
        else
            D[d+r] = Din[m+r];
            D[m+r] = Din[d+r];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

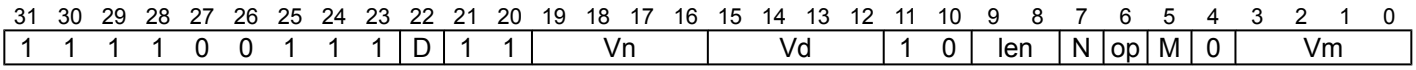
VTBL, VTBX

Vector Table Lookup uses byte indexes in a control vector to look up byte values in a table and generate a new vector. Indexes out of range return 0.
Vector Table Extension works in the same way, except that indexes out of range leave the destination element unchanged.
Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.
It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the VTBL variant

Applies when `(op == 0)`

```
VTBL{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

Encoding for the VTBX variant

Applies when `(op == 1)`

```
VTBX{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

Decode for all variants of this encoding

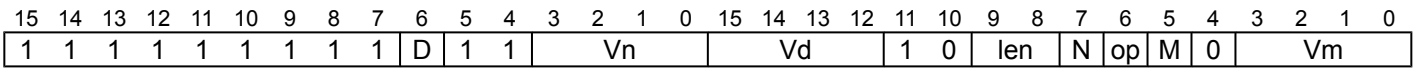
```
constant is_vtbl = (op == '0');  constant length = UInt(len)+1;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
if n+length > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `n + length > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. This behavior does not affect any general-purpose registers.

T1



Encoding for the VTBL variant

Applies when `(op == 0)`

```
VTBL{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

Encoding for the VTBX variant

Applies when `(op == 1)`

```
VTBX{<c>}{<q>}.8 <Dd>, <list>, <Dm>
```

Decode for all variants of this encoding

```
constant is_vtbl = (op == '0');  constant length = UInt(len)+1;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
if n+length > 32 then UNPREDICTABLE;
```

CONSTRAINED UNPREDICTABLE behavior

If `n + length > 32`, then one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction executes as NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. This behavior does not affect any general-purpose registers.

For more information about the CONSTRAINED UNPREDICTABLE behavior of this instruction, see *Architectural Constraints on UNPREDICTABLE behaviors*.

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<list> The vectors containing the table. It must be one of:

{<Dn>}
Encoded as len = 0b00.

{<Dn>, <Dn+1>}
Encoded as len = 0b01.

{<Dn>, <Dn+1>, <Dn+2>}
Encoded as len = 0b10.

{<Dn>, <Dn+1>, <Dn+2>, <Dn+3>}
Encoded as len = 0b11.

<Dm> Is the 64-bit name of the SIMD&FP source register holding the indices, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();

    // Create 256-bit = 32-byte table variable, with zeros in entries that will not be used.
    constant table3 = if length == 4 then D[n+3] else Zeros(64);
    constant table2 = if length >= 3 then D[n+2] else Zeros(64);
    constant table1 = if length >= 2 then D[n+1] else Zeros(64);
    constant table = table3 : table2 : table1 : D[n];

    for i = 0 to 7
        constant index = UInt(Elem[D[m],i,8]);
        if index < 8*length then
            Elem[D[d],i,8] = Elem[table,index,8];
        else
            if is_vtbl then
                Elem[D[d],i,8] = Zeros(8);
            // else Elem[D[d],i,8] unchanged
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
    - The values of the data supplied in any of its registers.
    - The values of the NZCV flags.

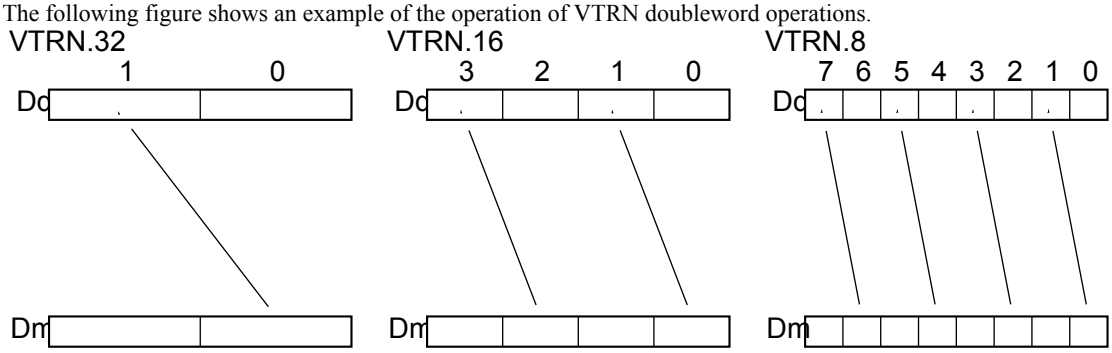
VTRN

Vector Transpose treats the elements of its operand vectors as elements of 2 x 2 matrices, and transposes the matrices.
The elements of the vectors can be 8-bit, 16-bit, or 32-bit. There is no distinction between data types.
The following figure shows an example of the operation of VTRN doubleword operations.



Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.
This instruction is used by the pseudo-instructions VUZP (alias), and VZIP (alias).
It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	D	1	1	size		1	0	Vd				0	0	0	0	1	Q	M	0	Vm			

Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VTRN{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VTRN{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	1	1	1	1	D	1	1	size		1	0	Vd				0	0	0	0	1	Q	M	0	Vm			

Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VTRN{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VTRN{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);  constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the vectors, encoded in “size”:

size	<dt>
00	8
01	16
10	32
11	RESERVED

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    constant h = elements DIV 2;

    for r = 0 to regs-1
        if d == m then
            D[d+r] = bits(64) UNKNOWN;
        else
            for e = 0 to h-1
                Elem[D[d+r],2*e+1,esize] = Elem[Din[m+r],2*e,esize];
                Elem[D[m+r],2*e,esize] = Elem[Din[d+r],2*e+1,esize];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VTST

Vector Test Bits takes each element in a vector, and bitwise ANDs it with the corresponding element of a second vector. If the result is not zero, the corresponding element in the destination vector is set to all ones. Otherwise, it is set to all zeros.

The operand vector elements can be any one of:

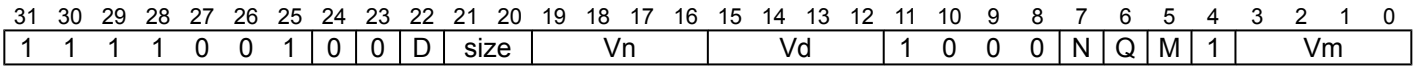
- 8-bit, 16-bit, or 32-bit fields.

The result vector elements are fields the same size as the operand vector elements.

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VTST{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

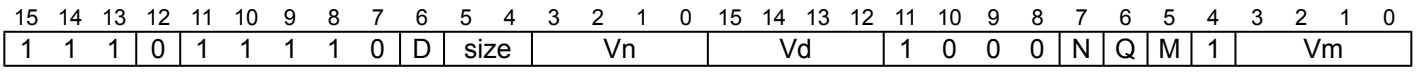
Applies when `(Q == 1)`

```
VTST{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

T1



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VTST{<c>}{<q>}.<dt> {<Dd>,} <Dn>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VTST{<c>}{<q>}.<dt> {<Qd>,} <Qn>, <Qm>
```

Decode for all variants of this encoding

```
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1' || Vm<0> == '1') then UNDEFINED;
if size == '11' then UNDEFINED;
constant esize = 8 << UInt(size);  constant elements = 64 DIV esize;
constant d = UInt(D:Vd);  constant n = UInt(N:Vn);  constant m = UInt(M:Vm);
constant regs = if Q == '0' then 1 else 2;
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> Is the data type for the elements of the operands, encoded in “size”:

size	<dt>
00	8
01	16
10	32

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qn> Is the 128-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field as <Qn>*2.

<Qm> Is the 128-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dn> Is the 64-bit name of the first SIMD&FP source register, encoded in the "N:Vn" field.

<Dm> Is the 64-bit name of the second SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    for r = 0 to regs-1
        for e = 0 to elements-1
            if !IsZero(Elem[D[n+r],e,esize] AND Elem[D[m+r],e,esize]) then
                Elem[D[d+r],e,esize] = Ones(esize);
            else
                Elem[D[d+r],e,esize] = Zeros(esize);
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

VUDOT (by element)

Dot Product index form with unsigned integers. This instruction performs the dot product of the four 8-bit elements in each 32-bit element of the first source register with the four 8-bit elements of an indexed 32-bit element in the second source register, accumulating the result into the corresponding 32-bit element of the destination register.

In Armv8.2 and Armv8.3, this is an OPTIONAL instruction. From Armv8.4 it is mandatory for all implementations to support it.

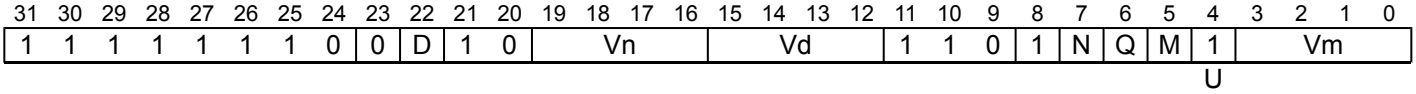
Note

ID_ISAR6.DP indicates whether this instruction is supported.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

(FEAT_DotProd)



Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VUDOT{<q>}.U8 <Dd>, <Dn>, <Dm>[<index>]
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VUDOT{<q>}.U8 <Qd>, <Qn>, <Dm>[<index>]
```

Decode for all variants of this encoding

```
if !IsFeatureImplemented(FEAT_DotProd) then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vn<0> == '1') then UNDEFINED;
constant boolean signed = (U=='0');
constant integer d = UInt(D:Vd);

VUMMLA

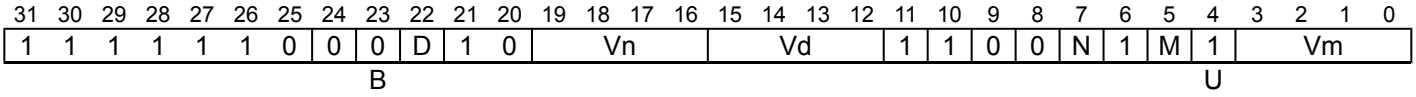
The widening integer matrix multiply-accumulate instruction multiplies the 2x8 matrix of unsigned 8-bit integer values held in the first source vector by the 8x2 matrix of unsigned 8-bit integer values in the second source vector. The resulting 2x2 32-bit integer matrix product is destructively added to the 32-bit integer matrix accumulator held in the destination vector. This is equivalent to performing an 8-way dot product per destination element.

From Armv8.2, this is an OPTIONAL instruction. *ID_ISAR6*.I8MM indicates whether this instruction is supported in the T32 and A32 instruction sets.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

(FEAT_AA32I8MM)



Encoding for the A1 variant

```
VUMMLA{<q>}.U8 <Qd>, <Qn>, <Qm>
```

Decode for this encoding

```
if !IsFeatureImplemented(FEAT_AA32I8MM) then UNDEFINED;
boolean op1_unsigned;
boolean op2_unsigned;
case B:U of
    when '00' op1_unsigned = FALSE; op2_unsigned = FALSE;

VUZP

Vector Unzip de-interleaves the elements of two vectors.

The elements of the vectors can be 8-bit, 16-bit, or 32-bit. There is no distinction between data types.

The following figure shows an example of the operation of VUZP doubleword operation for data type 8.

VUZP.8, doubleword

	Register state before operation								Register state after operation							
Dd	A7	A6	A5	A4	A3	A2	A1	A0	B6	B4	B2	B0	A6	A4	A2	A0
Dm	B7	B6	B5	B4	B3	B2	B1	B0	B7	B5	B3	B1	A7	A5	A3	A1

The following figure shows an example of the operation of VUZP quadword operation for data type 32.

VUZP.32, quadword

	Register state before operation				Register state after operation			
Qd	A3	A2	A1	A0	B2	B0	A2	A0
Qm	B3	B2	B1	B0	B3	B1	A3	A1

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	0	0	1	1	1	D	1	1	size		1	0	Vd				0	0	0	1	0	Q	M	0	Vm			

Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VUZP{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VUZP{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' || (Q == '0' && size == '10') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant quadword_operation = (Q == '1');  constant esize = 8 << UInt(size);
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

T1

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	1	1	1	1	1	1	1	1	D	1	1	size		1	0	Vd				0	0	0	1	0	Q	M	0	Vm			

Encoding for the 64-bit SIMD vector variant

Applies when `(Q == 0)`

```
VUZP{<c>}{<q>}.<dt> <Dd>, <Dm>
```

Encoding for the 128-bit SIMD vector variant

Applies when `(Q == 1)`

```
VUZP{<c>}{<q>}.<dt> <Qd>, <Qm>
```

Decode for all variants of this encoding

```
if size == '11' || (Q == '0' && size == '10') then UNDEFINED;
if Q == '1' && (Vd<0> == '1' || Vm<0> == '1') then UNDEFINED;
constant quadword_operation = (Q == '1');  constant esize = 8 << UInt(size);
constant d = UInt(D:Vd);  constant m = UInt(M:Vm);
```

Assembler Symbols

<c> For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional.

For encoding T1: see *Standard assembler syntax fields*.

<q> See *Standard assembler syntax fields*.

<dt> For the 64-bit SIMD vector variant: is the data type for the elements of the vectors, encoded in “size”:

size	<dt>
00	8
01	16
1x	RESERVED

For the 128-bit SIMD vector variant: is the data type for the elements of the vectors, encoded in “size”:

size	<dt>
00	8
01	16
10	32
11	RESERVED

<Qd> Is the 128-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field as <Qd>*2.

<Qm> Is the 128-bit name of the SIMD&FP source register, encoded in the "M:Vm" field as <Qm>*2.

<Dd> Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.

<Dm> Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

```
if ConditionPassed() then
    EncodingSpecificOperations();  CheckAdvSIMDEnabled();
    if quadword_operation then
        if d == m then
            Q[d>>1] = bits(128) UNKNOWN;
        else
            constant zipped_q = Q[m>>1]:Q[d>>1];
            for e = 0 to (128 DIV esize) - 1
                Elem[Q[d>>1],e,esize] = Elem[zipped_q,2*e,esize];
                Elem[Q[m>>1],e,esize] = Elem[zipped_q,2*e+1,esize];
    else
        if d == m then
            D[d] = bits(64) UNKNOWN;
        else
            constant zipped_d = D[m]:D[d];
            for e = 0 to (64 DIV esize) - 1
                Elem[D[d],e,esize] = Elem[zipped_d,2*e,esize];
                Elem[D[m],e,esize] = Elem[zipped_d,2*e+1,esize];
```

Operational information

If CPSR.DIT is 1 and this instruction passes its condition execution check:

- The execution time of this instruction is independent of:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.
- The response of this instruction to asynchronous exceptions does not vary based on:
  - The values of the data supplied in any of its registers.
  - The values of the NZCV flags.

VUZP (alias)

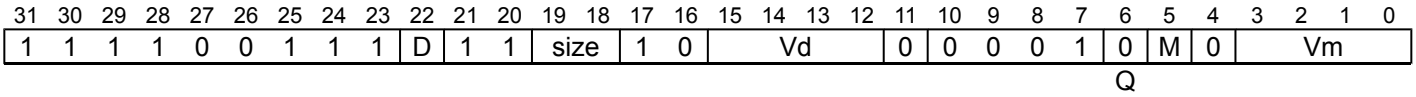
Vector Unzip de-interleaves the elements of two vectors.

This is a pseudo-instruction of VTRN. This means:

- The encodings in this description are named to match the encodings of VTRN.
- The assembler syntax is used only for assembly, and is not used on disassembly.
- The description of VTRN gives the operational pseudocode, any CONSTRAINED UNPREDICTABLE behavior, and any operational information for this instruction.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1



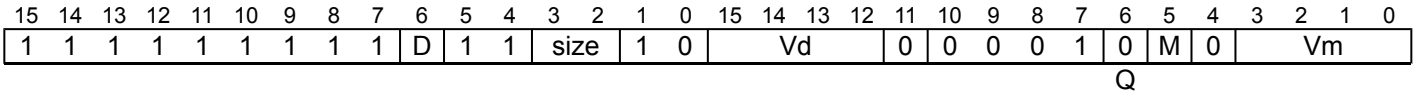
Encoding for the 64-bit SIMD vector variant

```
VUZP{<c>}{<q>}.32 <Dd>, <Dm>
```

is equivalent to

```
VTRN{<c>}{<q>}.32 <Dd>, <Dm>
```

T1



Encoding for the 64-bit SIMD vector variant

```
VUZP{<c>}{<q>}.32 <Dd>, <Dm>
```

is equivalent to

```
VTRN{<c>}{<q>}.32 <Dd>, <Dm>
```

Assembler Symbols

<c>	For encoding A1: see *Standard assembler syntax fields*. This encoding must be unconditional. For encoding T1: see *Standard assembler syntax fields*.
<q>	See *Standard assembler syntax fields*.
<Dd>	Is the 64-bit name of the SIMD&FP destination register, encoded in the "D:Vd" field.
<Dm>	Is the 64-bit name of the SIMD&FP source register, encoded in the "M:Vm" field.

Operation

The description of VTRN gives the operational pseudocode for this instruction.

Internal version only: isa v01_32, pseudocode v2024-12_rel ; Build timestamp: 2024-12-16T10:54

VZIP

Vector Zip interleaves the elements of two vectors.

The elements of the vectors can be 8-bit, 16-bit, or 32-bit. There is no distinction between data types.

The following figure shows an example of the operation of VZIP doubleword operation for data type 8.

VZIP.8, doubleword

	Register state before operation								Register state after operation							
Dd	A7	A6	A5	A4	A3	A2	A1	A0	B3	A3	B2	A2	B1	A1	B0	A0
Dm	B7	B6	B5	B4	B3	B2	B1	B0	B7	A7	B6	A6	B5	A5	B4	A4

The following figure shows an example of the operation of VZIP quadword operation for data type 32.

VZIP.32, quadword

	Register state before operation				Register state after operation			
Qd	A3	A2	A1	A0	B1	A1	B0	A0
Qm	B3	B2	B1	B0	B3	A3	B2	A2

Depending on settings in the *CPACR*, *NSACR*, and *HCPTR* registers, and the Security state and PE mode in which the instruction is executed, an attempt to execute the instruction might be UNDEFINED, or trapped to Hyp mode. For more information see *Enabling Advanced SIMD and floating-point support*.

It has encodings from the following instruction sets: A32 (A1) and T32 (T1) .

A1

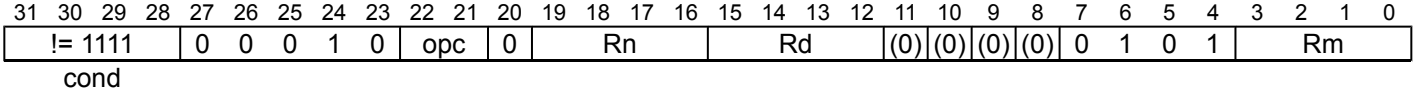
The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings*

Integer Saturating Arithmetic

The encodings in this section are decoded from Miscellaneous.

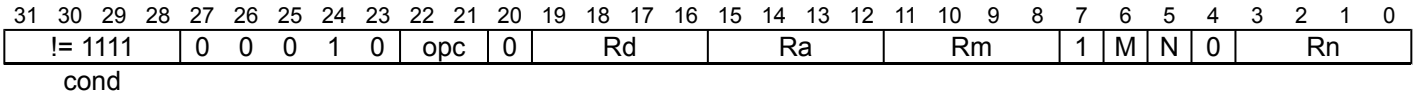


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	QADD
01	QSUB
10	QDADD
11	QDSUB

Halfword Multiply and Accumulate

The encodings in this section are decoded from Data-processing and miscellaneous instructions.



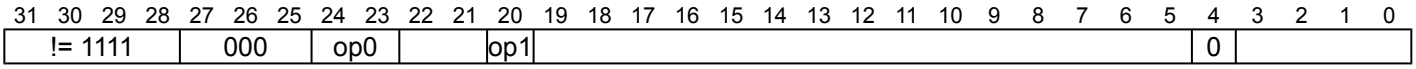
The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	M	N	Instruction Details
00			SMLABB, SMLABT, SMLATB, SMLATT
01	0	0	SMLAWB, SMLAWT — SMLAWB
01	0	1	SMULWB, SMULWT — SMULWB

Decode fields opc	M	N	Instruction Details
01	1	0	SMLAWB, SMLAWT — SMLAWT
01	1	1	SMULWB, SMULWT — SMULWT
10			SMLALBB, SMLALBT, SMLALTB, SMLALTT
11			SMULBB, SMULBT, SMULTB, SMULTT

Data-processing register (immediate shift)

The encodings in this section are decoded from Data-processing and miscellaneous instructions.

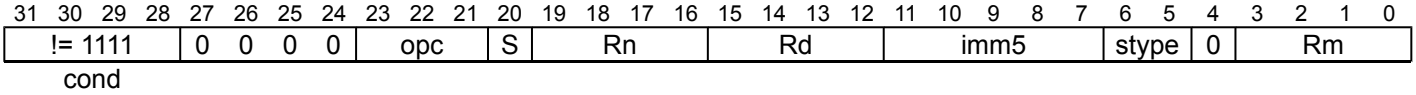


The following constraints also apply to this encoding: op0:op1 != 100

Decode fields op0	op1	Instruction details
0x		Integer Data Processing (three register, immediate shift)
10	1	Integer Test and Compare (two register, immediate shift)
11		Logical Arithmetic (three register, immediate shift)

Integer Data Processing (three register, immediate shift)

The encodings in this section are decoded from Data-processing register (immediate shift).



The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	S	Rn	imm5:stype	Instruction Details
000			!= 0000011	AND, ANDS (register) — shift or rotate by value
000			0000011	AND, ANDS (register) — rotate right with extend
001			!= 0000011	EOR, EORS (register) — shift or rotate by value
001			0000011	EOR, EORS (register) — rotate right with extend
010	0	!= 1101	!= 0000011	SUB, SUBS (register) — SUB, shift or rotate by value
010	0	!= 1101	0000011	SUB, SUBS (register) — SUB, rotate right with extend
010	0	1101	!= 0000011	SUB, SUBS (SP minus register) — SUB, shift or rotate by value
010	0	1101	0000011	SUB, SUBS (SP minus register) — SUB, rotate right with extend
010	1	!= 1101	!= 0000011	SUB, SUBS (register) — SUBS, shift or rotate by value
010	1	!= 1101	0000011	SUB, SUBS (register) — SUBS, rotate right with extend
010	1	1101	!= 0000011	SUB, SUBS (SP minus register) — SUBS, shift or rotate by value
010	1	1101	0000011	SUB, SUBS (SP minus register) — SUBS, rotate right with extend
011			!= 0000011	RSB, RSBS (register) — shift or rotate by value
011			0000011	RSB, RSBS (register) — rotate right with extend
100	0	!= 1101	!= 0000011	ADD, ADDS (register) — ADD, shift or rotate by value
100	0	!= 1101	0000011	ADD, ADDS (register) — ADD, rotate right with extend
100	0	1101	!= 0000011	ADD, ADDS (SP plus register) — ADD, shift or rotate by value
100	0	1101	0000011	ADD, ADDS (SP plus register) — ADD, rotate right with extend

Decode fields				Instruction Details
opc	S	Rn	imm5:stype	
100	1	!= 1101	!= 0000011	ADD, ADDS (register) — ADDS, shift or rotate by value
100	1	!= 1101	0000011	ADD, ADDS (register) — ADDS, rotate right with extend
100	1	1101	!= 0000011	ADD, ADDS (SP plus register) — ADDS, shift or rotate by value
100	1	1101	0000011	ADD, ADDS (SP plus register) — ADDS, rotate right with extend
101			!= 0000011	ADC, ADCS (register) — shift or rotate by value
101			0000011	ADC, ADCS (register) — rotate right with extend
110			!= 0000011	SBC, SBCS (register) — shift or rotate by value
110			0000011	SBC, SBCS (register) — rotate right with extend
111			!= 0000011	RSC, RSCS (register) — shift or rotate by value
111			0000011	RSC, RSCS (register) — rotate right with extend

Integer Test and Compare (two register, immediate shift)

The encodings in this section are decoded from Data-processing register (immediate shift).

31 30 29 28	27 26 25 24 23	22 21	20	19 18 17 16	15 14	13 12	11 10 9 8 7	6 5	4	3 2 1 0
!= 1111	0 0 0 1 0	opc	1	Rn	(0) (0)	(0) (0)	imm5	stype	0	Rm
cond										

The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields		Instruction Details
opc	imm5:stype	
00	!= 0000011	TST (register) — shift or rotate by value
00	0000011	TST (register) — rotate right with extend
01	!= 0000011	TEQ (register) — shift or rotate by value
01	0000011	TEQ (register) — rotate right with extend
10	!= 0000011	CMP (register) — shift or rotate by value
10	0000011	CMP (register) — rotate right with extend
11	!= 0000011	CMN (register) — shift or rotate by value
11	0000011	CMN (register) — rotate right with extend

Logical Arithmetic (three register, immediate shift)

The encodings in this section are decoded from Data-processing register (immediate shift).

31 30 29 28	27 26 25 24 23	22 21	20	19 18 17 16	15 14 13 12	11 10 9 8 7	6 5	4	3 2 1 0
!= 1111	0 0 0 1 1	opc	S	Rn	Rd	imm5	stype	0	Rm
cond									

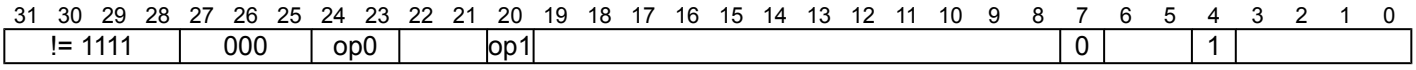
The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields		Instruction Details
opc	imm5:stype	
00	!= 0000011	ORR, ORRS (register) — shift or rotate by value
00	0000011	ORR, ORRS (register) — rotate right with extend
01	!= 0000011	MOV, MOVS (register) — shift or rotate by value
01	0000011	MOV, MOVS (register) — rotate right with extend
10	!= 0000011	BIC, BICS (register) — shift or rotate by value
10	0000011	BIC, BICS (register) — rotate right with extend
11	!= 0000011	MVN, MVNS (register) — shift or rotate by value

Decode fields opc	imm5:stype	Instruction Details
11	0000011	MVN, MVNS (register) — rotate right with extend

Data-processing register (register shift)

The encodings in this section are decoded from Data-processing and miscellaneous instructions.

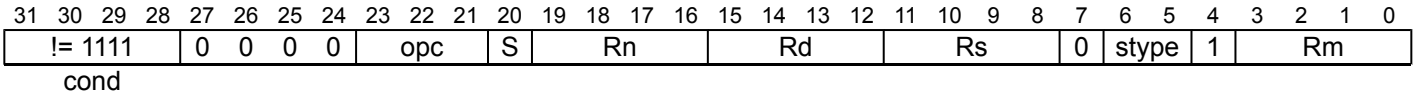


The following constraints also apply to this encoding: op0:op1 != 100

Decode fields op0	op1	Instruction details
0x		Integer Data Processing (three register, register shift)
10	1	Integer Test and Compare (two register, register shift)
11		Logical Arithmetic (three register, register shift)

Integer Data Processing (three register, register shift)

The encodings in this section are decoded from Data-processing register (register shift).

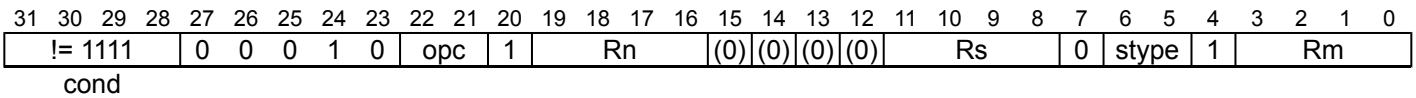


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
000	AND, ANDS (register-shifted register)
001	EOR, EORS (register-shifted register)
010	SUB, SUBS (register-shifted register)
011	RSB, RSBS (register-shifted register)
100	ADD, ADDS (register-shifted register)
101	ADC, ADCS (register-shifted register)
110	SBC, SBCS (register-shifted register)
111	RSC, RSCS (register-shifted register)

Integer Test and Compare (two register, register shift)

The encodings in this section are decoded from Data-processing register (register shift).



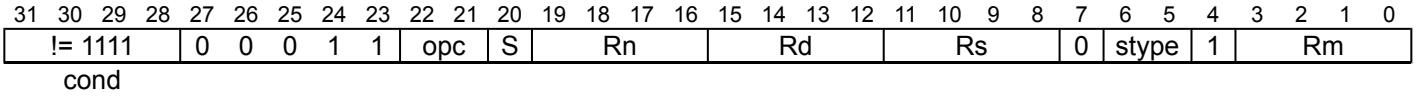
The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	TST (register-shifted register)
01	TEQ (register-shifted register)

Decode fields opc	Instruction Details
10	CMP (register-shifted register)
11	CMN (register-shifted register)

Logical Arithmetic (three register, register shift)

The encodings in this section are decoded from Data-processing register (register shift).

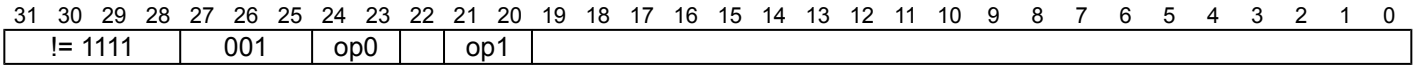


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	ORR, ORRS (register-shifted register)
01	MOV, MOVS (register-shifted register)
10	BIC, BICS (register-shifted register)
11	MVN, MVNS (register-shifted register)

Data-processing immediate

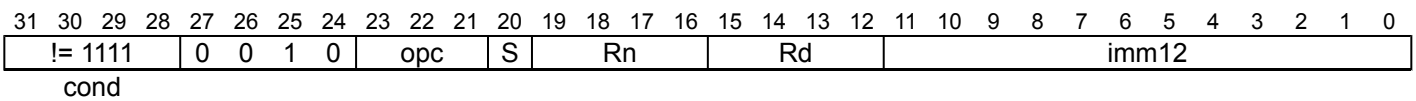
The encodings in this section are decoded from Data-processing and miscellaneous instructions.



Decode fields op0	op1	Instruction details
0x		Integer Data Processing (two register and immediate)
10	00	Move Halfword (immediate)
10	10	Move Special Register and Hints (immediate)
10	x1	Integer Test and Compare (one register and immediate)
11		Logical Arithmetic (two register and immediate)

Integer Data Processing (two register and immediate)

The encodings in this section are decoded from Data-processing immediate.



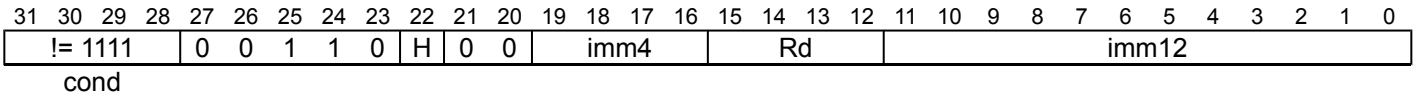
The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	S	Rn	Instruction Details
000			AND, ANDS (immediate)
001			EOR, EORS (immediate)
010	0	!= 11x1	SUB, SUBS (immediate) — SUB
010	0	1101	SUB, SUBS (SP minus immediate) — SUB
010	0	1111	ADR — A2

Decode fields opc	S	Rn	Instruction Details
010	1	!= 1101	SUB, SUBS (immediate) — SUBS
010	1	1101	SUB, SUBS (SP minus immediate) — SUBS
011			RSB, RSBS (immediate)
100	0	!= 11x1	ADD, ADDS (immediate) — ADD
100	0	1101	ADD, ADDS (SP plus immediate) — ADD
100	0	1111	ADR — A1
100	1	!= 1101	ADD, ADDS (immediate) — ADDS
100	1	1101	ADD, ADDS (SP plus immediate) — ADDS
101			ADC, ADCS (immediate)
110			SBC, SBCS (immediate)
111			RSC, RSCS (immediate)

Move Halfword (immediate)

The encodings in this section are decoded from Data-processing immediate.

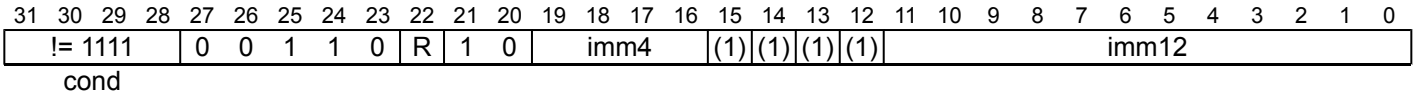


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields H	Instruction Details
0	MOV, MOVS (immediate)
1	MOVT

Move Special Register and Hints (immediate)

The encodings in this section are decoded from Data-processing immediate.



The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields R:imm4	imm12	Instruction Details	Feature
!= 00000		MSR (immediate)	-
00000	xxxx00000000	NOP	-
00000	xxxx00000001	YIELD	-

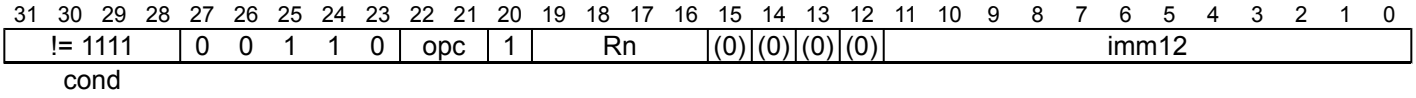
00000	xxxx10xxxxxx	Reserved hint, behaves as NOP	-
00000	xxxx110xxxxx	Reserved hint, behaves as NOP	-
00000	xxxx1110xxxx	Reserved hint, behaves as NOP	-
00000	xxxx1111xxxx	DBG	-

Integer Test and Compare (one register and immediate)

The encodings in this section are decoded from Data-processing immediate.

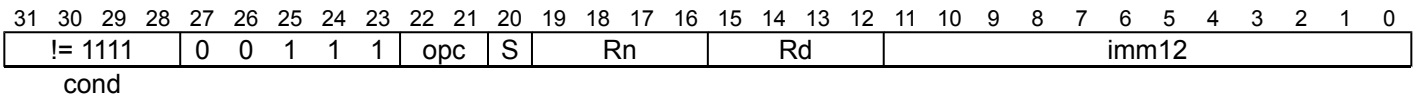


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	TST (immediate)
01	TEQ (immediate)
10	CMP (immediate)
11	CMN (immediate)

Logical Arithmetic (two register and immediate)

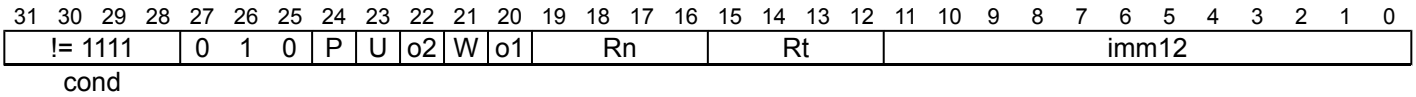
The encodings in this section are decoded from Data-processing immediate.



The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc	Instruction Details
00	ORR, ORRS (immediate)
01	MOV, MOVS (immediate)
10	BIC, BICS (immediate)
11	MVN, MVNS (immediate)

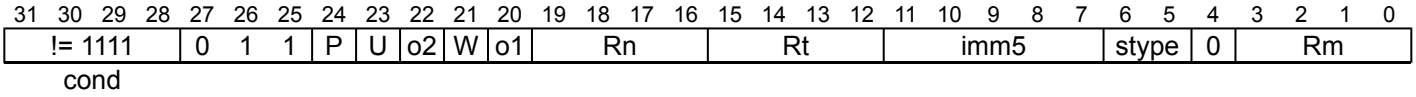
Load/Store Word, Unsigned Byte (immediate, literal)



The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields				Instruction Details
P:W	o2	o1	Rn	
!= 01	0	1	1111	LDR (literal)
!= 01	1	1	1111	LDRB (literal)
00	0	0		STR (immediate) — post-indexed
00	0	1	!= 1111	LDR (immediate) — post-indexed
00	1	0		STRB (immediate) — post-indexed
00	1	1	!= 1111	LDRB (immediate) — post-indexed
01	0	0		STRT
01	0	1		LDRT
01	1	0		STRBT
01	1	1		LDRBT
10	0	0		STR (immediate) — offset
10	0	1	!= 1111	LDR (immediate) — offset
10	1	0		STRB (immediate) — offset
10	1	1	!= 1111	LDRB (immediate) — offset
11	0	0		STR (immediate) — pre-indexed
11	0	1	!= 1111	LDR (immediate) — pre-indexed
11	1	0		STRB (immediate) — pre-indexed
11	1	1	!= 1111	LDRB (immediate) — pre-indexed

Load/Store Word, Unsigned Byte (register)

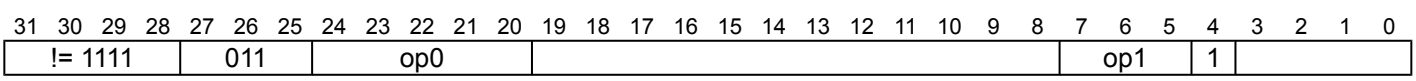


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields				Instruction Details
P	o2	W	o1	
0	0	0	0	STR (register) — post-indexed
0	0	0	1	LDR (register) — post-indexed
0	0	1	0	STRT
0	0	1	1	LDRT
0	1	0	0	STRB (register) — post-indexed
0	1	0	1	LDRB (register) — post-indexed
0	1	1	0	STRBT
0	1	1	1	LDRBT
1	0		0	STR (register) — pre-indexed
1	0		1	LDR (register) — pre-indexed
1	1		0	STRB (register) — pre-indexed
1	1		1	LDRB (register) — pre-indexed

Media instructions

The encodings in this section are decoded from A32 instruction set encoding.



Decode fields op0	op1	Instruction details
00xxx		Parallel Arithmetic
01000	101	SEL
01000	001	UNALLOCATED
01000	xx0	PKHBT, PKHTB

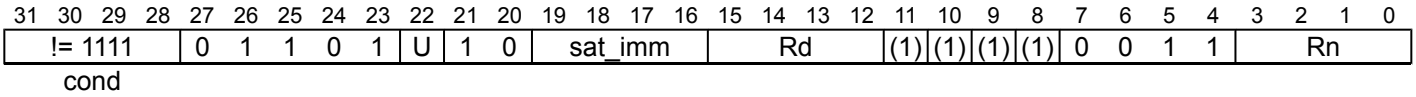
Saturate 16-bit

The encodings in this section are decoded from Media instructions.

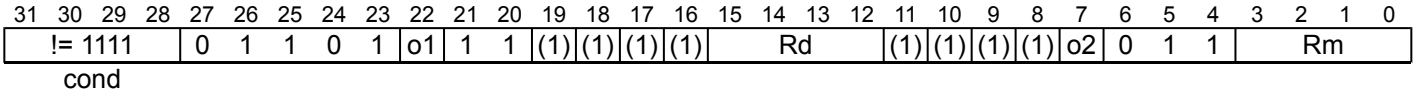


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields U	Instruction Details
0	SSAT16
1	USAT16

Reverse Bit/Byte

The encodings in this section are decoded from Media instructions.

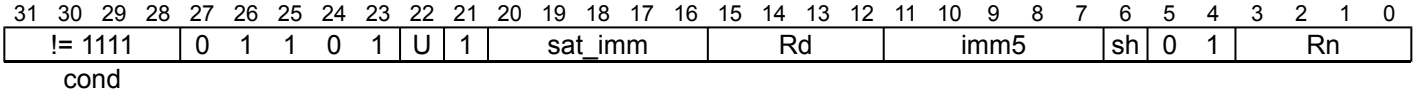


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields o1	o2	Instruction Details
0	0	REV
0	1	REV16
1	0	RBIT
1	1	REVSH

Saturate 32-bit

The encodings in this section are decoded from Media instructions.

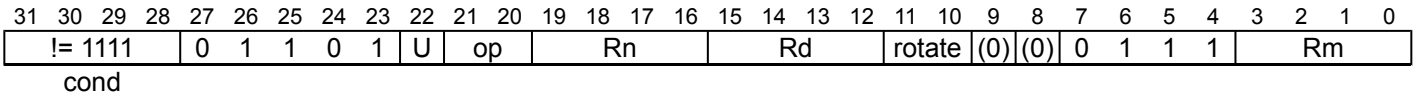


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields U	Instruction Details
0	SSAT
1	USAT

Extend and Add

The encodings in this section are decoded from Media instructions.



The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields U	op	Rn	Instruction Details
0	00	!= 1111	SXTAB16

Decode fields			Instruction Details

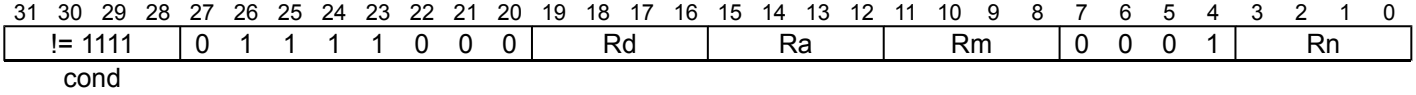
101		111	SMMLS, SMMLSR — SMMLSR

Decode fields op1	Ra	op2	Instruction Details
101	1111	000	SMMUL, SMMULR — SMMUL
101	1111	001	SMMUL, SMMULR — SMMULR
11x			UNALLOCATED

Unsigned Sum of Absolute Differences

The encodings in this section are decoded from Media instructions.

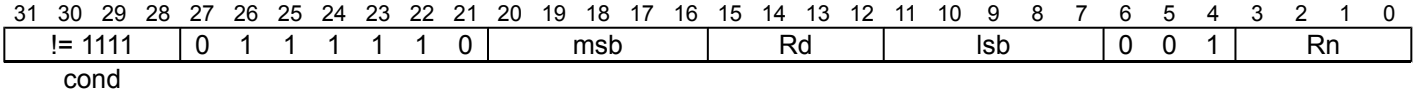


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields Ra	Instruction Details
!= 1111	USADA8
1111	USAD8

Bitfield Insert

The encodings in this section are decoded from Media instructions.

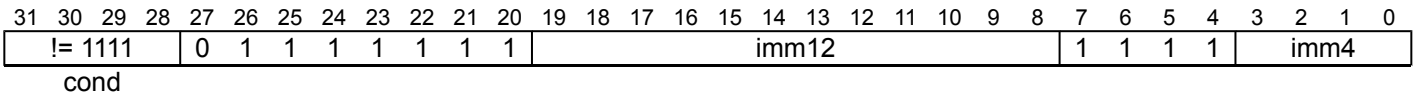


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields Rn	Instruction Details
!= 1111	BFI
1111	BFC

Permanently UNDEFINED

The encodings in this section are decoded from Media instructions.

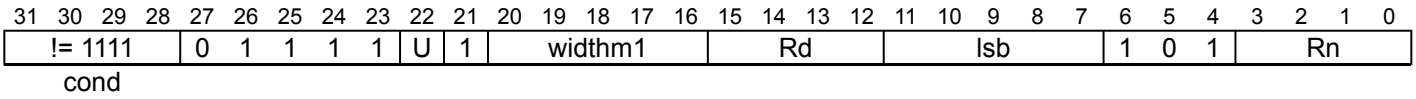


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields cond	Instruction Details
0xxx	UNALLOCATED
10xx	UNALLOCATED
110x	UNALLOCATED
1110	UDF

Bitfield Extract

The encodings in this section are decoded from Media instructions.

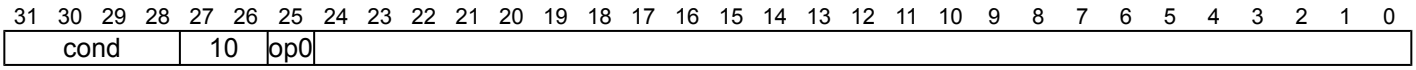


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields U	Instruction Details
0	SBFX
1	UBFX

Branch, branch with link, and block data transfer

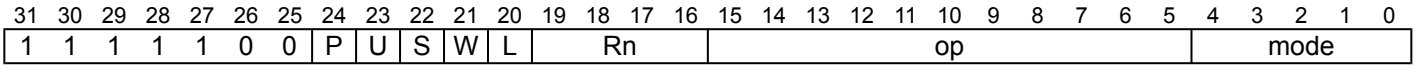
The encodings in this section are decoded from A32 instruction set encoding.



Decode fields cond	op0	Instruction details
1111	0	Exception Save/Restore
!= 1111	0	Load/Store Multiple
	1	Branch (immediate)

Exception Save/Restore

The encodings in this section are decoded from Branch, branch with link, and block data transfer.



Decode fields P	U	S	L	Instruction Details
		0	0	UNALLOCATED
0	0	0	1	RFE, RFEDA, RFEDB, RFEIA, RFEIB — Decrement After
0	0	1	0	SRS, SRSDA, SRSDB, SRSIA, SRSIB — Decrement After
0	1	0	1	RFE, RFEDA, RFEDB, RFEIA, RFEIB — Increment After

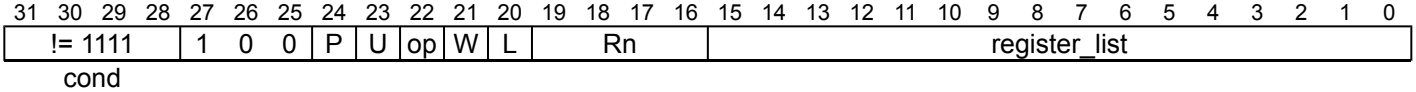
Load/Store Multiple

The encodings in this section are decoded from Branch, branch with link, and block data transfer.

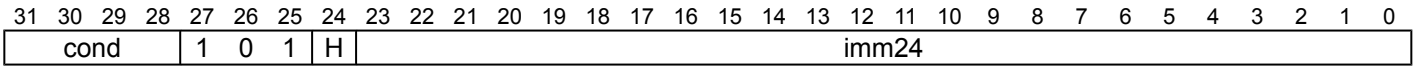


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields					Instruction Details
P	U	op	L	register_list	
0	0	0	0		STMDA, STMED
0	0	0	1		LDMDA, LDMFA
0	1	0	0		STM, STMIA, STMEA
0	1	0	1		LDM, LDMIA, LDMFD
		1	0		STM (User registers)
1	0	0	0		STMDB, STMFD
1	0	0	1		LDMDB, LDMEA
		1	1	0xxxxxxxxxxxxxxx	LDM (User registers)
1	1	0	0		STMIB, STMFA
1	1	0	1		LDMIB, LDMED
		1	1	1xxxxxxxxxxxxxxx	LDM (exception return)

Branch (immediate)

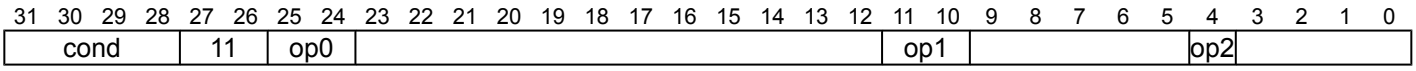
The encodings in this section are decoded from Branch, branch with link, and block data transfer.



Decode fields		Instruction Details
cond	H	
!= 1111	0	B
!= 1111	1	BL, BLX (immediate) — A1
1111		BL, BLX (immediate) — A2

System register access, Advanced SIMD, floating-point, and Supervisor call

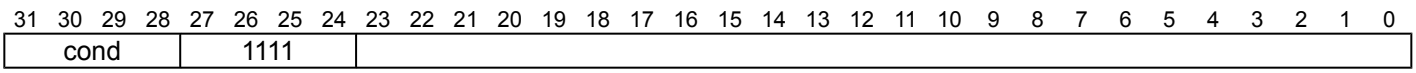
The encodings in this section are decoded from A32 instruction set encoding.



Decode fields				Instruction details
cond	op0	op1	op2	
	0x	0x		UNALLOCATED
	10	0x		UNALLOCATED
	11			Supervisor call
1111	!= 11	1x		Unconditional Advanced SIMD and floating-point instructions
!= 1111	0x	1x		Advanced SIMD and System register load/store and 64-bit move
!= 1111	10	1x	1	Advanced SIMD and System register 32-bit move
!= 1111	10	10	0	Floating-point data-processing
!= 1111	10	11	0	UNALLOCATED

Supervisor call

The encodings in this section are decoded from System register access, Advanced SIMD, floating-point, and Supervisor call.

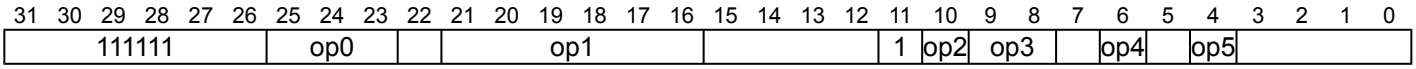


Decode fields **Instruction details**

cond	
1111	UNALLOCATED
!= 1111	SVC

Unconditional Advanced SIMD and floating-point instructions

The encodings in this section are decoded from System register access, Advanced SIMD, floating-point, and Supervisor call.

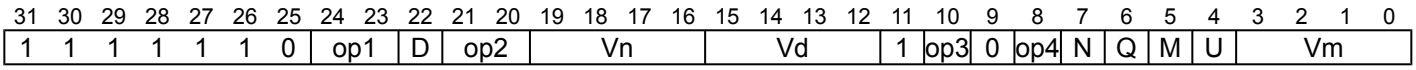


The following constraints also apply to this encoding: op0<2:1> != 11

Decode fields						Instruction details
op0	op1	op2	op3	op4	op5	
0xx			0x			Advanced SIMD three registers of the same length extension
100		0	!= 00	0	0	Floating-point conditional select
101	00xxxx	0	!= 00		0	Floating-point minNum/maxNum
101	110000	0	!= 00	1	0	Floating-point extraction and insertion
101	111xxx	0	!= 00	1	0	Floating-point directed convert to integer
10x		0	00			Advanced SIMD and floating-point multiply with accumulate
10x		1	0x			Advanced SIMD and floating-point dot product

Advanced SIMD three registers of the same length extension

The encodings in this section are decoded from Unconditional Advanced SIMD and floating-point instructions.



Decode fields						Instruction Details	Feature
op1	op2	op3	op4	Q	U		
x1	0x	0	0	0	0	VCADD — 64-bit SIMD vector	FEAT_FCMA
x1	0x	0	0	0	1	UNALLOCATED	-

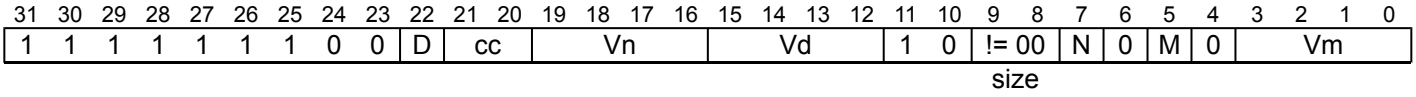
11	11	1	0			UNALLOCATED	-
11	11	1	1			UNALLOCATED	-

Floating-point conditional select

The encodings in this section are decoded from Unconditional Advanced SIMD and floating-point instructions.

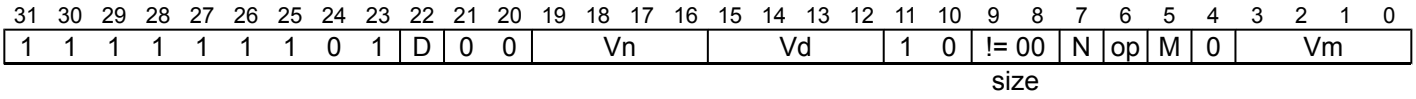


The following constraints also apply to this encoding: size != 00 && size != 00

Decode fields	Instruction Details	Feature
size		
01	VSELEQ, VSELGE, VSELGT, VSELVS — half-precision scalar	FEAT_FP16
10	VSELEQ, VSELGE, VSELGT, VSELVS — single-precision scalar	-
11	VSELEQ, VSELGE, VSELGT, VSELVS — double-precision scalar	-

Floating-point minNum/maxNum

The encodings in this section are decoded from Unconditional Advanced SIMD and floating-point instructions.

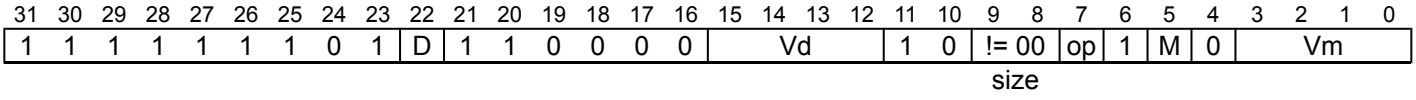


The following constraints also apply to this encoding: size != 00 && size != 00

Decode fields size	op	Instruction Details	Feature
01	0	VMAXNM — half-precision scalar	FEAT_FP16
01	1	VMINNM — half-precision scalar	FEAT_FP16
10	0	VMAXNM — single-precision scalar	-
10	1	VMINNM — single-precision scalar	-
11	0	VMAXNM — double-precision scalar	-
11	1	VMINNM — double-precision scalar	-

Floating-point extraction and insertion

The encodings in this section are decoded from Unconditional Advanced SIMD and floating-point instructions.

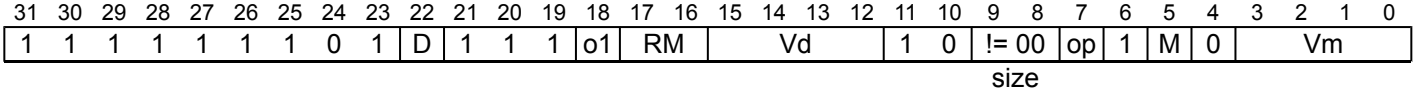


The following constraints also apply to this encoding: size != 00 && size != 00

Decode fields size	op	Instruction Details	Feature
01		UNALLOCATED	-
10	0	VMOVX	FEAT_FP16
10	1	VINS	FEAT_FP16
11		UNALLOCATED	-

Floating-point directed convert to integer

The encodings in this section are decoded from Unconditional Advanced SIMD and floating-point instructions.



The following constraints also apply to this encoding: size != 00 && size != 00

o1	Decode fields RM	size	op	Instruction Details	Feature
0		!= 00	1	UNALLOCATED	-
0	00	01	0	VRINTA (floating-point) — half-precision scalar	FEAT_FP16
0	00	10	0	VRINTA (floating-point) — single-precision scalar	-
0	00	11	0	VRINTA (floating-point) — double-precision scalar	-
0	01	01	0	VRINTN (floating-point) — half-precision scalar	FEAT_FP16
0	01	10	0	VRINTN (floating-point) — single-precision scalar	-
0	01	11	0	VRINTN (floating-point) — double-precision scalar	-
0	10	01	0	VRINTP (floating-point) — half-precision scalar	FEAT_FP16
0	10	10	0	VRINTP (floating-point) — single-precision scalar	-
0	10	11	0	VRINTP (floating-point) — double-precision scalar	-

Decode fields				Instruction Details	Feature
o1	RM	size	op		
0	11	01	0	VRINTM (floating-point) — half-precision scalar	FEAT_FP16
0	11	10	0	VRINTM (floating-point) — single-precision scalar	-
0	11	11	0	VRINTM (floating-point) — double-precision scalar	-
1	00	01		VCVTA (floating-point) — half-precision scalar	FEAT_FP16

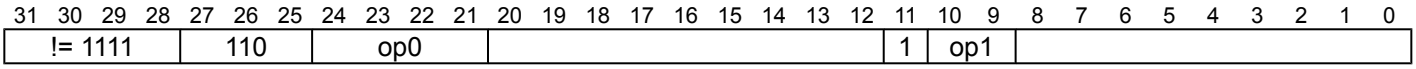
Advanced SIMD and System register load/store and 64-bit move

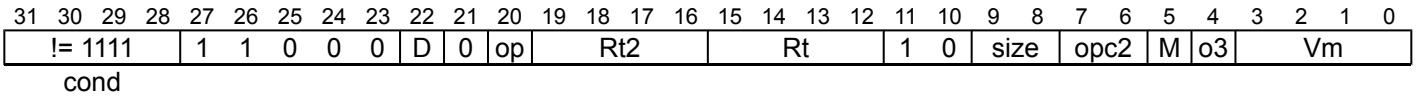
The encodings in this section are decoded from System register access, Advanced SIMD, floating-point, and Supervisor call.



Decode fields op0	op1	Instruction details
00x0	0x	Advanced SIMD and floating-point 64-bit move
00x0	11	System register 64-bit move
!= 00x0	0x	Advanced SIMD and floating-point load/store
!= 00x0	11	System register load/store
	10	UNALLOCATED

Advanced SIMD and floating-point 64-bit move

The encodings in this section are decoded from Advanced SIMD and System register load/store and 64-bit move.

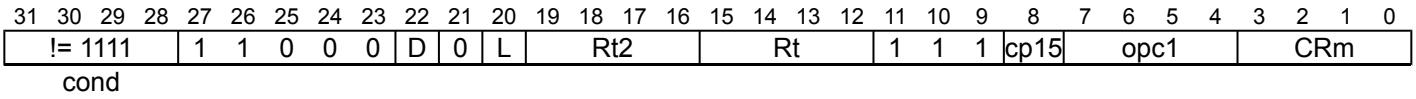


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields D	op	size	opc2	o3	Instruction Details
0					UNALLOCATED
1				0	UNALLOCATED
1		0x	00	1	UNALLOCATED
1			01		UNALLOCATED
1	0	10	00	1	VMOV (between two general-purpose registers and two single-precision registers) — from general-purpose registers
1	0	11	00	1	VMOV (between two general-purpose registers and a doubleword floating-point register) — from general-purpose registers
1			1x		UNALLOCATED
1	1	10	00	1	VMOV (between two general-purpose registers and two single-precision registers) — to general-purpose registers
1	1	11	00	1	VMOV (between two general-purpose registers and a doubleword floating-point register) — to general-purpose registers

System register 64-bit move

The encodings in this section are decoded from Advanced SIMD and System register load/store and 64-bit move.

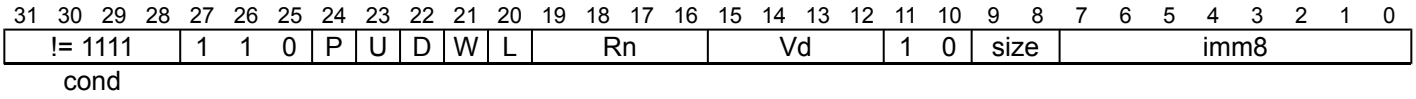


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields D	L	Instruction Details
0		UNALLOCATED
1	0	MCRR
1	1	MRRC

Advanced SIMD and floating-point load/store

The encodings in this section are decoded from Advanced SIMD and System register load/store and 64-bit move.



The following constraints also apply to this encoding: cond != 1111 && P:U:D:W != 00x0 && cond != 1111

Decode fields P	U	W	L	Rn	size	imm8	Instruction Details	Feature
0	0	1					UNALLOCATED	-

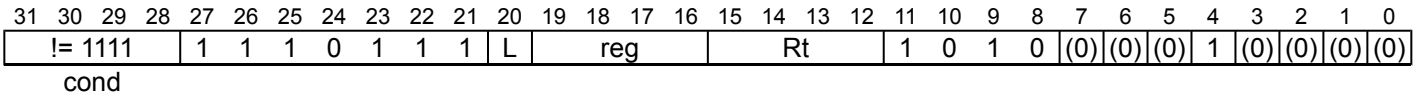
	011	Advanced SIMD 8/16/32-bit element move/duplicate	-
	10x	UNALLOCATED	-
	11x	System register 32-bit move	-

Floating-point move special register

The encodings in this section are decoded from Advanced SIMD and System register 32-bit move.

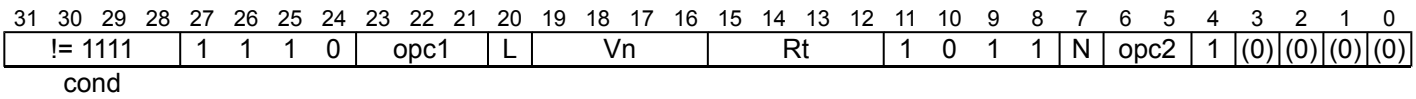


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields L	Instruction Details
0	VMSR
1	VMRS

Advanced SIMD 8/16/32-bit element move/duplicate

The encodings in this section are decoded from Advanced SIMD and System register 32-bit move.

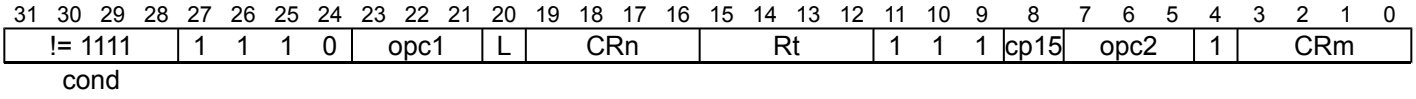


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields opc1	L	opc2	Instruction Details
0xx	0		VMOV (general-purpose register to scalar)
	1		VMOV (scalar to general-purpose register)
1xx	0	0x	VDUP (general-purpose register)
1xx	0	1x	UNALLOCATED

System register 32-bit move

The encodings in this section are decoded from Advanced SIMD and System register 32-bit move.

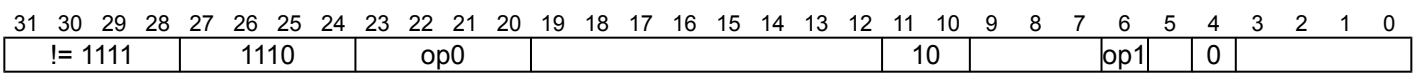


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields L	Instruction Details
0	MCR
1	MRC

Floating-point data-processing

The encodings in this section are decoded from System register access, Advanced SIMD, floating-point, and Supervisor call.

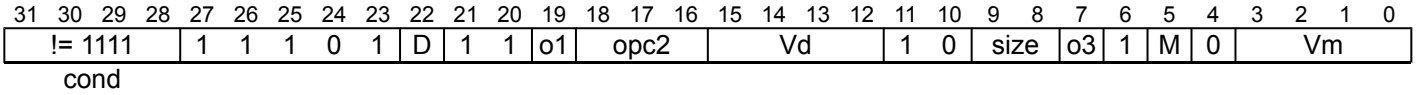


Decode fields op0	op1	Instruction details
1x11	1	Floating-point data-processing (two registers)

1x11	0	Floating-point move immediate
!= 1x11		Floating-point data-processing (three registers)

Floating-point data-processing (two registers)

The encodings in this section are decoded from Floating-point data-processing.



The following constraints also apply to this encoding: cond != 1111 && cond != 1111

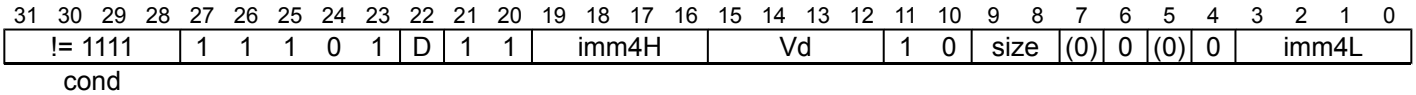
Floating-point move immediate

The encodings in this section are decoded from Floating-point data-processing.

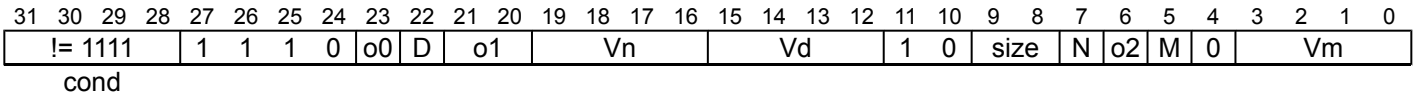


The following constraints also apply to this encoding: cond != 1111 && cond != 1111

Decode fields size	Instruction Details	Feature
00	UNALLOCATED	-
01	VMOV (immediate) — half-precision scalar	FEAT_FP16
10	VMOV (immediate) — single-precision scalar	-
11	VMOV (immediate) — double-precision scalar	-

Floating-point data-processing (three registers)

The encodings in this section are decoded from Floating-point data-processing.



The following constraints also apply to this encoding: cond != 1111 && o0:D:o1 != 1x11 && cond != 1111

Decode fields o0:o1	size	o2	Instruction Details	Feature
!= 111	00		UNALLOCATED	-
000	01	0	VMLA (floating-point) — half-precision scalar	FEAT_FP16
000	01	1	VMLS (floating-point) — half-precision scalar	FEAT_FP16
000	10	0	VMLA (floating-point) — single-precision scalar	-

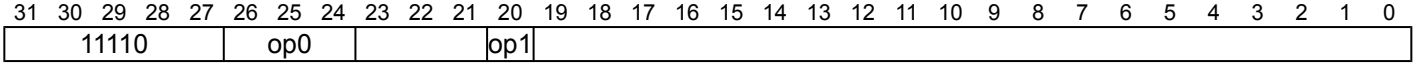
110	11	0	VFMA — double-precision scalar	-
110	11	1	VFMS — double-precision scalar	-

Unconditional instructions

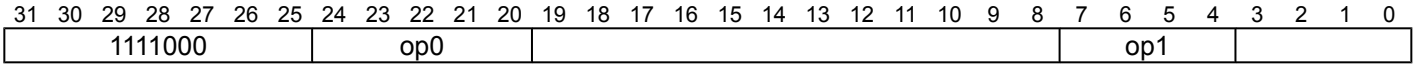
The encodings in this section are decoded from A32 instruction set encoding.



Decode fields op0	op1	Instruction details
00x		Miscellaneous
01x		Advanced SIMD data-processing
1xx	1	Memory hints and barriers
100	0	Advanced SIMD element or structure load/store
101	0	UNALLOCATED
11x	0	UNALLOCATED

Miscellaneous

The encodings in this section are decoded from Unconditional instructions.

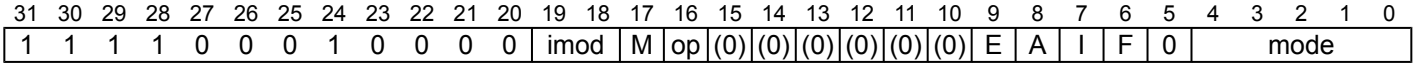


Decode fields op0	op1	Instruction details	Feature
0xxxx		UNALLOCATED	-
10000	xx0x	Change Process State	-
10001	1000	UNALLOCATED	-
10001	x100	UNALLOCATED	-
10001	xx01	UNALLOCATED	-
10001	0000	SETPAN	FEAT_PAN
1000x	0111	UNALLOCATED	-
10010	0111	CONSTRAINED UNPREDICTABLE	-
10011	0111	UNALLOCATED	-
1001x	xx0x	UNALLOCATED	-
100xx	0011	UNALLOCATED	-
100xx	0x10	UNALLOCATED	-
100xx	1x1x	UNALLOCATED	-
101xx		UNALLOCATED	-
11xxx		UNALLOCATED	-

The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings*

Change Process State

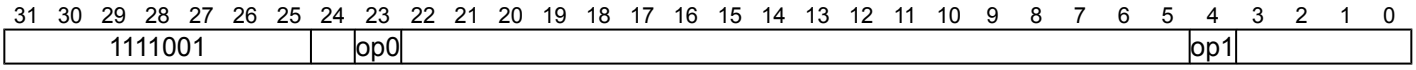
The encodings in this section are decoded from Miscellaneous.



Decode fields						Instruction Details
imod	M	op	I	F	mode	
		1	0	0	0xxxx	SETEND
00	1	0				CPS, CPSID, CPSIE — change mode
10		0				CPS, CPSID, CPSIE — interrupt enable and change mode
		1	0	0	1xxxx	UNALLOCATED
		1	0	1		UNALLOCATED
		1	1			UNALLOCATED
11		0				CPS, CPSID, CPSIE — interrupt disable and change mode

Advanced SIMD data-processing

The encodings in this section are decoded from Unconditional instructions.



Decode fields		Instruction details
op0	op1	
0		Advanced SIMD three registers of the same length
1	0	Advanced SIMD two registers, or three registers of different lengths
1	1	Advanced SIMD shifts and immediate generation

Advanced SIMD three registers of the same length

The encodings in this section are decoded from Advanced SIMD data-processing.

Memory hints and barriers

The encodings in this section are decoded from Unconditional instructions.

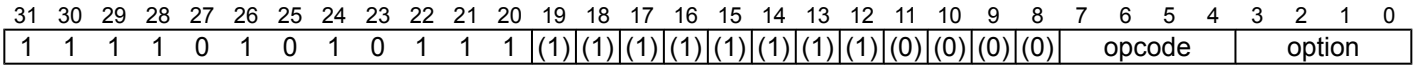
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
111101						op0					1																op1				

Decode fields		Instruction details
op0	op1	
00xx1		CONSTRAINED UNPREDICTABLE
01001		CONSTRAINED UNPREDICTABLE
01011		Barriers
011x1		CONSTRAINED UNPREDICTABLE
0xxx0		Preload (immediate)
1xxx0	0	Preload (register)
1xxx1	0	CONSTRAINED UNPREDICTABLE
1xxxx	1	UNALLOCATED

The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings*

Barriers

The encodings in this section are decoded from Memory hints and barriers.

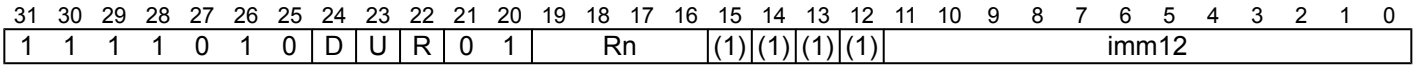


Decode fields opcode	option	Instruction Details	Feature
0000		CONSTRAINED UNPREDICTABLE	-
0001		CLREX	-
001x		CONSTRAINED UNPREDICTABLE	-
0100	!= 0x00	DSB	-
0100	0000	SSBB	-
0100	0100	PSSBB	-
0101		DMB	-
0110		ISB	-
0111		SB	FEAT_SB
1xxx		CONSTRAINED UNPREDICTABLE	-

The behavior of the CONSTRAINED UNPREDICTABLE encodings in this table is described in *CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instruction encodings*

Preload (immediate)

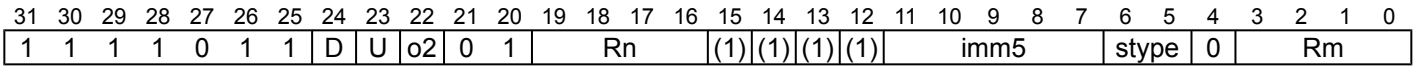
The encodings in this section are decoded from Memory hints and barriers.



Decode fields D	R	Rn	Instruction Details
0	0		Reserved hint, behaves as NOP
0	1		PLI (immediate, literal)
1		1111	PLD (literal)
1	0	!= 1111	PLD, PLDW (immediate) — preload write
1	1	!= 1111	PLD, PLDW (immediate) — preload read

Preload (register)

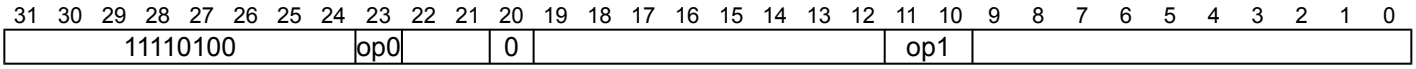
The encodings in this section are decoded from Memory hints and barriers.



Decode fields D	o2	imm5:stype	Instruction Details
0	0		Reserved hint, behaves as NOP
0	1	!= 0000011	PLI (register) — shift or rotate by value
0	1	0000011	PLI (register) — rotate right with extend
1	0	!= 0000011	PLD, PLDW (register) — preload write, optional shift or rotate
1	0	0000011	PLD, PLDW (register) — preload write, rotate right with extend
1	1	!= 0000011	PLD, PLDW (register) — preload read, optional shift or rotate
1	1	0000011	PLD, PLDW (register) — preload read, rotate right with extend

Advanced SIMD element or structure load/store

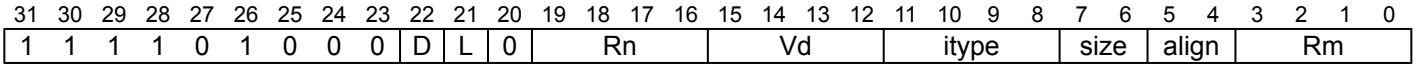
The encodings in this section are decoded from Unconditional instructions.



Decode fields op0	op1	Instruction details
0		Advanced SIMD load/store multiple structures
1	11	Advanced SIMD load single structure to all lanes
1	!= 11	Advanced SIMD load/store single structure to one lane

Advanced SIMD load/store multiple structures

The encodings in this section are decoded from Advanced SIMD element or structure load/store.



Decode fields L	itype	Rm	Instruction Details
0	000x	!= 11x1	VST4 (multiple 4-element structures)
0	000x	1101	VST4 (multiple 4-element structures)
0	000x	1111	VST4 (multiple 4-element structures)
0	0010	!= 11x1	VST1 (multiple single elements)
0	0010	1101	VST1 (multiple single elements)
0	0010	1111	VST1 (multiple single elements)
0	0011	!= 11x1	VST2 (multiple 2-element structures)
0	0011	1101	VST2 (multiple 2-element structures)
0	0011	1111	VST2 (multiple 2-element structures)
0	010x	!= 11x1	VST3 (multiple 3-element structures)
0	010x	1101	VST3 (multiple 3-element structures)
0	010x	1111	VST3 (multiple 3-element structures)
0	0110	!= 11x1	VST1 (multiple single elements)
0	0110	1101	VST1 (multiple single elements)
0	0110	1111	VST1 (multiple single elements)
0	0111	!= 11x1	VST1 (multiple single elements)
0	0111	1101	VST1 (multiple single elements)

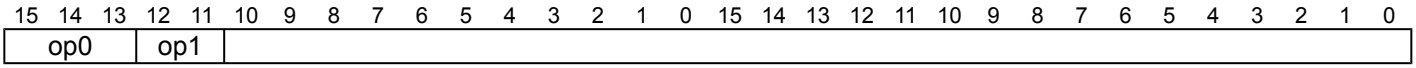
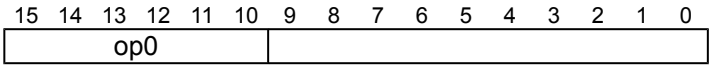
T32 instruction set encoding



Decode fields op0	Decode fields op1	Instruction details
!= 111		16-bit
111	00	B — T2
111	!= 00	32-bit

16-bit

The encodings in this section are decoded from T32 instruction set encoding.

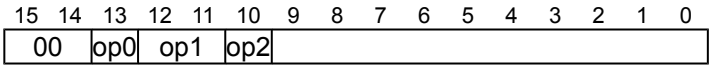


The following constraints also apply to this encoding: op0<5:3> != 111

Decode fields op0	Instruction details
00xxxx	Shift (immediate), add, subtract, move, and compare
010000	Data-processing (two low registers)
010001	Special data instructions and branch and exchange
01001x	LDR (literal) — T1
0101xx	Load/store (register offset)
011xxx	Load/store word/byte (immediate offset)
1000xx	Load/store halfword (immediate offset)
1001xx	Load/store (SP-relative)
1010xx	Add PC/SP (immediate)
1011xx	Miscellaneous 16-bit instructions
1100xx	Load/store multiple
1101xx	Conditional branch, and Supervisor Call

Shift (immediate), add, subtract, move, and compare

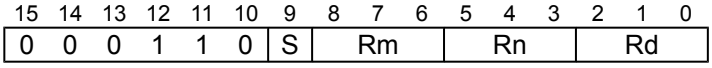
The encodings in this section are decoded from 16-bit.



Decode fields op0	Decode fields op1	Decode fields op2	Instruction details
0	11	0	Add, subtract (three low registers)
0	11	1	Add, subtract (two low registers and immediate)
0	!= 11		MOV, MOVS (register) — T2
1			Add, subtract, compare, move (one low register and immediate)

Add, subtract (three low registers)

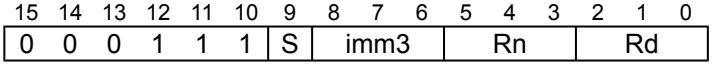
The encodings in this section are decoded from Shift (immediate), add, subtract, move, and compare.



Decode fields S	Instruction Details
0	ADD, ADDS (register)
1	SUB, SUBS (register)

Add, subtract (two low registers and immediate)

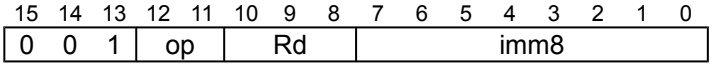
The encodings in this section are decoded from Shift (immediate), add, subtract, move, and compare.



Decode fields S	Instruction Details
0	ADD, ADDS (immediate)
1	SUB, SUBS (immediate)

Add, subtract, compare, move (one low register and immediate)

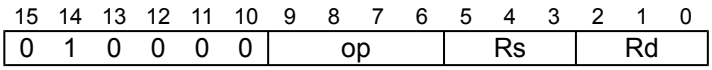
The encodings in this section are decoded from Shift (immediate), add, subtract, move, and compare.



Decode fields op	Instruction Details
00	MOV, MOVS (immediate)
01	CMP (immediate)
10	ADD, ADDS (immediate)
11	SUB, SUBS (immediate)

Data-processing (two low registers)

The encodings in this section are decoded from 16-bit.

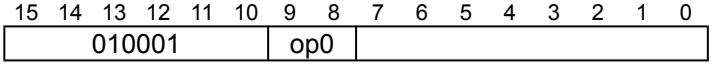


Decode fields op	Instruction Details
0000	AND, ANDS (register)
0001	EOR, EORS (register)
0010	MOV, MOVS (register-shifted register) — logical shift left
0011	MOV, MOVS (register-shifted register) — logical shift right
0100	MOV, MOVS (register-shifted register) — arithmetic shift right
0101	ADC, ADCS (register)
0110	SBC, SBCS (register)
0111	MOV, MOVS (register-shifted register) — rotate right
1000	TST (register)
1001	RSB, RSBS (immediate)
1010	CMP (register)
1011	CMN (register)

Decode fields op	Instruction Details
1100	ORR, ORRS (register)
1101	MUL, MULS
1110	BIC, BICS (register)
1111	MVN, MVNS (register)

Special data instructions and branch and exchange

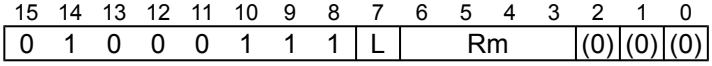
The encodings in this section are decoded from 16-bit.



Decode fields op0	Instruction details
11	Branch and exchange
!= 11	Add, subtract, compare, move (two high registers)

Branch and exchange

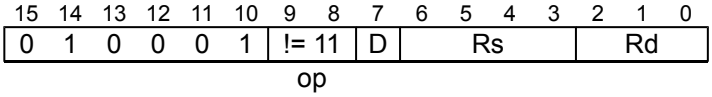
The encodings in this section are decoded from Special data instructions and branch and exchange.



Decode fields L	Instruction Details
0	BX
1	BLX (register)

Add, subtract, compare, move (two high registers)

The encodings in this section are decoded from Special data instructions and branch and exchange.

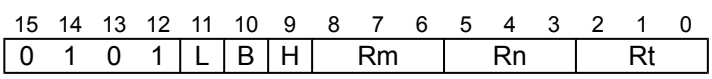


The following constraints also apply to this encoding: op != 11 && op != 11

op	Decode fields D:Rd	Rs	Instruction Details
00	!= 1101	!= 1101	ADD, ADDS (register)
00		1101	ADD, ADDS (SP plus register) — T1
00	1101	!= 1101	ADD, ADDS (SP plus register) — T2
01			CMP (register)
10			MOV, MOVS (register)

Load/store (register offset)

The encodings in this section are decoded from 16-bit.



Decode fields L	B	H	Instruction Details
0	0	0	STR (register)
0	0	1	STRH (register)
0	1	0	STRB (register)
0	1	1	LDRSB (register)
1	0	0	LDR (register)
1	0	1	LDRH (register)
1	1	0	LDRB (register)
1	1	1	LDRSH (register)

Load/store word/byte (immediate offset)

The encodings in this section are decoded from 16-bit.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	1	1	B	L	imm5					Rn			Rt		

Decode fields B	L	Instruction Details
0	0	STR (immediate)
0	1	LDR (immediate)
1	0	STRB (immediate)
1	1	LDRB (immediate)

Load/store halfword (immediate offset)

The encodings in this section are decoded from 16-bit.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	0	L	imm5					Rn			Rt		

Decode fields L	Instruction Details
0	STRH (immediate)
1	LDRH (immediate)

Load/store (SP-relative)

The encodings in this section are decoded from 16-bit.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	0	1	L	Rt			imm8							

Decode fields L	Instruction Details
0	STR (immediate)
1	LDR (immediate)

Add PC/SP (immediate)

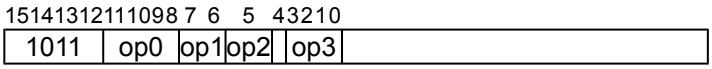
The encodings in this section are decoded from 16-bit.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
1	0	1	0	SP	Rd			imm8							

Decode fields SP	Instruction Details
0	ADR
1	ADD, ADDS (SP plus immediate)

Miscellaneous 16-bit instructions

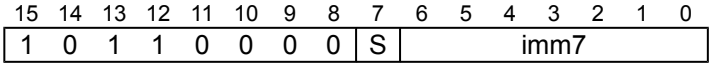
The encodings in this section are decoded from 16-bit.



Decode fields op0	op1	op2	op3	Instruction details	Feature
0000				Adjust SP (immediate)	-
0010				Extend	-
0110	00	0		SETPAN	FEAT_PAN
0110	00	1		UNALLOCATED	-
0110	01			Change Processor State	-
0110	1x			UNALLOCATED	-
0111				UNALLOCATED	-
1000				UNALLOCATED	-
1010	10			HLT	-
1010	!= 10			Reverse bytes	-
1110				BKPT	-
1111			0000	Hints	-
1111			!= 0000	IT	-
x0x1				CBNZ, CBZ	-
x10x				Push and Pop	-

Adjust SP (immediate)

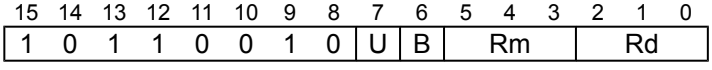
The encodings in this section are decoded from Miscellaneous 16-bit instructions.



Decode fields S	Instruction Details
0	ADD, ADDS (SP plus immediate)
1	SUB, SUBS (SP minus immediate)

Extend

The encodings in this section are decoded from Miscellaneous 16-bit instructions.

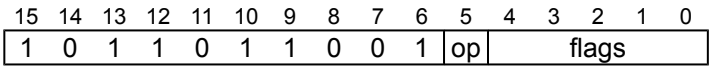


Decode fields U	B	Instruction Details
0	0	SXTH
0	1	SXTB
1	0	UXTH

Decode fields U	B	Instruction Details
1	1	UXTB

Change Processor State

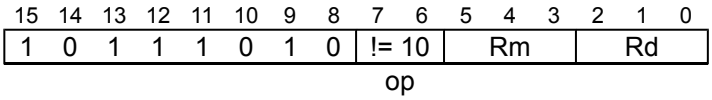
The encodings in this section are decoded from Miscellaneous 16-bit instructions.



Decode fields op	flags	Instruction Details
0		SETEND
1	0xxxx	CPS, CPSID, CPSIE — interrupt enable
1	1xxxx	CPS, CPSID, CPSIE — interrupt disable

Reverse bytes

The encodings in this section are decoded from Miscellaneous 16-bit instructions.

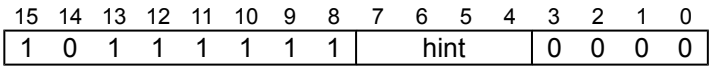


The following constraints also apply to this encoding: op != 10 && op != 10

Decode fields op	Instruction Details
00	REV
01	REV16
11	REVSH

Hints

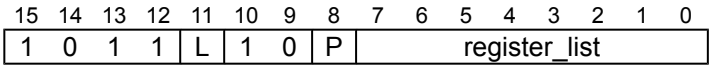
The encodings in this section are decoded from Miscellaneous 16-bit instructions.



Decode fields hint	Instruction Details
0000	NOP
0001	YIELD
0010	WFE
0011	WFI
0100	SEV
0101	SEVL
011x	Reserved hint, behaves as NOP
1xxx	Reserved hint, behaves as NOP

Push and Pop

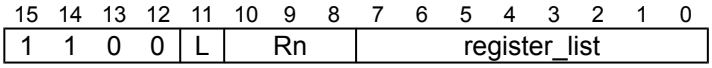
The encodings in this section are decoded from Miscellaneous 16-bit instructions.



Decode fields L	Instruction Details
0	PUSH
1	POP

Load/store multiple

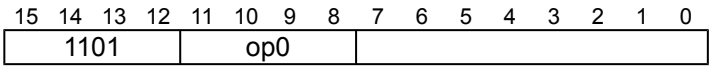
The encodings in this section are decoded from 16-bit.



Decode fields L	Instruction Details
0	STM, STMIA, STMEA
1	LDM, LDMIA, LDMFD

Conditional branch, and Supervisor Call

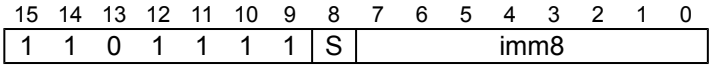
The encodings in this section are decoded from 16-bit.



Decode fields op0	Instruction details
111x	Exception generation
!= 111x	B — T1

Exception generation

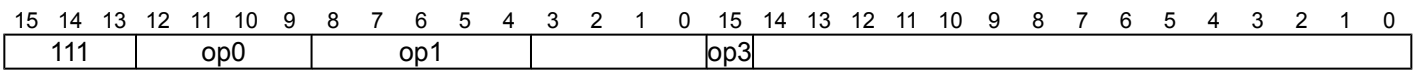
The encodings in this section are decoded from Conditional branch, and Supervisor Call.



Decode fields S	Instruction Details
0	UDF
1	SVC

32-bit

The encodings in this section are decoded from T32 instruction set encoding.



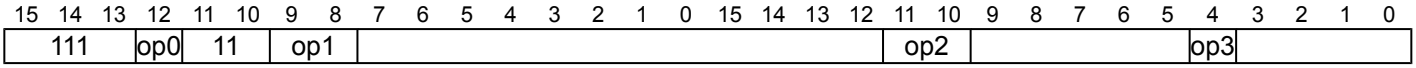
The following constraints also apply to this encoding: op0<3:2> != 00

Decode fields op0	op1	op3	Instruction details
x11x			System register access, Advanced SIMD, and floating-point

0100	xx0xx		Load/store multiple
0100	xx1xx		Load/store dual, load/store exclusive, load-acquire/store-release, and table branch
0101			Data-processing (shifted register)
10xx		1	Branches and miscellaneous control
10x0		0	Data-processing (modified immediate)
10x1	xxxx0	0	Data-processing (plain binary immediate)
10x1	xxxx1	0	UNALLOCATED
1100	1xxx0		Advanced SIMD element or structure load/store
1100	!= 1xxx0		Load/store single
1101	0xxxx		Data-processing (register)
1101	10xxx		Multiply, multiply accumulate, and absolute difference
1101	11xxx		Long multiply and divide

System register access, Advanced SIMD, and floating-point

The encodings in this section are decoded from 32-bit.



op0	Decode fields op1	op2	op3	Instruction details
	0x	0x		UNALLOCATED
	10	0x		UNALLOCATED
	11			Advanced SIMD data-processing
0	0x	1x		Advanced SIMD and System register load/store and 64-bit move
0	10	1x	1	Advanced SIMD and System register 32-bit move
0	10	10	0	Floating-point data-processing

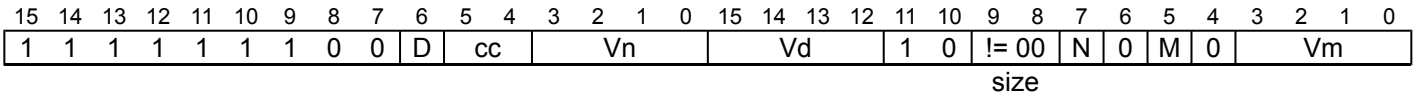
Floating-point conditional select

The encodings in this section are decoded from Additional Advanced SIMD and floating-point instructions.

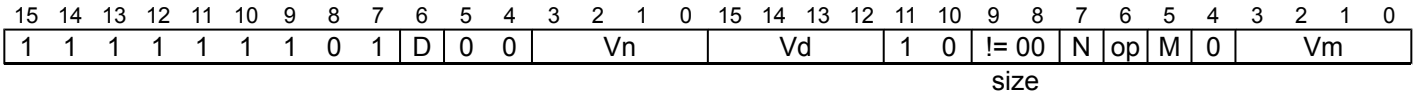


The following constraints also apply to this encoding: size != 00 && size != 00

Decode fields size	Instruction Details	Feature
01	VSELEQ, VSELGE, VSELGT, VSELVS — half-precision scalar	FEAT_FP16
10	VSELEQ, VSELGE, VSELGT, VSELVS — single-precision scalar	-
11	VSELEQ, VSELGE, VSELGT, VSELVS — double-precision scalar	-

Floating-point minNum/maxNum

The encodings in this section are decoded from Additional Advanced SIMD and floating-point instructions.

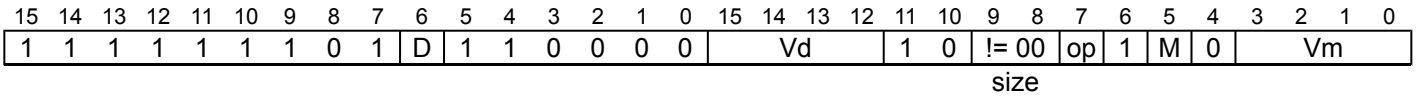


The following constraints also apply to this encoding: size != 00 && size != 00

Decode fields size	op	Instruction Details	Feature
01	0	VMAXNM — half-precision scalar	FEAT_FP16
01	1	VMINNM — half-precision scalar	FEAT_FP16
10	0	VMAXNM — single-precision scalar	-
10	1	VMINNM — single-precision scalar	-
11	0	VMAXNM — double-precision scalar	-
11	1	VMINNM — double-precision scalar	-

Floating-point extraction and insertion

The encodings in this section are decoded from Additional Advanced SIMD and floating-point instructions.

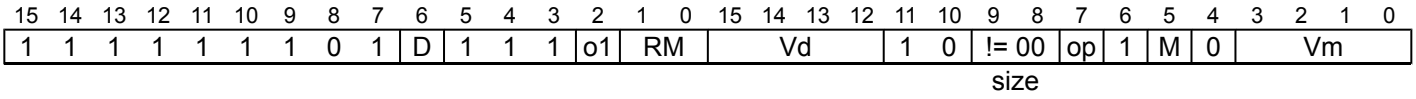


The following constraints also apply to this encoding: size != 00 && size != 00

Decode fields size	op	Instruction Details	Feature
01		UNALLOCATED	-
10	0	VMOVX	FEAT_FP16
10	1	VINS	FEAT_FP16
11		UNALLOCATED	-

Floating-point directed convert to integer

The encodings in this section are decoded from Additional Advanced SIMD and floating-point instructions.



The following constraints also apply to this encoding: size != 00 && size != 00

Decode fields				Instruction Details	Feature
o1	RM	size	op		
0		!= 00	1	UNALLOCATED	-
0	00	01	0	VRINTA (floating-point) — half-precision scalar	FEAT_FP16
0	00	10	0	VRINTA (floating-point) — single-precision scalar	-
0	00	11	0	VRINTA (floating-point) — double-precision scalar	-
0	01	01	0	VRINTN (floating-point) — half-precision scalar	FEAT_FP16
0	01	10	0	VRINTN (floating-point) — single-precision scalar	-
0	01	11	0	VRINTN (floating-point) — double-precision scalar	-
0	10	01	0	VRINTP (floating-point) — half-precision scalar	FEAT_FP16
0	10	10	0	VRINTP (floating-point) — single-precision scalar	-
0	10	11	0	VRINTP (floating-point) — double-precision scalar	-
0	11	01	0	VRINTM (floating-point) — half-precision scalar	FEAT_FP16
0	11	10	0	VRINTM (floating-point) — single-precision scalar	-
0	11	11	0	VRINTM (floating-point) — double-precision scalar	-
1	00	01		VCVTA (floating-point) — half-precision scalar	FEAT_FP16

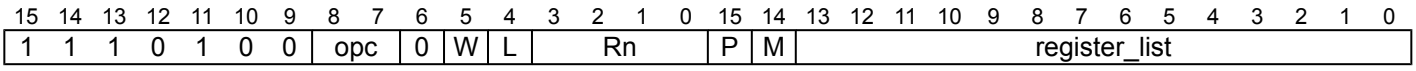
1	01	1			UNALLOCATED	-
1	1x	1			UNALLOCATED	-

Load/store multiple

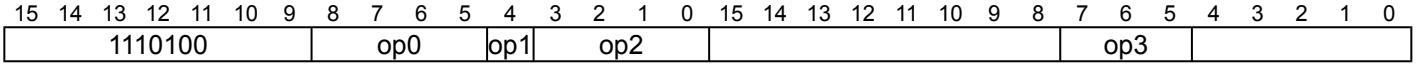
The encodings in this section are decoded from 32-bit.



Decode fields opc	L	Instruction Details
00	0	SRS, SRSDA, SRSDB, SRSIA, SRSIB — T1
00	1	RFE, RFEDA, RFEDB, RFEIA, RFEIB — T1
01	0	STM, STMIA, STMEA
01	1	LDM, LDMIA, LDMFD
10	0	STMDB, STMFD
10	1	LDMDB, LDMEA
11	0	SRS, SRSDA, SRSDB, SRSIA, SRSIB — T2
11	1	RFE, RFEDA, RFEDB, RFEIA, RFEIB — T2

Load/store dual, load/store exclusive, load-acquire/store-release, and table branch

The encodings in this section are decoded from 32-bit.



The following constraints also apply to this encoding: op0<1> == 1

Decode fields op0	op1	op2	op3	Instruction details
0010				Load/store exclusive
0110	0		000	UNALLOCATED
0110	1		000	TBB, TBH
0110			01x	Load/store exclusive byte/half/dual
0110			1xx	Load-acquire / Store-release
0x11		!= 1111		Load/store dual (immediate, post-indexed)
1x10		!= 1111		Load/store dual (immediate)
1x11		!= 1111		Load/store dual (immediate, pre-indexed)
!= 0xx0		1111		LDRD (literal)

Load/store exclusive

The encodings in this section are decoded from Load/store dual, load/store exclusive, load-acquire/store-release, and table branch.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

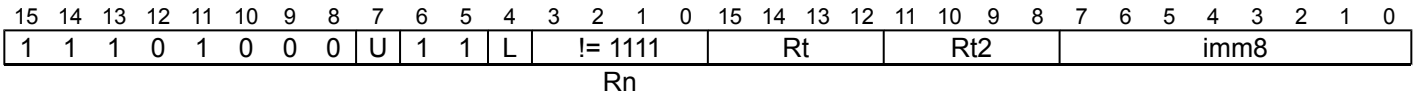
1	1	10	LDAEX
1	1	11	LDAEXD

Load/store dual (immediate, post-indexed)

The encodings in this section are decoded from Load/store dual, load/store exclusive, load-acquire/store-release, and table branch.

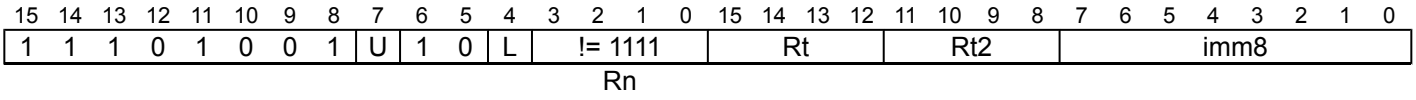


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields L	Instruction Details
0	STRD (immediate)
1	LDRD (immediate)

Load/store dual (immediate)

The encodings in this section are decoded from Load/store dual, load/store exclusive, load-acquire/store-release, and table branch.

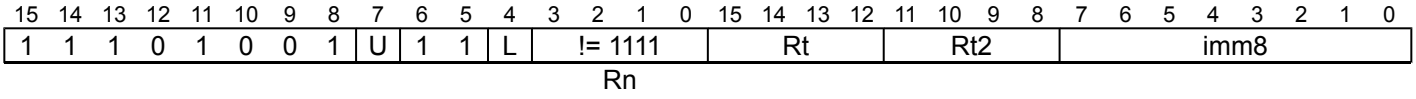


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields L	Instruction Details
0	STRD (immediate)
1	LDRD (immediate)

Load/store dual (immediate, pre-indexed)

The encodings in this section are decoded from Load/store dual, load/store exclusive, load-acquire/store-release, and table branch.

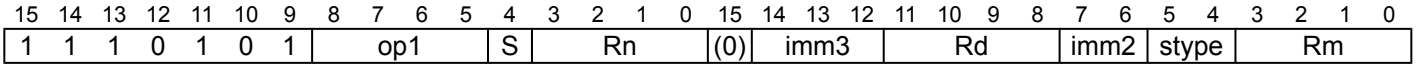


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields L	Instruction Details
0	STRD (immediate)
1	LDRD (immediate)

Data-processing (shifted register)

The encodings in this section are decoded from 32-bit.



Decode fields op1	S	Rn	imm3:imm2:stype	Rd	Instruction Details
0000	0		!= 0000011		AND, ANDS (register) — AND, shift or rotate by value
0000	0		0000011		AND, ANDS (register) — AND, rotate right with extend

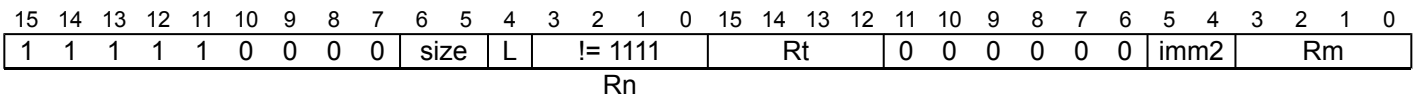
10	1	!= 1111	1100xx	Load/store, signed (negative immediate)
10	1	!= 1111	1110xx	Load/store, signed (unprivileged)
10	1	!= 1111	11x1xx	Load/store, signed (immediate, pre-indexed)
11	1	!= 1111		Load/store, signed (positive immediate)
1x	1	1111		Load, signed (literal)

Load/store, unsigned (register offset)

The encodings in this section are decoded from Load/store single.



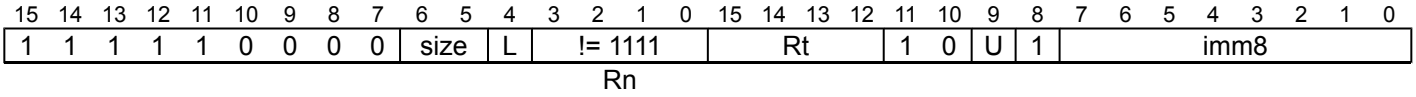
The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

size	L	Decode fields Rt	Instruction Details
00	0		STRB (register)
00	1	!= 1111	LDRB (register)
00	1	1111	PLD, PLDW (register) — preload read

Decode fields			Instruction Details
size	L	Rt	
01	0		STRH (register)
01	1	!= 1111	LDRH (register)
01	1	1111	PLD, PLDW (register) — preload write
10	0		STR (register)
10	1		LDR (register)
11			UNALLOCATED

Load/store, unsigned (immediate, post-indexed)

The encodings in this section are decoded from Load/store single.

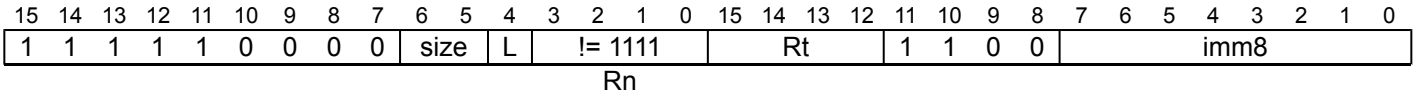


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields		Instruction Details
size	L	
00	0	STRB (immediate)
00	1	LDRB (immediate)
01	0	STRH (immediate)
01	1	LDRH (immediate)
10	0	STR (immediate)
10	1	LDR (immediate)
11		UNALLOCATED

Load/store, unsigned (negative immediate)

The encodings in this section are decoded from Load/store single.

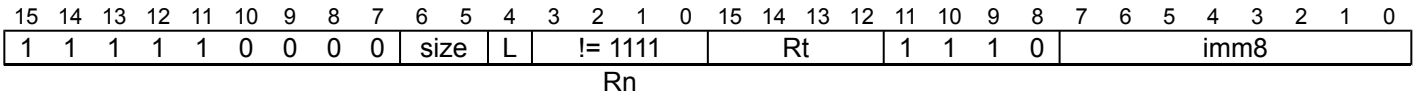


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields			Instruction Details
size	L	Rt	
00	0		STRB (immediate)
00	1	!= 1111	LDRB (immediate)
00	1	1111	PLD, PLDW (immediate) — preload read
01	0		STRH (immediate)
01	1	!= 1111	LDRH (immediate)
01	1	1111	PLD, PLDW (immediate) — preload write
10	0		STR (immediate)
10	1		LDR (immediate)
11			UNALLOCATED

Load/store, unsigned (unprivileged)

The encodings in this section are decoded from Load/store single.

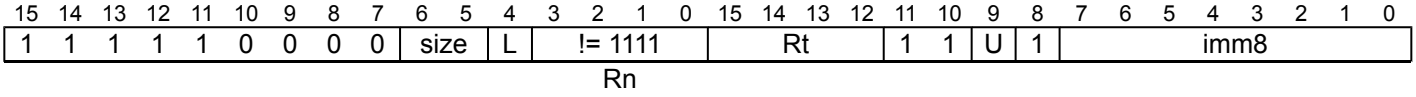


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields		Instruction Details
size	L	
00	0	STRBT
00	1	LDRBT
01	0	STRHT
01	1	LDRHT
10	0	STRT
10	1	LDRT
11		UNALLOCATED

Load/store, unsigned (immediate, pre-indexed)

The encodings in this section are decoded from Load/store single.

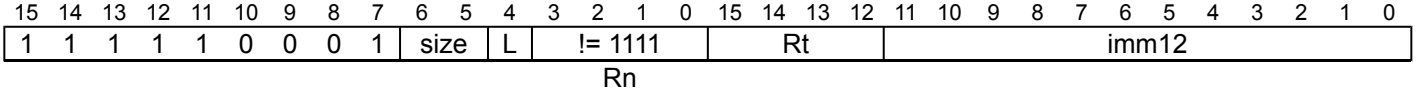


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields		Instruction Details
size	L	
00	0	STRB (immediate)
00	1	LDRB (immediate)
01	0	STRH (immediate)
01	1	LDRH (immediate)
10	0	STR (immediate)
10	1	LDR (immediate)
11		UNALLOCATED

Load/store, unsigned (positive immediate)

The encodings in this section are decoded from Load/store single.



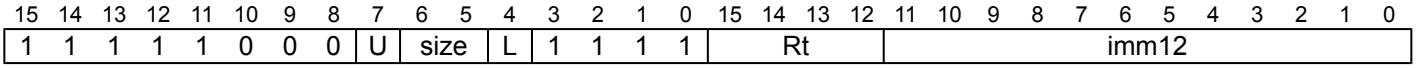
The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields			Instruction Details
size	L	Rt	
00	0		STRB (immediate)
00	1	!= 1111	LDRB (immediate)
00	1	1111	PLD, PLDW (immediate) — preload read

Decode fields size	L	Rt	Instruction Details
01	0		STRH (immediate)
01	1	!= 1111	LDRH (immediate)
01	1	1111	PLD, PLDW (immediate) — preload write
10	0		STR (immediate)
10	1		LDR (immediate)

Load, unsigned (literal)

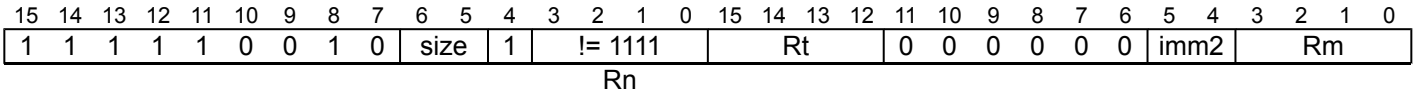
The encodings in this section are decoded from Load/store single.



Decode fields size	L	Rt	Instruction Details
0x	1	1111	PLD (literal)
00	1	!= 1111	LDRB (literal)
01	1	!= 1111	LDRH (literal)
10	1		LDR (literal)
11			UNALLOCATED

Load/store, signed (register offset)

The encodings in this section are decoded from Load/store single.

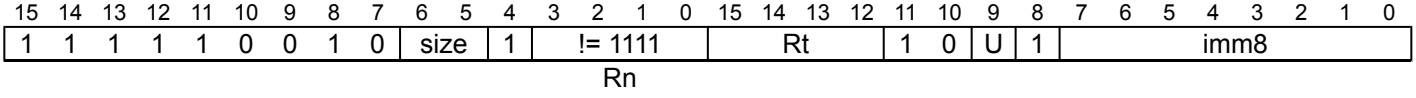


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields size	Rt	Instruction Details
00	!= 1111	LDRSB (register)
00	1111	PLI (register)
01	!= 1111	LDRSH (register)
01	1111	Reserved hint, behaves as NOP
1x		UNALLOCATED

Load/store, signed (immediate, post-indexed)

The encodings in this section are decoded from Load/store single.



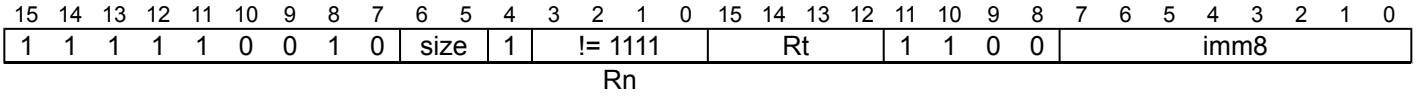
The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields size	Instruction Details
00	LDRSB (immediate)

Decode fields size	Instruction Details
01	LDRSH (immediate)
1x	UNALLOCATED

Load/store, signed (negative immediate)

The encodings in this section are decoded from Load/store single.

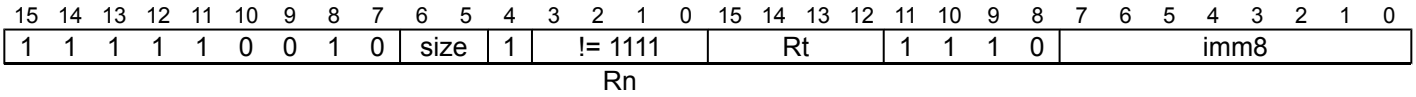


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields size	Rt	Instruction Details
00	!= 1111	LDRSB (immediate)
00	1111	PLI (immediate, literal)
01	!= 1111	LDRSH (immediate)
01	1111	Reserved hint, behaves as NOP
1x		UNALLOCATED

Load/store, signed (unprivileged)

The encodings in this section are decoded from Load/store single.

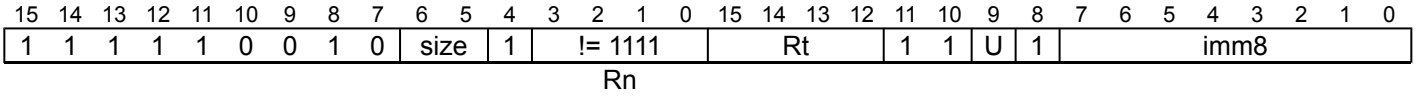


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields size	Instruction Details
00	LDRSBT
01	LDRSHT
1x	UNALLOCATED

Load/store, signed (immediate, pre-indexed)

The encodings in this section are decoded from Load/store single.

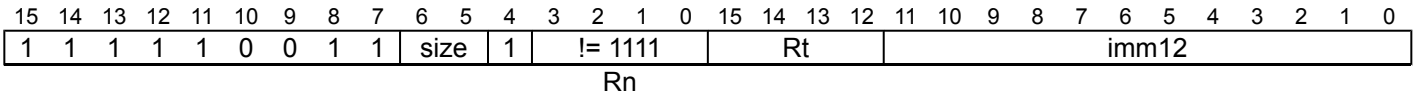


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields size	Instruction Details
00	LDRSB (immediate)
01	LDRSH (immediate)
1x	UNALLOCATED

Load/store, signed (positive immediate)

The encodings in this section are decoded from Load/store single.

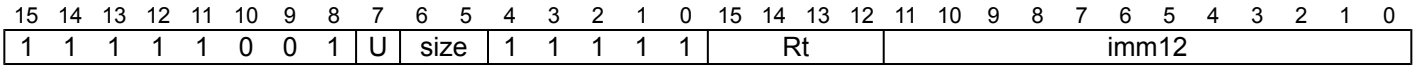


The following constraints also apply to this encoding: Rn != 1111 && Rn != 1111

Decode fields		Instruction Details
size	Rt	
00	!= 1111	LDRSB (immediate)
00	1111	PLI (immediate, literal)
01	!= 1111	LDRSH (immediate)
01	1111	Reserved hint, behaves as NOP

Load, signed (literal)

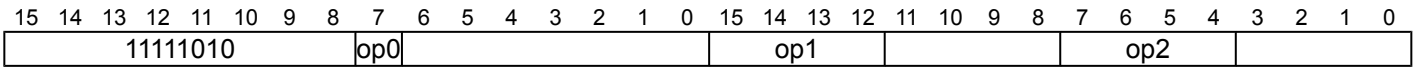
The encodings in this section are decoded from Load/store single.



Decode fields		Instruction Details
size	Rt	
00	!= 1111	LDRSB (literal)
00	1111	PLI (immediate, literal)
01	!= 1111	LDRSH (literal)
01	1111	Reserved hint, behaves as NOP
1x		UNALLOCATED

Data-processing (register)

The encodings in this section are decoded from 32-bit.



Decode fields			Instruction details
op0	op1	op2	
0	1111	0000	MOV, MOVS (register-shifted register) — T2, Flag setting
0	1111	0001	UNALLOCATED
0	1111	001x	UNALLOCATED

// Hint_Prefetch()
// ===============
// Signals the memory system that memory accesses of type HINT to or from the specified address are
// likely in the near future. The memory system may take some action to speed up the memory
// accesses when they do occur, such as pre-loading the specified address into one or more
// caches as indicated by the innermost cache level target (0=L1, 1=L2, etc) and non-temporal hint
// stream. Any or all prefetch hints may be treated as a NOP. A prefetch hint must not cause a
// synchronous abort due to Alignment or Translation faults and the like. Its only effect on
// software-visible state should be on caches and TLBs associated with address, which must be
// accessible by reads, writes or execution, as defined in the translation regime of the current
// Exception level. It is guaranteed not to access Device memory.
// A Prefetch_EXEC hint must not result in an access that could not be performed by a speculative
// instruction fetch, therefore if all associated MMUs are disabled, then it cannot access any
// memory location that cannot be accessed by instruction fetches.
