- There must be separate registers in the Secure (MPAMF_CSAMON_IDR_s), Non-secure (MPAMF_CSAMON_IDR_ns), Root (MPAMF_CSAMON_IDR_rt), and Realm (MPAMF_CSAMON_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_CSAMON_IDR shows the configuration of cache storage allocation monitoring for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.
- Access to MPAMF_CSAMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_CSAMON_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0098

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0098	MPAMF_CSAMON_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0098	MPAMF_CSAMON_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0098	MPAMF_CSAMON_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0098	MPAMF_CSAMON_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_CSUMON_IDR, MPAM Features Cache Storage Usage Monitoring ID register

The MPAMF_CSUMON_IDR characteristics are:

Purpose

Indicates the number of cache storage usage monitor instances and other properties of the CSU monitoring.

Configuration

The power domain of MPAMF_CSUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSU == '1'. Otherwise, direct accesses to MPAMF_CSUMON_IDR are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MPAMF_CSUMON_IDR_s indicates the number and properties of Secure cache storage usage monitoring.
- MPAMF_CSUMON_IDR_ns indicates the number and properties of Non-secure cache storage usage monitoring.
- If FEAT_RME is implemented the following statements also apply:
- MPAMF_CSUMON_IDR_rt indicates the number and properties of Root cache storage usage monitoring.
- MPAMF_CSUMON_IDR_rl indicates the number and properties of Realm cache storage usage monitoring.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

The power and reset domain of each MSC component is specific to that component.

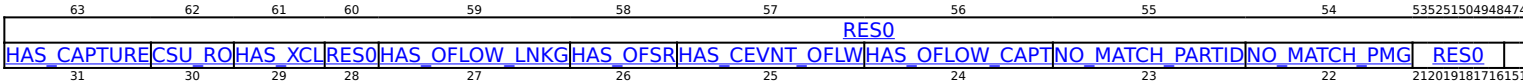
Attributes

MPAMF_CSUMON_IDR is a:

- 64-bit register when FEAT_MPAMv2_MSC is implemented
- 32-bit register when FEAT_MPAMv1p0 is implemented or FEAT_MPAMv0p1 is implemented

Field descriptions

When FEAT_MPAMv2_MSC is implemented:



Bits [63:33]

Reserved, RES0.

HAS_MON_SEC, bit [32]

Reports if monitor instance assignment to physical address space is implemented for the monitor type.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MON_SEC	Meaning
0b0	Monitor instance assignment to physical address space is not implemented for the monitor type.
0b1	Monitor instance assignment to physical address space is implemented for the monitor type. This value is mandatory if FEAT_RME is implemented.

Access to this field is RO.

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_CSU to the corresponding MSMON_CSU_CAPTURE on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CAPTURE	Meaning
0b0	MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.
0b1	The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.

If MPAMF_IDR.HAS_RIS is 1, this field reports that CSU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

CSU_RO, bit [30]

The implementation of MSMON_CSU is read-only.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSU_RO	Meaning
0b0	MSMON_CSU is read/write.
0b1	MSMON_CSU is read-only.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the MSMON_CSU monitor register is read-only for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_XCL, bit [29]

Has filtering to exclude clean data and implements the MSMON_CFG_CSU_FLT.XCL field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_XCL	Meaning
0b0	MSMON_CFG_CSU_FLT does not implement the XCL field.
0b1	MSMON_CFG_CSU_FLT implements the XCL field to exclude counting data in the clean state in the monitor instance.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the MSMON_CFG_CSU_FLT.XCL field is implemented in the CSU monitor instances for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Bit [28]

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]

Supports MSMON_CFG_CSU_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_LNKG	Meaning
0b0	Does not support CSU overflow linkage.
0b1	Supports CSU overflow linkage and the MSMON_CFG_CSU_CTL.OFLOW_LNKG field.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSU_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_OFSR, bit [26]

The CSU monitor overflow status bitmap register, MSMON_CSU_OFSR, is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFSR	Meaning
0b0	MSMON_CSU_OFSR register is not implemented.
0b1	MSMON_CSU_OFSR register is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the CSU monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_CEVNT_OFLW, bit [25]

Supports MSMON_CFG_CSU_CTL.CEVNT_OFLW field which can enable the CSU monitor instance to perform overflow behaviors on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CEVNT_OFLW	Meaning
0b0	Does not support MSMON_CFG_CSU_CTL.CEVNT_OFLW.
0b1	Supports MSMON_CFG_CSU_CTL.CEVNT_OFLW.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSU_CTL.CEVNT_OFLW is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_OFLOW_CAPT, bit [24]

Supports MSMON_CFG_CSU_CTL.OFLOW_CAPT field which can enable the CSU monitor instance to capture the monitor on an overflow.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_CAPT	Meaning
0b0	Does not support MSMON_CFG_CSU_CTL.OFLOW_CAPT.
0b1	Supports MSMON_CFG_CSU_CTL.OFLOW_CAPT.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSU_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

NO_MATCH_PARTID, bit [23]

Indicates support for using PARTID identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PARTID	Meaning
0b0	Supports cache storage usage monitoring based on PARTID.
0b1	Does not support cache storage usage monitoring based on PARTID.

Access to this field is RO.

NO_MATCH_PMG, bit [22]

Indicates support for using PMG identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PMG	Meaning
0b0	Supports cache storage usage monitoring based on PMG.
0b1	Does not support cache storage usage monitoring based on PMG.

Access to this field is RO.

Bits [21:16]

Reserved, RES0.

NUM_MON, bits [15:0]

The number of cache storage usage monitor instances implemented.

The largest MSMON_CFG_MON_SEL.MON_SEL value is NUM_MON minus 1.

If MPAMF_IDR.HAS_RIS is 1, this field reports the number of CSU monitor instances implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When FEAT_MPAMv1p0 is implemented or FEAT_MPAMv0p1 is implemented:

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_CSU to the corresponding MSMON_CSU_CAPTURE on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CAPTURE	Meaning
0b0	MSMON_CSU_CAPTURE is not implemented and there is no support for capture events in the CSU monitor.
0b1	The MSMON_CSU_CAPTURE register is implemented and the CSU monitor supports the capture event behavior.

If MPAMF_IDR.HAS_RIS is 1, this field reports that CSU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

CSU_RO, bit [30]

The implementation of MSMON_CSU is read-only.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSU_RO	Meaning
0b0	MSMON_CSU is read/write.
0b1	MSMON_CSU is read-only.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the MSMON_CSU monitor register is read-only for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_XCL, bit [29]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has filtering to exclude clean data and implements the MSMON_CFG_CSU_FLT.XCL field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_XCL	Meaning
0b0	MSMON_CFG_CSU_FLT does not implement the XCL field.
0b1	MSMON_CFG_CSU_FLT implements the XCL field to exclude counting data in the clean state in the monitor instance.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the MSMON_CFG_CSU_FLT.XCL field is implemented in the CSU monitor instances for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSU_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_LNKG	Meaning
0b0	Does not support CSU overflow linkage.
0b1	Supports CSU overflow linkage and the MSMON_CFG_CSU_CTL.OFLOW_LNKG field.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSU_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFSR, bit [26]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The CSU monitor overflow status bitmap register, MSMON_CSU_OFSR, is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFSR	Meaning
0b0	MSMON_CSU_OFSR register is not implemented.
0b1	MSMON_CSU_OFSR register is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the CSU monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_CEVNT_OFLW, bit [25]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSU_CTL.CEVNT_OFLW field which can enable the CSU monitor instance to perform overflow behaviors on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CEVNT_OFLW	Meaning
0b0	Does not support MSMON_CFG_CSU_CTL.CEVNT_OFLW.
0b1	Supports MSMON_CFG_CSU_CTL.CEVNT_OFLW.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSU_CTL.CEVNT_OFLW is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFLOW_CAPT, bit [24]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSU_CTL.OFLOW_CAPT field which can enable the CSU monitor instance to capture the monitor on an overflow.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_CAPT	Meaning
0b0	Does not support MSMON_CFG_CSU_CTL.OFLOW_CAPT.
0b1	Supports MSMON_CFG_CSU_CTL.OFLOW_CAPT.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSU_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NO_MATCH_PARTID, bit [23]

Indicates support for using PARTID identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PARTID	Meaning
0b0	Supports cache storage usage monitoring based on PARTID.
0b1	Does not support cache storage usage monitoring based on PARTID.

Access to this field is RO.

NO_MATCH_PMG, bit [22]

Indicates support for using PMG identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PMG	Meaning
0b0	Supports cache storage usage monitoring based on PMG.
0b1	Does not support cache storage usage monitoring based on PMG.

Access to this field is RO.

Bits [21:16]

Reserved, RES0.

NUM_MON, bits [15:0]

The number of cache storage usage monitor instances implemented.

The largest MSMON_CFG_MON_SEL.MON_SEL value is NUM_MON minus 1.

If MPAMF_IDR.HAS_RIS is 1, this field reports the number of CSU monitor instances implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_CSUMON_IDR

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MPAMF_CSUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.
- MPAMF_CSUMON_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_CSUMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_ns.
- There must be separate registers in the Secure (MPAMF_CSUMON_IDR_s) and Non-secure (MPAMF_CSUMON_IDR_ns) MPAM feature pages.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_CSUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_CSUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_CSUMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_ns, MPAMF_CSUMON_IDR_rt, or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rt or MPAMF_CSUMON_IDR_rl.
- MPAMF_CSUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_CSUMON_IDR_rl.

- There must be separate registers in the Secure (MPAMF_CSUMON_IDR_s), Non-secure (MPAMF_CSUMON_IDR_ns), Root (MPAMF_CSUMON_IDR_rt), and Realm (MPAMF_CSUMON_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_CSUMON_IDR shows the configuration of cache storage usage monitoring for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.
- Access to MPAMF_CSUMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_CSUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0088

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0088	MPAMF_CSUMON_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0088	MPAMF_CSUMON_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0088	MPAMF_CSUMON_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0088	MPAMF_CSUMON_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ECR, MPAM Error Control Register

The MPAMF_ECR characteristics are:

Purpose

MPAMF_ECR is a 32-bit read/write register that controls MPAM error interrupts for this MSC.

MPAMF_ECR_s controls Secure MPAM error handling. MPAMF_ECR_ns controls Non-secure MPAM error handling. MPAMF_ECR_rt controls Root MPAM error handling. MPAMF_ECR_rl controls Realm MPAM error handling.

Configuration

The power domain of MPAMF_ECR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented. Otherwise, direct accesses to MPAMF_ECR are RES0.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ECR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

INTEN, bit [0]

Interrupt Enable.

INTEN	Meaning
0b0	MPAM error interrupts are not signaled.
0b1	MPAM error interrupts are signaled.

Accessing MPAMF_ECR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMF_ECR_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ECR_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ECR_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ECR_rl must only be accessible from the Realm MPAM feature page.
- MPAMF_ECR_s, MPAMF_ECR_ns, MPAMF_ECR_rt, and MPAMF_ECR_rl must be separate registers:
- The Secure instance (MPAMF_ECR_s) accesses the error interrupt controls used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ECR_ns) accesses the error interrupt controls used for Non-secure PARTIDs.
- The Root instance (MPAMF_ECR_rt) accesses the error interrupt controls used for Root PARTIDs.
- The Realm instance (MPAMF_ECR_rl) accesses the error interrupt controls used for Realm PARTIDs.

MPAMF_ECR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x00F0

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F0	MPAMF_ECR_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F0	MPAMF_ECR_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00F0	MPAMF_ECR_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00F0	MPAMF_ECR_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ERR_MSI_ADDR_H, MPAM Error MSI High-part Address Register

The MPAMF_ERR_MSI_ADDR_H characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_H_s is the high part of the MSI write address for error interrupts related to Secure PARTIDs.
MPAMF_ERR_MSI_ADDR_H_ns is the high part of the MSI write address for error interrupts related to Non-secure PARTIDs.
MPAMF_ERR_MSI_ADDR_H_rt is the high part of the MSI write address for error interrupts related to Root PARTIDs.
MPAMF_ERR_MSI_ADDR_H_rl is the high part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ERR_MSI == '1'. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_H are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_H is a 32-bit register.

Field descriptions

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MPAMF_ERR_MSI_ADDR_H

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMF_ERR_MSI_ADDR_H_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_rl must only be accessible from the Realm MPAM feature page.
- MPAMF_ERR_MSI_ADDR_H_s, MPAMF_ERR_MSI_ADDR_H_ns, MPAMF_ERR_MSI_ADDR_H_rt, and MPAMF_ERR_MSI_ADDR_H_rl must be separate registers:
- The Secure instance (MPAMF_ERR_MSI_ADDR_H_s) accesses the high part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_H_ns) accesses the high part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_H_rt) accesses the high part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_H_rl) accesses the high part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x00E4

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E4	MPAMF_ERR_MSI_ADDR_H_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E4	MPAMF_ERR_MSI_ADDR_H_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E4	MPAMF_ERR_MSI_ADDR_H_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E4	MPAMF_ERR_MSI_ADDR_H_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ERR_MSI_ADDR_L, MPAM Error MSI Low-part Address Register

The MPAMF_ERR_MSI_ADDR_L characteristics are:

Purpose

MPAMF_ERR_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM error MSI address.

MPAMF_ERR_MSI_ADDR_L_s is the low part of the MSI write address for error interrupts related to Secure PARTIDs.
MPAMF_ERR_MSI_ADDR_L_ns is the low part of the MSI write address for error interrupts related to Non-secure PARTIDs.
MPAMF_ERR_MSI_ADDR_L_rt is the low part of the MSI write address for error interrupts related to Root PARTIDs.
MPAMF_ERR_MSI_ADDR_L_rl is the low part of the MSI write address for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ERR_MSI == '1'. Otherwise, direct accesses to MPAMF_ERR_MSI_ADDR_L are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ADDR_L is a 32-bit register.

Field descriptions

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reserved, RES0.

Accessing MPAMF_ERR_MSI_ADDR_L

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMF_ERR_MSI_ADDR_L_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_rl must only be accessible from the Realm MPAM feature page.
- MPAMF_ERR_MSI_ADDR_L_s, MPAMF_ERR_MSI_ADDR_L_ns, MPAMF_ERR_MSI_ADDR_L_rt, and MPAMF_ERR_MSI_ADDR_L_rl must be separate registers:
- The Secure instance (MPAMF_ERR_MSI_ADDR_L_s) accesses the low part of the memory address for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ADDR_L_ns) accesses the low part of the memory address for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ADDR_L_rt) accesses the low part of the memory address for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ADDR_L_rl) accesses the low part of the memory address for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x00E0

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E0	MPAMF_ERR_MSI_ADDR_L_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E0	MPAMF_ERR_MSI_ADDR_L_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E0	MPAMF_ERR_MSI_ADDR_L_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E0	MPAMF_ERR_MSI_ADDR_L_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ERR_MSI_ATTR, MPAM Error MSI Write Attributes Register

The MPAMF_ERR_MSI_ATTR characteristics are:

Purpose

MPAMF_ERR_MSI_ATTR is a 32-bit read/write register that controls MPAM error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_ATTR_s controls the attributes of Secure MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_ns controls the attributes of Non-secure MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_rt controls the attributes of Root MPAM error MSI writes. MPAMF_ERR_MSI_ATTR_rl controls the attributes of Realm MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ERR_MSI == '1'. Otherwise, direct accesses to MPAMF_ERR_MSI_ATTR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_ATTR is a 32-bit register.

Field descriptions

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

MSI_SH	Meaning
0b00	Non-shareable.
0b01	Reserved, CONSTRAINED UNPREDICTABLE.
0b10	Outer Shareable.
0b11	Inner Shareable.

When MPAMF_ERR_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note

This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE).

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cacheable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cacheable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MPAMF_ERR_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more than 'n' characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Error interrupt MSI Enable.

MSIEN	Meaning
0b0	MPAM error MSI writes are not generated to signal enabled MPAM error interrupts. When error MSI writes are disabled, hardwired error interrupts could be generated.
0b1	MPAM error MSI writes are generated to signal enabled MPAM error interrupts. When error MSI writes are enabled, hardwired error interrupts are not generated.

The value of this field affects whether hardwired error interrupts are generated.

The reset behavior of this field is:

- On a MSC reset, this field resets to '0'.

Accessing MPAMF_ERR_MSI_ATTR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMF_ERR_MSI_ATTR_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_ATTR_rl must only be accessible from the Realm MPAM feature page.
- MPAMF_ERR_MSI_ATTR_s, MPAMF_ERR_MSI_ATTR_ns, MPAMF_ERR_MSI_ATTR_rt, and MPAMF_ERR_MSI_ATTR_rl must be separate registers:
- The Secure instance (MPAMF_ERR_MSI_ATTR_s) accesses the memory access attributes for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_ATTR_ns) accesses the memory access attributes for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_ATTR_rt) accesses the memory access attributes for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_ATTR_rl) accesses the memory access attributes for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x00EC

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00EC	MPAMF_ERR_MSI_ATTR_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00EC	MPAMF_ERR_MSI_ATTR_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00EC	MPAMF_ERR_MSI_ATTR_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00EC	MPAMF_ERR_MSI_ATTR_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ERR_MSI_DATA, MPAM Error MSI Data Register

The MPAMF_ERR_MSI_DATA characteristics are:

Purpose

MPAMF_ERR_MSI_DATA is a 32-bit read/write register for the MPAM error MSI data.

MPAMF_ERR_MSI_DATA_s is the data for the MSI write for error interrupts related to Secure PARTIDs. MPAMF_ERR_MSI_DATA_ns is the data for the MSI write for error interrupts related to Non-secure PARTIDs. MPAMF_ERR_MSI_DATA_rt is the data for the MSI write for error interrupts related to Root PARTIDs. MPAMF_ERR_MSI_DATA_rl is the data for the MSI write for error interrupts related to Realm PARTIDs.

Configuration

The power domain of MPAMF_ERR_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ERR_MSI == '1'. Otherwise, direct accesses to MPAMF_ERR_MSI_DATA are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_DATA is a 32-bit register.

Field descriptions

MSI_DATA, bits [31:0]

MSI data to be written to ITS to signal an MSI.

Accessing MPAMF_ERR_MSI_DATA

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMF_ERR_MSI_DATA_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_DATA_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_DATA_rl must only be accessible from the Realm MPAM feature page.
- MPAMF_ERR_MSI_DATA_s, MPAMF_ERR_MSI_DATA_ns, MPAMF_ERR_MSI_DATA_rt, and MPAMF_ERR_MSI_DATA_rl must be separate registers:
- The Secure instance (MPAMF_ERR_MSI_DATA_s) accesses the data for MSI write to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_DATA_ns) accesses the data for MSI write to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_DATA_rt) accesses the data for MSI write to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_DATA_rl) accesses the data for MSI write to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x00E8

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00E8	MPAMF_ERR_MSI_DATA_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00E8	MPAMF_ERR_MSI_DATA_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00E8	MPAMF_ERR_MSI_DATA_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00E8	MPAMF_ERR_MSI_DATA_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ERR_MSI_MPAM, MPAM Error MSI Write MPAM Information Register

The MPAMF_ERR_MSI_MPAM characteristics are:

Purpose

MPAMF_ERR_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for error MSI write attributes for MPAM errors in this MSC.

MPAMF_ERR_MSI_MPAM_s controls MPAM information labeling of Secure MPAM error MSI writes. MPAMF_ERR_MSI_MPAM_ns controls MPAM information labeling of Non-secure MPAM error MSI writes. MPAMF_ERR_MSI_MPAM_rt controls MPAM information labeling of Root MPAM error MSI writes. MPAMF_ERR_MSI_MPAM_rl controls MPAM information labeling of Realm MPAM error MSI writes.

Configuration

The power domain of MPAMF_ERR_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ERR_MSI == '1'. Otherwise, direct accesses to MPAMF_ERR_MSI_MPAM are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ERR_MSI_MPAM is a 32-bit register.

Field descriptions

When FEAT_MPAMv2_MSC is implemented:

PMG, bits [31:16]

Performance monitoring group for MSI write attributes for MPAM errors in this MSC.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition number for MSI write attributes for MPAM errors in this MSC.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for PARTID MSC error interrupt write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for MSC error interrupt write.

The PARTID in this register is in the Secure PARTID space in the MPAMF_ERR_MSI_MPAM_s instance and in the Non-secure PARTID space in the MPAMF_ERR_MSI_MPAM_ns instance of this register.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMF_ERR_MSI_MPAM

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMF_ERR_MSI_MPAM_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ERR_MSI_MPAM_rl must only be accessible from the Realm MPAM feature page.
- MPAMF_ERR_MSI_MPAM_s, MPAMF_ERR_MSI_MPAM_ns, MPAMF_ERR_MSI_MPAM_rt, and MPAMF_ERR_MSI_MPAM_rl must be separate registers:
- The Secure instance (MPAMF_ERR_MSI_MPAM_s) accesses the MPAM information for MSI write request to signal an MPAM error used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ERR_MSI_MPAM_ns) accesses the MPAM information for MSI write request to signal an MPAM error used for Non-secure PARTIDs.
- The Root instance (MPAMF_ERR_MSI_MPAM_rt) accesses the MPAM information for MSI write request to signal an MPAM error used for Root PARTIDs.
- The Realm instance (MPAMF_ERR_MSI_MPAM_rl) accesses the MPAM information for MSI write request to signal an MPAM error used for Realm PARTIDs.

MPAMF_ERR_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x00DC

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00DC	MPAMF_ERR_MSI_MPAM_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00DC	MPAMF_ERR_MSI_MPAM_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00DC	MPAMF_ERR_MSI_MPAM_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00DC	MPAMF_ERR_MSI_MPAM_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ESR, MPAM Error Status Register

The MPAMF_ESR characteristics are:

Purpose

Indicates MPAM error status for this MSC.

MPAMF_ESR_s reports Secure MPAM errors. MPAMF_ESR_ns reports Non-secure MPAM errors. MPAMF_ESR_rt reports Root MPAM errors. MPAMF_ESR_rl reports Realm MPAM errors.

Software should write this register after reading the status of an error to reset ERRCODE to 0x0000 and OVRWR to 0 so that future errors are not reported with OVRWR set.

Configuration

The power domain of MPAMF_ESR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented. Otherwise, direct accesses to MPAMF_ESR are RES0.

MPAMF_ESR is 64-bit register when MPAM v0.1 or v1.1 is implemented and MPAMF_IDR.HAS_EXTD_ESR == 1.

Otherwise, MPAMF_ESR is a 32-bit register.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

The power and reset domain of each MSC component is specific to that component.

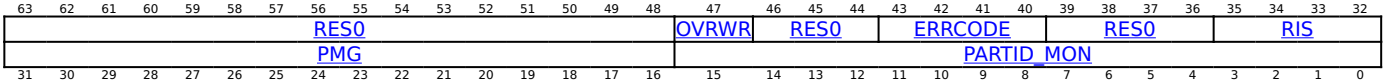
Attributes

MPAMF_ESR is a:

- 64-bit register when FEAT_MPAMv2_MSC is implemented
- 64-bit register when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == '1'
- 32-bit register otherwise

Field descriptions

When FEAT_MPAMv2_MSC is implemented:



Bits [63:48]

Reserved, RES0.

OVRWR, bit [47]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is nonzero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is nonzero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [46:44]

Reserved, RES0.

ERRCODE, bits [43:40]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Undefined_RIS_PART_SEL.
0b1001	RIS_No_Control.
0b1010	Undefined_RIS_MON_SEL.
0b1011	RIS_No_Monitor.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

Bits [39:36]

Reserved, RES0.

RIS, bits [35:32]
When MPAMF_IDR.HAS_RIS == '1':

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

Otherwise:

Reserved, RES0.

PMG, bits [31:16]

Performance monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

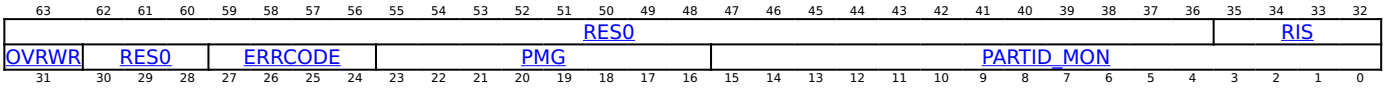
PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_IDR.HAS_EXTD_ESR == '1':



Bits [63:36]

Reserved, RES0.

RIS, bits [35:32]
When MPAMF_IDR.HAS_RIS == '1':

Resource Instance Selector. Where applicable to the ERRCODE, captures the RIS value for the error.

Otherwise:

Reserved, RES0.

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is nonzero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is nonzero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is zero must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Undefined_RIS_PART_SEL.
0b1001	RIS_No_Control.
0b1010	Undefined_RIS_MON_SEL.
0b1011	RIS_No_Monitor.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0.

Otherwise:

OVRWR, bit [31]

Overwritten.

If 0 and ERRCODE == 0b0000, no errors have occurred.

If 0 and ERRCODE is nonzero, a single error has occurred and is recorded in this register.

If 1 and ERRCODE is nonzero, multiple errors have occurred and this register records the most recent error.

The state where this bit is 1 and ERRCODE is 0 must not be produced by hardware and is only reached when software writes this combination into this register.

Bits [30:28]

Reserved, RES0.

ERRCODE, bits [27:24]

Error code.

ERRCODE	Meaning
0b0000	No error.
0b0001	PARTID_SEL_Range.
0b0010	Req_PARTID_Range.
0b0011	MSMONCFG_ID_RANGE.
0b0100	Req_PMG_Range.
0b0101	Monitor_Range.
0b0110	intPARTID_Range.
0b0111	Unexpected_INTERNAL.
0b1000	Reserved.
0b1001	Reserved.
0b1010	Reserved.
0b1011	Reserved.
0b1100	Reserved.
0b1101	Reserved.
0b1110	Reserved.
0b1111	Reserved.

PMG, bits [23:16]

Program monitoring group.

Set to the PMG on an error that captures PMG. Otherwise, set to 0x00 on an error that does not capture PMG.

PARTID_MON, bits [15:0]

PARTID or monitor.

Set to the PARTID on an error that captures PARTID.

Set to the monitor index on an error that captures MON.

On an error that captures neither PARTID nor MON, this field is set to 0x0000.

Accessing MPAMF_ESR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMF_ESR_s must only be accessible from the Secure MPAM feature page.
- MPAMF_ESR_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMF_ESR_rt must only be accessible from the Root MPAM feature page.
- MPAMF_ESR_rl must only be accessible from the Realm MPAM feature page.
- MPAMF_ESR_s, MPAMF_ESR_ns, MPAMF_ESR_rt, and MPAMF_ESR_rl must be separate registers:
- The Secure instance (MPAMF_ESR_s) accesses the error status used for Secure PARTIDs.
- The Non-secure instance (MPAMF_ESR_ns) accesses the error status used for Non-secure PARTIDs.
- The Root instance (MPAMF_ESR_rt) accesses the error status used for Root PARTIDs.
- The Realm instance (MPAMF_ESR_rl) accesses the error status used for Realm PARTIDs.

MPAMF_ESR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x00F8

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x00F8	MPAMF_ESR_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x00F8	MPAMF_ESR_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x00F8	MPAMF_ESR_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x00F8	MPAMF_ESR_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_IDR, MPAM Features Identification Register

The MPAMF_IDR characteristics are:

Purpose

Indicates which memory partitioning and monitoring features are present on this MSC.

Configuration

The power domain of MPAMF_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, or FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented. Otherwise, direct accesses to MPAMF_IDR are RES0.

If FEAT_MPAMv1p0 or FEAT_MPAMv0p1 is implemented, the following statements apply:

- MPAMF_IDR_s indicates the MPAM features accessed from the Secure MPAM feature page.
- MPAMF_IDR_ns indicates the MPAM features accessed from the Non-secure MPAM feature page.

If both FEAT_MPAMv1p0 or FEAT_MPAMv0p1 is implemented and FEAT_RME are implemented, the following statements apply:

- MPAMF_IDR_rt indicates the MPAM features accessed from the Root MPAM feature page.
- MPAMF_IDR_rl indicates the MPAM features accessed from the Realm MPAM feature page.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

The power and reset domain of each MSC component is specific to that component.

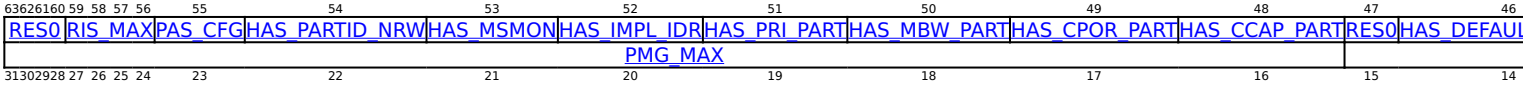
Attributes

MPAMF_IDR is a:

- 64-bit register when FEAT_MPAMv2_MSC is implemented
- 64-bit register when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented
- 32-bit register otherwise

Field descriptions

When FEAT_MPAMv2_MSC is implemented:



Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]
When MPAMF_IDR.HAS_RIS == '1':

Maximum RIS value supported in MPAMCFG_PART_SEL. Must be 0b0000 if MPAMF_IDR.HAS_RIS == 0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

PAS_CFG, bit [55]
When FEAT_RME is implemented:

States support for configuring the physical address space of the feature page.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAS_CFG	Meaning
0b0	Support for configuring the physical address space of the feature page is not implemented.
0b1	Support for configuring the physical address space of the feature page is implemented.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [54]

Has PARTID Narrowing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID, or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.

Access to this field is RO.

HAS_MSMON, bit [53]

Has resource Monitors. Indicates whether this MSC has MPAM resource monitors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.

Access to this field is RO.

HAS_IMPL_IDR, bit [52]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, MPAMF_IMPL_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR.
0b1	Has MPAMF_IMPL_IDR.

Access to this field is RO.

HAS_PRI_PART, bit [51]

Has Priority Partitioning. Indicates that MPAM priority partitioning is implemented and MPAMF_PRI_IDR exists.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR.
0b1	Has priority partitioning and MPAMF_PRI_IDR.

Access to this field is RO.

HAS_MBW_PART, bit [50]

Has Memory Bandwidth Partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

Access to this field is RO.

HAS_CPOR_PART, bit [49]

Has Cache Portion Partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM<n> registers.

Access to this field is RO.

HAS_CCAP_PART, bit [48]

Has Cache Capacity Partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

Access to this field is RO.

Bit [47]

Reserved, RES0.

HAS_DEFAULT_PARTID, bit [46]

Indicates support in an MSC for a default resource control configuration.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_DEFAULT_PARTID	Meaning
0b0	The default resource control configuration is supported.
0b1	The default resource control configuration is not supported.

FEAT_MPAM_MSC_DCTRL implements the functionality identified by the value 0b1.

Access to this field is RO.

HAS_OUT_TL, bit [45]

Has egress translation. Indicates that this MSC supports egress MPAM information bundle manipulation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OUT_TL	Meaning
0b0	MPAM information bundle manipulation for egress translation is not supported.
0b1	MPAM information bundle manipulation for egress translation is supported.

Access to this field is RO.

HAS_IN_TL, bit [44]

Has ingress translation. Indicates that this MSC supports ingress MPAM information bundle manipulation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_IN_TL	Meaning
0b0	MPAM information bundle manipulation for ingress translation is not supported.
0b1	MPAM information bundle manipulation for ingress translation is supported.

Access to this field is RO.

HAS_NFU, bit [43]

Has No Future Use field in MPAMCFG_DIS. Indicates that MPAMCFG_DIS.NFU is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_NFU	Meaning
0b0	MPAMCFG_DIS.NFU is not implemented. A PARTID disabled through access to MPAMCFG_DIS must preserve the control settings of the disabled PARTID.
0b1	Implements MPAMCFG_DIS.NFU. A PARTID disabled with NFU as 1 may have its control settings forgotten.

If MPAMF_IDR.HAS_ENDIS is 0b0, this field must also be 0b0.

This field must be the same in each instance of this register and for any value in MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_ENDIS, bit [42]

Has PARTID enable and disable. Indicates that this MSC supports PARTID disable and enable via MPAMCFG_DIS, MPAMCFG_EN and MPAMCFG_EN_FLAGS registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ENDIS	Meaning
0b0	Does not support PARTID enable and disable functionality, and MPAMCFG_EN, MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers are not implemented.
0b1	Supports PARTID enable and disable through the MPAMCFG_EN, MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers.

All three registers must be implemented when this field is 1, MPAMCFG_EN, MPAMCFG_DIS, and MPAMCFG_EN_FLAGS.

This field must be the same in each instance of this register and for any value in MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Bit [41]

Reserved, RES0.

HAS_ERR_MSI, bit [40]

Has support for MSI writes to signal MPAM error interrupts. These registers are implemented: MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ERR_MSI	Meaning
0b0	MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM registers are not implemented.
0b1	MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM are implemented and can be used to generate writes to signal error interrupts.

If MPAMF_IDR.HAS_ESR is 0, this bit must also be 0.

Access to this field is RO.

HAS_ESR, bit [39]

MPAMF_ESR is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ESR	Meaning
0b0	MPAMF_ESR, MPAMF_ECR, and MPAM error handling are not implemented.
0b1	MPAMF_ESR, MPAMF_ECR, and MPAM error handling are implemented.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

Access to this field is RO.

Bit [38]

Reserved, RES0.

NO_IMPL_MSMON, bit [37]
When MPAMF_IDR.HAS_IMPL_IDR == '1':

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource monitors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_IMPL_MSMON	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors.

If MPAMF_IDR.RIS is 1, this field indicates the presence of IMPLEMENTATION DEFINED resource monitors described in MPAMF_IMPL_IDR for the selected resource instance.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NO_IMPL_PART, bit [36]
When MPAMF_IDR.HAS_IMPL_IDR == '1':

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource controls.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_IMPL_PART	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.

If MPAMF_IDR.RIS is 1, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in MPAMF_IMPL_IDR for the selected resource instance.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [35:33]

Reserved, RES0.

HAS_RIS, bit [32]

Has resource instance selector. Indicates that MPAMCFG_PART_SEL contains the RIS field that selects a resource instance to control.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_RIS	Meaning
0b0	MPAMCFG_PART_SEL does not implement the MPAMCFG_PART_SEL.RIS field or multiple resource instance support.
0b1	MPAMCFG_PART_SEL implements the MPAMCFG_PART_SEL.RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX.

Access to this field is RO.

PMG_MAX, bits [31:16]

Maximum supported value of PMG.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

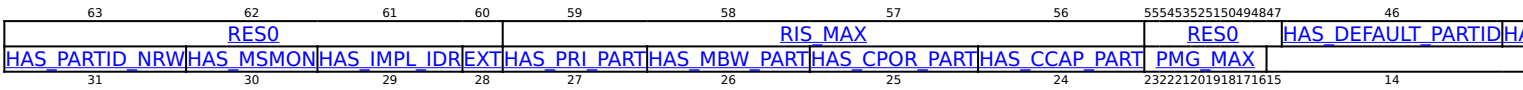
PARTID_MAX, bits [15:0]

Maximum supported value of PARTID.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:



Bits [63:60]

Reserved, RES0.

RIS_MAX, bits [59:56]
When MPAMF_IDR.EXT == '1' and MPAMF_IDR.HAS_RIS == '1':

Maximum RIS value supported in MPAMCFG_PART_SEL. Must be 0b0000 if MPAMF_IDR.HAS_RIS == 0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [55:47]

Reserved, RES0.

HAS_DEFAULT_PARTID, bit [46]
When MPAMF_IDR.EXT == '1':

Indicates support in an MSC for a default resource control configuration.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_DEFAULT_PARTID	Meaning
0b0	The default resource control configuration is supported.
0b1	The default resource control configuration is not supported.

FEAT_MPAM_MSC_DCTRL implements the functionality identified by the value 0b1.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OUT_TL, bit [45]
When MPAMF_IDR.EXT == '1':

Has egress translation. Indicates that this MSC supports egress MPAM information bundle manipulation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OUT_TL	Meaning
0b0	MPAM information bundle manipulation for egress translation is not supported.
0b1	MPAM information bundle manipulation for egress translation is supported.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_IN_TL, bit [44]
When MPAMF_IDR.EXT == '1':

Has ingress translation. Indicates that this MSC supports ingress MPAM information bundle manipulation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_IN_TL	Meaning
0b0	MPAM information bundle manipulation for ingress translation is not supported.
0b1	MPAM information bundle manipulation for ingress translation is supported.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_NFU, bit [43]
When MPAMF_IDR.EXT == '1':

Has No Future Use field in MPAMCFG_DIS. Indicates that MPAMCFG_DIS.NFU is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_NFU	Meaning
0b0	MPAMCFG_DIS.NFU is not implemented. A PARTID disabled through access to MPAMCFG_DIS must preserve the control settings of the disabled PARTID.
0b1	Implements MPAMCFG_DIS.NFU. A PARTID disabled with NFU as 1 may have its control settings forgotten.

If MPAMF_IDR.HAS_ENDIS is 0b0, this field must also be 0b0.

This field must be the same in each instance of this register and for any value in MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_ENDIS, bit [42]
When MPAMF_IDR.EXT == '1':

Has PARTID enable and disable. Indicates that this MSC supports PARTID disable and enable via MPAMCFG_DIS, MPAMCFG_EN and MPAMCFG_EN_FLAGS registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ENDIS	Meaning
0b0	Does not support PARTID enable and disable functionality, and MPAMCFG_EN, MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers are not implemented.
0b1	Supports PARTID enable and disable through the MPAMCFG_EN, MPAMCFG_DIS and MPAMCFG_EN_FLAGS registers.

All three registers must be implemented when this field is 1, MPAMCFG_EN, MPAMCFG_DIS, and MPAMCFG_EN_FLAGS.

This field must be the same in each instance of this register and for any value in MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

SP4, bit [41]
When MPAMF_IDR.EXT == '1' and FEAT_RME is implemented:

Indicates whether this MSC supports 4 PARTID spaces.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SP4	Meaning
0b0	This MSC supports two PARTID spaces.
0b1	This MSC supports four PARTID spaces.

This field must read the same in each instance of this register and for any value in MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_ERR_MSI, bit [40]
When MPAMF_IDR.EXT == '1':

Has support for MSI writes to signal MPAM error interrupts. These registers are implemented: MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ERR_MSI	Meaning
0b0	MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM registers are not implemented.
0b1	MPAMF_ERR_MSI_ADDR_L, MPAMF_ERR_MSI_ADDR_H, MPAMF_ERR_MSI_ATTR, MPAMF_ERR_MSI_DATA, and MPAMF_ERR_MSI_MPAM are implemented and can be used to generate writes to signal error interrupts.

If MPAMF_IDR.HAS_ESR is 0, this bit must also be 0.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_ESR, bit [39]
When MPAMF_IDR.EXT == '1':

MPAMF_ESR is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ESR	Meaning
0b0	MPAMF_ESR, MPAMF_ECR, and MPAM error handling are not implemented.
0b1	MPAMF_ESR, MPAMF_ECR, and MPAM error handling are implemented.

If an MSC cannot encounter any of the error conditions listed in 'Errors in MSCs' in Arm® Architecture Reference Manual Supplement, Memory System Resource Partitioning and Monitoring (MPAM), for Armv8-A (ARM DDI 0598), both the MPAMF_ESR and MPAMF_ECR must be RAZ/WI.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_EXTD_ESR, bit [38]
When MPAMF_IDR.EXT == '1':

MPAMF_ESR is 64 bits.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_EXTD_ESR	Meaning
0b0	MPAMF_ESR is 32 bits.
0b1	MPAMF_ESR is 64 bits.

When MPAMF_IDR.HAS_RIS and MPAMF_IDR.HAS_ESR, this field must be 1.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NO_IMPL_MSMON, bit [37]
When MPAMF_IDR.EXT == '1' and MPAMF_IDR.HAS_IMPL_IDR == '1':

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource monitors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_IMPL_MSMON	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource monitor.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource monitors.

If MPAMF_IDR.RIS is 1, this field indicates the presence of IMPLEMENTATION DEFINED resource monitors described in MPAMF_IMPL_IDR for the selected resource instance.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NO_IMPL_PART, bit [36]
When MPAMF_IDR.EXT == '1' and MPAMF_IDR.HAS_IMPL_IDR == '1':

MPAMF_IMPL_IDR defines no IMPLEMENTATION DEFINED resource controls.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_IMPL_PART	Meaning
0b0	MPAMF_IMPL_IDR defines at least one IMPLEMENTATION DEFINED resource control.
0b1	MPAMF_IMPL_IDR does not define any IMPLEMENTATION DEFINED resource controls.

If MPAMF_IDR.RIS is 1, this field indicates the presence of IMPLEMENTATION DEFINED resource controls described in MPAMF_IMPL_IDR for the selected resource instance.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [35:33]

Reserved, RES0.

HAS_RIS, bit [32]
When MPAMF_IDR.EXT == '1':

Has resource instance selector. Indicates that MPAMCFG_PART_SEL contains the RIS field that selects a resource instance to control.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_RIS	Meaning
0b0	MPAMCFG_PART_SEL does not implement the MPAMCFG_PART_SEL.RIS field or multiple resource instance support.
0b1	MPAMCFG_PART_SEL implements the MPAMCFG_PART_SEL.RIS field and MPAM resource instance numbers up to and including MPAMF_IDR.RIS_MAX.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_PARTID_NRW, bit [31]

Has PARTID Narrowing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID, or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.

Access to this field is RO.

HAS_MSMON, bit [30]

Has resource Monitors. Indicates whether this MSC has MPAM resource monitors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.

Access to this field is RO.

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, MPAMF_IMPL_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR.
0b1	Has MPAMF_IMPL_IDR.

Access to this field is RO.

EXT, bit [28]

Extended MPAMF_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXT	Meaning
0b0	MPAMF_IDR has no defined bits in [63:32]. The register is effectively 32 bits.
0b1	MPAMF_IDR has bits defined in [63:32]. The register is 64 bits.

Access to this field is RO.

HAS_PRI_PART, bit [27]

Has Priority Partitioning. Indicates that MPAM priority partitioning is implemented and MPAMF_PRI_IDR exists.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR.
0b1	Has priority partitioning and MPAMF_PRI_IDR.

If MPAMF_IDR.RIS is 1, this field indicates the presence of priority partitioning resource controls as described in MPAMF_PRI_IDR for the selected resource instance.

Access to this field is RO.

HAS_MBW_PART, bit [26]

Has Memory Bandwidth Partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

If MPAMF_IDR.RIS is 1, this field indicates the presence of memory bandwidth partitioning resource controls as described in MPAMF_MBW_IDR for the selected resource instance.

Access to this field is RO.

HAS_CPOR_PART, bit [25]

Has Cache Portion Partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM<n> registers.

If MPAMF_IDR.RIS is 1, this field indicates the presence of cache portion partitioning resource controls as described in MPAMF_CPOR_IDR for the selected resource instance.

Access to this field is RO.

HAS_CCAP_PART, bit [24]

Has Cache Capacity Partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

If MPAMF_IDR.RIS is 1, this field indicates the presence of cache capacity partitioning resource controls as described in MPAMF_CCAP_IDR for the selected resource instance.

Access to this field is RO.

PMG_MAX, bits [23:16]

Maximum supported value of PMG.

The value of this field is permitted to vary between the instances of MPAMF_IDR, each reporting the maximum supported PMG value in the PARTID space associated with that instance.

In MPAMF_IDR_s, this field is permitted to report the maximum PMG value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PMG value for the Secure PARTID space can be read from MPAMF_SIDR.PMG_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PARTID_MAX, bits [15:0]

Maximum supported value of PARTID.

The value of this field is permitted to vary between the instances of MPAMF_IDR, each reporting the maximum supported PARTID value in the PARTID space associated with that instance.

In MPAMF_IDR_s, this field is permitted to report the maximum PARTID value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PARTID value for the Secure PARTID space can be read from MPAMF_SIDR.PARTID_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

31	30	29	28	27	26	25	24	23:22:21:20:19:18:17:16	15:14:13:12:11:10:9:8:7:6:5:4:3:2:1:0
HAS_PARTID_NRW	HAS_MSMON	HAS_IMPL_IDR	RES0	HAS_PRI_PART	HAS_MBW_PART	HAS_CPOR_PART	HAS_CCAP_PART	PMG_MAX	PARTID_MAX

HAS_PARTID_NRW, bit [31]

Has PARTID Narrowing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PARTID_NRW	Meaning
0b0	Does not have MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID, or intPARTID mapping support.
0b1	Supports the MPAMF_PARTID_NRW_IDR, MPAMCFG_INTPARTID registers.

Access to this field is RO.

HAS_MSMON, bit [30]

Has resource Monitors. Indicates whether this MSC has MPAM resource monitors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MSMON	Meaning
0b0	Does not support MPAM resource monitoring by groups or MPAMF_MSMON_IDR.
0b1	Supports resource monitoring by matching a combination of PARTID and PMG. See MPAMF_MSMON_IDR.

Access to this field is RO.

HAS_IMPL_IDR, bit [29]

Has MPAMF_IMPL_IDR. Indicates whether this MSC has the IMPLEMENTATION SPECIFIC MPAM features register, MPAMF_IMPL_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_IMPL_IDR	Meaning
0b0	Does not have MPAMF_IMPL_IDR.
0b1	Has MPAMF_IMPL_IDR.

Access to this field is RO.

Bit [28]

Reserved, RES0.

HAS_PRI_PART, bit [27]

Has Priority Partitioning. Indicates that MPAM priority partitioning is implemented and MPAMF_PRI_IDR exists.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PRI_PART	Meaning
0b0	Does not support priority partitioning or have MPAMF_PRI_IDR.
0b1	Has priority partitioning and MPAMF_PRI_IDR.

Access to this field is RO.

HAS_MBW_PART, bit [26]

Has Memory Bandwidth Partitioning. Indicates whether this MSC implements MPAM memory bandwidth partitioning and MPAMF_MBW_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MBW_PART	Meaning
0b0	Does not support memory bandwidth partitioning or have MPAMF_MBW_IDR register.
0b1	Has MPAMF_MBW_IDR register.

Access to this field is RO.

HAS_CPOR_PART, bit [25]

Has Cache Portion Partitioning. Indicates whether this MSC implements MPAM cache portion partitioning and MPAMF_CPOR_IDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CPOR_PART	Meaning
0b0	Does not support cache portion partitioning or have MPAMF_CPOR_IDR or MPAMCFG_CPBM<n> registers.
0b1	Has MPAMF_CPOR_IDR and MPAMCFG_CPBM<n> registers.

Access to this field is RO.

HAS_CCAP_PART, bit [24]

Has Cache Capacity Partitioning. Indicates whether this MSC implements MPAM cache capacity partitioning and the MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CCAP_PART	Meaning
0b0	Does not support cache capacity partitioning or have MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.
0b1	Has MPAMF_CCAP_IDR and MPAMCFG_CMAX registers.

Access to this field is RO.

PMG_MAX, bits [23:16]

Maximum supported value of PMG.

The value of this field is permitted to vary between the instances of MPAMF_IDR, each reporting the maximum supported PMG value in the PARTID space associated with that instance.

In MPAMF_IDR_s, this field is permitted to report the maximum PMG value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PMG value for the Secure PARTID space can be read from MPAMF_SIDR.PMG_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PARTID_MAX, bits [15:0]

Maximum supported value of PARTID.

The value of this field is permitted to vary between the instances of MPAMF_IDR, each reporting the maximum supported PARTID value in the PARTID space associated with that instance.

In MPAMF_IDR_s, this field is permitted to report the maximum PARTID value for the Non-secure PARTID space or for the Secure PARTID space. The maximum PARTID value for the Secure PARTID space can be read from MPAMF_SIDR.PARTID_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_IDR

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MPAMF_IDR must be readable from the Non-secure and Secure MPAM feature pages.
- MPAMF_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_IDR_s is permitted to have either the same or different contents to MPAMF_IDR_ns.
- There must be separate registers in the Secure (MPAMF_IDR_s) and Non-secure (MPAMF_IDR_ns) MPAM feature pages.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_IDR_s is permitted to have either the same or different contents to MPAMF_IDR_ns, MPAMF_IDR_rt, or MPAMF_IDR_rl.
- MPAMF_IDR_ns is permitted to have either the same or different contents to MPAMF_IDR_rt or MPAMF_IDR_rl.
- MPAMF_IDR_rt is permitted to have either the same or different contents to MPAMF_IDR_rl.
- There must be separate registers in the Secure (MPAMF_IDR_s), Non-secure (MPAMF_IDR_ns), Root (MPAMF_IDR_rt), and Realm (MPAMF_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1

- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_IDR shows the configuration of MSC MPAM for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0000

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0000	MPAMF_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0000	MPAMF_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0000	MPAMF_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0000	MPAMF_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_IIDR, MPAM Implementation Identification Register

The MPAMF_IIDR characteristics are:

Purpose

Uniquely identifies the MSC implementation by the combination of implementer, product ID, variant, and revision.

Configuration

The power domain of MPAMF_IIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented. Otherwise, direct accesses to MPAMF_IIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:20]

The MSC implementer as identified in the MPAMF_IIDR.Implementer field must assure each product has a unique ProductID from any other with the same Implementer value.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

This field distinguishes product variants or major revisions of the product.

Note

Implementations of ProductID with differing software interfaces are expected to have different values in the MPAMF_IIDR.Variant field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

This field distinguishes minor revisions of the product.

Note

This field is intended to differentiate product revisions that are minor changes and are largely software compatible with previous revisions.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the MPAM MSC.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for MPAMF_IIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_IIDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_IIDR must be readable from the Secure, Non-secure, Root, and Realm MPAM feature pages.
- MPAMF_IIDR must have the same contents in the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0018

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0018	MPAMF_IIDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0018	MPAMF_IIDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0018	MPAMF_IIDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0018	MPAMF_IIDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_IMPL_IDR, MPAM Implementation-Specific Partitioning Feature Identification Register

The MPAMF_IMPL_IDR characteristics are:

Purpose

Indicates the implementation-defined partitioning and monitoring features and parameters of the MSC.

MPAMF_IMPL_IDR_s indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Secure MPAM feature page. MPAMF_IMPL_IDR_ns indicates those accessed from the Non-secure MPAM feature page. MPAMF_IMPL_IDR_rt indicates IMPLEMENTATION DEFINED partitioning and monitoring features accessed from the Root MPAM feature page. MPAMF_IMPL_IDR_rl indicates those accessed from the Realm MPAM feature page.

If MPAMF_IDR.HAS_RIS is 1, this register gives the implementation-specific features and parameters of the resource instance selected by MPAMCFG_PART_SEL.RIS for any features that are specific to the resource.

Configuration

The power domain of MPAMF_IMPL_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAM is implemented or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_IMPL_IDR == '1'. Otherwise, direct accesses to MPAMF_IMPL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IMPL_IDR is a 32-bit register.

Field descriptions

IMPLFEAT, bits [31:0]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

IMPLFEAT, bits [31:0] of bits [31:0]

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of IMPLEMENTATION DEFINED MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

If RIS is implemented, this register indicates the implementation-specific features and parameters of the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

IMPLEMENTATION DEFINED, bits [31:0] of bits [31:0]

All 32 bits of this register are available to be used as the implementer sees fit to indicate the presence of IMPLEMENTATION DEFINED MPAM features in this MSC and to give additional implementation-specific read-only information about the parameters of implementation-specific MPAM features to software.

Accessing MPAMF_IMPL_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_IMPL_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_IMPL_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:

- MPAMF_IMPL_IDR_s is permitted to have either the same or different contents to MPAMF_IMPL_IDR_ns, MPAMF_IMPL_IDR_rt, or MPAMF_IMPL_IDR_rl.
- MPAMF_IMPL_IDR_ns is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rt or MPAMF_IMPL_IDR_rl.
- MPAMF_IMPL_IDR_rt is permitted to have either the same or different contents to MPAMF_IMPL_IDR_rl.
- There must be separate registers in the Secure (MPAMF_IMPL_IDR_s), Non-secure (MPAMF_IMPL_IDR_ns), Root (MPAMF_IMPL_IDR_rt), and Realm (MPAMF_IMPL_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_IMPL_IDR shows the configuration of implementation-specific features for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_IMPL_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0028

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0028	MPAMF_IMPL_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0028	MPAMF_IMPL_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0028	MPAMF_IMPL_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0028	MPAMF_IMPL_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_IN_TL_IDR, MPAM Ingress PARTID Translation ID Register

The MPAMF_IN_TL_IDR characteristics are:

Purpose

Indicates the ingress PARTID translation capabilities of the MSC.

Configuration

The power domain of MPAMF_IN_TL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented and MPAMF_IDR.HAS_IN_TL == '1'. Otherwise, direct accesses to MPAMF_IN_TL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_IN_TL_IDR is a 32-bit register.

Field descriptions

HAS_DIRECT_TL, bit [31]

Indicates support for direct ingress translation of PARTIDs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_DIRECT_TL	Meaning
0b0	Direct ingress translation of PARTIDs is not supported.
0b1	Direct ingress translation of PARTIDs is supported for those PARTIDs with an explicitly set translation configuration.

Access to this field is RO.

HAS_BASE_MASK, bit [30]

Indicates support for computed ingress translation of PARTIDs using a configurable mask and base.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_BASE_MASK	Meaning
0b0	Computed ingress translation of PARTIDs using a configurable mask and base is not supported.
0b1	Computed ingress translation of PARTIDs using a configurable mask and base is supported for those PARTIDs without an explicitly set translation configuration.

Access to this field is RO.

Bits [29:16]

Reserved, RES0.

IN_PARTID_MAX, bits [15:0]
When MPAMF_IN_TL_IDR.HAS_DIRECT_TL == '1':

Maximum value for PARTIDs to be used as direct ingress translations, as configured in MPAMCFG_IN_TL.PARTID_TL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing MPAMF_IN_TL_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_IN_TL_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_IN_TL_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_IN_TL_IDR_s is permitted to have either the same or different contents to MPAMF_IN_TL_IDR_ns, MPAMF_IN_TL_IDR_rt, or MPAMF_IN_TL_IDR_rl.
- MPAMF_IN_TL_IDR_ns is permitted to have either the same or different contents to MPAMF_IN_TL_IDR_rt or MPAMF_IN_TL_IDR_rl.
- MPAMF_IN_TL_IDR_rt is permitted to have either the same or different contents to MPAMF_IN_TL_IDR_rl.
- There must be separate registers in the Secure (MPAMF_IN_TL_IDR_s), Non-secure (MPAMF_IN_TL_IDR_ns), Root (MPAMF_IN_TL_IDR_rt), and Realm (MPAMF_IN_TL_IDR_rl) MPAM feature pages.

MPAMF_IN_TL_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3000

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x3000	MPAMF_IN_TL_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3000	MPAMF_IN_TL_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3000	MPAMF_IN_TL_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3000	MPAMF_IN_TL_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_MBW_IDR, MPAM Memory Bandwidth Partitioning Identification Register

The MPAMF_MBW_IDR characteristics are:

Purpose

Indicates which MPAM bandwidth partitioning features are present on this MSC.

MPAMF_MBW_IDR_s indicates bandwidth partitioning features accessed from the Secure MPAM feature page. MPAMF_MBW_IDR_ns indicates bandwidth partitioning features accessed from the Non-secure MPAM feature page. MPAMF_MBW_IDR_rt indicates bandwidth partitioning features accessed from the Root MPAM feature page. MPAMF_MBW_IDR_rl indicates bandwidth partitioning features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

Configuration

The power domain of MPAMF_MBW_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAM is implemented or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_MBW_PART == '1'. Otherwise, direct accesses to MPAMF_MBW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBW_IDR is a 32-bit register.

Field descriptions

Bits [31:29]

Reserved, RES0.

BWPBM_WD, bits [28:16]

Bandwidth portion bitmap width.

The number of bandwidth portion bits in the MPAMCFG_MBW_PBM<n> register array.

If MPAMF_MBW_IDR.HAS_PBM is 1, this field must contain a value from 1 to 4096, inclusive. Values greater than 32 require a group of 32-bit registers to access the BWPBM, up to 128 if BWPBM_WD is the largest value.

If MPAMF_MBW_IDR.HAS_PBM is 0, this field must be ignored by software.

If RIS is implemented, this field indicates the width of the memory bandwidth portion bitmap partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [15]

Reserved, RES0.

WINDWR, bit [14]

Indicates the bandwidth accounting period register is writable.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WINDWR	Meaning
0b0	The bandwidth accounting period is readable from MPAMCFG_MBW_WINWD which might be fixed or vary due to clock rate reconfiguration of the memory channel or memory controller.
0b1	The bandwidth accounting width is readable and writable per partition in MPAMCFG_MBW_WINWD.

Access to this field is RO.

HAS_PROP, bit [13]

Indicates that this MSC implements proportional stride bandwidth partitioning and the MPAMCFG_MBW_PROP register can be accessed.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PROP	Meaning
0b0	There is no memory bandwidth proportional stride control and the MPAMCFG_MBW_PROP register is RES0.
0b1	The proportional stride memory bandwidth partitioning scheme is supported and the MPAMCFG_MBW_PROP register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth proportional stride partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_PBM, bit [12]

Indicates that bandwidth portion partitioning is implemented and the MPAMCFG_MBW_PBM<n> register array can be accessed.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_PBM	Meaning
0b0	There is no memory bandwidth portion control and the MPAMCFG_MBW_PBM<n> is RES0.
0b1	The memory bandwidth portion allocation scheme exists and the MPAMCFG_MBW_PBM<n> register can be accessed.

If RIS is implemented, this field indicates the presence of the memory bandwidth portion partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_MAX, bit [11]

Indicates that this MSC implements maximum bandwidth partitioning and the MPAMCFG_MBW_MAX register can be accessed.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MAX	Meaning
0b0	There is no maximum memory bandwidth control and the MPAMCFG_MBW_MAX register is RES0.
0b1	The maximum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MAX register can be accessed. The MPAMF_MBW_IDR.MAX_LIM and MPAMCFG_MBW_MAX.HARDLIM fields indicate which limit behaviors are implemented and enabled.

If RIS is implemented, this field indicates the presence of the maximum bandwidth partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_MIN, bit [10]

Indicates that this MSC implements minimum bandwidth partitioning and the MPAMCFG_MBW_MIN register can be accessed.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MIN	Meaning
0b0	There is no minimum memory bandwidth control and the MPAMCFG_MBW_MIN register is RES0.
0b1	The minimum memory bandwidth allocation scheme is supported and the MPAMCFG_MBW_MIN register can be accessed.

If RIS is implemented, this field indicates the presence of the minimum bandwidth partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

MAX_LIM, bits [9:8]

Implemented maximum bandwidth partitioning behaviors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MAX_LIM	Meaning
0b00	Both soft limit and hard limit behaviors are implemented.
0b01	Soft limit behavior is implemented, hard limit behavior is not implemented.
0b10	Hard limit behavior is implemented, soft limit behavior is not implemented.

If both soft limit and hard limit behaviors are implemented, MPAMCFG_MBW_MAX.HARDLIM selects which behavior is used.

If RIS is implemented, this field indicates the implemented maximum bandwidth limit partitioning behaviors for the resource instance selected by MPAMCFG_PART_SEL.RIS.

When MPAMF_MBW_IDR.HAS_MAX != '1', access to this field is RES0 .

Bits [7:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Number of implemented bits in the bandwidth allocation fields: MIN, MAX, and STRIDE. See MPAMCFG_MBW_MIN, MPAMCFG_MBW_MAX, and MPAMCFG_MBW_PROP.

In any of these bandwidth allocation fields exist, this field must have a value from 1 to 16, inclusive. Otherwise, it is permitted to be 0.

If RIS is implemented, this field indicates the number of implemented bits in the bandwidth allocation control fields for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_MBW_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_MBW_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_MBW_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_MBW_IDR_s is permitted to have either the same or different contents to MPAMF_MBW_IDR_ns, MPAMF_MBW_IDR_rt, or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_ns is permitted to have either the same or different contents to MPAMF_MBW_IDR_rt or MPAMF_MBW_IDR_rl.
- MPAMF_MBW_IDR_rt is permitted to have either the same or different contents to MPAMF_MBW_IDR_rl.
- There must be separate registers in the Secure (MPAMF_MBW_IDR_s), Non-secure (MPAMF_MBW_IDR_ns), Root (MPAMF_MBW_IDR_rt), and Realm (MPAMF_MBW_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_MBW_IDR shows the configuration of memory bandwidth partitioning for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_MBW_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0040

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0040	MPAMF_MBW_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0040	MPAMF_MBW_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0040	MPAMF_MBW_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0040	MPAMF_MBW_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_MBWUMON_IDR, MPAM Features Memory Bandwidth Usage Monitoring ID register

The MPAMF_MBWUMON_IDR characteristics are:

Purpose

Indicates the number of memory bandwidth usage monitor instances implemented. This register also indicates several properties of MBWU monitoring, including whether the implementation supports capture, scaling, or long counters.

Configuration

The power domain of MPAMF_MBWUMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_MBWU == '1'. Otherwise, direct accesses to MPAMF_MBWUMON_IDR are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MPAMF_MBWUMON_IDR_s indicates the number and properties of Secure memory bandwidth usage monitoring.
- MPAMF_MBWUMON_IDR_ns indicates the number and properties of Non-secure memory bandwidth usage monitoring.
- If FEAT_RME is implemented the following statements also apply:
- MPAMF_MBWUMON_IDR_rt indicates the number and properties of Root memory bandwidth usage monitoring.
- MPAMF_MBWUMON_IDR_rl indicates the number and properties of Realm memory bandwidth usage monitoring.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MBWUMON_IDR is a:

- 64-bit register when FEAT_MPAMv2_MSC is implemented
- 32-bit register when FEAT_MPAMv1p0 is implemented or FEAT_MPAMv0p1 is implemented

Field descriptions

When FEAT_MPAMv2_MSC is implemented:

Bits [63:33]

Reserved, RES0.

HAS_MON_SEC, bit [32]

Reports if monitor instance assignment to physical address space is implemented for the monitor type.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MON_SEC	Meaning
0b0	Monitor instance assignment to physical address space is not implemented for the monitor type.
0b1	Monitor instance assignment to physical address space is implemented for the monitor type. This value is mandatory if FEAT_RME is implemented.

Access to this field is RO.

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_MBWU to the corresponding MSMON_MBWU_CAPTURE on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CAPTURE	Meaning
0b0	MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.
0b1	The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MBWU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_LONG is 1, this also reports that MSMON_MBWU_L_CAPTURE is implemented.

Access to this field is RO.

HAS_LONG, bit [30]

Reports whether MSMON_MBWU_L is implemented.

If HAS_CAPTURE is 1, reports whether MSMON_MBWU_L_CAPTURE is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_LONG	Meaning
0b0	Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE.
0b1	Implements MSMON_MBWU_L. If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the long MBWU monitor is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, this also reports that MSMON_MBWU_L_CAPTURE is implemented.

Access to this field is RO.

LWD, bit [29]
When MPAMF_MBWUMON_IDR.HAS_LONG == '1':

Long register VALUE width.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LWD	Meaning
0b0	MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

If MPAMF_IDR.HAS_RIS is 1, this field reports the length of the MSMON_MBWU_L.VALUE field implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_RWBW, bit [28]

Read/write bandwidth selection is implemented in MSMON_CFG_MBWU_FLT.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_RWBW	Meaning
0b0	Read/write bandwidth selection is not implemented.
0b1	Read/write bandwidth selection is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports whether read/write bandwidth collection selection is available in MSMON_CFG_MBWU_FLT for resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_OFLOW_LNKG, bit [27]

Supports MSMON_CFG_MBWU_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_LNKG	Meaning
0b0	Does not support MBWU overflow linkage.
0b1	Supports MBWU overflow linkage and the MSMON_CFG_MBWU_CTL.OFLOW_LNKG field.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_MBWU_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_OFSR, bit [26]

The MBWU monitor overflow status bitmap register, MSMON_MBWU_OFSR, is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFSR	Meaning
0b0	MSMON_MBWU_OFSR register is not implemented.
0b1	MSMON_MBWU_OFSR register is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the MBWU monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_CEVNT_OFLW, bit [25]

Supports MSMON_CFG_MBWU_CTL.CEVNT_OFLW field which can enable the MBWU monitor instance to perform overflow behaviors on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CEVNT_OFLW	Meaning
0b0	Does not support MSMON_CFG_MBWU_CTL.CEVNT_OFLW.
0b1	Supports MSMON_CFG_MBWU_CTL.CEVNT_OFLW.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_MBWU_CTL.CEVNT_OFLW is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_OFLOW_CAPT, bit [24]

Supports MSMON_CFG_MBWU_CTL.OFLOW_CAPT field which can enable the MBWU monitor instance to capture the monitor on an overflow.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_CAPT	Meaning
0b0	Does not support MSMON_CFG_MBWU_CTL.OFLOW_CAPT.
0b1	Supports MSMON_CFG_MBWU_CTL.OFLOW_CAPT.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_MBWU_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

NO_MATCH_PARTID, bit [23]

Indicates support for using PARTID identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PARTID	Meaning
0b0	Supports memory bandwidth usage monitoring based on PARTID.
0b1	Does not support memory bandwidth usage monitoring based on PARTID.

Access to this field is RO.

NO_MATCH_PMG, bit [22]

Indicates support for using PMG identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PMG	Meaning
0b0	Supports memory bandwidth usage monitoring based on PMG.
0b1	Does not support memory bandwidth usage monitoring based on PMG.

Access to this field is RO.

Bit [21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of MSMON_MBWU.VALUE in bits. If scaling is enabled by MSMON_CFG_MBWU_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

If MPAMF_IDR.HAS_RIS is 1, this field reports the scale value for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, MSMON_CFG_MON_SEL.MON_SEL, is NUM_MON minus 1.

If MPAMF_IDR.HAS_RIS is 1, this field reports the number of MBWU monitor instances for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When FEAT_MPAMv1p0 is implemented or FEAT_MPAMv0p1 is implemented:

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_MBWU to the corresponding MSMON_MBWU_CAPTURE on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CAPTURE	Meaning
0b0	MSMON_MBWU_CAPTURE is not implemented and there is no support for capture events in the MBWU monitor.
0b1	The MSMON_MBWU_CAPTURE register is implemented and the MBWU monitor supports the capture event behavior.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MBWU monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_LONG is 1, this also reports that MSMON_MBWU_L_CAPTURE is implemented.

Access to this field is RO.

HAS_LONG, bit [30]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Reports whether MSMON_MBWU_L is implemented.

If HAS_CAPTURE is 1, reports whether MSMON_MBWU_L_CAPTURE is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_LONG	Meaning
0b0	Does not implement MSMON_MBWU_L or MSMON_MBWU_L_CAPTURE.
0b1	Implements MSMON_MBWU_L. If HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE is also implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the long MBWU monitor is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, this also reports that MSMON_MBWU_L_CAPTURE is implemented.

Access to this field is RO.

Otherwise:

Reserved, RES0.

LWD, bit [29]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_LONG == '1':

Long register VALUE width.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LWD	Meaning
0b0	MSMON_MBWU_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If HAS_LONG is 1 and MPAMF_MBWUMON_IDR.HAS_CAPTURE is 1, MSMON_MBWU_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_MBWU_L has 63-bit VALUE field in bits [62:0]. If MPAMF_MBWUMON_IDR.HAS_CAPTURE == 1, MSMON_MBWU_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

If MPAMF_IDR.HAS_RIS is 1, this field reports the length of the MSMON_MBWU_L.VALUE field implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_RWBW, bit [28]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Read/write bandwidth selection is implemented in MSMON_CFG_MBWU_FLT.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_RWBW	Meaning
0b0	Read/write bandwidth selection is not implemented.
0b1	Read/write bandwidth selection is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports whether read/write bandwidth collection selection is available in MSMON_CFG_MBWU_FLT for resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_MBWU_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_LNKG	Meaning
0b0	Does not support MBWU overflow linkage.
0b1	Supports MBWU overflow linkage and the MSMON_CFG_MBWU_CTL.OFLOW_LNKG field.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_MBWU_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFSR, bit [26]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The MBWU monitor overflow status bitmap register, MSMON_MBWU_OFSR, is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFSR	Meaning
0b0	MSMON_MBWU_OFSR register is not implemented.
0b1	MSMON_MBWU_OFSR register is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the MBWU monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_CEVNT_OFLW, bit [25]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_MBWU_CTL.CEVNT_OFLW field which can enable the MBWU monitor instance to perform overflow behaviors on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CEVNT_OFLW	Meaning
0b0	Does not support MSMON_CFG_MBWU_CTL.CEVNT_OFLW.
0b1	Supports MSMON_CFG_MBWU_CTL.CEVNT_OFLW.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_MBWU_CTL.CEVNT_OFLW is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFLOW_CAPT, bit [24]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_MBWU_CTL.OFLOW_CAPT field which can enable the MBWU monitor instance to capture the monitor on an overflow.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_CAPT	Meaning
0b0	Does not support MSMON_CFG_MBWU_CTL.OFLOW_CAPT.
0b1	Supports MSMON_CFG_MBWU_CTL.OFLOW_CAPT.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_MBWU_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NO_MATCH_PARTID, bit [23]

Indicates support for using PARTID identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PARTID	Meaning
0b0	Supports memory bandwidth usage monitoring based on PARTID.
0b1	Does not support memory bandwidth usage monitoring based on PARTID.

Access to this field is RO.

NO_MATCH_PMG, bit [22]

Indicates support for using PMG identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PMG	Meaning
0b0	Supports memory bandwidth usage monitoring based on PMG.
0b1	Does not support memory bandwidth usage monitoring based on PMG.

Access to this field is RO.

Bit [21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of MSMON_MBWU.VALUE in bits. If scaling is enabled by MSMON_CFG_MBWU_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

If MPAMF_IDR.HAS_RIS is 1, this field reports the scale value for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

NUM_MON, bits [15:0]

The number of memory bandwidth usage monitor instances implemented. The largest monitor instance selector, MSMON_CFG_MON_SEL.MON_SEL, is NUM_MON minus 1.

If MPAMF_IDR.HAS_RIS is 1, this field reports the number of MBWU monitor instances for MSMON_MBWU.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_MBWUMON_IDR

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MPAMF_MBWUMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.
- MPAMF_MBWUMON_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_MBWUMON_IDR_s is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_ns.
- There must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s) and Non-secure (MPAMF_MBWUMON_IDR_ns) MPAM feature pages.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_MBWUMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.

- MPAMF_MBWUMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_MBWUMON_IDR_s is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_ns, MPAMF_MBWUMON_IDR_rt, or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rt or MPAMF_MBWUMON_IDR_rl.
- MPAMF_MBWUMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MBWUMON_IDR_rl.
- There must be separate registers in the Secure (MPAMF_MBWUMON_IDR_s), Non-secure (MPAMF_MBWUMON_IDR_ns), Root (MPAMF_MBWUMON_IDR_rt), and Realm (MPAMF_MBWUMON_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_MBWUMON_IDR shows the configuration of memory bandwidth monitoring for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.
- Access to MPAMF_MBWUMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_MBWUMON_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0090

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0090	MPAMF_MBWUMON_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0090	MPAMF_MBWUMON_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0090	MPAMF_MBWUMON_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0090	MPAMF_MBWUMON_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_MSMON_IDR, MPAM Resource Monitoring Identification Register

The MPAMF_MSMON_IDR characteristics are:

Purpose

Indicates which MPAM monitoring features are present on this MSC.

MPAMF_MSMON_IDR_s indicates Secure monitoring features. MPAMF_MSMON_IDR_ns indicates Non-secure monitoring features. MPAMF_MSMON_IDR_rt indicates Root monitoring features. MPAMF_MSMON_IDR_rl indicates Realm monitoring features.

If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

Configuration

The power domain of MPAMF_MSMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv2_MSC is implemented or FEAT_MPAM is implemented) and MPAMF_IDR.HAS_MSMON == '1'. Otherwise, direct accesses to MPAMF_MSMON_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_MSMON_IDR is a 32-bit register.

Field descriptions

HAS_LOCAL_CAPT_EVNT, bit [31]

Has local capture event generator. Indicates whether this MSC has the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_LOCAL_CAPT_EVNT	Meaning
0b0	Does not support MPAM local capture event generator or MSMON_CAPT_EVNT.
0b1	Supports the MPAM local capture event generator and the MSMON_CAPT_EVNT register.

Access to this field is RO.

NO_HW_OFLW_INTR, bit [30]
When FEAT_MPAMv1p1 is implemented:

Does not have hardwired MPAM monitor overflow interrupt.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_HW_OFLW_INTR	Meaning
0b0	Supports generating a hardwired interrupt to signal MPAM monitor overflow.
0b1	No support for a hardwired interrupt to signal MPAM monitor overflow.

If this field is 0, the MSC supports generating a hardwired interrupt for monitor overflow events.

If this field is 0 and the HAS_OFLW_MSI field in this register is 1, the MSC supports generating both hardwired interrupts and MSI writes to signal interrupts.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFLW_MSI, bit [29]
When FEAT_MPAMv1p1 is implemented:

Has support for MSI writes to signal MPAM monitor overflow interrupts. These registers are implemented: MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_MPAM.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLW_MSI	Meaning
0b0	MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_MPAM registers are not implemented.
0b1	MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA and MSMON_OFLOW_MSI_ATTR are implemented and can be used to generate writes to signal MPAM monitor overflow interrupts.

If MPAMF_MSMON_IDR.NO_HW_OFLW_INTR is 1 and this bit is 0, this MSC does not support monitor overflow interrupts.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFLOW_SR, bit [28]
When FEAT_MPAMv1p1 is implemented:

Has MPAM monitor overflow status register MSMON_OFLOW_SR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_SR	Meaning
0b0	Does not have MSMON_OFLOW_SR.
0b1	Supports MSMON_OFLOW_SR.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_TL_MONITORING, bits [27:26]
When FEAT_MPAM_MSC_DOMAINS is implemented:

Indicates whether the monitor supports filtering based on ingress unstranslated MPAM information, translated egress MPAM information, or intermediate MPAM information.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_TL_MONITORING	Meaning	Applies when
0b00	The monitor filters on the intermediate MPAM information, after ingress translation and before egress translation, if implemented and enabled.	
0b01	The monitor filters on the incoming untranslated MPAM information of the memory request, before ingress translation.	When MPAMF_IDR.HAS_IN_TL == '1'
0b10	The monitor filters on the outgoing resulting MPAM information of the memory request after egress translation.	When MPAMF_IDR.HAS_OUT_TL == '1'
0b11	Reserved.	

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [25:19]

Reserved, RES0.

MSMON_CSA, bit [18]

Reports if the cache storage allocation (CSA) monitor is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MSMON_CSA	Meaning
0b0	The cache storage allocation (CSA) monitor is not implemented.
0b1	The cache storage allocation (CSA) monitor is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the CSA monitor is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

MSMON_MBWU, bit [17]

Memory bandwidth usage monitoring. Indicates whether MPAM monitoring for Memory Bandwidth Usage by PARTID and PMG is implemented and whether the following bandwidth usage registers are accessible:

- MPAMF_MBWUMON_IDR, MSMON_CFG_MBWU_CTL, MSMON_CFG_MBWU_FLT, MSMON_MBWU.
- The optional MSMON_MBWU_CAPTURE.
- If MPAM v0.1 or MPAM v1.1 is implemented, the optional MSMON_MBWU_L and the optional MSMON_MBWU_L_CAPTURE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MSMON_MBWU	Meaning
0b0	Does not have monitoring for memory bandwidth usage and does not use the bandwidth usage registers.
0b1	Has monitoring of memory bandwidth usage and uses the bandwidth usage registers.

If RIS is implemented, this field indicates that memory bandwidth usage monitoring is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS as described in MPAMF_MBWUMON_IDR.

Access to this field is RO.

MSMON_CSU, bit [16]

Cache storage usage monitoring. Indicates whether MPAM monitoring of cache storage usage by PARTID and PMG is implemented and the following registers are accessible:

- MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU.
- The optional MSMON_CSU_CAPTURE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MSMON_CSU	Meaning
0b0	Does not have monitoring for cache storage usage or the MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU or MSMON_CSU_CAPTURE registers.
0b1	Has monitoring of cache storage usage and the MPAMF_CSUMON_IDR, MSMON_CFG_CSU_CTL, MSMON_CFG_CSU_FLT, MSMON_CSU and optional MSMON_CSU_CAPTURE registers.

If RIS is implemented, this field indicates that cache storage usage monitoring is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS as described in MPAMF_CSUMON_IDR.

Access to this field is RO.

Bits [15:0]

Reserved, RES0.

Accessing MPAMF_MSMON_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_MSMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_MSMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_MSMON_IDR_s is permitted to have either the same or different contents to MPAMF_MSMON_IDR_ns, MPAMF_MSMON_IDR_rt, or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_ns is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rt or MPAMF_MSMON_IDR_rl.
- MPAMF_MSMON_IDR_rt is permitted to have either the same or different contents to MPAMF_MSMON_IDR_rl.
- There must be separate registers in the Secure (MPAMF_MSMON_IDR_s), Non-secure (MPAMF_MSMON_IDR_ns), Root (MPAMF_MSMON_IDR_rt), and Realm (MPAMF_MSMON_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_MSMON_IDR shows the configuration of memory system monitoring for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.
- Access to MPAMF_MSMON_IDR is not affected by MSMON_CFG_MON_SEL.RIS.

MPAMF_MSMON_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0080

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_s	0x0080	MPAMF_MSMON_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0080	MPAMF_MSMON_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0080	MPAMF_MSMON_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0080	MPAMF_MSMON_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_OUT_TL_IDR, MPAM Egress PARTID Translation ID Register

The MPAMF_OUT_TL_IDR characteristics are:

Purpose

Indicates the egress PARTID translation capabilities of the MSC.

Configuration

The power domain of MPAMF_OUT_TL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented and MPAMF_IDR.HAS_OUT_TL == '1'. Otherwise, direct accesses to MPAMF_OUT_TL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_OUT_TL_IDR is a 32-bit register.

Field descriptions

HAS_DIRECT_TL, bit [31]

Indicates support for direct egress translation of PARTIDs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_DIRECT_TL	Meaning
0b0	Direct egress translation of PARTIDs is not supported.
0b1	Direct egress translation of PARTIDs is supported for those PARTIDs with an explicitly set translation configuration.

Access to this field is RO.

HAS_BASE_MASK, bit [30]

Indicates support for computed egress translation of PARTIDs using a configurable mask and base.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_BASE_MASK	Meaning
0b0	Computed egress translation of PARTIDs using a configurable mask and base is not supported.
0b1	Computed egress translation of PARTIDs using a configurable mask and base is supported for those PARTIDs without an explicitly set translation configuration.

Access to this field is RO.

Bits [29:16]

Reserved, RES0.

OUT_PARTID_MAX, bits [15:0]
When MPAMF_OUT_TL_IDR.HAS_DIRECT_TL == '1':

Maximum value for PARTIDs to be used as direct egress translations, as configured in MPAMCFG_OUT_TL.PARTID_TL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing MPAMF_OUT_TL_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_OUT_TL_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_OUT_TL_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_OUT_TL_IDR_s is permitted to have either the same or different contents to MPAMF_OUT_TL_IDR_ns, MPAMF_OUT_TL_IDR_rt, or MPAMF_OUT_TL_IDR_rl.
- MPAMF_OUT_TL_IDR_ns is permitted to have either the same or different contents to MPAMF_OUT_TL_IDR_rt or MPAMF_OUT_TL_IDR_rl.
- MPAMF_OUT_TL_IDR_rt is permitted to have either the same or different contents to MPAMF_OUT_TL_IDR_rl.
- There must be separate registers in the Secure (MPAMF_OUT_TL_IDR_s), Non-secure (MPAMF_OUT_TL_IDR_ns), Root (MPAMF_OUT_TL_IDR_rt), and Realm (MPAMF_OUT_TL_IDR_rl) MPAM feature pages.

MPAMF_OUT_TL_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3200

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x3200	MPAMF_OUT_TL_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3200	MPAMF_OUT_TL_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3200	MPAMF_OUT_TL_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3200	MPAMF_OUT_TL_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_PARTID_NRW_IDR, MPAM PARTID Narrowing ID register

The MPAMF_PARTID_NRW_IDR characteristics are:

Purpose

Indicates the largest internal PARTID for this MSC.

MPAMF_PARTID_NRW_IDR_s indicates the largest Secure internal PARTID. MPAMF_PARTID_NRW_IDR_ns indicates the largest Non-secure internal PARTID.

When FEAT_RME is implemented: MPAMF_PARTID_NRW_rt indicates the largest Root internal PARTID. MPAMF_PARTID_NRW_rl indicates the largest Realm internal PARTID.

PARTID narrowing is global to the MSC and does not vary by resource instance.

Configuration

The power domain of MPAMF_PARTID_NRW_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_PARTID_NRW == '1'. Otherwise, direct accesses to MPAMF_PARTID_NRW_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PARTID_NRW_IDR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

INTPARTID_MAX, bits [15:0]

The largest intPARTID supported in this MSC.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_PARTID_NRW_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_PARTID_NRW_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_PARTID_NRW_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_PARTID_NRW_IDR_s is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_ns, MPAMF_PARTID_NRW_IDR_rt, or MPAMF_PARTID_NRW_IDR_rl.
- MPAMF_PARTID_NRW_IDR_ns is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_rt or MPAMF_PARTID_NRW_IDR_rl.
- MPAMF_PARTID_NRW_IDR_rt is permitted to have either the same or different contents to MPAMF_PARTID_NRW_IDR_rl.
- There must be separate registers in the Secure (MPAMF_PARTID_NRW_IDR_s), Non-secure (MPAMF_PARTID_NRW_IDR_ns), Root (MPAMF_PARTID_NRW_IDR_rt), and Realm (MPAMF_PARTID_NRW_IDR_rl) MPAM feature pages.

MPAMF_PARTID_NRW_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0050

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0050	MPAMF_PARTID_NRW_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0050	MPAMF_PARTID_NRW_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0050	MPAMF_PARTID_NRW_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0050	MPAMF_PARTID_NRW_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_PMG_IN_TL_IDR, MPAM PMG Translation Ingress Identification Register

The MPAMF_PMG_IN_TL_IDR characteristics are:

Purpose

Reports the capabilities and properties of the ingress PMG translation feature of the MSC.

Configuration

The power domain of MPAMF_PMG_IN_TL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented and MPAMF_IDR.HAS_IN_TL == '1'. Otherwise, direct accesses to MPAMF_PMG_IN_TL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PMG_IN_TL_IDR is a 32-bit register.

Field descriptions

DIRECT, bit [31]

Reports support for direct translation of PMG at ingress to the MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIRECT	Meaning
0b0	Direct translation of PMG at ingress to the MSC is not supported.
0b1	Direct translation of PMG at ingress to the MSC is supported. Direct translations are configured in MSMON_IN_TL.

Access to this field is RO.

BASE_MASK, bit [30]

Reports support for computed translation of PMG at ingress to the MSC, using a configurable base and mask.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BASE_MASK	Meaning
0b0	Computed translation of PMG at ingress to the MSC using a configurable base and mask is not supported.
0b1	Computed translation of PMG at ingress to the MSC using a configurable base and mask is supported. Direct translation takes precedence. Base and mask are configured in MSMON_IN_TL_BASE and MSMON_IN_TL_MASK.

Access to this field is RO.

Bits [29:16]

Reserved, RES0.

PMGTL_MAX, bits [15:0]
When MPAMF_PMG_IN_TL_IDR.DIRECT == '1':

Reports the maximum value of PMG translation supported for direct translations at ingress to the MSC, as configured in MSMON_IN_TL.PMGTL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing MPAMF_PMG_IN_TL_IDR

MPAMF_PMG_IN_TL_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2400

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_PMG_OUT_TL_IDR, MPAM PMG Translation Egress Identification Register

The MPAMF_PMG_OUT_TL_IDR characteristics are:

Purpose

Reports the capabilities and properties of the egress PMG translation feature of the MSC.

Configuration

The power domain of MPAMF_PMG_OUT_TL_IDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented and MPAMF_IDR.HAS_OUT_TL == '1'. Otherwise, direct accesses to MPAMF_PMG_OUT_TL_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PMG_OUT_TL_IDR is a 32-bit register.

Field descriptions

DIRECT, bit [31]

Reports support for direct translation of PMG at egress from the MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIRECT	Meaning
0b0	Direct translation of PMG at egress from the MSC is not supported.
0b1	Direct translation of PMG at egress from the MSC is supported. Direct translations are configured in MSMON_OUT_TL.

Access to this field is RO.

BASE_MASK, bit [30]

Reports support for computed translation of PMG at egress from the MSC, using a configurable base and mask.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BASE_MASK	Meaning
0b0	Computed translation of PMG at egress from the MSC using a configurable base and mask is not supported.
0b1	Computed translation of PMG at egress from the MSC using a configurable base and mask is supported. Direct translation takes precedence. Base and mask are configured in MSMON_OUT_TL_BASE and MSMON_OUT_TL_MASK.

Access to this field is RO.

Bits [29:16]

Reserved, RES0.

PMGTL_MAX, bits [15:0]
When MPAMF_PMG_OUT_TL_IDR.DIRECT == '1':

Reports the maximum value of PMG translation supported for direct translations at egress from the MSC, as configured in MSMON_OUT_TL.PMGTL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing MPAMF_PMG_OUT_TL_IDR

MPAMF_PMG_OUT_TL_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2408

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_PRI_IDR, MPAM Priority Partitioning Identification Register

The MPAMF_PRI_IDR characteristics are:

Purpose

Indicates which MPAM priority partitioning features are present on this MSC.

MPAMF_PRI_IDR_s indicates priority partitioning features accessed from the Secure MPAM feature page. MPAMF_PRI_IDR_ns indicates priority partitioning features accessed from the Non-secure MPAM feature page. MPAMF_PRI_IDR_rt indicates priority partitioning features accessed from the Root MPAM feature page. MPAMF_PRI_IDR_rl indicates priority partitioning features accessed from the Realm MPAM feature page.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has that information within the field description.

Configuration

The power domain of MPAMF_PRI_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_PRI_PART == '1'. Otherwise, direct accesses to MPAMF_PRI_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_PRI_IDR is a 32-bit register.

Field descriptions

Bits [31:26]

Reserved, RES0.

DSPRI_WD, bits [25:20]

Number of implemented bits in the downstream priority field (DSPRI) of MPAMCFG_PRI.

If HAS_DSPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_DSPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of downstream priority bits for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [19:18]

Reserved, RES0.

DSPRI_0_IS_LOW, bit [17]

Indicates whether 0 in MPAMCFG_PRI.DSPRI is the lowest or the highest downstream priority.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DSPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI.DSPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI.DSPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest downstream priority for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_DSPRI, bit [16]

Indicates that the MPAMCFG_PRI register implements the DSPRI field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_DSPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement a downstream priority (DSPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports downstream priority partitioning and implements the downstream priority (DSPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that downstream priority is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Bits [15:10]

Reserved, RES0.

INTPRI_WD, bits [9:4]

Number of implemented bits in the internal priority field (INTPRI) in the MPAMCFG_PRI register.

If HAS_INTPRI == 1, this field must contain a value from 1 to 16, inclusive.

If HAS_INTPRI == 0, this field must be 0.

If RIS is implemented, this field indicates the number of internal priority bits for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [3:2]

Reserved, RES0.

INTPRI_0_IS_LOW, bit [1]

Indicates whether 0 in MPAMCFG_PRI.INTPRI is the lowest or the highest internal priority.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INTPRI_0_IS_LOW	Meaning
0b0	In the MPAMCFG_PRI.INTPRI field, a value of 0 means the highest priority.
0b1	In the MPAMCFG_PRI.INTPRI field, a value of 0 means the lowest priority.

If RIS is implemented, this field indicates that 0 is the lowest internal priority for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_INTPRI, bit [0]

Indicates that this MSC implements the INTPRI field in the MPAMCFG_PRI register.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_INTPRI	Meaning
0b0	This MSC supports priority partitioning, but does not implement the internal priority (INTPRI) field in the MPAMCFG_PRI register.
0b1	This MSC supports internal priority partitioning and implements the internal priority (INTPRI) field in the MPAMCFG_PRI register.

If RIS is implemented, this field indicates that internal priority is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Accessing MPAMF_PRI_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_PRI_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_PRI_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_PRI_IDR_s is permitted to have either the same or different contents to MPAMF_PRI_IDR_ns, MPAMF_PRI_IDR_rt, or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_ns is permitted to have either the same or different contents to MPAMF_PRI_IDR_rt or MPAMF_PRI_IDR_rl.
- MPAMF_PRI_IDR_rt is permitted to have either the same or different contents to MPAMF_PRI_IDR_rl.
- There must be separate registers in the Secure (MPAMF_PRI_IDR_s), Non-secure (MPAMF_PRI_IDR_ns), Root (MPAMF_PRI_IDR_rt), and Realm (MPAMF_PRI_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_PRI_IDR shows the configuration of priority partitioning for the resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_PRI_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0048

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0048	MPAMF_PRI_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0048	MPAMF_PRI_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0048	MPAMF_PRI_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0048	MPAMF_PRI_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_ROOTCR, MPAM Root Control Register

The MPAMF_ROOTCR characteristics are:

Purpose

Allows Root software to configure the physical address space to which the MSC feature page is assigned.

Configuration

The power domain of MPAMF_ROOTCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, FEAT_RME is implemented, and MPAMF_IDR.PAS_CFG == '1'. Otherwise, direct accesses to MPAMF_ROOTCR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_ROOTCR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

PAS_MAP, bits [2:0]

Controls the physical address space to which the feature page is assigned.

PAS_MAP	Meaning
0b000	The feature page is assigned to Non-secure physical address space.
0b001	The feature page is assigned to Secure physical address space.
0b010	The feature page is assigned to Realm physical address space.
0b011	The feature page is assigned to Root physical address space.
0b100	Reserved.
0b101	Reserved.
0b110	Reserved.
0b111	The feature page is not assigned to any physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0`.

Accessing MPAMF_ROOTCR

MPAMF_ROOTCR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2200

Accessible as follows:

- When an access is not Root, accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_SIDR, MPAM Features Secure Identification Register

The MPAMF_SIDR characteristics are:

Purpose

The MPAMF_SIDR is a 32-bit read-only register that indicates the maximum Secure PARTID and Secure PMG on this MSC.

Configuration

The power domain of MPAMF_SIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented. Otherwise, direct accesses to MPAMF_SIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_SIDR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

S_PMG_MAX, bits [23:16]

Maximum value of Secure PMG supported by this component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

S_PARTID_MAX, bits [15:0]

Maximum value of Secure PARTID supported by this component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_SIDR

This register is only within the Secure MPAM feature page memory frame.

MPAMF_SIDR must only be readable from the Secure MPAM feature page. If the system or the MSC does not support the Secure address map, this register must not be accessible.

MPAMF_SIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0008	MPAMF_SIDR_s

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CAPT_EVNT, MPAM Capture Event Generation Register

The MSMON_CAPT_EVNT characteristics are:

Purpose

Generates a local capture event when written with bit[0] as 1.

MSMON_CAPT_EVNT generates local capture events in the physical address space selected by MPAMF_ROOTCR.PAS_MAP

Configuration

The power domain of MSMON_CAPT_EVNT is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.HAS_LOCAL_CAPT_EVNT == '1'. Otherwise, direct accesses to MSMON_CAPT_EVNT are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CAPT_EVNT is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

ALL, bit [1]

In the Secure instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Secure and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.

In the Non-secure instance of this register, this field is RAZ/WI.

In the Root instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Root, Realm, Secure, and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Root monitor instances within this MSC that are configured with CAPT_EVNT = 7.

In the Realm instance of this register:

- If ALL is written as 1 and NOW is also written as 1, signal a capture event to Realm and Non-secure monitor instances in this MSC that are configured with CAPT_EVNT = 7.
- If ALL is written as 0 and NOW is written as 1, signal a capture event to Realm monitor instances within this MSC that are configured with CAPT_EVNT = 7.

This bit always reads as zero.

ALL	Meaning
0b0	Send capture event only to monitor instances in the same MPAM feature page as this register.
0b1	Send capture event to monitor instances in certain MPAM feature pages as described in the ALL field of this register.

NOW, bit [0]

When written as 1, this bit causes an event to those monitor instances described in the ALL field that have CAPT_EVNT set to the value of 7.

When this bit is written as 0, no event is signaled.

This bit always reads as zero.

Accessing MSMON_CAPT_EVNT

This register is within the MPAM feature page memory frames. In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

MSMON_CAPT_EVNT_s must only be accessible from the Secure MPAM feature page. MSMON_CAPT_EVNT_ns must only be accessible from the Non-secure MPAM feature page.

MSMON_CAPT_EVNT_s and MSMON_CAPT_EVNT_ns must be separate registers. The Secure instance (MSMON_CAPT_EVNT_s) can generate local capture events for Secure monitor instances only or for Secure and Non-secure monitor instances, and the Non-secure instance (MSMON_CAPT_EVNT_ns) can generate local capture events for Non-secure monitor instances only.

MSMON_CAPT_EVNT can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0808

When FEAT_MPAMv2_MSC is implemented, accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0808	MSMON_CAPT_EVNT_s

Accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0808	MSMON_CAPT_EVNT_ns

Accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0808	MSMON_CAPT_EVNT_rt

When FEAT_RME is implemented, accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0808	MSMON_CAPT_EVNT_rl

When FEAT_RME is implemented, accesses to this register are WO/RAZ.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CFG_CSA_CTL, MPAM Memory System Monitor Configure Cache Storage Allocation Monitor Control Register

The MSMON_CFG_CSA_CTL characteristics are:

Purpose

Controls the CSA monitor selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_CSA_CTL is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSA == '1'. Otherwise, direct accesses to MSMON_CFG_CSA_CTL are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CFG_CSA_CTL_s controls the Secure cache storage allocation monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSA_CTL_ns controls Non-secure cache storage allocation monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CFG_CSA_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSA_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSA_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSA_CTL is a 32-bit register.

Field descriptions

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, MSMON_CSA of the monitor instance is copied to MSMON_CSA_CAPTURE of the same instance. If the long counter is also implemented, MSMON_CSA_L is also copied to MSMON_CSA_L_CAPTURE.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional, but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

When MPAMF_CSAMON_IDR.HAS_CAPTURE == '0', access to this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset MSMON_CSA.VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	MSMON_CSA.VALUE field of the monitor instance is not reset on capture.
0b1	MSMON_CSA.VALUE field of the monitor instance is reset on capture.

This control bit affects both MSMON_CSA and MSMON_CSA_L in implementations that include MSMON_CSA_L.

When MPAMF_CSAMON_IDR.HAS_CAPTURE == '0', access to this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_CSA has overflowed.

OFLOW_STATUS	Meaning
0b0	MSMON_CSA.VALUE has not overflowed.
0b1	MSMON_CSA.VALUE has overflowed at least once since this bit was last written to zero.

Overflow status for MSMON_CSA_L.VALUE is reported in MSMON_CFG_CSA_CTL.OFLOW_STATUS_L.

If MPAMF_CSAMON_IDR.HAS_CEVNT_OFLW is 1 or MPAMF_CSAMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_CSA when this field is 1 resets this field to 0.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of MSMON_CSA.VALUE.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSA.VALUE.
0b1	An implementation-specific interrupt is signaled on an overflow of MSMON_CSA.VALUE.

Interrupt enable for overflow of MSMON_CSA_L.VALUE is controlled by MSMON_CFG_CSA_CTL.OFLOW_INTR_L.

When MSMON_CFG_CSA_CTL.OFLOW_INTR == '0', access to this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether MSMON_CSA.VALUE field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	MSMON_CSA.VALUE field of the monitor instance wraps on overflow.
0b1	MSMON_CSA.VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

When a MSMON_CSA.VALUE of a monitor instance is frozen it does not change until MSMON_CSA register for that instance has been written. If the monitor implements both MSMON_CSA and MSMON_CSA_L registers, both are frozen. A write to a frozen register unfreezes the count for just that register.

This control bit affects both MSMON_CSA and MSMON_CSA_L in implementations that include MSMON_CSA_L.

OFLOW_CAPT, bit [23]
When (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_CSAMON_IDR.HAS_OFLOW_CAPT == '1':

Capture Monitor on Overflow.

OFLOW_CAPT	Meaning
0b0	Monitor register MSMON_CSA is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_CSA is captured and the MSMON_CSA.{NRDY, VALUE} fields are copied to the monitor instance's MSMON_CSA_CAPTURE register on an overflow or when affected by an overflow linkage event. The monitor instance treats an overflow of this monitor instance as a private capture event. If MSMON_CFG_CSA_CTL.CEVNT_OFLW is 1, this monitor instance also treats an overflow linkage event as a capture event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

This bit does not control whether MSMON_CSA_L is captured on an overflow or overflow linkage event. See MSMON_CFG_CSA_CTL.OFLOW_CAPT_L.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

SCLEN, bit [19]

MSMON_CSA.VALUE Scaling Enable.

Enables scaling of MSMON_CSA.VALUE by MPAMF_CSAMON_IDR.SCALE.

SCLEN	Meaning
0b0	MSMON_CSA.VALUE has bytes counted by the monitor instance.
0b1	MSMON_CSA.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_CSAMON_IDR.SCALE.

CEVNT_OFLW, bit [18]
When (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_CSAMON_IDR.HAS_CEVNT_OFLW == '1':

Capture Event performs overflow behavior.

CEVNT_OFLW	Meaning
0b0	On a capture event matching the CAPT_EVNT field the capture behaviors are performed. The NRDY and VALUE fields are transferred to the monitor instance's capture register.
0b1	On a capture event matching the CAPT_EVNT field the monitor instance treats a capture event as an overflow and the overflow behaviors are performed. The behavior is controlled by the MSMON_CFG_CSA_CTL.{OFLOW_FRZ, OFLOW_CAPT, OFLOW_CAPT_L, CAPT_RESET} fields. The MSMON_CFG_CSA_CTL.{OFLOW_STATUS, OFLOW_STATUS_L} fields are set for this monitor instance.

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]
When MPAMF_CSAMON_IDR.NO_MATCH_PMG == '0':

Controls whether the monitor instance only counts allocations caused by the PMG matching MSMON_CFG_CSA_FLT.PMG.

MATCH_PMG	Meaning
0b0	The monitor instance counts allocations caused by any PMG value.
0b1	The monitor instance only counts allocations caused by the PMG value matching MSMON_CFG_CSA_FLT.PMG.

Otherwise:

Reserved, RES0.

MATCH_PARTID, bit [16]
When MPAMF_CSAMON_IDR.NO_MATCH_PARTID == '0':

Controls whether the monitor instance only counts allocations caused by the PARTID matching MSMON_CFG_CSA_FLT.PARTID.

MATCH_PARTID	Meaning
0b0	The monitor instance counts allocations caused by any PARTID value.
0b1	The monitor instance only counts allocations caused by the PARTID value matching MSMON_CFG_CSA_FLT.PARTID.

Otherwise:

Reserved, RES0.

OFLOW_STATUS_L, bit [15]
When (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_CSAMON_IDR.HAS_LONG == '0':

Reports whether MSMON_CSA_L.VALUE has overflowed.

OFLOW_STATUS_L	Meaning
0b0	MSMON_CSA_L.VALUE has not overflowed.
0b1	MSMON_CSA_L.VALUE has overflowed at least once since this bit was last written to zero.

Overflow status of MSMON_CSA.VALUE is reported in MSMON_CFG_CSA_CTL.OFLOW_STATUS.

If MPAMF_CSAMON_IDR.HAS_CEVNT_OFLW is 1 or MPAMF_CSAMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_CSA_L when this field is 1 resets this field to 0.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]
When (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_CSAMON_IDR.HAS_LONG == '1':

Overflow Interrupt for MSMON_CSA_L.

Controls whether an MPAM overflow interrupt is generated when MSMON_CSA_L.VALUE overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSA_L.VALUE.
0b1	An implementation-specific interrupt is signaled on overflow of MSMON_CSA_L.VALUE.

When MSMON_CFG_CSA_CTL.OFLOW_INTR_L == '0', access to this field is RAZ/WI.

Otherwise:

Reserved, RES0.

OFLOW_CAPT_L, bit [13]
When (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_CSAMON_IDR.HAS_LONG == '1', and MPAMF_CSAMON_IDR.HAS_OFLOW_CAPT == '1':

Capture Long Monitor on Overflow.

Controls whether MSMON_CSA_L is copied to MSMON_CSA_L_CAPTURE on an overflow or an overflow linkage event.

OFLOW_CAPT_L	Meaning
0b0	Monitor register MSMON_CSA_L is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_CSA_L is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

If this bit is 1, this monitor instance treats an overflow of this monitor instance as a private capture event.

If this bit is 1, this monitor instance also treats overflow linkage events for which it qualifies as a private capture event.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

OFLOW_LNKG, bits [10:8]
When (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_CSAMON_IDR.HAS_OFLOW_LNKG == '1':

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

OFLOW_LNKG	Meaning
0b000	Overflow of the monitor instance only affects this monitor instance.
0b001	Overflow of this monitor instance signals Capture Event 1.
0b010	Overflow of this monitor instance signals Capture Event 2.
0b011	Overflow of this monitor instance signals Capture Event 3.
0b100	Overflow of this monitor instance signals Capture Event 4.
0b101	Overflow of this monitor instance signals Capture Event 5.
0b110	Overflow of this monitor instance signals Capture Event 6.
0b111	Reserved.

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The CSA monitor is TYPE = 0x44.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x44.

Access to this field is RO.

Accessing MSMON_CFG_CSA_CTL

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CFG_CSA_CTL_s must only be accessible from the Secure MPAM feature page. MSMON_CFG_CSA_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSA_CTL_s and MSMON_CFG_CSA_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_CSA_CTL_s) accesses the cache storage allocation monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSA_CTL_ns) accesses the cache storage allocation monitor controls used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CFG_CSA_CTL_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSA_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSA_CTL_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_CSA_CTL_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CFG_CSA_CTL_s, MSMON_CFG_CSA_CTL_ns, MSMON_CFG_CSA_CTL_rt, and MSMON_CFG_CSA_CTL_rl must be separate registers:
- The Secure instance (MSMON_CFG_CSA_CTL_s) accesses the cache storage allocation monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSA_CTL_ns) accesses the cache storage allocation monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSA_CTL_rt) accesses the cache storage allocation monitor controls used for Root PARTIDs.

- The Realm instance (MSMON_CFG_CSA_CTL_rl) accesses the cache storage allocation monitor controls used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CFG_CSA_CTL is accessible in the PA space defined by MSMON_CSA_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, loads and stores to MSMON_CFG_CSA_CTL access the monitor configuration settings for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, loads and stores to MSMON_CFG_CSA_CTL access the monitor configuration settings for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Loads and stores to MSMON_CFG_CSA_CTL access the monitor configuration settings for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_CSA_CTL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0838

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0838	MSMON_CFG_CSA_CTL_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0838	MSMON_CFG_CSA_CTL_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0838	MSMON_CFG_CSA_CTL_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0838	MSMON_CFG_CSA_CTL_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CFG_CSA_FLT, MPAM Memory System Monitor Configure Cache Storage Allocation Monitor Filter Register

The MSMON_CFG_CSA_FLT characteristics are:

Purpose

Controls PARTID and PMG to count in the CSA monitor selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_CSA_FLT is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSA == '1'. Otherwise, direct accesses to MSMON_CFG_CSA_FLT are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CFG_CSA_FLT_s sets filter conditions for the Secure cache storage allocation monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSA_CTL_ns sets filter conditions for the Non-secure cache storage allocation monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CFG_CSA_FLT_rt sets the filter conditions for the Root PARTID selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSA_FLT_rl sets the filter conditions for the Realm PARTID selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSA_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSA_FLT is a 32-bit register.

Field descriptions

When FEAT_MPAMv2_MSC is implemented:

PMG, bits [31:16]

Performance monitoring group to filter cache storage allocation monitoring.

If MSMON_CFG_CSA_CTL.MATCH_PMG is 0, this field is not used to match cache allocations to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSA_CTL.MATCH_PMG is 1, the monitor selected by MSMON_CFG_MON_SEL counts cache allocations caused by requests labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter cache storage allocation monitoring.

If MSMON_CFG_CSA_CTL.MATCH_PARTID is 0, this field is not used to match cache allocations to a PARTID and the contents of this field is ignored.

If MSMON_CFG_CSA_CTL.MATCH_PARTID is 1, the monitor selected by MSMON_CFG_MON_SEL counts cache allocations caused by requests labeled with PARTID equal to this field.

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter cache storage allocation monitoring.

If MSMON_CFG_CSA_CTL.MATCH_PMG is 0, this field is not used to match cache allocations to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSA_CTL.MATCH_PMG is 1, the monitor selected by MSMON_CFG_MON_SEL counts cache allocations caused by requests labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter cache storage allocation monitoring.

If MSMON_CFG_CSA_CTL.MATCH_PARTID is 0, this field is not used to match cache allocations to a PARTID and the contents of this field is ignored.

If MSMON_CFG_CSA_CTL.MATCH_PARTID is 1, the monitor selected by MSMON_CFG_MON_SEL counts cache allocations caused by requests labeled with PARTID equal to this field.

Accessing MSMON_CFG_CSA_FLT

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CFG_CSA_FLT_s must only be accessible from the Secure MPAM feature page. MSMON_CFG_CSA_FLT_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSA_FLT_s and MSMON_CFG_CSA_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_CSA_FLT_s) accesses the PARTID and PMG matching for a cache storage allocation monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSA_FLT_ns) accesses the PARTID and PMG matching for a cache storage allocation monitor used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CFG_CSA_FLT_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSA_FLT_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSA_FLT_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_CSA_FLT_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CFG_CSA_FLT_s, MSMON_CFG_CSA_FLT_ns, MSMON_CFG_CSA_FLT_rt, and MSMON_CFG_CSA_FLT_rl must be separate registers:
- The Secure instance (MSMON_CFG_CSA_FLT_s) accesses the PARTID and PMG matching for a cache storage allocation monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSA_FLT_ns) accesses the PARTID and PMG matching for a cache storage allocation monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSA_FLT_rt) accesses the PARTID and PMG matching for a cache storage allocation monitor used for Root PARTIDs.

- The Realm instance (MSMON_CFG_CSA_FLT_rl) accesses the PARTID and PMG matching for a cache storage allocation monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CFG_CSA_FLT is accessible in the PA space defined by MSMON_CSA_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, loads and stores to MSMON_CFG_CSA_FLT access the monitor configuration settings for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, loads and stores to MSMON_CFG_CSA_FLT access the monitor configuration settings for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Loads and stores to MSMON_CFG_CSA_FLT access the monitor configuration settings for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_CSA_FLT can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0830

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0830	MSMON_CFG_CSA_FLT_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0830	MSMON_CFG_CSA_FLT_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0830	MSMON_CFG_CSA_FLT_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0830	MSMON_CFG_CSA_FLT_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CFG_CSU_CTL, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Control Register

The MSMON_CFG_CSU_CTL characteristics are:

Purpose

Controls the CSU monitor selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_CTL is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSU == '1'. Otherwise, direct accesses to MSMON_CFG_CSU_CTL are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CFG_CSU_CTL_s controls the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSU_CTL_ns controls Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CFG_CSU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10
EN	CAPT_EVNT		CAPT_RESET	OFLOW_STATUS	OFLOW_INTR	OFLOW_FRZ	OFLOW_CAPT	SUBTYPE			RES0	CEVNT_OFLW	MATCH_PMG	MATCH_PARTID		RES0					OFLO

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional, but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

When MPAMF_CSUMON_IDR.HAS_CAPTURE == '0', access to this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset after capture.

Controls whether the value of MSMON_CSU is reset to zero immediately after being copied to MSMON_CSU_CAPTURE.

CAPT_RESET	Meaning
0b0	Monitor is not reset on capture.
0b1	Monitor is reset on capture.

Because the CSU monitor type produces a measurement rather than a count, it might not make sense to ever reset the value after a capture. If there is no reason to ever reset a CSU monitor, this field is RAZ/WI.

When MPAMF_CSUMON_IDR.HAS_CAPTURE == '0', access to this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_CSU has overflowed.

If MPAMF_CSUMON_IDR.HAS_CEVNT_OFLW is 1 or MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_CSU when this field is 1 resets this field to 0.

OFLOW_STATUS	Meaning
0b0	No overflow has occurred.
0b1	At least one overflow has occurred since this bit was last written to zero.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

OFLOW_INTR, bit [25]

Overflow Interrupt.

Controls whether an overflow interrupt is generated when the value of MSMON_CSU has overflowed.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_CSU.
0b1	On overflow, an implementation-specific interrupt is signaled.

When MSMON_CFG_CSU_CTL.OFLOW_INTR == '0', access to this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze Monitor on Overflow.

Controls whether the value of MSMON_CSU.VALUE freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	Monitor count wraps on overflow.
0b1	Monitor count freezes on overflow. The frozen value might be 0 or another value if the monitor overflowed with an increment larger than 1.

If overflow is not possible for a CSU monitor in the implementation, this field is RAZ/WI.

When a MSMON_CSU.VALUE of a monitor instance is frozen it does not change until MSMON_CSU register for that instance has been written.

OFLOW_CAPT, bit [23]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_CAPT == '1':

Capture Monitor on Overflow.

OFLOW_CAPT	Meaning
0b0	Monitor is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor is captured and the MSMON_CSU.{NRDY, VALUE} fields are copied to the monitor instance's capture register on an overflow or when affected by an overflow linkage event. The monitor instance treats an overflow of this monitor instance as a private capture event. If MSMON_CFG_CSU_CTL.CEVNT_OFLW is 1, this monitor instance also treats an overflow linkage event as a capture event. If the OFLOW_FRZ field is 1, the monitor does not continue to count after the overflow or overflow linkage event. If the CAPT_RESET field is 1, the monitor instance resets to 0.

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of cache storage usage counted by this monitor.

This field is not currently used for CSU monitors, but reserved for future use.

This field is RAZ/WI.

Bit [19]

Reserved, RES0.

CEVNT_OFLW, bit [18]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_CEVNT_OFLW == '1':

Capture Event performs overflow behavior.

CEVNT_OFLW	Meaning
0b0	On a capture event matching the CAPT_EVNT field, the capture behaviors are performed. The MSMON_CSU.{VALUE, NRDY} fields are transferred to the monitor instance's capture register.
0b1	On a capture event matching the CAPT_EVNT field, the monitor instance treats a capture event as an overflow and the overflow behaviors are performed. The behavior is controlled by the MSMON_CFG_CSU_CTL.{OFLOW_FRZ, OFLOW_CAPT, CAPT_RESET} fields. The MSMON_CFG_CSU_CTL.OFLOW_STATUS field is set for this monitor instance.

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]
When MPAMF_CSUMON_IDR.NO_MATCH_PMG == '0':

Match PMG.

Controls whether the monitor measures only storage used with PMG matching MSMON_CFG_CSU_FLT.PMG.

MATCH_PMG	Meaning
0b0	The monitor measures storage used with any PMG value.
0b1	The monitor only measures storage used with the PMG value matching MSMON_CFG_CSU_FLT.PMG.

If MATCH_PMG is 1 and MATCH_PARTID is 0, usage is reported for requests with a PMG matching MSMON_CFG_CSU_FLT.PMG regardless of their PARTID value.

Otherwise:

Reserved, RES0.

MATCH_PARTID, bit [16]
When MPAMF_CSUMON_IDR.NO_MATCH_PARTID == '0':

Match PARTID.

Controls whether the monitor measures only storage used with PARTID matching MSMON_CFG_CSU_FLT.PARTID.

MATCH_PARTID	Meaning
0b0	The monitor measures storage used with any PARTID value.
0b1	The monitor only measures storage used with the PARTID value matching MSMON_CFG_CSU_FLT.PARTID.

Otherwise:

Reserved, RES0.

Bits [15:11]

Reserved, RES0.

OFLOW_LNKG, bits [10:8]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_OFLOW_LNKG == '1':

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

OFLOW_LNKG	Meaning
0b000	Overflow of the monitor instance only affects this monitor instance.
0b001	Overflow of this monitor instance signals Capture Event 1.
0b010	Overflow of this monitor instance signals Capture Event 2.
0b011	Overflow of this monitor instance signals Capture Event 3.
0b100	Overflow of this monitor instance signals Capture Event 4.
0b101	Overflow of this monitor instance signals Capture Event 5.
0b110	Overflow of this monitor instance signals Capture Event 6.
0b111	Reserved.

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The CSU monitor is TYPE = 0x43.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x43.

Access to this field is RO.

Accessing MSMON_CFG_CSU_CTL

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CFG_CSU_CTL_s must only be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_CTL_s and MSMON_CFG_CSU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CFG_CSU_CTL_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSU_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_CTL_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_CSU_CTL_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CFG_CSU_CTL_s, MSMON_CFG_CSU_CTL_ns, MSMON_CFG_CSU_CTL_rt, and MSMON_CFG_CSU_CTL_rl must be separate registers:
- The Secure instance (MSMON_CFG_CSU_CTL_s) accesses the cache storage usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSU_CTL_ns) accesses the cache storage usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSU_CTL_rt) accesses the cache storage usage monitor controls used for Root PARTIDs.

- The Realm instance (MSMON_CFG_CSU_CTL_rl) accesses the cache storage usage monitor controls used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CFG_CSU_CTL is accessible in the PA space defined by MSMON_CSU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Loads and stores to MSMON_CFG_CSU_CTL access the cache storage usage monitor configuration settings for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_CSU_CTL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0818

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0818	MSMON_CFG_CSU_CTL_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0818	MSMON_CFG_CSU_CTL_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0818	MSMON_CFG_CSU_CTL_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0818	MSMON_CFG_CSU_CTL_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CFG_CSU_FLT, MPAM Memory System Monitor Configure Cache Storage Usage Monitor Filter Register

The MSMON_CFG_CSU_FLT characteristics are:

Purpose

Configures PARTID and PMG to measure or count in the CSU monitor selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_CSU_FLT is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSU == '1'. Otherwise, direct accesses to MSMON_CFG_CSU_FLT are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CFG_CSU_FLT_s sets filter conditions for the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSU_CTL_ns sets filter conditions for the Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CFG_CSU_FLT_rt sets the filter conditions for the Root PARTID selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_CSU_FLT_rl sets the filter conditions for the Realm PARTID selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_CSU_FLT is a 32-bit register.

Field descriptions

When FEAT_MPAMv2_MSC is implemented:

PMG, bits [31:16]

Performance monitoring group to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID is 1, the monitor instance selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID is 0, the behavior of the monitor instance selected by MSMON_CFG_MON_SEL is CONSTRAINED UNPREDICTABLE. See MSMON_CFG_CSU_CTL.MATCH_PMG for more information.

PARTID, bits [15:0]

Partition ID to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 0 and MSMON_CFG_CSU_CTL.MATCH_PMG is 0, the monitor measures all allocated cache storage.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 0 and MSMON_CFG_CSU_CTL.MATCH_PMG is 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of MSMON_CFG_CSU_CTL.MATCH_PMG.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 1 and MSMON_CFG_CSU_CTL.MATCH_PMG is 0, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 1 and MSMON_CFG_CSU_CTL.MATCH_PMG is 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
XCL	RES0							PMG								PARTID															

XCL, bit [31]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSUMON_IDR.HAS_XCL == '1':

Exclude Clean. The monitor instance does not count cache storage used by lines in an unmodified cache state.

XCL	Meaning
0b0	Monitor instance counts cache storage in modified and unmodified cache lines.
0b1	Monitor instance counts cache storage in modified cache lines only.

Otherwise:

Reserved, RES0.

Bits [30:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 0, this field is not used to match cache storage to a PMG and the contents of this field is ignored.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID is 1, the monitor instance selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PMG equal to this field and PARTID equal to the PARTID field.

If MSMON_CFG_CSU_CTL.MATCH_PMG is 1 and MSMON_CFG_CSU_CTL.MATCH_PARTID is 0, the behavior of the monitor instance selected by MSMON_CFG_MON_SEL is CONSTRAINED UNPREDICTABLE. See MSMON_CFG_CSU_CTL.MATCH_PMG for more information.

PARTID, bits [15:0]

Partition ID to filter cache storage usage monitoring.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 0 and MSMON_CFG_CSU_CTL.MATCH_PMG is 0, the monitor measures all allocated cache storage.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 0 and MSMON_CFG_CSU_CTL.MATCH_PMG is 1, the behavior of the monitor is CONSTRAINED UNPREDICTABLE. See the description of MSMON_CFG_CSU_CTL.MATCH_PMG.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 1 and MSMON_CFG_CSU_CTL.MATCH_PMG is 0, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field.

If MSMON_CFG_CSU_CTL.MATCH_PARTID is 1 and MSMON_CFG_CSU_CTL.MATCH_PMG is 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts cache storage labeled with PARTID equal to this field and PMG equal to the PMG field.

Accessing MSMON_CFG_CSU_FLT

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.

- MSMON_CFG_CSU_FLT_s must only be accessible from the Secure MPAM feature page. MSMON_CFG_CSU_FLT_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_FLT_s and MSMON_CFG_CSU_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_CSU_FLT_s) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_CSU_FLT_ns) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CFG_CSU_FLT_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_CSU_FLT_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_CSU_FLT_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_CSU_FLT_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CFG_CSU_FLT_s, MSMON_CFG_CSU_FLT_ns, MSMON_CFG_CSU_FLT_rt, and MSMON_CFG_CSU_FLT_rl must be separate registers:
- The Secure instance (MSMON_CFG_CSU_FLT_s) accesses the PARTID and PMG matching for a cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_CSU_FLT_ns) accesses the PARTID and PMG matching for a cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_CSU_FLT_rt) accesses the PARTID and PMG matching for a cache storage usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CFG_CSU_FLT_rl) accesses the PARTID and PMG matching for a cache storage usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CFG_CSU_FLT is accessible in the PA space defined by MSMON_CSU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, loads and stores to MSMON_CFG_CSU_FLT access the monitor configuration settings for the resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, loads and stores to MSMON_CFG_CSU_FLT access the monitor configuration settings for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Loads and stores to MSMON_CFG_CSU_FLT access the monitor configuration settings for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_CSU_FLT can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0810

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0810	MSMON_CFG_CSU_FLT_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0810	MSMON_CFG_CSU_FLT_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0810	MSMON_CFG_CSU_FLT_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0810	MSMON_CFG_CSU_FLT_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CFG_MBWU_CTL, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Control Register

The MSMON_CFG_MBWU_CTL characteristics are:

Purpose

Controls the MBWU monitor selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_CTL is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_MBWU == '1'. Otherwise, direct accesses to MSMON_CFG_MBWU_CTL are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CFG_MBWU_CTL_s controls the Secure memory bandwidth usage monitor monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_MBWU_CTL_ns controls Non-secure memory bandwidth usage monitor monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CFG_MBWU_CTL_rt controls the monitor configuration for the Root PARTID selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_MBWU_CTL_rl controls the monitor configuration for the Realm PARTID selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_MBWU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_CTL is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
EN	CAPT_EVNT		CAPT_RESET	OFLOW_STATUS		OFLOW_INTR	OFLOW_FRZ	OFLOW_CAPT	SUBTYPE			SCLEN	CEVNT_OFLW	MATCH_PMG	MATCH_PARTID	OFLOW_STA

EN, bit [31]

Enabled.

EN	Meaning
0b0	The monitor instance is disabled and must not collect any information.
0b1	The monitor instance is enabled to collect information according to the configuration of the instance.

CAPT_EVNT, bits [30:28]

Capture event selector.

When the selected capture event occurs, MSMON_MBWU of the monitor instance is copied to MSMON_MBWU_CAPTURE of the same instance. If the long counter is also implemented, MSMON_MBWU_L is also copied to MSMON_MBWU_L_CAPTURE.

Select the event that triggers capture from the following:

CAPT_EVNT	Meaning
0b000	No capture event is triggered.
0b001	External capture event 1 (optional, but recommended)
0b010	External capture event 2 (optional)
0b011	External capture event 3 (optional)
0b100	External capture event 4 (optional)
0b101	External capture event 5 (optional)
0b110	External capture event 6 (optional)
0b111	Capture occurs when a MSMON_CAPT_EVNT register in this MSC is written and causes a capture event for the Security state of this monitor. (optional)

The values marked as optional indicate capture event sources that can be omitted in an implementation. Those values representing non-implemented event sources must not trigger a capture event.

When MPAMF_MBWUMON_IDR.HAS_CAPTURE == '0', access to this field is RAZ/WI.

CAPT_RESET, bit [27]

Reset MSMON_MBWU.VALUE after capture.

Controls whether the VALUE field of the monitor instance is reset to zero immediately after being copied to the corresponding capture register.

CAPT_RESET	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance is not reset on capture.
0b1	MSMON_MBWU.VALUE field of the monitor instance is reset on capture.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

When MPAMF_MBWUMON_IDR.HAS_CAPTURE == '0', access to this field is RAZ/WI.

OFLOW_STATUS, bit [26]

Overflow status.

Indicates whether the value of MSMON_MBWU has overflowed.

OFLOW_STATUS	Meaning
0b0	MSMON_MBWU.VALUE has not overflowed.
0b1	MSMON_MBWU.VALUE has overflowed at least once since this bit was last written to zero.

Overflow status for MSMON_MBWU_L.VALUE is reported in MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L.

If MPAMF_MBWUMON_IDR.HAS_CEVNT_OFLW is 1 or MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_MBWU when this field is 1 resets this field to 0.

OFLOW_INTR, bit [25]

Enable interrupt on overflow of MSMON_MBWU.VALUE.

OFLOW_INTR	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU.VALUE.
0b1	An implementation-specific interrupt is signaled on an overflow of MSMON_MBWU.VALUE.

Interrupt enable for overflow of MSMON_MBWU_L.VALUE is controlled by MSMON_CFG_MBWU_CTL.OFLOW_INTR_L.

When MSMON_CFG_MBWU_CTL.OFLOW_INTR == '0', access to this field is RAZ/WI.

OFLOW_FRZ, bit [24]

Freeze monitor instance on overflow.

Controls whether MSMON_MBWU.VALUE field of the monitor instance freezes on an overflow.

OFLOW_FRZ	Meaning
0b0	MSMON_MBWU.VALUE field of the monitor instance wraps on overflow.
0b1	MSMON_MBWU.VALUE field of the monitor instance freezes on overflow. If the increment that caused the overflow was 1, the frozen value is the post-increment value of 0. If the increment that caused the overflow was larger than 1, the frozen value of the monitor might be 0 or a larger value less than the final increment.

When a MSMON_MBWU.VALUE of a monitor instance is frozen it does not change until MSMON_MBWU register for that instance has been written. If the monitor implements both MSMON_MBWU and MSMON_MBWU_L registers, both are frozen. A write to a frozen register unfreezes the count for just that register.

This control bit affects both MSMON_MBWU and MSMON_MBWU_L in implementations that include MSMON_MBWU_L.

OFLOW_CAPT, bit [23]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT == '1':

Capture Monitor on Overflow.

OFLOW_CAPT	Meaning
0b0	Monitor register MSMON_MBWU is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_MBWU is captured and the MSMON_MBWU.{NRDY, VALUE} fields are copied to the monitor instance's MSMON_MBWU_CAPTURE register on an overflow or when affected by an overflow linkage event. The monitor instance treats an overflow of this monitor instance as a private capture event. If MSMON_CFG_MBWU_CTL.CEVNT_OFLW is 1, this monitor instance also treats an overflow linkage event as a capture event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

This bit does not control whether MSMON_MBWU_L is captured on an overflow or overflow linkage event. See MSMON_CFG_MBWU_CTL.OFLOW_CAPT_L.

Otherwise:

Reserved, RES0.

SUBTYPE, bits [22:20]

Subtype. Type of bandwidth counted by this monitor.

This field is not currently used for MBWU monitors, but reserved for future use.

This field is RAZ/WI.

SCLEN, bit [19]

MSMON_MBWU.VALUE Scaling Enable.

Enables scaling of MSMON_MBWU.VALUE by MPAMF_MBWUMON_IDR.SCALE.

SCLEN	Meaning
0b0	MSMON_MBWU.VALUE has bytes counted by the monitor instance.
0b1	MSMON_MBWU.VALUE has bytes counted by the monitor instance, shifted right by MPAMF_MBWUMON_IDR.SCALE.

CEVNT_OFLW, bit [18]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_CEVNT_OFLW == '1':

Capture Event performs overflow behavior.

CEVNT_OFLW	Meaning
0b0	On a capture event matching the CAPT_EVNT field the capture behaviors are performed. The NRDY and VALUE fields are transferred to the monitor instance's capture register.
0b1	On a capture event matching the CAPT_EVNT field the monitor instance treats a capture event as an overflow and the overflow behaviors are performed. The behavior is controlled by the MSMON_CFG_MBWU_CTL.{OFLOW_FRZ, OFLOW_CAPT, OFLOW_CAPT_L, CAPT_RESET} fields. The MSMON_CFG_MBWU_CTL.{OFLOW_STATUS, OFLOW_STATUS_L} fields are set for this monitor instance.

Otherwise:

Reserved, RES0.

MATCH_PMG, bit [17]
When MPAMF_MBWUMON_IDR.NO_MATCH_PMG == '0':

Match PMG.

Controls whether the monitor instance only counts data transferred with PMG matching MSMON_CFG_MBWU_FLT.PMG.

MATCH_PMG	Meaning
0b0	The monitor instance counts data transferred with any PMG value.
0b1	The monitor instance only counts data transferred with the PMG value matching MSMON_CFG_MBWU_FLT.PMG.

Otherwise:

Reserved, RES0.

MATCH_PARTID, bit [16]
When MPAMF_MBWUMON_IDR.NO_MATCH_PARTID == '0':

Match PARTID.

Controls whether the monitor instance counts only data transferred with PARTID matching MSMON_CFG_MBWU_FLT.PARTID.

MATCH_PARTID	Meaning
0b0	The monitor instance counts data transferred with any PARTID value.
0b1	The monitor instance only counts data transferred with the PARTID value matching MSMON_CFG_MBWU_FLT.PARTID.

Otherwise:

Reserved, RES0.

OFLOW_STATUS_L, bit [15]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Overflow Status of MSMON_MBWU_L.VALUE of the monitor instance.

Indicates whether MSMON_MBWU_L.VALUE has overflowed.

OFLOW_STATUS_L	Meaning
0b0	MSMON_MBWU_L.VALUE has not overflowed.
0b1	MSMON_MBWU_L.VALUE has overflowed at least once since this bit was last written to zero.

If MPAMF_MBWUMON_IDR.HAS_LONG == 0, this bit is RES0.

Overflow status of MSMON_MBWU.VALUE is reported in MSMON_CFG_MBWU_CTL.OFLOW_STATUS.

If MPAMF_MBWUMON_IDR.HAS_CEVNT_OFLW is 1 or MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG is 1, then a store to MSMON_MBWU_L when this field is 1 resets this field to 0.

Otherwise:

Reserved, RES0.

OFLOW_INTR_L, bit [14]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_LONG == '1':

Overflow Interrupt for MSMON_MBWU_L.

Controls whether an MPAM overflow interrupt is generated when MSMON_MBWU_L.VALUE overflows.

OFLOW_INTR_L	Meaning
0b0	No interrupt is signaled on an overflow of MSMON_MBWU_L.VALUE.
0b1	An implementation-specific interrupt is signaled on overflow of MSMON_MBWU_L.VALUE.

When MSMON_CFG_MBWU_CTL.OFLOW_INTR_L == '0', access to this field is RAZ/WI.

Otherwise:

Reserved, RES0.

OFLOW_CAPT_L, bit [13]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_MBWUMON_IDR.HAS_LONG == '1', and MPAMF_MBWUMON_IDR.HAS_OFLOW_CAPT == '1':

Capture Long Monitor on Overflow.

Controls whether MSMON_MBWU_L is copied to MSMON_MBWU_L_CAPTURE on an overflow or an overflow linkage event.

OFLOW_CAPT_L	Meaning
0b0	Monitor register MSMON_MBWU_L is not captured on an overflow or when affected by an overflow linkage event.
0b1	Monitor register MSMON_MBWU_L is captured on an overflow or when affected by an overflow linkage event. If OFLOW_FRZ is 1, the monitor does not continue to count after the overflow or overflow linkage event. If CAPT_RESET is 1, the monitor instance resets to 0.

If this bit is 1, this monitor instance treats an overflow of this monitor instance as a private capture event.

If this bit is 1, this monitor instance also treats overflow linkage events for which it qualifies as a private capture event.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

OFLOW_LNKG, bits [10:8]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_MBWUMON_IDR.HAS_OFLOW_LNKG == '1':

Overflow linkage event.

Controls signaling of a capture event on overflow of this monitor instance.

OFLOW_LNKG	Meaning
0b000	Overflow of the monitor instance only affects this monitor instance.
0b001	Overflow of this monitor instance signals Capture Event 1.
0b010	Overflow of this monitor instance signals Capture Event 2.
0b011	Overflow of this monitor instance signals Capture Event 3.
0b100	Overflow of this monitor instance signals Capture Event 4.
0b101	Overflow of this monitor instance signals Capture Event 5.
0b110	Overflow of this monitor instance signals Capture Event 6.
0b111	Reserved.

Otherwise:

Reserved, RES0.

TYPE, bits [7:0]

Monitor Type Code. The MBWU monitor is TYPE = 0x42.

TYPE is a read-only constant indicating the type of the monitor.

Reads as 0x42.

Access to this field is RO.

Accessing MSMON_CFG_MBWU_CTL

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CFG_MBWU_CTL_s must only be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_s and MSMON_CFG_MBWU_CTL_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CFG_MBWU_CTL_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_CTL_rt must only be accessible from the Root MPAM feature page.

- MSMON_CFG_MBWU_CTL_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CFG_MBWU_CTL_s, MSMON_CFG_MBWU_CTL_ns, MSMON_CFG_MBWU_CTL_rt, and MSMON_CFG_MBWU_CTL_rl must be separate registers:
- The Secure instance (MSMON_CFG_MBWU_CTL_s) accesses the memory bandwidth usage monitor controls used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MBWU_CTL_ns) accesses the memory bandwidth usage monitor controls used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MBWU_CTL_rt) accesses the memory bandwidth usage monitor controls used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MBWU_CTL_rl) accesses the memory bandwidth usage monitor controls used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CFG_MBWU_CTL is accessible in the PA space defined by MSMON_MBWU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Loads and stores to MSMON_CFG_MBWU_CTL access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_MBWU_CTL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0828

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0828	MSMON_CFG_MBWU_CTL_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0828	MSMON_CFG_MBWU_CTL_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0828	MSMON_CFG_MBWU_CTL_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0828	MSMON_CFG_MBWU_CTL_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CFG_MBWU_FLT, MPAM Memory System Monitor Configure Memory Bandwidth Usage Monitor Filter Register

The MSMON_CFG_MBWU_FLT characteristics are:

Purpose

Controls PARTID and PMG to measure or count in the MBWU monitor selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CFG_MBWU_FLT is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_MBWU == '1'. Otherwise, direct accesses to MSMON_CFG_MBWU_FLT are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CFG_MBWU_FLT_s sets filter conditions for the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_MBWU_CTL_ns sets filter conditions for the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CFG_MBWU_FLT_rt sets the filter conditions for the Root PARTID selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CFG_MBWU_FLT_rl sets the filter conditions for the Realm PARTID selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_MBWU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance filter configuration accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MBWU_FLT is a 32-bit register.

Field descriptions

When FEAT_MPAMv2_MSC is implemented:

PMG, bits [31:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PARTID equal to this field.

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

RW filtering.

RWBW, bits [31:30]
When MPAMF_MBWUMON_IDR.HAS_RWBW == '1':

Read/write bandwidth filter. Configures the selected monitor instance to count all bandwidth, only read bandwidth or only write bandwidth.

RWBW	Meaning
0b00	Monitor instance counts read bandwidth and write bandwidth.
0b01	Monitor instance counts write bandwidth only.
0b10	Monitor instance counts read bandwidth only.
0b11	Reserved.

Otherwise:

Reserved, RES0.

Bits [29:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 0, this field is not used to match memory bandwidth to a PMG and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PMG == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PMG equal to this field.

PARTID, bits [15:0]

Partition ID to filter memory bandwidth usage monitoring.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 0, this field is not used to match memory bandwidth to a PARTID and the contents of this field is ignored.

If MSMON_CFG_MBWU_CTL.MATCH_PARTID == 1, the monitor selected by MSMON_CFG_MON_SEL measures or counts memory bandwidth labeled with PARTID equal to this field.

Accessing MSMON_CFG_MBWU_FLT

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CFG_MBWU_FLT_s must only be accessible from the Secure MPAM feature page. MSMON_CFG_MBWU_FLT_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_FLT_s and MSMON_CFG_MBWU_FLT_ns must be separate registers. The Secure instance (MSMON_CFG_MBWU_FLT_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure

PARTIDs, and the Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CFG_MBWU_FLT_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_MBWU_FLT_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MBWU_FLT_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_MBWU_FLT_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CFG_MBWU_FLT_s, MSMON_CFG_MBWU_FLT_ns, MSMON_CFG_MBWU_FLT_rt, and MSMON_CFG_MBWU_FLT_rl must be separate registers:
- The Secure instance (MSMON_CFG_MBWU_FLT_s) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MBWU_FLT_ns) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MBWU_FLT_rt) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MBWU_FLT_rl) accesses the PARTID and PMG matching for a memory bandwidth usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CFG_MBWU_FLT is accessible in the PA space defined by MSMON_MBWU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Loads and stores to MSMON_CFG_MBWU_FLT access the monitor configuration settings for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CFG_MBWU_FLT can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0820

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0820	MSMON_CFG_MBWU_FLT_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0820	MSMON_CFG_MBWU_FLT_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0820	MSMON_CFG_MBWU_FLT_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0820	MSMON_CFG_MBWU_FLT_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CFG_MON_SEL, MPAM Monitor Instance Selection Register

The MSMON_CFG_MON_SEL characteristics are:

Purpose

Selects a monitor instance to access through the MSMON configuration and counter registers.

MSMON_CFG_MON_SEL_s selects a Secure monitor instance to access via the Secure MPAM feature page. MSMON_CFG_MON_SEL_ns selects a Non-secure monitor instance to access via the Non-secure MPAM feature page. MSMON_CFG_MON_SEL_rt selects a Root monitor instance to access via the Root MPAM feature page. MSMON_CFG_MON_SEL_rl selects a Realm monitor instance to access via the Realm MPAM feature page.

Note

Different performance monitoring features within an MSC could have different numbers of monitor instances. See the NUM_MON field in the corresponding ID register. This means that a monitor out-of-bounds error might be signaled when an MSMON_CFG register is accessed because the value in MSMON_CFG_MON_SEL.MON_SEL is too large for the particular monitoring feature.

To configure a monitor, set MON_SEL in this register to the index of the monitor instance to configure, then write to the MSMON_CFG_x register to set the configuration of the monitor. At a later time, read the monitor register (for example, MSMON_MBWU) to get the value of the monitor.

Configuration

The power domain of MSMON_CFG_MON_SEL is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and (MPAMF_IDR.HAS_MSMON == '1', or (MPAMF_IDR.HAS_IMPL_IDR == '1' and MPAMF_IDR.EXT == '0'), or (MPAMF_IDR.HAS_IMPL_IDR == '1', MPAMF_IDR.EXT == '1', and MPAMF_IDR.NO_IMPL_MSMON == '0')). Otherwise, direct accesses to MSMON_CFG_MON_SEL are RES0.

MSMON_CFG_MON_SEL_s is the instance of MSMON_CFG_MON_SEL in the Secure PA space.

MSMON_CFG_MON_SEL_ns is the instance of MSMON_CFG_MON_SEL in the Non-secure PA space.

If FEAT_RME is implemented, the following statements apply:

- MSMON_CFG_MON_SEL_rt is the instance of MSMON_CFG_MON_SEL in the Root PA space.
- MSMON_CFG_MON_SEL_rl is the instance of MSMON_CFG_MON_SEL in the Realm PA space.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CFG_MON_SEL is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == '1', and MPAMF_IDR.HAS_RIS == '1':

Resource Instance Selector. RIS selects one resource to configure through MSMON_CFG registers.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

MON_SEL, bits [15:0]

Selects the monitor instance to configure or read.

Reads and writes to other MSMON registers are indexed by MON_SEL and by the NS bit used to access MSMON_CFG_MON_SEL to access the configuration for a single monitor.

Accessing MSMON_CFG_MON_SEL

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CFG_MON_SEL_s must only be accessible from the Secure MPAM feature page. MSMON_CFG_MON_SEL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MON_SEL_s and MSMON_CFG_MON_SEL_ns must be separate registers. The Secure instance (MSMON_CFG_MON_SEL_s) accesses the monitor instance selector used for Secure PARTIDs, and the Non-secure instance (MSMON_CFG_MON_SEL_ns) accesses the monitor instance selector used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CFG_MON_SEL_s must only be accessible from the Secure MPAM feature page.
- MSMON_CFG_MON_SEL_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CFG_MON_SEL_rt must only be accessible from the Root MPAM feature page.
- MSMON_CFG_MON_SEL_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CFG_MON_SEL_s, MSMON_CFG_MON_SEL_ns, MSMON_CFG_MON_SEL_rt, and MSMON_CFG_MON_SEL_rl must be separate registers:
- The Secure instance (MSMON_CFG_MON_SEL_s) accesses the monitor instance selector used for Secure PARTIDs.
- The Non-secure instance (MSMON_CFG_MON_SEL_ns) accesses the monitor instance selector used for Non-secure PARTIDs.
- The Root instance (MSMON_CFG_MON_SEL_rt) accesses the monitor instance selector used for Root PARTIDs.
- The Realm instance (MSMON_CFG_MON_SEL_rl) accesses the monitor instance selector used for Realm PARTIDs.

MSMON_CFG_MON_SEL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0800	MSMON_CFG_MON_SEL_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0800	MSMON_CFG_MON_SEL_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0800	MSMON_CFG_MON_SEL_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0800	MSMON_CFG_MON_SEL_rl

When FEAT_RME is implemented, accesses to this register are RW.

Component	Offset
MPAM	0x0800

When FEAT_MPAMv2_MSC is implemented and FEAT_MPAMv2_MSC_MON_SEC is not implemented, accesses to this register are RW.

Component	Offset	Instance
MPAM	0x0800	MSMON_CFG_MON_SEL_ns

When FEAT_MPAMv2_MSC_MON_SEC is implemented and an access is Non-secure, accesses to this register are RW.

Component	Offset	Instance
MPAM	0x0800	MSMON_CFG_MON_SEL_s

When FEAT_MPAMv2_MSC_MON_SEC is implemented and an access is Secure, accesses to this register are RW.

Component	Offset	Instance
MPAM	0x0800	MSMON_CFG_MON_SEL_rl

When FEAT_MPAMv2_MSC_MON_SEC is implemented and an access is Realm, accesses to this register are RW.

Component	Offset	Instance
MPAM	0x0800	MSMON_CFG_MON_SEL_rt

When FEAT_MPAMv2_MSC_MON_SEC is implemented and an access is Root, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSA, MPAM Cache Storage Allocation Monitor Register

The MSMON_CSA characteristics are:

Purpose

Accesses the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSA is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSA == '1'. Otherwise, direct accesses to MSMON_CSA are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSA_s is the Secure cache storage allocation monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_ns is the Non-secure cache storage allocation monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSA_rt is the Root cache storage allocation monitor instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_rl is the Realm cache storage allocation monitor instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSA_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

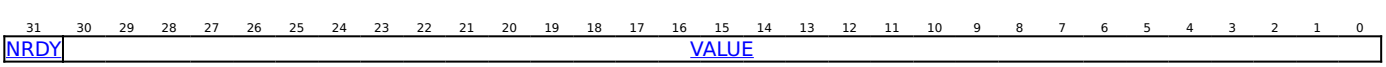
- If MPAMF_IDR.HAS_RIS is 1, the monitor instance register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSA is a 32-bit register.

Field descriptions



NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSA.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSA.VALUE field might be inaccurate or otherwise not represent the actual cache storage allocations.

VALUE, bits [30:0]

Cache storage allocation counter value if MSMON_CSA.NRDY is 0. Invalid if MSMON_CSA.NRDY is 1.

VALUE is the scaled count of bytes allocated since the monitor was last reset that met the criteria set in MSMON_CFG_CSA_FLT and MSMON_CFG_CSA_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

If MSMON_CFG_CSA_CTL.SCLEN enables scaling, the count in VALUE is the number of bytes shifted right by MPAMF_CSAMON_IDR.SCALE bit positions and rounded.

Accessing MSMON_CSA

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CSA_s must only be accessible from the Secure MPAM feature page. MSMON_CSA_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_s and MSMON_CSA_ns must be separate registers. The Secure instance (MSMON_CSA_s) accesses the cache storage allocation monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSA_ns) accesses the cache storage allocation monitor used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSA_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSA_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSA_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CSA_s, MSMON_CSA_ns, MSMON_CSA_rt, and MSMON_CSA_rl must be separate registers:
- The Secure instance (MSMON_CSA_s) accesses the cache storage allocation monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSA_ns) accesses the cache storage allocation monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSA_rt) accesses the cache storage allocation monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSA_rl) accesses the cache storage allocation monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSA is accessible in the PA space defined by MSMON_CSA_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_CSA access the cache storage allocation monitor instance for the resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_CSA access the cache storage allocation monitor instance for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_CSA access the cache storage allocation monitor for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSA can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08A0

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_s	0x08A0	MSMON_CSA_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08A0	MSMON_CSA_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08A0	MSMON_CSA_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08A0	MSMON_CSA_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSA_CAPTURE, MPAM Cache Storage Allocation Monitor Capture Register

The MSMON_CSA_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_CSA monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSA_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSA == '1', and MPAMF_CSAMON_IDR.HAS_CAPTURE == '1'. Otherwise, direct accesses to MSMON_CSA_CAPTURE are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSA_CAPTURE_s is the Secure cache storage allocation monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_CAPTURE_ns is the Non-secure cache storage allocation monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSA_CAPTURE_rt is the Root cache storage allocation monitor capture instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_CAPTURE_rl is the Realm cache storage allocation monitor capture instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSA_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSA_CAPTURE is a 32-bit register.

Field descriptions

NRDY, bit [31]

Not Ready. The captured NRDY bit from the corresponding instance of MSMON_CSA. This bit indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_CSA_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_CSA_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage allocations.

VALUE, bits [30:0]

Captured cache storage allocation counter value if MSMON_CSA_CAPTURE.NRDY is 0. Invalid if MSMON_CSA_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of MSMON_CSA, the count of bytes allocated since the monitor was last reset that meet the criteria set in MSMON_CFG_CSA_FLT and MSMON_CFG_CSA_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

VALUE captures the MSMON_CSA.VALUE and preserves any scaling that had been performed on the VALUE field in that register.

Accessing MSMON_CSA_CAPTURE

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CSA_CAPTURE_s must only be accessible from the Secure MPAM feature page. MSMON_CSA_CAPTURE_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_CAPTURE_s and MSMON_CSA_CAPTURE_ns must be separate registers. The Secure instance (MSMON_CSA_CAPTURE_s) accesses the captured cache storage allocation monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSA_CAPTURE_ns) accesses the captured cache storage allocation monitor used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSA_CAPTURE_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSA_CAPTURE_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_CAPTURE_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSA_CAPTURE_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CSA_CAPTURE_s, MSMON_CSA_CAPTURE_ns, MSMON_CSA_CAPTURE_rt, and MSMON_CSA_CAPTURE_rl must be separate registers:
- The Secure instance (MSMON_CSA_CAPTURE_s) accesses the captured cache storage allocation monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSA_CAPTURE_ns) accesses the captured cache storage allocation monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSA_CAPTURE_rt) accesses the captured cache storage allocation monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSA_CAPTURE_rl) accesses the captured cache storage allocation monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSA_CAPTURE is accessible in the PA space defined by MSMON_CSA_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_CSA_CAPTURE access the monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_CSA_CAPTURE access the monitor instance for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_CSA_CAPTURE access the monitor for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSA_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08A8

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08A8	MSMON_CSA_CAPTURE_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08A8	MSMON_CSA_CAPTURE_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08A8	MSMON_CSA_CAPTURE_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08A8	MSMON_CSA_CAPTURE_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSA_L, MPAM Long Cache Storage Allocation Monitor Register

The MSMON_CSA_L characteristics are:

Purpose

Accesses the cache storage allocation long monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSA_L is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSA == '1', and MPAMF_CSAMON_IDR.HAS_LONG == '1'. Otherwise, direct accesses to MSMON_CSA_L are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSA_L_s is the Secure long cache storage allocation monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_L_ns is the Non-secure long cache storage allocation monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSA_L_rt is the Root long cache storage allocation monitor instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_L_rl is the Realm long cache storage allocation monitor instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSA_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

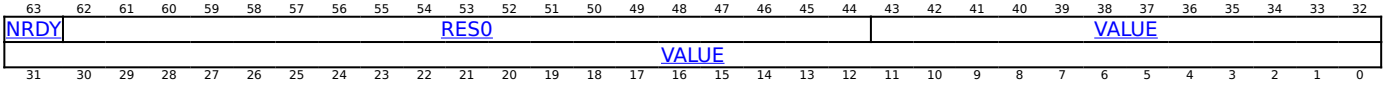
The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSA_L is a 64-bit register.

Field descriptions

When MPAMF_CSAMON_IDR.LWD == '0':



NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSA_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSA_L.VALUE field might be inaccurate or otherwise not represent the actual cache storage allocations.

Bits [62:44]

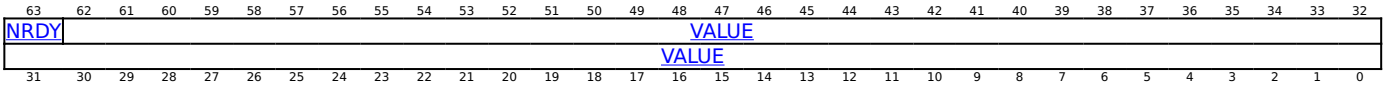
Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) cache storage allocation counter value if MSMON_CSA_L.NRDY is 0. Invalid if MSMON_CSA_L.NRDY is 1.

VALUE is the long count of bytes allocated since the monitor was last reset that met the criteria set in MSMON_CFG_CSA_FLT and MSMON_CFG_CSA_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_CSAMON_IDR.LWD == '1':



NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSA_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSA_L.VALUE field might be inaccurate or otherwise not represent the actual cache storage allocations.

VALUE, bits [62:0]

Long (63-bit) cache storage allocation counter value if MSMON_CSA_L.NRDY is 0. Invalid if MSMON_CSA_L.NRDY is 1.

VALUE is the long count of bytes allocated since the monitor instance was last reset that met the criteria set in MSMON_CFG_CSA_FLT and MSMON_CFG_CSA_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_CSA_L

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CSA_L_s must only be accessible from the Secure MPAM feature page. MSMON_CSA_L_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_L_s and MSMON_CSA_L_ns must be separate registers. The Secure instance (MSMON_CSA_L_s) accesses the long cache storage allocation monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSA_L_ns) accesses the long cache storage allocation monitor used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSA_L_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSA_L_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_L_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSA_L_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CSA_L_s, MSMON_CSA_L_ns, MSMON_CSA_L_rt, and MSMON_CSA_L_rl must be separate registers:
- The Secure instance (MSMON_CSA_L_s) accesses the long cache storage allocation monitor used for Secure PARTIDs.

- The Non-secure instance (MSMON_CSA_L_ns) accesses the long cache storage allocation monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSA_L_rt) accesses the long cache storage allocation monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSA_L_rl) accesses the long cache storage allocation monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSA_L is accessible in the PA space defined by MSMON_CSA_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_CSA_L access the long cache storage allocation monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_CSA_L access the long cache storage allocation monitor instance for the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_CSA_L access the long cache storage allocation monitor for the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSA_L can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08B0

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08B0	MSMON_CSA_L_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08B0	MSMON_CSA_L_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08B0	MSMON_CSA_L_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08B0	MSMON_CSA_L_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSA_L_CAPTURE, MPAM Long Cache Storage Allocation Monitor Capture Register

The MSMON_CSA_L_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_CSA_L monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSA_L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSA == '1', MPAMF_CSAMON_IDR.HAS_CAPTURE == '1', and MPAMF_CSAMON_IDR.HAS_LONG == '1'. Otherwise, direct accesses to MSMON_CSA_L_CAPTURE are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSA_L_CAPTURE_s is the Secure long cache storage allocation monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_L_CAPTURE_ns is the Non-secure long cache storage allocation monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSA_L_CAPTURE_rt is the Root long cache storage allocation monitor capture instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CSA_L_CAPTURE_rl is the Realm long cache storage allocation monitor capture instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSA_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance long capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

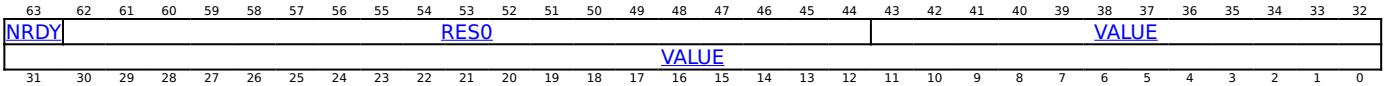
The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSA_L_CAPTURE is a 64-bit register.

Field descriptions

When MPAMF_CSAMON_IDR.LWD == '0':



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_CSA_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_CSA_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage allocations.

Bits [62:44]

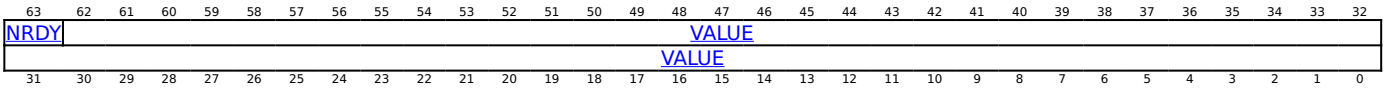
Reserved, RES0.

VALUE, bits [43:0]

Captured long cache storage allocation counter value if MSMON_CSA_L_CAPTURE.NRDY is 0. Invalid if MSMON_CSA_L_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes allocated since the monitor instance was last reset that met the criteria set in MSMON_CFG_CSA_FLT and MSMON_CFG_CSA_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_CSAMON_IDR.LWD == '1':



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_CSA_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_CSA_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage allocations.

VALUE, bits [62:0]

The captured long cache storage allocation counter value if MSMON_CSA_L_CAPTURE.NRDY is 0. Invalid if MSMON_CSA_L_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes allocated since the monitor instance was last reset that met the criteria set in MSMON_CFG_CSA_FLT and MSMON_CFG_CSA_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_CSA_L_CAPTURE

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CSA_L_CAPTURE_s must only be accessible from the Secure MPAM feature page. MSMON_CSA_L_CAPTURE_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_L_CAPTURE_s and MSMON_CSA_L_CAPTURE_ns must be separate registers. The Secure instance (MSMON_CSA_L_CAPTURE_s) accesses the captured long cache storage allocation monitor used for Secure PARTIDs, and the Non-secure instance (MSMON_CSA_L_CAPTURE_ns) accesses the captured long cache storage allocation monitor used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSA_L_CAPTURE_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSA_L_CAPTURE_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_L_CAPTURE_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSA_L_CAPTURE_rl must only be accessible from the Realm MPAM feature page.

- MSMON_CSA_L_CAPTURE_s, MSMON_CSA_L_CAPTURE_ns, MSMON_CSA_L_CAPTURE_rt, and MSMON_CSA_L_CAPTURE_rl must be separate registers:
- The Secure instance (MSMON_CSA_L_CAPTURE_s) accesses the captured long cache storage allocation monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSA_L_CAPTURE_ns) accesses the captured long cache storage allocation monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSA_L_CAPTURE_rt) accesses the captured long cache storage allocation monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSA_L_CAPTURE_rl) accesses the captured long cache storage allocation monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSA_L_CAPTURE is accessible in the PA space defined by MSMON_CSA_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_CSA_L_CAPTURE access the monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_CSA_L_CAPTURE access the monitor instance for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_CSA_L_CAPTURE access the monitor for the cache storage allocation monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSA_L_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08B8

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08B8	MSMON_CSA_L_CAPTURE_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08B8	MSMON_CSA_L_CAPTURE_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08B8	MSMON_CSA_L_CAPTURE_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08B8	MSMON_CSA_L_CAPTURE_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSA_OFSR, MPAM CSA Monitor Overflow Status Register

The MSMON_CSA_OFSR characteristics are:

Purpose

Shows bitmap of CSA monitor instance overflow status for a contiguous group of 32 monitor instances.

Configuration

The power domain of MSMON_CSA_OFSR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSA == '1', and MPAMF_CSAMON_IDR.HAS_OFSR == '1'. Otherwise, direct accesses to MSMON_CSA_OFSR are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSA_OFSR_s gives a bitmap of pending CSA overflow status for 32 Secure CSA monitor instances.
- MSMON_CSA_OFSR_ns gives a bitmap of pending CSA overflow status for 32 Non-secure CSA monitor instances.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSA_OFSR_rt gives a bitmap of pending CSA overflow status for 32 Root CSA monitor instances.
- MSMON_CSA_OFSR_rl gives a bitmap of pending CSA overflow status for 32 Realm CSA monitor instances.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSA_OFSR is a 32-bit register.

Field descriptions

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for CSA monitor instances. The RIS and the contiguous range of CSA monitor instances are set in MSMON_CFG_MON_SEL. i of 0 corresponds to the CSA monitor instance MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0.

OFPND<i>	Meaning
0b0	CSA monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	CSA monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading MSMON_OFLOW_SR to determine that a CSA monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing MSMON_CFG_MON_SEL.MON_SEL by 32.

A pending overflow may be in either the MSMON_CFG_CSA_CTL.OFLOW_STATUS or MSMON_CFG_CSA_CTL.OFLOW_STATUS_L field.

Accessing MSMON_CSA_OFSR

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MSMON_CSA_OFSR_s must only be accessible from the Secure MPAM feature page. MSMON_CSA_OFSR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_OFSR_s and MSMON_CSA_OFSR_ns must be separate registers. The Secure instance (MSMON_CSA_OFSR_s) accesses the CSA monitor overflow status bitmap used for Secure PARTIDs, and the Non-secure instance (MSMON_CSA_OFSR_ns) accesses the CSA monitor overflow status bitmap used for Non-secure PARTIDs.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSA_OFSR_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSA_OFSR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSA_OFSR_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSA_OFSR_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CSA_OFSR_s, MSMON_CSA_OFSR_ns, MSMON_CSA_OFSR_rt, and MSMON_CSA_OFSR_rl must be separate registers:
- The Secure instance (MSMON_CSA_OFSR_s) accesses the CSA monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSA_OFSR_ns) accesses the CSA monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_CSA_OFSR_rt) accesses the CSA monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_CSA_OFSR_rl) accesses the CSA monitor overflow status bitmap used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSA_OFSR is accessible in the PA space defined by MSMON_CSA_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If FEAT_MPAMv2_MSC_MON_SEC is implemented and a monitor instance with index <i> is assigned to a PA space, MSMON_CSA_OFSR.OFPND<i> is RAZ if the access is from a Security state that cannot access that PA space.

MSMON_CSA_OFSR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08C0

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08C0	MSMON_CSA_OFSR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08C0	MSMON_CSA_OFSR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08C0	MSMON_CSA_OFSR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08C0	MSMON_CSA_OFSR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSA_ROOTCR, MPAM Monitor Cache Storage Allocation Root Control Register

The MSMON_CSA_ROOTCR characteristics are:

Purpose

Allows Root software to control the PA space of:

- The monitor instance selected in MSMON_SEL_ROOTCR.
- Accesses matched for filtering by the monitor instance.
- Events that will trigger a capture.

Configuration

The power domain of MSMON_CSA_ROOTCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, FEAT_RME is implemented, MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSA == '1', and MPAMF_CSAMON_IDR.HAS_MON_SEC == '1'. Otherwise, direct accesses to MSMON_CSA_ROOTCR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSA_ROOTCR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

PAS, bits [2:0]

PA space of the monitor instance selected in MSMON_SEL_ROOTCR.SEL.

Also restricts which accesses are monitored by the monitor instance based on their PAS.

PAS	Meaning
0b000	NS_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Only accesses with Non-secure or Non-secure Protected PAS are monitored. Only events triggered from Non-secure PAS cause capture.
0b001	NS_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Accesses with any Non-secure and Realm PAS are monitored. Events triggered from any Non-secure and Realm PAS cause capture.
0b010	NS_Any: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Accesses with any PAS are monitored. Events triggered from any PAS cause capture.
0b011	RL_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Realm PA space. Only accesses with Realm PAS are monitored. Only events triggered from Realm PAS cause capture.
0b100	RL_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Realm PA space. Only accesses with Realm or Non-secure PAS are monitored. Only events triggered from Realm or Non-secure PAS cause capture.
0b101	S_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Secure PA space. Only accesses with Secure PAS are monitored. Only events triggered from Secure PAS cause capture.
0b110	S_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Secure PA space. Only accesses with Secure or Non-secure PAS are monitored. Only events triggered from Secure or Non-secure PAS cause capture.
0b111	RT_Any: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Root PA space. Accesses with any PAS are monitored. Events triggered from any PAS cause capture.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0`.

Accessing MSMON_CSA_ROOTCR

MSMON_CSA_ROOTCR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2210

Accessible as follows:

- When an access is not Root, accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSU, MPAM Cache Storage Usage Monitor Register

The MSMON_CSU characteristics are:

Purpose

Accesses the CSU monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSU is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSU == '1'. Otherwise, direct accesses to MSMON_CSU are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSU_s is the Secure cache storage usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CSU_ns is the Non-secure cache storage usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSU_rt is the Root cache storage usage monitor instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CSU_rl is the Realm cache storage usage monitor instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU is a 32-bit register.

Field descriptions

NRDY, bit [31]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_CSU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_CSU.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Cache storage usage measurement value if MSMON_CSU.NRDY is 0. Invalid if MSMON_CSU.NRDY is 1.

VALUE is the cache storage usage measured in bytes meeting the criteria set in MSMON_CFG_CSU_FLT and MSMON_CFG_CSU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_CSU

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSU_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSU_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSU_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CSU_s, MSMON_CSU_ns, MSMON_CSU_rt, and MSMON_CSU_rl must be separate registers:
- The Secure instance (MSMON_CSU_s) accesses the cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_ns) accesses the cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_rt) accesses the cache storage usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSU_rl) accesses the cache storage usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSU is accessible in the PA space defined by MSMON_CSU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_CSU access the cache storage usage monitor monitor instance for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_CSU access the cache storage usage monitor monitor for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSU can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0840	MSMON_CSU_s

Accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == '0', accesses to this register are RW.
- When MPAMF_CSUMON_IDR.CSU_RO == '1', accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0840	MSMON_CSU_ns

Accessible as follows:

- When MPAMF_CSUMON_IDR.CSU_RO == '0', accesses to this register are RW.
- When MPAMF_CSUMON_IDR.CSU_RO == '1', accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0840	MSMON_CSU_rt

Accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == '0', accesses to this register are RW.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == '1', accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0840	MSMON_CSU_rl

Accessible as follows:

- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == '0', accesses to this register are RW.
- When FEAT_RME is implemented and MPAMF_CSUMON_IDR.CSU_RO == '1', accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSU_CAPTURE, MPAM Cache Storage Usage Monitor Capture Register

The MSMON_CSU_CAPTURE characteristics are:

Purpose

MSMON_CSU_CAPTURE is a 32-bit read/write register that accesses the captured MSMON_CSU monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_CSU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSU == '1', and MPAMF_CSUMON_IDR.HAS_CAPTURE == '1'. Otherwise, direct accesses to MSMON_CSU_CAPTURE are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSU_CAPTURE_s is the Secure cache storage usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_CSU_CAPTURE_ns is the Non-secure cache storage usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSU_CAPTURE_rt is the Root cache storage usage monitor capture instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_CSU_CAPTURE_rl is the Realm cache storage usage monitor capture instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_CSU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_CAPTURE is a 32-bit register.

Field descriptions

NRDY, bit [31]

Not Ready. Indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_CSU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_CSU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual cache storage usage.

VALUE, bits [30:0]

Captured cache storage usage measurement if MSMON_CSU_CAPTURE.NRDY is 0. Invalid if MSMON_CSU_CAPTURE.NRDY is 1.

VALUE is the captured cache storage usage measurement in bytes meeting the criteria set in MSMON_CFG_CSU_FLT and MSMON_CFG_CSU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_CSU_CAPTURE

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSU_CAPTURE_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSU_CAPTURE_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_CAPTURE_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSU_CAPTURE_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CSU_CAPTURE_s, MSMON_CSU_CAPTURE_ns, MSMON_CSU_CAPTURE_rt, and MSMON_CSU_CAPTURE_rl must be separate registers:
- The Secure instance (MSMON_CSU_CAPTURE_s) accesses the captured cache storage usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_CAPTURE_ns) accesses the captured cache storage usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_CAPTURE_rt) accesses the captured cache storage usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_CSU_CAPTURE_rl) accesses the captured cache storage usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSU_CAPTURE is accessible in the PA space defined by MSMON_CSU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache resource instance selected by MSMON_CFG_MON_SEL.RIS and the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_CSU_CAPTURE access the monitor instance for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_CSU_CAPTURE access the monitor for the cache storage usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_CSU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0848

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0848	MSMON_CSU_CAPTURE_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0848	MSMON_CSU_CAPTURE_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0848	MSMON_CSU_CAPTURE_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0848	MSMON_CSU_CAPTURE_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSU_OFSR, MPAM CSU Monitor Overflow Status Register

The MSMON_CSU_OFSR characteristics are:

Purpose

MSMON_CSU_OFSR is a 32-bit read-only register that shows bitmap of CSU monitor instance overflow status for a contiguous group of 32 monitor instances.

Configuration

The power domain of MSMON_CSU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSU == '1', and MPAMF_CSUMON_IDR.HAS_OFSR == '1'. Otherwise, direct accesses to MSMON_CSU_OFSR are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_CSU_OFSR_s gives a bitmap of pending CSU overflow status for 32 Secure CSU monitor instances.
- MSMON_CSU_OFSR_ns gives a bitmap of pending CSU overflow status for 32 Non-secure CSU monitor instances.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_CSU_OFSR_rt gives a bitmap of pending CSU overflow status for 32 Root CSU monitor instances.
- MSMON_CSU_OFSR_rl gives a bitmap of pending CSU overflow status for 32 Realm CSU monitor instances.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_OFSR is a 32-bit register.

Field descriptions

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for CSU monitor instances. The RIS and the contiguous range of CSU monitor instances are set in MSMON_CFG_MON_SEL. i of 0 corresponds to the CSU monitor instance MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0.

OFPND<i>	Meaning
0b0	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	CSU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading MSMON_OFLOW_SR to determine that a CSU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing MSMON_CFG_MON_SEL.MON_SEL by 32.

Accessing MSMON_CSU_OFSR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_CSU_OFSR_s must only be accessible from the Secure MPAM feature page.
- MSMON_CSU_OFSR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_CSU_OFSR_rt must only be accessible from the Root MPAM feature page.
- MSMON_CSU_OFSR_rl must only be accessible from the Realm MPAM feature page.
- MSMON_CSU_OFSR_s, MSMON_CSU_OFSR_ns, MSMON_CSU_OFSR_rt, and MSMON_CSU_OFSR_rl must be separate registers:

- The Secure instance (MSMON_CSU_OFSR_s) accesses the CSU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_CSU_OFSR_ns) accesses the CSU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_CSU_OFSR_rt) accesses the CSU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_CSU_OFSR_rl) accesses the CSU monitor overflow status bitmap used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_CSU_OFSR is accessible in the PA space defined by MSMON_CSU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If FEAT_MPAMv2_MSC_MON_SEC is implemented and a monitor instance with index <i> is assigned to a PA space, MSMON_CSU_OFSR.OFPND<i> is RAZ if the access is from a Security state that cannot access that PA space.

MSMON_CSU_OFSR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0858

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0858	MSMON_CSU_OFSR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0858	MSMON_CSU_OFSR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0858	MSMON_CSU_OFSR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0858	MSMON_CSU_OFSR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MSMON_CSU_ROOTCR, MPAM Monitor Cache Storage Usage Root Control Register

The MSMON_CSU_ROOTCR characteristics are:

Purpose

Allows Root software to control the PA space of:

- The monitor instance selected in MSMON_SEL_ROOTCR.
- Accesses matched for filtering by the monitor instance.
- Events that will trigger a capture.

Configuration

The power domain of MSMON_CSU_ROOTCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, FEAT_RME is implemented, MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_CSU == '1', and MPAMF_CSUMON_IDR.HAS_MON_SEC == '1'. Otherwise, direct accesses to MSMON_CSU_ROOTCR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_CSU_ROOTCR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

PAS, bits [2:0]

PA space of the monitor instance selected in MSMON_SEL_ROOTCR.SEL.

Also restricts which accesses are monitored by the monitor instance based on their PAS.

PAS	Meaning
0b000	NS_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Only accesses with Non-secure or Non-secure Protected PAS are monitored. Only events triggered from Non-secure PAS cause capture.
0b001	NS_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Accesses with any Non-secure and Realm PAS are monitored. Events triggered from any Non-secure and Realm PAS cause capture.
0b010	NS_Any: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Accesses with any PAS are monitored. Events triggered from any PAS cause capture.
0b011	RL_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Realm PA space. Only accesses with Realm PAS are monitored. Only events triggered from Realm PAS cause capture.
0b100	RL_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Realm PA space. Only accesses with Realm or Non-secure PAS are monitored. Only events triggered from Realm or Non-secure PAS cause capture.
0b101	S_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Secure PA space. Only accesses with Secure PAS are monitored. Only events triggered from Secure PAS cause capture.
0b110	S_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Secure PA space. Only accesses with Secure or Non-secure PAS are monitored. Only events triggered from Secure or Non-secure PAS cause capture.
0b111	RT_Any: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Root PA space. Accesses with any PAS are monitored. Events triggered from any PAS cause capture.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0`.

Accessing MSMON_CSU_ROOTCR

MSMON_CSU_ROOTCR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2218

Accessible as follows:

- When an access is not Root, accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_IN_TL, MPAM PMG Translation Ingress Control Register

The MSMON_IN_TL characteristics are:

Purpose

Enables ingress PMG translation and configures direct ingress PMG translations.

Configuration

The power domain of MSMON_IN_TL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented and MPAMF_IDR.HAS_IN_TL == '1'. Otherwise, direct accesses to MSMON_IN_TL are RES0.

The effects of this register are unaffected by Resource instance selection, if implemented and identified by MPAMF_IDR.HAS_RIS.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_IN_TL is a 32-bit register.

Field descriptions

ENABLE, bit [31]

Enables ingress PMG translation in the MSC.

ENABLE	Meaning
0b0	Ingress PMG translation is disabled.
0b1	Ingress PMG translation is enabled.

The value of this field has no effect on the ability of the MSC to create direct ingress translation configurations.

Bits [30:16]

Reserved, RES0.

PMGTL, bits [15:0]
When MPAMF_PMG_IN_TL_IDR.DIRECT == '1':

Value configured as the result of a direct PMG translation of the ingress PMG configured in MSMON_PMG_SEL.PMG when MSMON_PMG_SEL.INGRESS_TL is 1.

Otherwise:

Reserved, RES0.

Accessing MSMON_IN_TL

MSMON_IN_TL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2410

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_IN_TL_BASE, MPAM PMG Translation Ingress Base Control Register

The MSMON_IN_TL_BASE characteristics are:

Purpose

Configures the base value used to compute translation PMGs for ingress PMGs that do not have direct translation.

Configuration

The power domain of MSMON_IN_TL_BASE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, MPAMF_IDR.HAS_IN_TL == '1', and MPAMF_PMG_IN_TL_IDR.BASE_MASK == '1'. Otherwise, direct accesses to MSMON_IN_TL_BASE are RES0.

The effects of this register are unaffected by Resource instance selection, if implemented and identified by MPAMF_IDR.HAS_RIS.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_IN_TL_BASE is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

BASE, bits [15:0]

Base value used to compute the ingress translation of PMGs that do not have a direct translation configured.

Accessing MSMON_IN_TL_BASE

MSMON_IN_TL_BASE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2418

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_IN_TL_MASK, MPAM PMG Translation Ingress Mask Control Register

The MSMON_IN_TL_MASK characteristics are:

Purpose

Configures the mask value used to compute translation PMGs for ingress PMGs that do not have direct translation.

Configuration

The power domain of MSMON_IN_TL_MASK is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, MPAMF_IDR.HAS_IN_TL == '1', and MPAMF_PMG_IN_TL_IDR.BASE_MASK == '1'. Otherwise, direct accesses to MSMON_IN_TL_MASK are RES0.

The effects of this register are unaffected by Resource instance selection, if implemented and identified by MPAMF_IDR.HAS_RIS.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_IN_TL_MASK is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

MASK_WD, bits [4:0]

Value used to calculate the mask as 2^{MASK_WD}-1. The mask is then used to compute the ingress translation of PMGs that do not have a direct translation configured.

Accessing MSMON_IN_TL_MASK

MSMON_IN_TL_MASK can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2420

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_MBWU, MPAM Memory Bandwidth Usage Monitor Register

The MSMON_MBWU characteristics are:

Purpose

Accesses the monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_MBWU == '1'. Otherwise, direct accesses to MSMON_MBWU are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_MBWU_s is the Secure memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_ns is the Non-secure memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_MBWU_rt is the Root memory bandwidth usage monitor instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_rl is the Realm memory bandwidth usage monitor instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_MBWU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU is a 32-bit register.

Field descriptions

NRDY, bit [31]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Memory bandwidth usage counter value if MSMON_MBWU.NRDY is 0. Invalid if MSMON_MBWU.NRDY is 1.

VALUE is the scaled count of bytes transferred since the monitor was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

If MSMON_CFG_MBWU_CTL.SCLEN enables scaling, the count in VALUE is the number of bytes shifted right by MPAMF_MBWUMON_IDR.SCALE bit positions and rounded.

Accessing MSMON_MBWU

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_MBWU_s must only be accessible from the Secure MPAM feature page.
- MSMON_MBWU_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_rt must only be accessible from the Root MPAM feature page.
- MSMON_MBWU_rl must only be accessible from the Realm MPAM feature page.
- MSMON_MBWU_s, MSMON_MBWU_ns, MSMON_MBWU_rt, and MSMON_MBWU_rl must be separate registers:
- The Secure instance (MSMON_MBWU_s) accesses the memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_ns) accesses the memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_rt) accesses the memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_rl) accesses the memory bandwidth usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_MBWU is accessible in the PA space defined by MSMON_MBWU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_MBWU access the memory bandwidth usage monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_MBWU access the memory bandwidth usage monitor for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0860

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0860	MSMON_MBWU_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0860	MSMON_MBWU_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0860	MSMON_MBWU_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0860	MSMON_MBWU_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_MBWU_CAPTURE, MPAM Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_MBWU == '1', and MPAMF_MBWUMON_IDR.HAS_CAPTURE == '1'. Otherwise, direct accesses to MSMON_MBWU_CAPTURE are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_MBWU_CAPTURE_s is the Secure memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_CAPTURE_ns is the Non-secure memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_MBWU_CAPTURE_rt is the Root memory bandwidth usage monitor capture instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_CAPTURE_rl is the Realm memory bandwidth usage monitor capture instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_MBWU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_CAPTURE is a 32-bit register.

Field descriptions

NRDY, bit [31]

Not Ready. The captured NRDY bit from the corresponding instance of MSMON_MBWU. This bit indicates whether the captured monitor value has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [30:0]

Captured memory bandwidth usage counter value if MSMON_MBWU_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_CAPTURE.NRDY is 1.

VALUE is the captured VALUE field from the corresponding instance of MSMON_MBWU, the count of bytes transferred since the monitor was last reset that meet the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

VALUE captures the MSMON_MBWU.VALUE and preserves any scaling that had been performed on the VALUE field in that register.

Accessing MSMON_MBWU_CAPTURE

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_MBWU_CAPTURE_s must only be accessible from the Secure MPAM feature page.
- MSMON_MBWU_CAPTURE_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_CAPTURE_rt must only be accessible from the Root MPAM feature page.
- MSMON_MBWU_CAPTURE_rl must only be accessible from the Realm MPAM feature page.
- MSMON_MBWU_CAPTURE_s, MSMON_MBWU_CAPTURE_ns, MSMON_MBWU_CAPTURE_rt, and MSMON_MBWU_CAPTURE_rl must be separate registers:
- The Secure instance (MSMON_MBWU_CAPTURE_s) accesses the captured memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_CAPTURE_ns) accesses the captured memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_CAPTURE_rt) accesses the captured memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_CAPTURE_rl) accesses the captured memory bandwidth usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_MBWU_CAPTURE is accessible in the PA space defined by MSMON_MBWU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_MBWU_CAPTURE access the monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_MBWU_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_MBWU_CAPTURE access the monitor for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0868

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0868	MSMON_MBWU_CAPTURE_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0868	MSMON_MBWU_CAPTURE_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0868	MSMON_MBWU_CAPTURE_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0868	MSMON_MBWU_CAPTURE_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_MBWU_L, MPAM Long Memory Bandwidth Usage Monitor Register

The MSMON_MBWU_L characteristics are:

Purpose

Accesses the monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU_L is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_MBWU == '1', and MPAMF_MBWUMON_IDR.HAS_LONG == '1'. Otherwise, direct accesses to MSMON_MBWU_L are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_MBWU_L_s is the Secure long memory bandwidth usage monitor instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_L_ns is the Non-secure long memory bandwidth usage monitor instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_MBWU_L_rt is the Root long memory bandwidth usage monitor instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_L_rl is the Realm long memory bandwidth usage monitor instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_MBWU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance long monitor register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

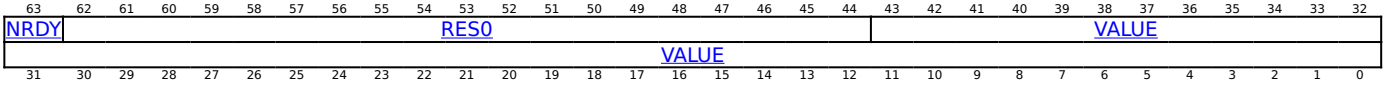
The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == '0':



NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

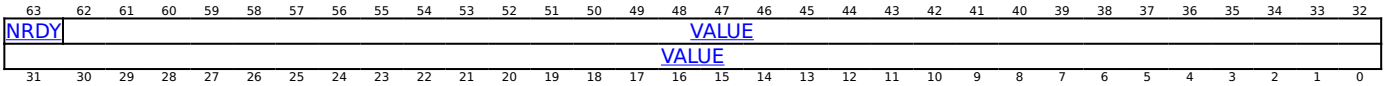
Reserved, RES0.

VALUE, bits [43:0]

Long (44-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == '1':



NRDY, bit [63]

Not Ready. Indicates whether the monitor instance has possibly inaccurate data.

NRDY	Meaning
0b0	The monitor instance is ready and the MSMON_MBWU_L.VALUE field is accurate.
0b1	The monitor instance is not ready and the contents of the MSMON_MBWU_L.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

Long (63-bit) memory bandwidth usage counter value if MSMON_MBWU_L.NRDY is 0. Invalid if MSMON_MBWU_L.NRDY is 1.

VALUE is the long count of bytes transferred since the monitor instance was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_MBWU_L

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_MBWU_L_s must only be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_rt must only be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_rl must only be accessible from the Realm MPAM feature page.
- MSMON_MBWU_L_s, MSMON_MBWU_L_ns, MSMON_MBWU_L_rt, and MSMON_MBWU_L_rl must be separate registers:
- The Secure instance (MSMON_MBWU_L_s) accesses the long memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_L_ns) accesses the long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_rt) accesses the long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_rl) accesses the long memory bandwidth usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_MBWU_L is accessible in the PA space defined by MSMON_MBWU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor instance for the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_MBWU_L access the long memory bandwidth usage monitor for the monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_L can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0880

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0880	MSMON_MBWU_L_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0880	MSMON_MBWU_L_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0880	MSMON_MBWU_L_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0880	MSMON_MBWU_L_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_MBWU_L_CAPTURE, MPAM Long Memory Bandwidth Usage Monitor Capture Register

The MSMON_MBWU_L_CAPTURE characteristics are:

Purpose

Accesses the captured MSMON_MBWU_L monitor instance selected by MSMON_CFG_MON_SEL.

Configuration

The power domain of MSMON_MBWU_L_CAPTURE is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_MBWU == '1', MPAMF_MBWUMON_IDR.HAS_CAPTURE == '1', and MPAMF_MBWUMON_IDR.HAS_LONG == '1'. Otherwise, direct accesses to MSMON_MBWU_L_CAPTURE are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_MBWU_L_CAPTURE_s is the Secure long memory bandwidth usage monitor capture instance selected by the Secure instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_L_CAPTURE_ns is the Non-secure long memory bandwidth usage monitor capture instance selected by the Non-secure instance of MSMON_CFG_MON_SEL.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_MBWU_L_CAPTURE_rt is the Root long memory bandwidth usage monitor capture instance selected by the Root instance of MSMON_CFG_MON_SEL.
- MSMON_MBWU_L_CAPTURE_rl is the Realm long memory bandwidth usage monitor capture instance selected by the Realm instance of MSMON_CFG_MON_SEL.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, the following statement applies:

- MSMON_MBWU_ROOTCR.PAS controls the PAS this register applies to.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, the monitor instance long capture register accessed is for the resource instance currently selected by MSMON_CFG_MON_SEL.RIS and the monitor instance of that resource instance selected by MSMON_CFG_MON_SEL.MON_SEL.

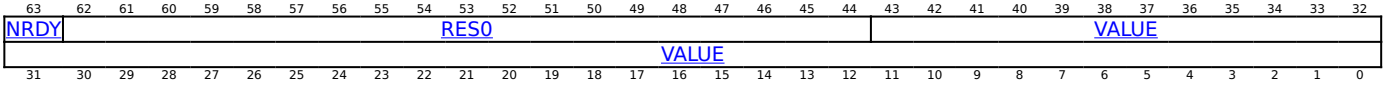
The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_L_CAPTURE is a 64-bit register.

Field descriptions

When MPAMF_MBWUMON_IDR.LWD == '0':



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

Bits [62:44]

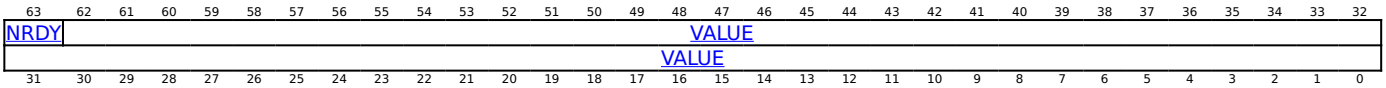
Reserved, RES0.

VALUE, bits [43:0]

Captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 44-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

When MPAMF_MBWUMON_IDR.LWD == '1':



NRDY, bit [63]

Not Ready. Indicates whether the monitor has possibly inaccurate data.

NRDY	Meaning
0b0	The captured monitor instance was ready and the MSMON_MBWU_L_CAPTURE.VALUE field is accurate.
0b1	The captured monitor instance was not ready and the contents of the MSMON_MBWU_L_CAPTURE.VALUE field might be inaccurate or otherwise not represent the actual memory bandwidth usage.

VALUE, bits [62:0]

The captured long memory bandwidth usage counter value if MSMON_MBWU_L_CAPTURE.NRDY is 0. Invalid if MSMON_MBWU_L_CAPTURE.NRDY is 1.

VALUE is the captured 63-bit count of bytes transferred since the monitor instance was last reset that met the criteria set in MSMON_CFG_MBWU_FLT and MSMON_CFG_MBWU_CTL for the monitor instance selected by MSMON_CFG_MON_SEL.

Accessing MSMON_MBWU_L_CAPTURE

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_MBWU_L_CAPTURE_s must only be accessible from the Secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rt must only be accessible from the Root MPAM feature page.
- MSMON_MBWU_L_CAPTURE_rl must only be accessible from the Realm MPAM feature page.
- MSMON_MBWU_L_CAPTURE_s, MSMON_MBWU_L_CAPTURE_ns, MSMON_MBWU_L_CAPTURE_rt, and MSMON_MBWU_L_CAPTURE_rl must be separate registers:
- The Secure instance (MSMON_MBWU_L_CAPTURE_s) accesses the captured long memory bandwidth usage monitor used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_L_CAPTURE_ns) accesses the captured long memory bandwidth usage monitor used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_L_CAPTURE_rt) accesses the captured long memory bandwidth usage monitor used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_L_CAPTURE_rl) accesses the captured long memory bandwidth usage monitor used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_MBWU_L_CAPTURE is accessible in the PA space defined by MSMON_MBWU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When RIS is implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the bandwidth resource instance selected by MSMON_CFG_MON_SEL.RIS and the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.
- When RIS is not implemented, reads and writes to MSMON_MBWU_L_CAPTURE access the monitor instance for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

Otherwise, the following statements apply:

- Reads and writes to MSMON_MBWU_L_CAPTURE access the monitor for the memory bandwidth usage monitor instance selected by MSMON_CFG_MON_SEL.MON_SEL.

MSMON_MBWU_L_CAPTURE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0890

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0890	MSMON_MBWU_L_CAPTURE_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0890	MSMON_MBWU_L_CAPTURE_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0890	MSMON_MBWU_L_CAPTURE_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0890	MSMON_MBWU_L_CAPTURE_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_MBWU_OFSR, MPAM MBWU Monitor Overflow Status Register

The MSMON_MBWU_OFSR characteristics are:

Purpose

MSMON_MBWU_OFSR is a 32-bit read-only register that shows bitmap of MBWU monitor instance overflow status for a contiguous group of 32 monitor instances.

Configuration

The power domain of MSMON_MBWU_OFSR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_MBWU == '1', and MPAMF_MBWUMON_IDR.HAS_OFSR == '1'. Otherwise, direct accesses to MSMON_MBWU_OFSR are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MSMON_MBWU_OFSR_s gives a bitmap of pending MBWU overflow status for 32 Secure MBWU monitor instances.
- MSMON_MBWU_OFSR_ns gives a bitmap of pending MBWU overflow status for 32 Non-secure MBWU monitor instances.
- If FEAT_RME is implemented, the following statements also apply:
- MSMON_MBWU_OFSR_rt gives a bitmap of pending MBWU overflow status for 32 Root MBWU monitor instances.
- MSMON_MBWU_OFSR_rl gives a bitmap of pending MBWU overflow status for 32 Realm MBWU monitor instances.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_OFSR is a 32-bit register.

Field descriptions

OFPND<i>, bit [i], for i = 31 to 0

Overflow status bitmap for MBWU monitor instances. The RIS and the contiguous range of MBWU monitor instances are set in MSMON_CFG_MON_SEL. i of 0 corresponds to the MBWU monitor instance MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0.

OFPND<i>	Meaning
0b0	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) does not have a pending overflow.
0b1	MBWU monitor instance (MSMON_CFG_MON_SEL.MON_SEL & 0xFFE0 + i) has a pending overflow.

After reading MSMON_OFLOW_SR to determine that an MBWU monitor instance has a pending overflow and which RIS values have pending overflows, an interrupt service routine could poll groups of 32 monitor instances in a RIS for pending monitors by reading this bitmap and incrementing MSMON_CFG_MON_SEL.MON_SEL by 32.

A pending overflow may be in either the MSMON_CFG_MBWU_CTL.OFLOW_STATUS or MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L field.

Accessing MSMON_MBWU_OFSR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_MBWU_OFSR_s must only be accessible from the Secure MPAM feature page.
- MSMON_MBWU_OFSR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_MBWU_OFSR_rt must only be accessible from the Root MPAM feature page.
- MSMON_MBWU_OFSR_rl must only be accessible from the Realm MPAM feature page.

- MSMON_MBWU_OFSR_s, MSMON_MBWU_OFSR_ns, MSMON_MBWU_OFSR_rt, and MSMON_MBWU_OFSR_rl must be separate registers:
- The Secure instance (MSMON_MBWU_OFSR_s) accesses the MBWU monitor overflow status bitmap used for Secure PARTIDs.
- The Non-secure instance (MSMON_MBWU_OFSR_ns) accesses the MBWU monitor overflow status bitmap used for Non-secure PARTIDs.
- The Root instance (MSMON_MBWU_OFSR_rt) accesses the MBWU monitor overflow status bitmap used for Root PARTIDs.
- The Realm instance (MSMON_MBWU_OFSR_rl) accesses the MBWU monitor overflow status bitmap used for Realm PARTIDs.

If FEAT_MPAMv2_MSC_MON_SEC is implemented, MSMON_MBWU_OFSR is accessible in the PA space defined by MSMON_MBWU_ROOTCR.PAS. The PA space of each monitor instance selectable by MSMON_CFG_MON_SEL can be configured independently.

If FEAT_MPAMv2_MSC_MON_SEC is implemented and a monitor instance with index <i> is assigned to a PA space, MSMON_MBWU_OFSR.OFPND<i> is RAZ if the access is from a Security state that cannot access that PA space.

MSMON_MBWU_OFSR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0898

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0898	MSMON_MBWU_OFSR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0898	MSMON_MBWU_OFSR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0898	MSMON_MBWU_OFSR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0898	MSMON_MBWU_OFSR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MSMON_MBWU_ROOTCR, MPAM Monitor Memory Bandwidth Usage Root Control Register

The MSMON_MBWU_ROOTCR characteristics are:

Purpose

Allows Root software to control the PA space of:

- The monitor instance selected in MSMON_SEL_ROOTCR.
- Accesses matched for filtering by the monitor instance.
- Events that will trigger a capture.

Configuration

The power domain of MSMON_MBWU_ROOTCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, FEAT_RME is implemented, MPAMF_IDR.HAS_MSMON == '1', MPAMF_MSMON_IDR.MSMON_MBWU == '1', and MPAMF_MBWUMON_IDR.HAS_MON_SEC == '1'. Otherwise, direct accesses to MSMON_MBWU_ROOTCR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_MBWU_ROOTCR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

PAS, bits [2:0]

PA space of the monitor instance selected in MSMON_SEL_ROOTCR.SEL.

Also restricts which accesses are monitored by the monitor instance based on their PAS.

PAS	Meaning
0b000	NS_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Only accesses with Non-secure or Non-secure Protected PAS are monitored. Only events triggered from Non-secure PAS cause capture.
0b001	NS_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Accesses with any Non-secure and Realm PAS are monitored. Events triggered from any Non-secure and Realm PAS cause capture.
0b010	NS_Any: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Non-secure PA space. Accesses with any PAS are monitored. Events triggered from any PAS cause capture.
0b011	RL_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Realm PA space. Only accesses with Realm PAS are monitored. Only events triggered from Realm PAS cause capture.
0b100	RL_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Realm PA space. Only accesses with Realm or Non-secure PAS are monitored. Only events triggered from Realm or Non-secure PAS cause capture.
0b101	S_Only: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Secure PA space. Only accesses with Secure PAS are monitored. Only events triggered from Secure PAS cause capture.
0b110	S_Plus: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Secure PA space. Only accesses with Secure or Non-secure PAS are monitored. Only events triggered from Secure or Non-secure PAS cause capture.
0b111	RT_Any: The monitor instance selected in MSMON_SEL_ROOTCR.SEL is assigned to Root PA space. Accesses with any PAS are monitored. Events triggered from any PAS cause capture.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0`.

Accessing MSMON_MBWU_ROOTCR

MSMON_MBWU_ROOTCR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2220

Accessible as follows:

- When an access is not Root, accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OFLOW_MSI_ADDR_H, MPAM Monitor Overflow MSI Write High-part Address Register

The MSMON_OFLOW_MSI_ADDR_H characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_H is a 32-bit read/write register for the high part of the MPAM monitor overflow MSI address.

MSMON_OFLOW_MSI_ADDR_H_s is the high part of the MSI write address for monitor overflow interrupts from Secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_ns is the high part of the MSI write address for monitor overflow interrupts from Non-secure monitor instances. MSMON_OFLOW_MSI_ADDR_H_rt is the high part of the MSI write address for monitor overflow interrupts from Root monitor instances. MSMON_OFLOW_MSI_ADDR_H_rl is the high part of the MSI write address for monitor overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_H is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p1 is implemented or FEAT_MPAMv2_MSC is implemented) and MPAMF_MSMON_IDR.HAS_OFLW_MSI == '1'. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_H are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_H is a 32-bit register.

Field descriptions

Bits [31:20]

Reserved, RES0.

MSI_ADDR_H, bits [19:0]

MSI write address bits[51:32].

Accessing MSMON_OFLOW_MSI_ADDR_H

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLW_MSI_ADDR_H_s must only be accessible from the Secure MPAM feature page.
- MSMON_OFLW_MSI_ADDR_H_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_OFLW_MSI_ADDR_H_rt must only be accessible from the Root MPAM feature page.
- MSMON_OFLW_MSI_ADDR_H_rl must only be accessible from the Realm MPAM feature page.

MSMON_OFLW_MSI_ADDR_H_s, MSMON_OFLW_MSI_ADDR_H_ns, MSMON_OFLW_MSI_ADDR_H_rt, and MSMON_OFLW_MSI_ADDR_H_rl must be separate registers:

- The Secure instance (MSMON_OFLW_MSI_ADDR_H_s) accesses the high part of the monitor overflow MSI write address of Secure monitors.
- The Non-secure instance (MSMON_OFLW_MSI_ADDR_H_ns) accesses the high part of the monitor overflow MSI write address of Non-secure monitors.
- The Root instance (MSMON_OFLW_MSI_ADDR_H_rt) accesses the high part of the monitor overflow MSI write address of Root monitors.
- The Realm instance (MSMON_OFLW_MSI_ADDR_H_rl) accesses the high part of the monitor overflow MSI write address of Realm monitors.

MSMON_OFLOW_MSI_ADDR_H can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08E4

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E4	MSMON_OFLW_MSI_ADDR_H_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E4	MSMON_OFLW_MSI_ADDR_H_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08E4	MSMON_OFLW_MSI_ADDR_H_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08E4	MSMON_OFLW_MSI_ADDR_H_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OFLOW_MSI_ADDR_L, MPAM Monitor Overflow MSI Low-part Address Register

The MSMON_OFLOW_MSI_ADDR_L characteristics are:

Purpose

MSMON_OFLOW_MSI_ADDR_L is a 32-bit read/write register for the low part of the MPAM monitor MSI address.

MSMON_OFLOW_MSI_ADDR_L_s is the low part of the MSI write address for overflow interrupts from Secure monitor intances.
MSMON_OFLOW_MSI_ADDR_L_ns is the low part of the MSI write address for overflow interrupts from Non-secure monitor instances.
MSMON_OFLOW_MSI_ADDR_L_rt is the low part of the MSI write address for overflow interrupts from Root monitor intances.
MSMON_OFLOW_MSI_ADDR_L_rl is the low part of the MSI write address for overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_ADDR_L is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p1 is implemented or FEAT_MPAMv2_MSC is implemented) and MPAMF_MSMON_IDR.HAS_OFLW_MSI == '1'. Otherwise, direct accesses to MSMON_OFLOW_MSI_ADDR_L are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ADDR_L is a 32-bit register.

Field descriptions

MSI_ADDR_L, bits [31:2]

MSI write address bits[31:2].

Bits [1:0]

Reserved, RES0.

Accessing MSMON_OFLOW_MSI_ADDR_L

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MSMON_OFLOW_MSI_ADDR_L_s must only be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_rt must only be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_rl must only be accessible from the Realm MPAM feature page.
- MSMON_OFLOW_MSI_ADDR_L_s, MSMON_OFLOW_MSI_ADDR_L_ns, MSMON_OFLOW_MSI_ADDR_L_rt, and MSMON_OFLOW_MSI_ADDR_L_rl must be separate registers:
- The Secure instance (MSMON_OFLOW_MSI_ADDR_L_s) accesses the low part of the overflow MSI write address used for Secure PARTIDs.
- The Non-secure instance (MSMON_OFLOW_MSI_ADDR_L_ns) accesses the low part of the overflow MSI write address used for Non-secure PARTIDs.
- The Root instance (MSMON_OFLOW_MSI_ADDR_L_rt) accesses the low part of the overflow MSI write address used for Root PARTIDs.
- The Realm instance (MSMON_OFLOW_MSI_ADDR_L_rl) accesses the low part of the overflow MSI write address used for Realm PARTIDs.

MSMON_OFLOW_MSI_ADDR_L can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08E0

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E0	MSMON_OFLOW_MSI_ADDR_L_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E0	MSMON_OFLOW_MSI_ADDR_L_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08E0	MSMON_OFLOW_MSI_ADDR_L_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08E0	MSMON_OFLOW_MSI_ADDR_L_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OFLOW_MSI_ATTR, MPAM Monitor Overflow MSI Write Attributes Register

The MSMON_OFLOW_MSI_ATTR characteristics are:

Purpose

MSMON_OFLOW_MSI_ATTR is a 32-bit read/write register that controls MPAM monitor overflow MSI write attributes for MPAM monitor overflows in this MSC.

MSMON_OFLOW_MSI_ATTR_s controls Secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_ns controls Non-secure MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rt controls Root MPAM monitor overflow MSI writes. MSMON_OFLOW_MSI_ATTR_rl controls Realm MPAM monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_ATTR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p1 is implemented or FEAT_MPAMv2_MSC is implemented) and MPAMF_MSMON_IDR.HAS_OFLW_MSI == '1'. Otherwise, direct accesses to MSMON_OFLOW_MSI_ATTR are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_ATTR is a 32-bit register.

Field descriptions

Bits [31:30]

Reserved, RES0.

MSI_SH, bits [29:28]

Sharability attribute of MSI writes.

MSI_SH	Meaning
0b00	Non-shareable.
0b01	Reserved, CONSTRAINED UNPREDICTABLE.
0b10	Outer Shareable.
0b11	Inner Shareable.

When MSMON_OFLOW_MSI_ATTR.MSI_MEMATTR specifies a Device memory type, the contents of this field are IGNORED and Shareability is effectively Outer Shareable.

MSI_MEMATTR, bits [27:24]

Memory attributes of MSI writes.

Note

This encoding matches the VMSAv8-64 stage 2 MemAttr[3:0] field as described in the Arm ARM, except that the following encodings are Reserved (not UNPREDICTABLE) and behave as DEvice-nGnRnE: 0b0100, 0b1000, and 0b1100.

MSI_MEMATTR	Meaning
0b0000	Device-nGnRnE.
0b0001	Device-nGnRE.
0b0010	Device-nGRE.
0b0011	Device-GRE.
0b0100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b0101	Normal Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal Inner Write-Through Cacheable, Outer Non-cacheable.
0b0111	Normal Inner Write-Back Cacheable, Outer Non-cacheable.
0b1000	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1001	Normal Inner Non-Cachable, Outer Write-Through Cacheable.
0b1010	Normal Inner Write-Through Cacheable, Outer Write-Through Cachable.
0b1011	Normal Inner Write-Back Cacheable, Outer Write-Through Cachable.
0b1100	Reserved. Behave as Device-nGnRnE, 0b0000.
0b1101	Normal Inner Non-cacheable, Outer Write-Back Cacheable.
0b1110	Normal Inner Write-Through Cacheable, Outer Write-Back Cacheable.
0b1111	Normal Inner Write-Back Cacheable, Outer Write-Back Cacheable.

When this field specifies a Device memory type, the contents of MSMON_OFLOW_MSI_ATTR.MSI_SH are IGNORED and Shareability is effectively Outer Shareable.

Device types may be implemented as any Device type with more n characters. For example, if this field is set to 0b0010, an implementation may treat the MSI write as the specified type, Device-nGRE, or as Device-nGnRE or as Device-nGnRnE.

Reserved encodings 0b0100, 0b1000, and 0b1100 must be implemented to behave the same as the 0b0000 encoding.

Bits [23:1]

Reserved, RES0.

MSIEN, bit [0]

Monitor overflow MSI write enable.

MSIEN	Meaning
0b0	MPAM monitor overflow MSI writes are not generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are disabled, hardwired monitor overflow interrupt could be generated if hardwired monitor overflow interrupt is implemented.
0b1	MPAM monitor overflow MSI writes are generated to signal enabled MPAM monitor overflow interrupts. When monitor overflow MSI writes are enabled, hardwired monitor overflow interrupts are not generated.

This enable affects whether a hardwired overlow interrupt is generated.

The reset behavior of this field is:

- On a MSC reset, this field resets to '0'.

Accessing MSMON_OFLOW_MSI_ATTR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_ATTR_s must only be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rt must only be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_ATTR_rl must only be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_ATTR_s, MSMON_OFLOW_MSI_ATTR_ns, MSMON_OFLOW_MSI_ATTR_rt, and MSMON_OFLOW_MSI_ATTR_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_MSI_ATTR_s) accesses the monitor overflow MSI write attributes of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_ATTR_ns) accesses the monitor overflow MSI write attributes of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_ATTR_rt) accesses the monitor overflow MSI write attributes of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_ATTR_rl) accesses the monitor overflow MSI write attributes of Realm monitors.

MSMON_OFLOW_MSI_ATTR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08EC

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08EC	MSMON_OFLOW_MSI_ATTR_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08EC	MSMON_OFLOW_MSI_ATTR_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08EC	MSMON_OFLOW_MSI_ATTR_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08EC	MSMON_OFLOW_MSI_ATTR_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OFLOW_MSI_DATA, MPAM Monitor Overflow MSI Write Data Register

The MSMON_OFLOW_MSI_DATA characteristics are:

Purpose

MSMON_OFLOW_MSI_DATA is a 32-bit read/write register for the MPAM monitor overflow MSI data.

MSMON_OFLOW_MSI_DATA_s is the data for the MSI write for monitor overflow from Secure monitor instances.
MSMON_OFLOW_MSI_DATA_ns is the data for the MSI writes for monitor overflow interrupts from Non-secure monitor instances.
MSMON_OFLOW_MSI_DATA_rt is the data for the MSI write for monitor overflow from Root monitor instances.
MSMON_OFLOW_MSI_DATA_rl is the data for the MSI writes for monitor overflow interrupts from Realm monitor instances.

Configuration

The power domain of MSMON_OFLOW_MSI_DATA is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p1 is implemented or FEAT_MPAMv2_MSC is implemented) and MPAMF_MSMON_IDR.HAS_OFLW_MSI == '1'. Otherwise, direct accesses to MSMON_OFLOW_MSI_DATA are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_DATA is a 32-bit register.

Field descriptions

MSI_DATA, bits [31:0]

MSI write data word.

Accessing MSMON_OFLOW_MSI_DATA

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_DATA_s must only be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rt must only be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_DATA_rl must only be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_DATA_s, MSMON_OFLOW_MSI_DATA_ns, MSMON_OFLOW_MSI_DATA_rt, and MSMON_OFLOW_MSI_DATA_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_MSI_DATA_s) accesses the monitor overflow MSI write data of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_DATA_ns) accesses the monitor overflow MSI write data of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_DATA_rt) accesses the monitor overflow MSI write data of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_DATA_rl) accesses the monitor overflow MSI write data of Realm monitors.

MSMON_OFLOW_MSI_DATA can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08E8

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08E8	MSMON_OFLOW_MSI_DATA_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08E8	MSMON_OFLOW_MSI_DATA_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08E8	MSMON_OFLOW_MSI_DATA_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08E8	MSMON_OFLOW_MSI_DATA_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OFLOW_MSI_MPAM, MPAM Monitor Overflow MSI Write MPAM Information Register

The MSMON_OFLOW_MSI_MPAM characteristics are:

Purpose

MSMON_OFLOW_MSI_MPAM is a 32-bit read/write register that sets the MPAM information for a monitor overflow MSI write.

MSMON_OFLOW_MSI_MPAM_s controls MPAM information labeling of Secure monitor overflow MSI writes.
MSMON_OFLOW_MSI_MPAM_ns controls MPAM information labeling of Non-secure monitor overflow MSI writes.
MSMON_OFLOW_MSI_MPAM_rt controls MPAM information labeling of Root monitor overflow MSI writes.
MSMON_OFLOW_MSI_MPAM_rl controls MPAM information labeling of Realm monitor overflow MSI writes.

Configuration

The power domain of MSMON_OFLOW_MSI_MPAM is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p1 is implemented or FEAT_MPAMv2_MSC is implemented) and MPAMF_MSMON_IDR.HAS_OFLW_MSI == '1'. Otherwise, direct accesses to MSMON_OFLOW_MSI_MPAM are RES0.

MSMON_OFLOW_MSI_ADDR_L, MSMON_OFLOW_MSI_ADDR_H, MSMON_OFLOW_MSI_ATTR, MSMON_OFLOW_MSI_DATA, and MSMON_OFLOW_MSI_MPAM must all be implemented to support MSI writes for monitor overflow interrupts.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_MSI_MPAM is a 32-bit register.

Field descriptions

When FEAT_MPAMv2_MSC is implemented:

PMG, bits [31:16]

Performance monitoring group for an MSC monitor overflow MSI write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition number for an MSC monitor overflow MSI write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

Performance monitoring group property for an MSC monitor overflow MSI write.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition ID for an MSC monitor overflow MSI write.

The PARTID in this field is in the Secure PARTID space in the MSMON_OFLOW_MSI_MPAM_s instance and in the Non-secure PARTID space in the MSMON_OFLOW_MSI_MPAM_ns instance of this register.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Accessing MSMON_OFLOW_MSI_MPAM

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_MSI_MPAM_s must only be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rt must only be accessible from the Root MPAM feature page.
- MSMON_OFLOW_MSI_MPAM_rl must only be accessible from the Realm MPAM feature page.

MSMON_OFLOW_MSI_MPAM_s, MSMON_OFLOW_MSI_MPAM_ns, MSMON_OFLOW_MSI_MPAM_rt, and MSMON_OFLOW_MSI_MPAM_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_MSI_MPAM_s) accesses the monitor overflow MSI MPAM information of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_MSI_MPAM_ns) accesses the monitor overflow MSI MPAM information of Non-secure monitors.
- The Root instance (MSMON_OFLOW_MSI_MPAM_rt) accesses the monitor overflow MSI MPAM information of Root monitors.
- The Realm instance (MSMON_OFLOW_MSI_MPAM_rl) accesses the monitor overflow MSI MPAM information of Realm monitors.

MSMON_OFLOW_MSI_MPAM can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08DC

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08DC	MSMON_OFLOW_MSI_MPAM_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08DC	MSMON_OFLOW_MSI_MPAM_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08DC	MSMON_OFLOW_MSI_MPAM_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08DC	MSMON_OFLOW_MSI_MPAM_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OFLOW_SR, MPAM Monitor Overflow Status Register

The MSMON_OFLOW_SR characteristics are:

Purpose

MSMON_OFLOW_SR is a 32-bit read-only register that shows MPAM monitor overflow status for this MSC.

MSMON_OFLOW_SR_s gives the status of overflows of Secure MPAM monitors. MSMON_OFLOW_SR_ns gives the status of overflows of Non-secure MPAM monitors. MSMON_OFLOW_SR_rt gives the status of overflows of Root MPAM monitors. MSMON_OFLOW_SR_rl gives the status of overflows of Realm MPAM monitors.

Configuration

The power domain of MSMON_OFLOW_SR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.HAS_OFLOW_SR == '1'. Otherwise, direct accesses to MSMON_OFLOW_SR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OFLOW_SR is a 32-bit register.

Field descriptions

CSU_OFLOW_PND, bit [31]

At least one cache storage usage monitor has OFLOW_STATUS of 1 in MSMON_CFG_CSU_CTL.

CSU_OFLOW_PND	Meaning
0b0	There are no cache storage usage monitor instances where MSMON_CFG_CSU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_CSU_CTL for at least one of the cache storage usage monitor instances has OFLOW_STATUS set to 1.

This field clears when MSMON_CFG_CSU_CTL.OFLOW_STATUS has been reset to 0 for all CSU monitor instances in this MSC.

MBWU_OFLOW_PND, bit [30]

At least one memory bandwidth usage monitor instance has OFLOW_STATUS or OFLOW_STATUS_L of 1 in MSMON_CFG_MBWU_CTL.

MBWU_OFLOW_PND	Meaning
0b0	There are no memory bandwidth usage monitor instances where MSMON_CFG_MBWU_CTL.OFLOW_STATUS is 1.
0b1	MSMON_CFG_MBWU_CTL for at least one of the memory bandwidth usage monitor instances has either OFLOW_STATUS or OFLOW_STATUS_L set to 1.

This field clears when MSMON_CFG_MBWU_CTL.OFLOW_STATUS and MSMON_CFG_MBWU_CTL.OFLOW_STATUS_L have been reset to 0 for all MBWU monitor instances in this MSC.

CSA_OFLOW_PND, bit [29]
When MPAMF_MSMON_IDR.MSMON_CSA == '1':

If MPAMF_CSAMON_IDR.HAS_LONG is 1, reports that MSMON_CFG_CSA_CTL.{OFLOW_STATUS,OFLOW_STATUS_L} are {1,x} or {x,1} for at least one cache storage allocation monitor instance. Otherwise, reports that MSMON_CFG_CSA_CTL.OFLOW_STATUS is 1 for at least one cache storage allocation monitor instance.

CSA_OFLOW_PND	Meaning
0b0	If MPAMF_CSAMON_IDR.HAS_LONG is 1, then MSMON_CFG_CSA_CTL.{OFLOW_STATUS,OFLOW_STATUS_L} are {0,0} for all cache storage allocation monitor instances. Otherwise, MSMON_CFG_CSA_CTL.OFLOW_STATUS is 0 for all cache storage allocation monitor instances.
0b1	If MPAMF_CSAMON_IDR.HAS_LONG is 1, then MSMON_CFG_CSA_CTL.{OFLOW_STATUS,OFLOW_STATUS_L} are {1,x} or {x,1} for at least one cache storage allocation monitor instance. Otherwise, MSMON_CFG_CSA_CTL.OFLOW_STATUS is 1 for at least one cache storage allocation monitor instance.

If MPAMF_CSAMON_IDR.HAS_LONG is 1, the value of this field becomes 0 when MSMON_CFG_CSA_CTL.{OFLOW_STATUS,OFLOW_STATUS_L} are reset to {0,0} for all cache storage allocation monitor instances. Otherwise, the value of this field becomes 0 when MSMON_CFG_CSA_CTL.OFLOW_STATUS is reset to 0 for all cache storage allocation monitor instances.

The reset behavior of this field is:

- On a MSC reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [28:16]

Reserved, RES0.

RIS_PND<r>, bit [r], for r = 15 to 0

Overflow status by RIS.

RIS_PND<r>	Meaning
0b0	RIS r has no unread overflows of any type of monitor.
0b1	RIS r has at least one unread overflow in at least one of the monitor types.

Combined with the CSU_OFLOW_PND and MBWU_OFLOW_PND flags in this register, an interrupt service routine could poll only the monitor types indicated in monitors for the resource instances flagged in this field.

Bit r is set when any monitor instance of any type in resource instance r has OFLOW_STATUS or OFLOW_STATUS_L set to 1.

Accessing MSMON_OFLOW_SR

This register is within the MPAM feature page memory frames.

In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MSMON_OFLOW_SR_s must only be accessible from the Secure MPAM feature page.
- MSMON_OFLOW_SR_ns must only be accessible from the Non-secure MPAM feature page.
- MSMON_OFLOW_SR_rt must only be accessible from the Root MPAM feature page.
- MSMON_OFLOW_SR_rl must only be accessible from the Realm MPAM feature page.

MSMON_OFLOW_SR_s, MSMON_OFLOW_SR_ns, MSMON_OFLOW_SR_rt, and MSMON_OFLOW_SR_rl must be separate registers:

- The Secure instance (MSMON_OFLOW_SR_s) accesses the monitor overflow status summary of Secure monitors.
- The Non-secure instance (MSMON_OFLOW_SR_ns) accesses the monitor overflow status summary of Non-secure monitors.
- The Root instance (MSMON_OFLOW_SR_rt) accesses the monitor overflow status summary of Root monitors.
- The Realm instance (MSMON_OFLOW_SR_rl) accesses the monitor overflow status summary of Realm monitors.

MSMON_OFLOW_SR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x08F0

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x08F0	MSMON_OFLOW_SR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x08F0	MSMON_OFLOW_SR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x08F0	MSMON_OFLOW_SR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x08F0	MSMON_OFLOW_SR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OUT_TL, MPAM PMG Translation Egress Control Register

The MSMON_OUT_TL characteristics are:

Purpose

Enables egress PMG translation and configures direct egress PMG translations.

Configuration

The power domain of MSMON_OUT_TL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented and MPAMF_IDR.HAS_OUT_TL == '1'. Otherwise, direct accesses to MSMON_OUT_TL are RES0.

The effects of this register are unaffected by Resource instance selection, if implemented and identified by MPAMF_IDR.HAS_RIS.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OUT_TL is a 32-bit register.

Field descriptions

ENABLE, bit [31]

Enables egress PMG translation in the MSC.

ENABLE	Meaning
0b0	Egress PMG translation is disabled.
0b1	Egress PMG translation is enabled.

The value of this field has no effect on the ability of the MSC to create direct egress translation configurations.

Bits [30:16]

Reserved, RES0.

PMGTL, bits [15:0]
When MPAMF_PMG_OUT_TL_IDR.DIRECT == '1':

Value configured as the result of a direct PMG translation of the egress PMG configured in MSMON_PMG_SEL.PMG when MSMON_PMG_SEL.INGRESS_TL is 0.

Otherwise:

Reserved, RES0.

Accessing MSMON_OUT_TL

MSMON_OUT_TL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2428

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OUT_TL_BASE, MPAM PMG Translation Egress Base Control Register

The MSMON_OUT_TL_BASE characteristics are:

Purpose

Configures the base value used to compute translation PMGs for egress PMGs that do not have direct translation.

Configuration

The power domain of MSMON_OUT_TL_BASE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, MPAMF_IDR.HAS_OUT_TL == '1', and MPAMF_PMG_OUT_TL_IDR.BASE_MASK == '1'. Otherwise, direct accesses to MSMON_OUT_TL_BASE are RES0.

The effects of this register are unaffected by Resource instance selection, if implemented and identified by MPAMF_IDR.HAS_RIS.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OUT_TL_BASE is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

BASE, bits [15:0]

Base value used to compute the egress translation of PMGs that do not have a direct translation configured.

Accessing MSMON_OUT_TL_BASE

MSMON_OUT_TL_BASE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2430

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_OUT_TL_MASK, MPAM PMG Translation Egress Mask Control Register

The MSMON_OUT_TL_MASK characteristics are:

Purpose

Configures the mask value used to compute translation PMGs for egress PMGs that do not have direct translation.

Configuration

The power domain of MSMON_OUT_TL_MASK is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, MPAMF_IDR.HAS_OUT_TL == '1', and MPAMF_PMG_OUT_TL_IDR.BASE_MASK == '1'. Otherwise, direct accesses to MSMON_OUT_TL_MASK are RES0.

The effects of this register are unaffected by Resource instance selection, if implemented and identified by MPAMF_IDR.HAS_RIS.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_OUT_TL_MASK is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

MASK_WD, bits [4:0]

Value used to calculate the mask as 2^{MASK_WD}-1. The mask is then used to compute the egress translation of PMGs that do not have a direct translation configured.

Accessing MSMON_OUT_TL_MASK

MSMON_OUT_TL_MASK can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2438

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MSMON_PMG_SEL, MPAM PMG Selection Control Register

The MSMON_PMG_SEL characteristics are:

Purpose

Selects the PMG to configure by subsequent writes to control registers.

Configuration

The power domain of MSMON_PMG_SEL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented and FEAT_MPAM_MSC_DOMAINS is implemented. Otherwise, direct accesses to MSMON_PMG_SEL are RES0.

If the MSC is implemented as shared by multiple physical address spaces, MSMON_PMG_SEL is banked for each physical address space that shares the MSC.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_PMG_SEL is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

INGRESS_TL, bit [17]
When (MPAMF_IDR.HAS_IN_TL == '1' and MPAMF_PMG_IN_TL_IDR.DIRECT == '1') or (MPAMF_IDR.HAS_OUT_TL == '1' and MPAMF_PMG_OUT_TL_IDR.DIRECT == '1'):

Controls if the value in MSMON_PMG_SEL.PMG is used for either ingress translation configuration, or PMG-sensitive behavior and egress translation configuration.

INGRESS_TL	Meaning
0b0	MSMON_PMG_SEL.PMG is used on configuration of PMG-sensitive behavior. If MPAMF_IDR.HAS_OUT_TL is 1 and MPAMF_PMG_OUT_TL_IDR.DIRECT is 1, MSMON_PMG_SEL.PMG is also used on configuration of a direct egress translation as the source PMG to be translated.
0b1	MSMON_PMG_SEL.PMG is used on configuration of a direct ingress translation as the source PMG to be translated.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if any the following are true:
  - MPAMF_IDR.HAS_IN_TL == '0'.
  - MPAMF_PMG_IN_TL_IDR.DIRECT == '0'.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

PMG, bits [15:0]

Selects the PMG to configure by subsequent writes to control registers.

Reads and writes to other MSMON registers with PMG-sensitive behavior are indexed by the value of this field to access the configuration for a single PMG.

Accessing MSMON_PMG_SEL

MSMON_PMG_SEL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2500

Accesses to this register are RW.

MSMON_SEL_ROOTCR, MPAM Monitor Selection Root Control Register

The MSMON_SEL_ROOTCR characteristics are:

Purpose

Allows Root software to select a monitor instance to be assigned to a physical address space.

Configuration

The power domain of MSMON_SEL_ROOTCR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv2_MSC is implemented, FEAT_RME is implemented, MPAMF_IDR.HAS_MSMON == '1', and ((MPAMF_MSMON_IDR.MSMON_CSA == '1' and MPAMF_CSAMON_IDR.HAS_MON_SEC == '1'), or (MPAMF_MSMON_IDR.MSMON_CSU == '1' and MPAMF_CSUMON_IDR.HAS_MON_SEC == '1'), or (MPAMF_MSMON_IDR.MSMON_MBWU == '1' and MPAMF_MBWUMON_IDR.HAS_MON_SEC == '1')). Otherwise, direct accesses to MSMON_SEL_ROOTCR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MSMON_SEL_ROOTCR is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]
When MPAMF_IDR.HAS_RIS == '1':

Index of the resource instance to which the selected monitor instance is associated.

Otherwise:

Reserved, RES0.

Bits [23:16]

Reserved, RES0.

MON_SEL, bits [15:0]

Index of the selected monitor instance to be assigned to a physical address space.

Accessing MSMON_SEL_ROOTCR

MSMON_SEL_ROOTCR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x2208

Accessible as follows:

- When an access is not Root, accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

External register OSLAR_EL1 bits [31:0] are architecturally mapped to AArch64 System register OSLAR_EL1[31:0].

OSLAR_EL1 is in the Core power domain.

The OS Lock can also be locked or unlocked using DBGOSLAR.

If FEAT_Debugv8p2 is not implemented, it is IMPLEMENTATION DEFINED whether external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

If FEAT_Debugv8p2 is implemented, external debug accesses to OSLAR_EL1 are ignored and return an error when AllowExternalDebugAccess() returns FALSE for the access.

Attributes

OSLAR_EL1 is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use EDPRSR.OSLK to check the current status of the lock.

Accessing OSLAR_EL1

OSLAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x300	OSLAR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or (!AllowExternalDebugAccess(addrdesc) and FEAT_Debugv8p2 is implemented), accesses to this register generate an error response.
- When AllowExternalDebugAccess(addrdesc) and SoftwareLockStatus(addrdesc), accesses to this register are WI.
- When AllowExternalDebugAccess(addrdesc) and !SoftwareLockStatus(addrdesc), accesses to this register are WO.
- Otherwise, accesses to this register are IMPDEF.

2025-12-10 16:11:30, 2025-12_rel

TRBAUTHSTATUS, Authentication Status Register

The TRBAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBAUTHSTATUS is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBAUTHSTATUS are RES0.

Attributes

TRBAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

RTNID	Meaning
0b00	Not implemented.

RTID, bits [25:24]

Root invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

RLNID	Meaning
0b00	Not implemented.

RLID, bits [13:12]

Realm invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

Secure non-invasive debug.

SNID	Meaning
0b00	Not implemented.

SID, bits [5:4]

Secure invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

NSNID, bits [3:2]

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Not implemented.

NSID, bits [1:0]

Non-secure invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.NSID.

Accessing TRBAUTHSTATUS

TRBAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFB8	TRBAUTHSTATUS

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBBASER_EL1, Trace Buffer Base Address Register

The TRBBASER_EL1 characteristics are:

Purpose

Defines the base address for the trace buffer.

Configuration

External register TRBBASER_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBBASER_EL1[63:0].

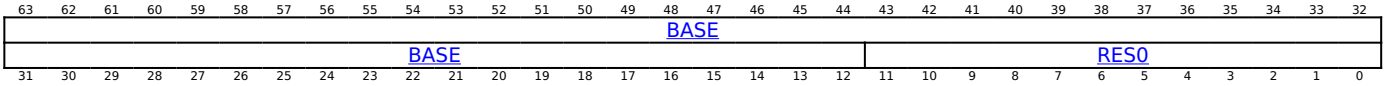
TRBBASER_EL1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBBASER_EL1 are RES0.

Attributes

TRBBASER_EL1 is a 64-bit register.

Field descriptions



BASE, bits [63:12]

Trace Buffer Base pointer address. (TRBBASER_EL1.BASE << 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing TRBBASER_EL1

The PE might ignore a write to TRBBASER_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1 and the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1 and the Trace Buffer Unit is using External mode.

TRBBASER_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x000	TRBBASER_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRBCIDR0, Component Identification Register 0

The TRBCIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBCIDR0 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBCIDR0 are RES0.

Attributes

TRBCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Reads as 0x0D.

Access to this field is RO.

Accessing TRBCIDR0

TRBCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFF0	TRBCIDR0

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBCIDR1, Component Identification Register 1

The TRBCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBCIDR1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBCIDR1 are RES0.

Attributes

TRBCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight peripheral.

Other values are defined by the CoreSight Architecture.

Access to this field is RO.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is RO.

Accessing TRBCIDR1

TRBCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFF4	TRBCIDR1

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBCIDR2, Component Identification Register 2

The TRBCIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBCIDR2 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBCIDR2 are RES0.

Attributes

TRBCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.

Reads as 0x05.

Access to this field is RO.

Accessing TRBCIDR2

TRBCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFF8	TRBCIDR2

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBCIDR3, Component Identification Register 3

The TRBCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBCIDR3 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBCIDR3 are RES0.

Attributes

TRBCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as 0xB1.

Access to this field is RO.

Accessing TRBCIDR3

TRBCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFFC	TRBCIDR3

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBCR, Trace Buffer Control Register

The TRBCR characteristics are:

Purpose

Provides trace buffer controls for an external debugger.

Configuration

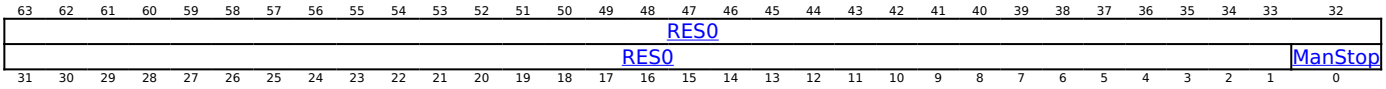
TRBCR is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBCR are RES0.

Attributes

TRBCR is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

ManStop, bit [0]

Flush and Stop collection. A write of 1 to this field causes a trace buffer flush, and on completion of the flush, Collection is stopped and the Trace Buffer Unit writes all trace data it has Accepted from the trace unit to memory, adding padding data if necessary.

Access to this field is WO/RAZ.

Accessing TRBCR

TRBCR can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x038	TRBCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRBDEVAFF, Device Affinity Register

The TRBDEVAFF characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

Reads the same value as the MPIDR_EL1 register for the PE that this trace buffer has affinity with.

Depending on the IMPLEMENTATION DEFINED nature of the system, it might be possible that TRBDEVAFF is read before system firmware has configured the trace buffer and/or the PE or group of PEs that the trace buffer has affinity with. When this is the case, TRBDEVAFF reads as zero.

Configuration

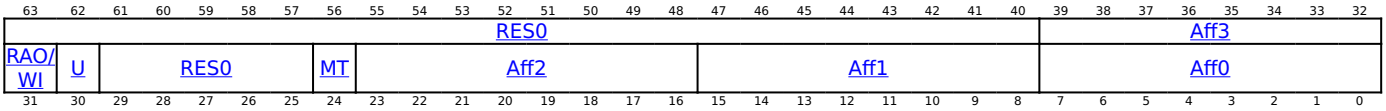
TRBDEVAFF is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVAFF are RES0.

Attributes

TRBDEVAFF is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRBDEVAFF

TRBDEVAFF can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFA8	TRBDEVAFF

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBDEVARCH, Trace Buffer Device Architecture Register

The TRBDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

TRBDEVARCH is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVARCH are RES0.

Attributes

TRBDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architect of the component. For Trace Buffer, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the TRBDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
0b0000	First revision.
0b0001	As 0b0000, and adds: • If EL2 and FEAT_FGT are implemented, a fine-grained trap on the TSB CSYNC instruction. • If EL2 is implemented, an EL2 control to override TRBLIMITR_EL1.nVM. • The TRBE Profiling exception extension, FEAT_TRBE_EXC.

All other values are reserved.

FEAT_TRBE implements the functionality identified by the value 0b0000.

FEAT_TRBEv1p1 implements the functionality identified by the value 0b0001.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	Trace Buffer Extension version 1.

All other values are reserved.

TRBDEVARCH.ARCHVER and TRBDEVARCH.ARCHPART are also defined as a single field, TRBDEVARCH.ARCHID, so that TRBDEVARCH.ARCHVER is TRBDEVARCH.ARCHID[15:12].

Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA18	Armv9-A Trace Buffer Extension.

TRBDEVARCH.ARCHVER and TRBDEVARCH.ARCHPART are also defined as a single field, TRBDEVARCH.ARCHID, so that TRBDEVARCH.ARCHPART is TRBDEVARCH.ARCHID[11:0].

Access to this field is RO.

Accessing TRBDEVARCH

TRBDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFBC	TRBDEVARCH

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBDEVID, Device Configuration Register

The TRBDEVID characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBDEVID is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVID are RES0.

Attributes

TRBDEVID is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRBDEVID

TRBDEVID can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFC8	TRBDEVID

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBDEVID1, Device Configuration Register 1

The TRBDEVID1 characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBDEVID1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVID1 are RES0.

Attributes

TRBDEVID1 is a 32-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:

PMG_MAX, bits [31:16]
When FEAT_TRBE_MPAM is implemented:

Largest permitted PMG value. The TRBMPAM_EL1.PMG field must implement at least enough bits to represent TRBDEVID1.PMG_MAX.

If FEAT_MPAMv2 is implemented, then bits 32:24 of the register are an extension of the PMG_MAX field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

PARTID_MAX, bits [15:0]
When FEAT_TRBE_MPAM is implemented:

Largest permitted PARTID value. The TRBMPAM_EL1.PARTID field must implement at least enough bits to represent TRBDEVID1.PARTID_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented:

Bits [31:24]

Reserved, RES0.

PMG_MAX, bits [23:16]
When FEAT_TRBE_MPAM is implemented:

Largest permitted PMG value. The TRBMPAM_EL1.PMG field must implement at least enough bits to represent TRBDEVID1.PMG_MAX.

If FEAT_MPAMv2 is implemented, then bits 32:24 of the register are an extension of the PMG_MAX field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

PARTID_MAX, bits [15:0]
When FEAT_TRBE_MPAM is implemented:

Largest permitted PARTID value. The TRBMPAM_EL1.PARTID field must implement at least enough bits to represent TRBDEVID1.PARTID_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing TRBDEVID1

TRBDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFC4	TRBDEVID1

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBDEVID2, Device Configuration Register 2

The TRBDEVID2 characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBDEVID2 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVID2 are RES0.

Attributes

TRBDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRBDEVID2

TRBDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFC0	TRBDEVID2

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBDEVTYPE, Device Type Register

The TRBDEVTYPE characteristics are:

Purpose

Provides discovery information for the component. If the part number field is not recognized, a debugger can report the information that is provided by TRBDEVTYPE about the component instead.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBDEVTYPE is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBDEVTYPE are RES0.

Attributes

TRBDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Component sub-type.

SUB	Meaning
0b0010	When MAJOR == 0x1 (Trace sink), Trace buffer or router.

This field reads as 0x2.

Access to this field is RO.

MAJOR, bits [3:0]

Component major type.

MAJOR	Meaning
0b0001	Trace sink.

This field reads as 0x1.

Access to this field is RO.

Accessing TRBDEVTYPE

TRBDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFCC	TRBDEVTYPE

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

Purpose

Describes constraints on using the Trace Buffer Unit to an external debugger.

Configuration

External register TRBIDR_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBIDR_EL1[63:0].

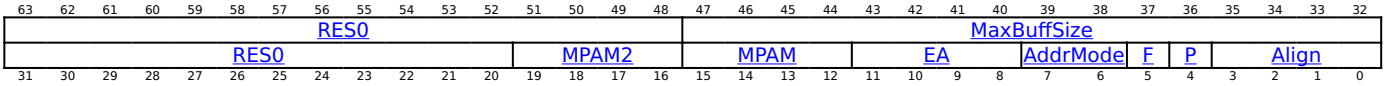
TRBIDR_EL1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBIDR_EL1 are RES0.

Attributes

TRBIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

MaxBuffSize, bits [47:32]

Maximum supported trace buffer size. Reserved for software use.

The only permitted value is 0x0000, indicating there is no limit to the maximum buffer size.

Reads as 0x0000.

Access to this field is RO.

Bits [31:20]

Reserved, RES0.

MPAM2, bits [19:16]
When FEAT_TRBE_EXT is implemented:

FEAT_MPAMv2 extensions. Indicates Memory Partitioning and Monitoring (MPAM) support using FEAT_MPAMv2 in the Trace Buffer Unit when using External mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM2	Meaning
0b0000	Trace Buffer External Mode is not implemented or the version of MPAM supported by this field is not implemented by the PE.
0b0001	FEAT_MPAMv2 is implemented by the Trace Buffer Unit, using default PARTID and PMG values in External mode.
0b0010	Trace Buffer MPAM extensions implemented, using FEAT_MPAMv2.

When FEAT_MPAMv2 is not implemented by the PE, the only permitted value is 0b0000.

When FEAT_MPAMv2 is implemented by the PE, the value 0b0000 is not permitted.

FEAT_TRBE_MPAM implements the functionality identified by the value 0b0010.

Access to this field is RO.

Otherwise:

Reserved, RES0.

MPAM, bits [15:12]
When FEAT_TRBE_EXT is implemented:

FEAT_MPAMv0p1 or FEAT_MPAMv1p0 extensions. Indicates Memory Partitioning and Monitoring (MPAM) support using FEAT_MPAMv0p1 or FEAT_MPAMv1p0 in the Trace Buffer Unit when using External mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM	Meaning
0b0000	Trace Buffer External Mode is not implemented or the version of MPAM supported by this field is not implemented by the PE.
0b0001	FEAT_MPAMv0p1 or FEAT_MPAMv1p0 is implemented by the Trace Buffer Unit, using default PARTID and PMG values in External mode.
0b0010	Trace Buffer MPAM extensions implemented, using FEAT_MPAMv0p1 or FEAT_MPAMv1p0.

When FEAT_MPAMv0p1 and FEAT_MPAMv1p0 are not implemented by the PE, the only permitted value is 0b0000.

When at least one of FEAT_MPAMv0p1 and FEAT_MPAMv1p0 are implemented by the PE, the value 0b0000 is not permitted.

FEAT_TRBE_MPAM implements the functionality identified by the value 0b0010.

Access to this field is RO.

Otherwise:

Reserved, RES0.

EA, bits [11:8]

External Abort handling. Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EA	Meaning
0b0000	Not described.
0b0001	The PE ignores External aborts on writes made by the Trace Buffer Unit.
0b0010	An External abort on a write made by the Trace Buffer Unit generates an asynchronous SError exception at the PE.

All other values are reserved.

From Armv9.3, the value 0b0000 is not permitted.

The behavior described by this field does not apply for External aborts on a translation table walk, translation table update, or GPT walk made by the Trace Buffer Unit that are reported as MMU faults using TRBSR_ELx. For more information, see 'External aborts'.

Access to this field is RO.

AddrMode, bits [7:6]

This field reads as an UNKNOWN value.

F, bit [5]

Flag updates. Describes how address translations performed by the Trace Buffer Unit manage the Access flag and dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F	Meaning
0b0	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is always disabled for all translation stages.
0b1	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is controlled in the same way as explicit memory accesses in the trace buffer owning translation regime.

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv9.3, the value 0 is not permitted.

Access to this field is RO.

P, bit [4]

This field reads as an UNKNOWN value.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to TRBPTR_EL1 and TRBTRG_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

Access to this field is RO.

Accessing TRBIDR_EL1

TRBIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x030	TRBIDR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

TRBITCTRL, Integration Mode Control Register

The TRBITCTRL characteristics are:

Purpose

A component can use TRBITCTRL to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBITCTRL is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBITCTRL are RES0.

Attributes

TRBITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]
When topology detection or integration functionality is implemented:

Integration Mode Enable.

IME	Meaning
0b0	Component functional mode.
0b1	Component integration mode. Support for topology detection and integration testing is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRBITCTRL

The PE might ignore a write to TRBITCTRL if any of the following apply:

- TRBLIMITR_EL1.E == 1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xF00	TRBITCTRL

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

TRBLAR, Lock Access Register

The TRBLAR characteristics are:

Purpose

For components that implement the Software Lock, used to lock and unlock the Software Lock. This component does not implement the Software Lock.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBLAR is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBLAR are RES0.

Attributes

TRBLAR is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, WI.

Software Lock Key. The Software Lock is not implemented.

This field ignores writes.

Accessing TRBLAR

TRBLAR can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFB0	TRBLAR

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

Purpose

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

Configuration

External register TRBLIMITR_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBLIMITR_EL1[63:0].

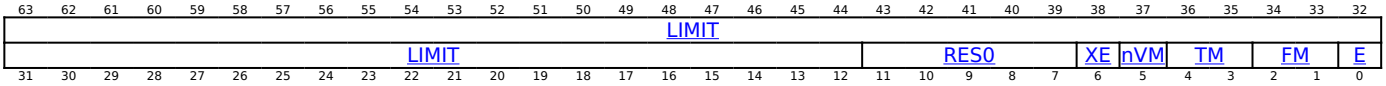
TRBLIMITR_EL1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are RES0.

Attributes

TRBLIMITR_EL1 is a 64-bit register.

Field descriptions



LIMIT, bits [63:12]

Trace buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

XE, bit [6]

Trace Buffer Unit External mode enable. Controls whether the Trace Buffer Unit is enabled when SelfHostedTraceEnabled() == FALSE.

XE	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is FALSE, the Trace Buffer Unit is enabled.

If SelfHostedTraceEnabled() == TRUE, then TRBLIMITR_EL1.E controls whether the Trace Buffer Unit is enabled.

All output is discarded by the Trace Buffer Unit when the Trace Buffer Unit is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

nVM, bit [5]

Address mode.

nVM	Meaning
0b0	The trace buffer pointers are virtual addresses.
0b1	The trace buffer pointers are: • Physical address in the owning security state if the owning translation regime has no stage 2 translation. • Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

If SelfHostedTraceEnabled() == FALSE, then the PE ignores the value of this field and the trace buffer pointers are always physical addresses.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !SelfHostedTraceEnabled(), access to this field is RES1 .
- Access to this field is RO if all the following are true:
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.
- Otherwise, access to this field is RW.

TM, bits [4:3]

Trigger mode.

TM	Meaning
0b00	Stop on trigger. Flush trace, then stop collection and set TRBSR_EL1.IRQ to 1 on Trigger Event.
0b01	IRQ on trigger. Continue collection and set TRBSR_EL1.IRQ to 1 on Trigger Event.
0b11	Ignore trigger. Continue collection and leave TRBSR_EL1.IRQ unchanged on Trigger Event.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

FM, bits [2:1]

Trace buffer mode.

FM	Meaning
0b00	Fill mode. Stop collection and set TRBSR_EL1.IRQ to 1 on current write pointer wrap.
0b01	Wrap mode. Continue collection and set TRBSR_EL1.IRQ to 1 on current write pointer wrap.
0b11	Circular Buffer mode. Continue collection and leave TRBSR_EL1.IRQ unchanged on current write pointer wrap.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Trace Buffer Unit enable. Controls whether the Trace Buffer Unit is enabled when SelfHostedTraceEnabled() == TRUE.

E	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is TRUE, the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, then TRBLIMITR_EL1.XE controls whether the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is not implemented, then the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE.

All output is discarded by the Trace Buffer Unit when the Trace Buffer Unit is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRBLIMITR_EL1

The PE might ignore a write to TRBLIMITR_EL1, other than a write that modifies TRBLIMITR_EL1.E or TRBLIMITR_EL1.XE as appropriate, if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

TRBLIMITR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x010	TRBLIMITR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRBLSR, Lock Status Register

The TRBLSR characteristics are:

Purpose

Indicates the Software Lock is not implemented.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBLSR is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBLSR are RES0.

Attributes

TRBLSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

Bits [2:1]

Reserved, RAZ.

Not thirty-two bit. Describes the size of the TRBLAR register.

This field reads-as-zero.

SLI, bit [0]

Indicates the Software Lock is not implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock is not implemented. Writes to the TRBLAR are ignored.
0b1	Software Lock is implemented.

Access to this field is RAZ/WI.

Accessing TRBLSR

TRBLSR can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFB4	TRBLSR

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

Purpose

Controls Trace Buffer Unit accesses to memory.

Configuration

External register TRBMAR_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBMAR_EL1[63:0].

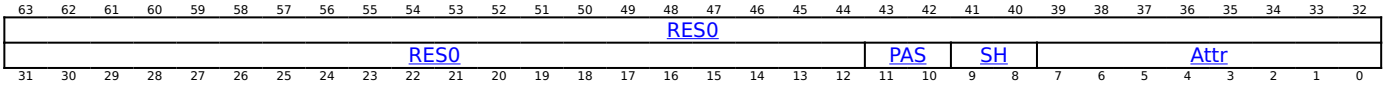
TRBMAR_EL1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBMAR_EL1 are RES0.

Attributes

TRBMAR_EL1 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

PAS, bits [11:10]

Physical address specifier. Defines the PAS attribute for memory addressed by the buffer in External mode.

PAS	Meaning	Applies when
0b00	Secure.	When FEAT_Secure is implemented
0b01	Non-secure.	
0b10	Root.	When FEAT_RME is implemented
0b11	Realm.	When FEAT_RME is implemented

All other values are reserved.

If the Trace Buffer Unit is using external mode and either TRBMAR_EL1.PAS is set to a reserved value, or the IMPLEMENTATION DEFINED authentication interface prohibits invasive debug of the Security state corresponding to the physical address space selected by TRBMAR_EL1.PAS, then when the Trace Buffer Unit receives trace data from the trace unit, it does not write the trace data to memory and generates a trace buffer management event. That is, if any of the following apply:

- ExternalInvasiveDebugEnabled() == FALSE.
- TRBMAR_EL1.PAS is 0b00, and either ExternalSecureInvasiveDebugEnabled() == FALSE or Secure state is not implemented.
- TRBMAR_EL1.PAS is 0b10, and either ExternalRootInvasiveDebugEnabled() == FALSE or FEAT_RME is not implemented.
- TRBMAR_EL1.PAS is 0b11, and either ExternalRealmInvasiveDebugEnabled() == FALSE or FEAT_RME is not implemented.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SH, bits [9:8]

Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when TRBMAR_EL1.Attr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Attr, bits [7:0]

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the trace buffer.

The encoding of this field is the same as that of a MAIR_ELx.Attr<n> field, as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBMAR_EL1

The PE might ignore a write to TRBMAR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1 and the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1 and the Trace Buffer Unit is using External mode.

TRBMAR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x028	TRBMAR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRBMPAM_EL1, Trace Buffer MPAM Configuration Register

The TRBMPAM_EL1 characteristics are:

Purpose

Defines the PARTID, PMG, and MPAM_SP values used by the trace buffer unit in external mode.

Configuration

External register TRBMPAM_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBMPAM_EL1[63:0].

TRBMPAM_EL1 is in the Core power domain.

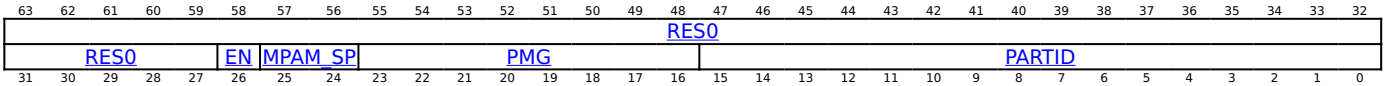
This register is present only when FEAT_TRBE_EXT is implemented and FEAT_TRBE_MPAM is implemented. Otherwise, direct accesses to TRBMPAM_EL1 are RES0.

Attributes

TRBMPAM_EL1 is a 64-bit register.

Field descriptions

When FEAT_MPAM is implemented:



Bits [63:27]

Reserved, RES0.

EN, bit [26]

Enable. Enables use of non-default MPAM values.

EN	Meaning
0b0	Use default MPAM values.
0b1	Use TRBMPAM_EL1.{PARTID, PMG, MPAM_SP}.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

MPAM_SP, bits [25:24]

Partition Identifier space. Selects the PARTID space.

MPAM_SP	Meaning	Applies when
0b00	PARTID is in the Secure PARTID space.	When FEAT_Secure is implemented
0b01	PARTID is in the Non-secure PARTID space.	
0b10	PARTID is in the Root PARTID space.	When FEAT_RME is implemented
0b11	PARTID is in the Realm PARTID space.	When FEAT_RME is implemented

If the Trace Buffer Unit is using external mode and either TRBMPAM_EL1.MPAM_SP is set to reserved value, or the IMPLEMENTATION DEFINED authentication interface prohibits invasive debug of the Security state corresponding to the Partition Identifier space selected by TRBMPAM_EL1.MPAM_SP, then when the Trace Buffer Unit receives trace data from the trace unit, it does not write the trace data to memory and generates a trace buffer management event.

The interface prohibits invasive debug of the Security state if any of the following apply:

- ExternalInvasiveDebugEnabled() == FALSE.
- Secure state is implemented, ExternalSecureInvasiveDebugEnabled() == FALSE and TRBMPAM_EL1.MPAM_SP is 0b00.
- FEAT_RME is implemented, ExternalRootInvasiveDebugEnabled() == FALSE, and TRBMPAM_EL1.MPAM_SP is 0b10.
- FEAT_RME is implemented, ExternalRealmInvasiveDebugEnabled() == FALSE, and TRBMPAM_EL1.MPAM_SP is 0b11.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PMG, bits [23:16]

Performance Monitoring Group. Selects the PMG.

Only sufficient low-order bits are required to represent the TRBDEVID1.PMG_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition Identifier. Selects the PARTID.

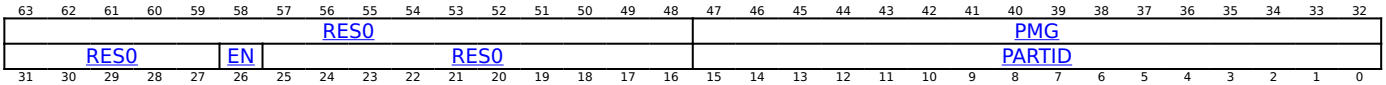
Only sufficient low-order bits are required to represent the TRBDEVID1.PARTID_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_MPAMv2 is implemented:



Bits [63:48]

Reserved, RES0.

PMG, bits [47:32]

Performance Monitoring Group. Selects the PMG.

Only sufficient low-order bits are required to represent the TRBDEVID1.PMG_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:27]

Reserved, RES0.

EN, bit [26]

Enable. Enables use of non-default MPAM values.

EN	Meaning
0b0	Use default MPAM values.
0b1	Use TRBMPAM_EL1.{PARTID, PMG}.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Bits [25:16]

Reserved, RES0.

PARTID, bits [15:0]

Partition Identifier. Selects the PARTID.

Only sufficient low-order bits are required to represent the TRBDEVID1.PARTID_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBMPAM_EL1

The PE might ignore a write to TRBMPAM_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1 and the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1 and the Trace Buffer Unit is using External mode.

TRBMPAM_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x040	TRBMPAM_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR0, Peripheral Identification Register 0

The TRBPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR0 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR0 are RES0.

Attributes

TRBPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - TRBPIDR1.PART_1 contains part number bits [11:8].
  - TRBPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - TRBPIDR1.PART_1 contains part number bits [15:12].
  - TRBPIDR0.PART_0 contains part number bits [11:4].
  - TRBPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, TRBPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRBPIDR0

TRBPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFE0	TRBPIDR0

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR1, Peripheral Identification Register 1

The TRBPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR1 are RES0.

Attributes

TRBPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- TRBPIDR1.DES_0: JEP106 identification code bits[3:0].
- TRBPIDR2.DES_1: JEP106 identification code bits[6:4].
- TRBPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - TRBPIDR1.PART_1 contains part number bits [11:8].
  - TRBPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - TRBPIDR1.PART_1 contains part number bits [15:12].
  - TRBPIDR0.PART_0 contains part number bits [11:4].
  - TRBPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, TRBPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRBPIDR1

TRBPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFE4	TRBPIDR1

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR2, Peripheral Identification Register 2

The TRBPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR2 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR2 are RES0.

Attributes

TRBPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- TRBPIDR2.REVISION indicates the 4-bit revision number.
- TRBPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- TRBPIDR2.REVISION indicates the 4-bit major revision number.
- TRBPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- TRBPIDR2.REVISION contains part number bits [3:0].
- TRBPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- TRBPIDR1.DES_0: JEP106 identification code bits[3:0].
- TRBPIDR2.DES_1: JEP106 identification code bits[6:4].
- TRBPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRBPIDR2

TRBPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFE8	TRBPIDR2

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR3, Peripheral Identification Register 3

The TRBPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR3 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR3 are RES0.

Attributes

TRBPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- TRBPIDR2.REVISION indicates the 4-bit revision number.
- TRBPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- TRBPIDR2.REVISION indicates the 4-bit major revision number.
- TRBPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- TRBPIDR2.REVISION contains part number bits [3:0].
- TRBPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

TRBPIDR3.CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

TRBPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRBPIDR3

TRBPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFEC	TRBPIDR3

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR4, Peripheral Identification Register 4

The TRBPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR4 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR4 are RES0.

Attributes

TRBPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIZE	Meaning
0b0000	One of the following is true: • The component uses a single 4KB block. • The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.
0b0001..0b1111	The component occupies $2^{\text{TRBPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- TRBPIDR1.DES_0: JEP106 identification code bits[3:0].
- TRBPIDR2.DES_1: JEP106 identification code bits[6:4].
- TRBPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRBPIDR4

TRBPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFD0	TRBPIDR4

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR5, Peripheral Identification Register 5

The TRBPIDR5 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR5 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR5 are RES0.

Attributes

TRBPIDR5 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRBPIDR5

TRBPIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFD4	TRBPIDR5

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR6, Peripheral Identification Register 6

The TRBPIDR6 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR6 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR6 are RES0.

Attributes

TRBPIDR6 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRBPIDR6

TRBPIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFD8	TRBPIDR6

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPIDR7, Peripheral Identification Register 7

The TRBPIDR7 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

TRBPIDR7 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPIDR7 are RES0.

Attributes

TRBPIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRBPIDR7

TRBPIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0xFDC	TRBPIDR7

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRBPTR_EL1, Trace Buffer Write Pointer Register

The TRBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the trace buffer.

Configuration

External register TRBPTR_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBPTR_EL1[63:0].

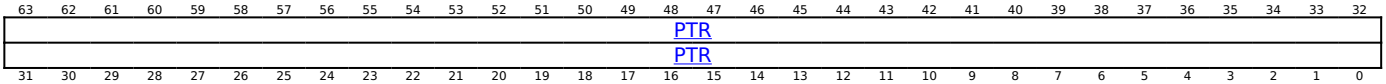
TRBPTR_EL1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBPTR_EL1 are RES0.

Attributes

TRBPTR_EL1 is a 64-bit register.

Field descriptions



PTR, bits [63:0]

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

If TRBIDR_EL1.Align is not zero, then it is IMPLEMENTATION DEFINED whether bits [M-1:0] are RES0 or read/write, where M is an integer between 1 and TRBIDR_EL1.Align inclusive.

The architecture places restrictions on the values that software can write to the pointer. For more information see 'Restrictions on Programming the Trace Buffer Unit'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBPTR_EL1

The PE might ignore a write to TRBPTR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1 and the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1 and the Trace Buffer Unit is using External mode.

TRBPTR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x008	TRBPTR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRBSR_EL1, Trace Buffer Status/syndrome Register

The TRBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

External register TRBSR_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBSR_EL1[63:0].

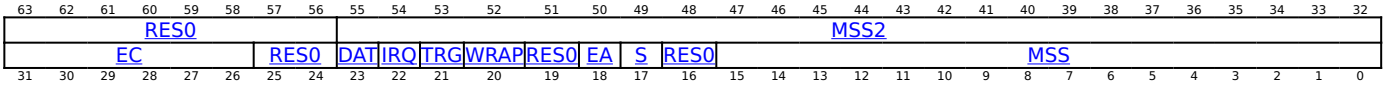
TRBSR_EL1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBSR_EL1 are RES0.

Attributes

TRBSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

MSS2 encoding for other trace buffer management events

Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

DPOIndex, bits [23:17]
When FEAT_S1POE2 is implemented:

DPOIndex for the fault.

For a stage 1 Permission fault, if FEAT_S1POE2 is implemented and MSS2.Overlay is 1, this field reports the POIndex from the translation for the access that generated the fault.

Otherwise:

Reserved, RES0.

OverlayFetch, bit [16]
When FEAT_S1POE2 is implemented:

Fetch of POE2 table.

OverlayFetch	Meaning
0b0	Fault was not generated on a fetch of IRT or DPOT information.
0b1	Fault was generated on a fetch of IRT or DPOT information.

Otherwise:

Reserved, RES0.

Bits [15:9]

Reserved, RES0.

TopLevel, bit [8]
When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented, TRBSR_EL1.EC == '100101', and GetTRBSR_EL1_FSC() IN {'0011xx'}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL1_FSC() IN {'0011xx'}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL1_FSC() IN {'0011xx'}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

MSS2 encoding for Granule Protection Check faults on write to trace buffer

Bits [23:0]

Reserved, RES0.

MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for other trace buffer management events	MSS2 encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to trace buffer	MSS2 encoding for Granule Protection Check faults on write to trace buffer	When FEAT_RME is implemented
0b011111	Trace buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:24]

Reserved, RES0.

DAT, bit [23]
When FEAT_TRBE_EXT is implemented:

Data. Indicates when the Trace Buffer Unit has trace data that has not yet been written to memory.

DAT	Meaning
0b0	Internal buffers are empty. All Trace operations Accepted by the Trace Buffer Unit will Complete in finite time.
0b1	Internal buffers are not empty.

When TRBSR_EL1.{DAT, S} is {0, 1}, meaning Collection is stopped and the Trace Buffer Unit internal buffers are empty, then all trace data has been written to memory. An additional Data Synchronization Barrier may be required to ensure that the writes are Complete. When TRBSR_EL1.DAT is 0 and Collection is not stopped, there may still be trace data held by the trace unit that the Trace Buffer Unit has not Accepted.

That is, TRBSR_EL1.DAT reads as 1 when the Trace Buffer Unit has Accepted trace data from the trace unit, but has not yet written it to memory.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IRQ, bit [22]

Maintenance status. Indicates that a trace buffer management event has been recorded.

IRQ	Meaning
0b0	No trace buffer management event for EL1 has been recorded.
0b1	A trace buffer management event for EL1 has been recorded.

When FEAT_TRBE_EXC is implemented, this field indicates a management event for EL1.

If FEAT_TRBE_EXC is implemented and the TRBE Profiling exception for EL1 is enabled, then when this field is 1, a TRBE Profiling exception for EL1 is pending

If FEAT_TRBE_EXC is not implemented or the TRBE Profiling exception for EL1 is disabled, then this field drives the TRBIRQ trace buffer interrupt request signal.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]
When the PE sets this bit as the result of an External abort:

External Abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Trace Buffer Unit.

It is IMPLEMENTATION DEFINED whether this field is set to 1 or is unchanged by the PE when a write by the Trace Buffer Unit generates an External abort on a translation table walk, translation table update, or GPT walk that is reported as an MMU fault. From Armv9.3, this field is not set to 1 by the PE for any other trace buffer management event.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the trace buffer management event.

The syndrome contents for each trace buffer management event are described in the following sections.

MSS encoding for other trace buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Trace buffer status code

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.
0b000100	Buffer size. The requested trace buffer size was too large.

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	

0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110010	PLB conflict abort.	When FEAT_S1POE2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to trace buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing TRBSR_EL1

The PE might ignore a write to TRBSR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1 and the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1 and the Trace Buffer Unit is using External mode.

TRBSR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x018	TRBSR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

Purpose

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

Configuration

External register TRBTRG_EL1 bits [63:0] are architecturally mapped to AArch64 System register TRBTRG_EL1[63:0].

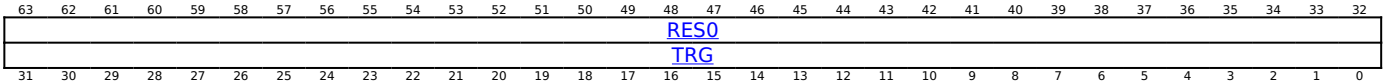
TRBTRG_EL1 is in the Core power domain.

This register is present only when FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to TRBTRG_EL1 are RES0.

Attributes

TRBTRG_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TRG, bits [31:0]

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is 1.

The architecture places restrictions on the values that software can write to the counter.

Note

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBTRG_EL1

The PE might ignore a write to TRBTRG_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1 and the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1 and the Trace Buffer Unit is using External mode.

TRBTRG_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
TRBE	0x020	TRBTRG_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalTraceBufferAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCACATR<n>, Trace Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

Purpose

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

Configuration

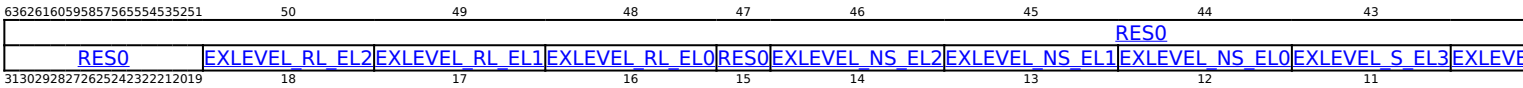
External register TRCACATR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCACATR<n>[63:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACATR<n> are RES0.

Attributes

TRCACATR<n> is a 64-bit register.

Field descriptions



Bits [63:19]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [18]
When FEAT_RME is implemented:

Realm EL2 address comparison control. Controls whether a comparison can occur at EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator performs comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator does not perform comparisons in Realm EL2.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator does not perform comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator performs comparisons in Realm EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [17]
When FEAT_RME is implemented:

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]
When FEAT_RME is implemented:

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]
When Non-secure EL2 is implemented:

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL2.
0b1	The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]
When Non-secure EL1 is implemented:

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL1.
0b1	The Address Comparator does not perform comparisons in Non-secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]
When Non-secure EL0 is implemented:

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL0.
0b1	The Address Comparator does not perform comparisons in Non-secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]
When EL3 is implemented:

EL3 address comparison control. Controls whether a comparison can occur at EL3.

EXLEVEL_S_EL3	Meaning
0b0	The Address Comparator performs comparisons at EL3.
0b1	The Address Comparator does not perform comparisons at EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]
When Secure EL2 is implemented:

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The Address Comparator performs comparisons in Secure EL2.
0b1	The Address Comparator does not perform comparisons in Secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]
When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The Address Comparator performs comparisons in Secure EL1.
0b1	The Address Comparator does not perform comparisons in Secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]
When Secure EL0 is implemented:

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

EXLEVEL_S_EL0	Meaning
0b0	The Address Comparator performs comparisons in Secure EL0.
0b1	The Address Comparator does not perform comparisons in Secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]
When TRCIDR4.NUMCIDC != '0000' or TRCIDR4.NUMVMIDC != '0000':

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

CONTEXT	Meaning	Applies when
0b000	Comparator 0.	
0b001	Comparator 1.	When UInt(TRCIDR4.NUMCIDC) > 1 or UInt(TRCIDR4.NUMVMIDC) > 1
0b010	Comparator 2.	When UInt(TRCIDR4.NUMCIDC) > 2 or UInt(TRCIDR4.NUMVMIDC) > 2
0b011	Comparator 3.	When UInt(TRCIDR4.NUMCIDC) > 3 or UInt(TRCIDR4.NUMVMIDC) > 3
0b100	Comparator 4.	When UInt(TRCIDR4.NUMCIDC) > 4 or UInt(TRCIDR4.NUMVMIDC) > 4
0b101	Comparator 5.	When UInt(TRCIDR4.NUMCIDC) > 5 or UInt(TRCIDR4.NUMVMIDC) > 5
0b110	Comparator 6.	When UInt(TRCIDR4.NUMCIDC) > 6 or UInt(TRCIDR4.NUMVMIDC) > 6
0b111	Comparator 7.	When UInt(TRCIDR4.NUMCIDC) > 7 or UInt(TRCIDR4.NUMVMIDC) > 7

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]
When TRCIDR4.NUMCIDC != '0000' or TRCIDR4.NUMVMIDC != '0000':

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

CONTEXTTYPE	Meaning	Applies when
0b00	The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.	
0b01	The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMCIDC != '0000'
0b10	The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMVMIDC != '0000'
0b11	The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.	When TRCIDR4.NUMCIDC != '0000' and TRCIDR4.NUMVMIDC != '0000'

If TRCIDR4.NUMCIDC == 0b0000, then bit [2] is RES0.

If TRCIDR4.NUMVMIDC == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing TRCACATR<n>

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 1.
- TRCVIIECTLR.EXCLUDE[n/2] == 1.
- TRCVIIECTLR.INCLUDE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
- TRCVISSCTLR.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- TRCQCTLR.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCACATR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x480 + (8 * n)	TRCACATR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCACVR<n>, Trace Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

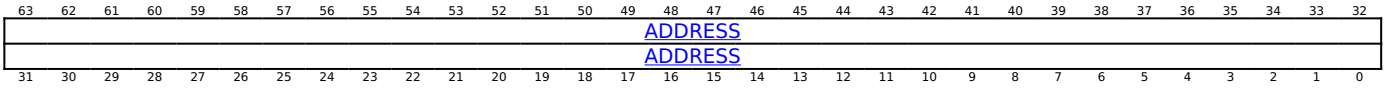
External register TRCACVR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCACVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACVR<n> are RES0.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in TRCACVR<n>.ADDRESS. This requires that the trace analyzer always programs all implemented bits of TRCACVR<n>.ADDRESS.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 1.
- TRCVIIECTLR.EXCLUDE[n/2] == 1.
- TRCVIIECTLR.INCLUDE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
- TRCVISSCTLR.STOP[n] == 1.
- TRCSSCCR<a>.ARC[n/2] == 1.
- TRCSSCCR<a>.SAC[n] == 1.
- TRCQCTLR.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCACVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x400 + (8 * n)	TRCACVR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCAUTHSTATUS, Trace Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCAUTHSTATUS bits [31:0] are architecturally mapped to AArch64 System register TRCAUTHSTATUS[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are RES0.

Attributes

TRCAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

HNID	Meaning
0b00	Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

HID	Meaning
0b00	Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

SNID	Meaning
0b00	Secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When Secure state is implemented, this field reads as 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When Secure state is not implemented, this field reads as 0b00.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

SID	Meaning
0b00	Secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

NSNID	Meaning
0b00	Non-secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When Non-secure state is implemented, this field reads as 0b11.

When Non-secure state is not implemented, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

NSID	Meaning
0b00	Non-secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

External debugger accesses to this register are unaffected by the OS Lock.

TRCAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB8	TRCAUTHSTATUS

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCAUXCTLR, Trace Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose

The function of this register is IMPLEMENTATION DEFINED.

Configuration

External register TRCAUXCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCAUXCTLR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCAUXCTLR are RES0.

Attributes

TRCAUXCTLR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to the expression `0x00000000`.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

TRCAUXCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x018	TRCAUXCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCBBCTLR, Trace Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

External register TRCBBCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCBBCTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, TRCIDR0.TRCBB == '1', and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCBBCTLR are RES0.

Attributes

TRCBBCTLR is a 32-bit register.

Field descriptions

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Mode.

MODE	Meaning
0b0	Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions.
0b1	Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Selects whether Address Range Comparator <m> is used with branch broadcasting.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCBBCTLR

Must be programmed if TRCCONFIGR.BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCBBCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x03C	TRCBBCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCCCTLR, Trace Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose

Set the threshold value for cycle counting.

Configuration

External register TRCCCCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCCCCTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR0.TRCCCI == '1'. Otherwise, direct accesses to TRCCCCTLR are RES0.

Attributes

TRCCCCTLR is a 32-bit register.

Field descriptions

Bits [31:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCCONFIGR.CCI enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if TRCCONFIGR.CCI == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCCCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x038	TRCCCCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCIDCCTLR0, Trace Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

Purpose

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 0 to 3.

Configuration

External register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to AArch64 System register TRCCIDCCTLR0[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, UInt(TRCIDR4.NUMCIDC) > 0x0, and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTLR0 are RES0.

Attributes

TRCCIDCCTLR0 is a 32-bit register.

Field descriptions

COMP3[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR0

If software uses the TRCCIDCVR<n> registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTLR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x680	TRCCIDCCTLR0

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCIDCCTLR1, Trace Context Identifier Comparator Control Register 1

The TRCCIDCCTLR1 characteristics are:

Purpose

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 4 to 7.

Configuration

External register TRCCIDCCTLR1 bits [31:0] are architecturally mapped to AArch64 System register TRCCIDCCTLR1[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, UInt(TRCIDR4.NUMCIDC) > 0x4, and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTLR1 are RES0.

Attributes

TRCCIDCCTLR1 is a 32-bit register.

Field descriptions

COMP7[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 7:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR1

If software uses the TRCCIDCVR<n> registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCCTLR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x684	TRCCIDCCTLR1

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCIDCVR<n>, Trace Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

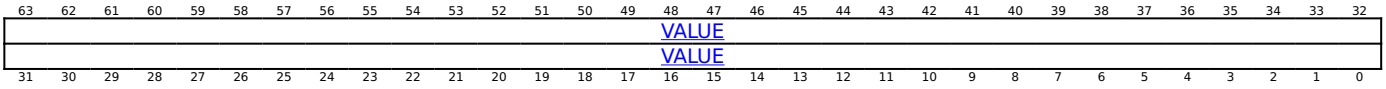
External register TRCCIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCCIDCVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMCIDC) > n. Otherwise, direct accesses to TRCCIDCVR<n> are RES0.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions



VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- TRCRSCTLR<a>.GROUP == 0b0110 and TRCRSCTLR<a>.CID[n] == 1.
- TRCACATR<a>.CONTEXTTYPE == 0b01 or 0b11 and TRCACATR<a>.CONTEXT == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCIDCVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x600 + (8 * n)	TRCCIDCVR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCIDR0, Trace Component Identification Register 0

The TRCCIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCIDR0 are RES0.

Attributes

TRCCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Reads as 0x0D.

Access to this field is RO.

Accessing TRCCIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFF0	TRCCIDR0

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCCIDR1, Trace Component Identification Register 1

The TRCCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCIDR1 are RES0.

Attributes

TRCCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight peripheral.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is RO.

Accessing TRCCIDR1

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFF4	TRCCIDR1

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCCIDR2, Trace Component Identification Register 2

The TRCCIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCIDR2 are RES0.

Attributes

TRCCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.

Reads as 0x05.

Access to this field is RO.

Accessing TRCCIDR2

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFF8	TRCCIDR2

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCCIDR3, Trace Component Identification Register 3

The TRCCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCIDR3 are RES0.

Attributes

TRCCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as 0xB1.

Access to this field is RO.

Accessing TRCCIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFFC	TRCCIDR3

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCCLAIMCLR, Trace Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

Purpose

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMCLR[31:0].

External register TRCCLAIMCLR bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMSET[31:0].

External register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCLAIMCLR are RES0.

Attributes

TRCCLAIMCLR is a 32-bit register.

Field descriptions

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLR[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Accessing this field has the following behavior:

- When m >= NUM_TRC_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing TRCCLAIMCLR

TRCCLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFA4	TRCCLAIMCLR

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCLAIMSET, Trace Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMSET[31:0].

External register TRCCLAIMSET bits [31:0] are architecturally mapped to AArch64 System register TRCCLAIMCLR[31:0].

External register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCLAIMSET are RES0.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 32-bit register.

Field descriptions

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

SET[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

Accessing this field has the following behavior:

- When m >= NUM_TRC_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is RAO/W1S.

Accessing TRCCLAIMSET

TRCCLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFA0	TRCCLAIMSET

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCNTCTLR<n>, Trace Counter Control Register <n>, n = 0 - 3

The TRCCNTCTLR<n> characteristics are:

Purpose

Controls the operation of Counter <n>.

Configuration

External register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTCTLR<n> are RES0.

Attributes

TRCCNTCTLR<n> is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

CNTCHAIN, bit [17]
When n is odd:

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

CNTCHAIN	Meaning
0b0	The Counter does not decrement when a reload event for Counter <n-1> occurs.
0b1	Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

RLDSELF	Meaning
0b0	Normal mode. The Counter is in Normal mode.
0b1	Self-reload mode. The Counter is in Self-reload mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Selects an event, that when it occurs causes a reload event for Counter <n>

Chooses the type of Resource Selector.

RLDEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Selects an event, that when it occurs causes a reload event for Counter <n>

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Selects an event, that when it occurs causes Counter <n> to decrement.

Chooses the type of Resource Selector.

CNTEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Selects an event, that when it occurs causes Counter <n> to decrement.

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTCTLR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTCTLR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x150 + (4 * n)	TRCCNTCTLR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCNTRLDVR<n>, Trace Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

External register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTRLDVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are RES0.

Attributes

TRCCNTRLDVR<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCNTRLDVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x140 + (4 * n)	TRCCNTRLDVR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCNTVR<n>, Trace Counter Value Register <n>, n = 0 - 3

The TRCCNTVR<n> characteristics are:

Purpose

This sets or returns the value of Counter <n>.

Configuration

External register TRCCNTVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCCNTVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTVR<n> are RES0.

Attributes

TRCCNTVR<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the count value of Counter.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCCNTVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x160 + (4 * n)	TRCCNTVR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

External register TRCCONFIGR bits [31:0] are architecturally mapped to AArch64 System register TRCCONFIGR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCCONFIGR are RES0.

Attributes

TRCCONFIGR is a 32-bit register.

Field descriptions

Bits [31:19]

Reserved, RES0.

ITO, bit [18]
When TRCIDR0.ITE == '1':

Instrumentation Trace Override.

ITO	Meaning
0b0	Instrumentation Trace Override disabled.
0b1	Instrumentation Trace Override enabled.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [17:16]

Reserved, RES0.

VMIDOPT, bit [15]
When TRCIDR2.VMIDOPT == '01':

Virtual context identifier selection control.

VMIDOPT	Meaning
0b0	VTTBR_EL2.VMID is used as the Virtual context identifier.
0b1	CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == '00':

Reserved, RES0.

Virtual context identifier selection control.

VTTBR_EL2.VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == '10':

Reserved, RES1.

Virtual context identifier selection control.

CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]
When TRCIDR0.QSUPP == '01':

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled. Q elements without instruction counts are disabled.

All other values are reserved.

When TRCIDR0.QSUPP == '10':

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b11	Q elements with instruction counts are enabled. Q elements without instruction counts are enabled.

All other values are reserved.

When TRCIDR0.QSUPP == '11':

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled. Q elements without instruction counts are disabled.
0b11	Q elements with instruction counts are enabled. Q elements without instruction counts are enabled.

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]
When TRCIDR0.RETSTACK == '1':

Return stack control.

RS	Meaning
0b0	Return stack is disabled.
0b1	Return stack is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]
When TRCIDR0.TSSIZE != '00000':

Global timestamp tracing control.

TS	Meaning
0b0	Global timestamp tracing is disabled.
0b1	Global timestamp tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]
When TRCIDR2.VMIDSIZE != '00000':

Virtual context identifier tracing control.

VMID	Meaning
0b0	Virtual context identifier tracing is disabled.
0b1	Virtual context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]
When TRCIDR2.CIDSIZE != '00000':

Context identifier tracing control.

CID	Meaning
0b0	Context identifier tracing is disabled.
0b1	Context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]
When TRCIDR0.TRCCCI == '1':

Cycle counting instruction tracing control.

CCI	Meaning
0b0	Cycle counting instruction tracing is disabled.
0b1	Cycle counting instruction tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]
When TRCIDR0.TRCBB == '1':

Branch broadcasting control.

BB	Meaning
0b0	Branch broadcasting is disabled.
0b1	Branch broadcasting is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCCONFIGR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x010	TRCCONFIGR

Accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered(), or !AllowExternalTraceAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCDEVAFF, Trace Device Affinity Register

The TRCDEVAFF characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

Reads the same value as the MPIDR_EL1 register for the PE that this trace unit has affinity with.

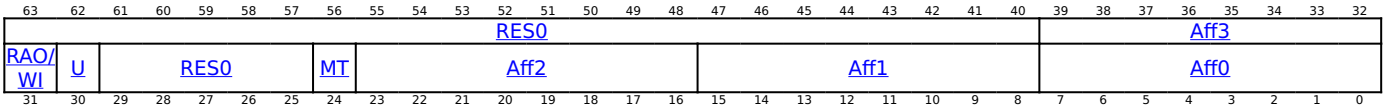
Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVAFF are RES0.

Attributes

TRCDEVAFF is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCDEVAFF

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVAFF can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFA8	TRCDEVAFF

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCDEVARCH, Trace Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVARCH bits [31:0] are architecturally mapped to AArch64 System register TRCDEVARCH[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVARCH are RES0.

Attributes

TRCDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architect of the component. For Trace, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the TRCDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
0b0000	ETEv1.0, FEAT_ETE.
0b0001	ETEv1.1, FEAT_ETEv1p1.
0b0010	ETEv1.2, FEAT_ETEv1p2.
0b0011	ETEv1.3, FEAT_ETEv1p3.

All other values are reserved.

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0101	ETEv1.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA13	Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

Access to this field is RO.

Accessing TRCDEVARCH

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFBC	TRCDEVARCH

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCDEVID, Trace Device Configuration Register

The TRCDEVID characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

External register TRCDEVID bits [31:0] are architecturally mapped to AArch64 System register TRCDEVID[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVID are RES0.

Attributes

TRCDEVID is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFC8	TRCDEVID

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCDEVID1, Trace Device Configuration Register 1

The TRCDEVID1 characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVID1 are RES0.

Attributes

TRCDEVID1 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID1

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFC4	TRCDEVID1

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCDEVID2, Trace Device Configuration Register 2

The TRCDEVID2 characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVID2 are RES0.

Attributes

TRCDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCDEVID2

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFC0	TRCDEVID2

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCDEVTYPE, Trace Device Type Register

The TRCDEVTYPE characteristics are:

Purpose

Provides discovery information for the component. If the part number field is not recognized, a debugger can report the information that is provided by TRCDEVTYPE about the component instead.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCDEVTYPE are RES0.

Attributes

TRCDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Component sub-type.

SUB	Meaning
0b0001	When MAJOR == 0x3 (Trace source): Associated with a PE.

This field reads as 0x1.

Access to this field is RO.

MAJOR, bits [3:0]

Component major type.

MAJOR	Meaning
0b0011	Trace source.

Other values are defined by the CoreSight Architecture.

This field reads as 0x3.

Access to this field is RO.

Accessing TRCDEVTYPE

External debugger accesses to this register are unaffected by the OS Lock.

TRCDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFCC	TRCDEVTYPE

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

TRCEVENTCTL0R, Trace Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

External register TRCEVENTCTL0R bits [31:0] are architecturally mapped to AArch64 System register TRCEVENTCTL0R[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR4.NUMRSPAIR != '0000'. Otherwise, direct accesses to TRCEVENTCTL0R are RES0.

Attributes

TRCEVENTCTL0R is a 32-bit register.

Field descriptions

EVENT3_TYPE, bit [31]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 3:

Chooses the type of Resource Selector.

EVENT3_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 3:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 2:

Chooses the type of Resource Selector.

EVENT2_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 2:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 1:

Chooses the type of Resource Selector.

EVENT1_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 1:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != '0000':

Chooses the type of Resource Selector.

EVENT0_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]
When TRCIDR4.NUMRSPAIR != '0000':

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCEVENTCTL0R

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL0R can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x020	TRCEVENTCTL0R

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCEVENTCTL1R, Trace Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

Configuration

External register TRCEVENTCTL1R bits [31:0] are architecturally mapped to AArch64 System register TRCEVENTCTL1R[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are RES0.

Attributes

TRCEVENTCTL1R is a 32-bit register.

Field descriptions

Bits [31:14]

Reserved, RES0.

OE, bit [13]
When TRCIDR5.OE == '1':

ETE Trace Output Enable control.

OE	Meaning
0b0	Trace output to any IMPLEMENTATION DEFINED trace output interface is disabled.
0b1	Trace output to any IMPLEMENTATION DEFINED trace output interface is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

LPOVERRIDE, bit [12]
When TRCIDR5.LPOVERRIDE == '1':

Low-power Override Mode select.

LPOVERRIDE	Meaning
0b0	Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.
0b1	Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

Otherwise:

Reserved, RES0.

ATB, bit [11]
When TRCIDR5.ATBTRIG == '1':

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

ATB	Meaning
0b0	ATB trigger is disabled.
0b1	ATB trigger is enabled.

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

INSTEN[<m>]	Meaning
0b0	The trace unit does not generate an Event element <m>.
0b1	The trace unit generates an Event element <m> when ETEEvent <m> occurs.

Accessing this field has the following behavior:

- When TRCIDR4.NUMRSPAIR == '0000', access to this field is RES0 .
- Access to this field is RES0 if all the following are true:
  - TRCIDR4.NUMRSPAIR != '0000'.
  - m > UInt(TRCIDR0.NUMEVENT).
- Otherwise, access to this field is RW.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEVENTCTL1R can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x024	TRCEVENTCTL1R

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCEXTINSELR<n>, Trace External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELR is an alias of TRCEXTINSELR0.

Configuration

External register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCEXTINSELR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR5.NUMEXTINSEL) > n. Otherwise, direct accesses to TRCEXTINSELR<n> are RES0.

Attributes

TRCEXTINSELR<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSELR<n>

Must be programmed if any of the following is true: TRCRSCTLR<a>.GROUP == 0b0000 and TRCRSCTLR<a>.EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCEXTINSELR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x120 + (4 * n)	TRCEXTINSELR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR0, Trace ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR0 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR0[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR0 are RES0.

Attributes

TRCIDR0 is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

The value of this field is an IMPLEMENTATION DEFINED choice of:

COMMTRANS	Meaning
0b0	Transaction Start elements are P0 elements.
0b1	Transaction Start elements are not P0 elements.

Access to this field is RO.

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

COMMOPT	Meaning
0b0	Commit mode 0.
0b1	Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- Access to this field is RAO/WI if all the following are true:
  - TRCIDR0.TRCCCI == '1'.
  - UInt(TRCIDR8.MAXSPEC) == 0x0.
- When TRCIDR0.TRCCCI == '0', access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TSSIZE	Meaning
0b00000	Global timestamping not implemented.
0b01000	Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b01000.

Access to this field is RO.

TSMARK, bit [23]

Indicates whether Timestamp Marker elements are generated.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TSMARK	Meaning
0b0	Timestamp Marker elements are not generated.
0b1	Timestamp Marker elements are generated.

Access to this field is RO.

ITE, bit [22]

Indicates whether Instrumentation Trace is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ITE	Meaning
0b0	Instrumentation Trace not implemented.
0b1	Instrumentation Trace implemented.

This field has the value 1 if FEAT_ITE is implemented.

Access to this field is RO.

Bits [21:18]

Reserved, RES0.

TRCEXDATA, bit [17]
When TRCIDR0.TRCDATA != '00':

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCEXDATA	Meaning
0b0	Tracing of data transfers for exceptions and exception returns not implemented.
0b1	Tracing of data transfers for exceptions and exception returns implemented.

Access to this field is RO.

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

QSUPP	Meaning
0b00	Q element support is not implemented.
0b01	Q element support is implemented, and only supports Q elements with instruction counts.
0b10	Q element support is implemented, and only supports Q elements without instruction counts.
0b11	Q element support is implemented, and supports: • Q elements with instruction counts. • Q elements without instruction counts.

Access to this field is RO.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

The value of this field is an IMPLEMENTATION DEFINED choice of:

QFILT	Meaning
0b0	Q element filtering is not implemented.
0b1	Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.

Access to this field is RO.

CONDTYPE, bits [13:12]
When TRCIDR0.TRCCOND == '1':

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CONDTYPE	Meaning
0b00	Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01	Conditional instructions are traced with an indication of the APSR condition flags.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]
When TRCIDR4.NUMRSPAIR == '0000':

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 0 ETEEvents.

All other values are reserved.

Access to this field is RO.

When TRCIDR4.NUMRSPAIR != '0000':

Indicates the number of ETEEvents implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMEVENT	Meaning
0b00	The trace unit supports 1 ETEEvent.
0b01	The trace unit supports 2 ETEEvents.
0b10	The trace unit supports 3 ETEEvents.
0b11	The trace unit supports 4 ETEEvents.

Access to this field is RO.

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RETSTACK	Meaning
0b0	Return stack not implemented.
0b1	Return stack implemented.

Access to this field is RO.

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCCCI	Meaning
0b0	Cycle counting not implemented.
0b1	Cycle counting implemented.

This field reads as 1.

Access to this field is RO.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCCOND	Meaning
0b0	Conditional instruction tracing not implemented.
0b1	Conditional instruction tracing implemented.

This field reads as 0.

Access to this field is RO.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCBB	Meaning
0b0	Branch broadcasting not implemented.
0b1	Branch broadcasting implemented.

This field reads as 1.

Access to this field is RO.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCDATA	Meaning
0b00	Data tracing not implemented.
0b11	Data tracing implemented.

All other values are reserved.

This field reads as 0b00.

Access to this field is RO.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INSTP0	Meaning
0b00	Load and store instructions are not P0 instructions.
0b11	Load and store instructions are P0 instructions.

All other values are reserved.

When FEAT_ETE is implemented, the only permitted value is 0b00.

Access to this field is RO.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

TRCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E0	TRCIDR0

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR1, Trace ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR1 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR1[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR1 are RES0.

Attributes

TRCIDR1 is a 32-bit register.

Field descriptions

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as MIDR_EL1.Implementer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

TRCARCHMAJ	Meaning
0b1111	If both TRCIDR1.TRCARCHMAJ and TRCIDR1.TRCARCHMIN == 0xF then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

Access to this field is RO.

TRCARCHMIN, bits [7:4]

Minor architecture version.

TRCARCHMIN	Meaning
0b1111	If both TRCIDR1.TRCARCHMAJ and TRCIDR1.TRCARCHMIN == 0xF then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

Access to this field is RO.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCIDR1

TRCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E4	TRCIDR1

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR10, Trace ID Register 10

The TRCIDR10 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR10 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR10[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR10 are RES0.

Attributes

TRCIDR10 is a 32-bit register.

Field descriptions

NUMP1KEY, bits [31:0]
When TRCIDR0.TRCDATA != '00':

Indicates the number of P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing TRCIDR10

TRCIDR10 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x188	TRCIDR10

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR11, Trace ID Register 11

The TRCIDR11 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR11 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR11[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR11 are RES0.

Attributes

TRCIDR11 is a 32-bit register.

Field descriptions

NUMP1SPC, bits [31:0]
When TRCIDR0.TRCDATA != '00':

Indicates the number of special P1 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing TRCIDR11

TRCIDR11 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x18C	TRCIDR11

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR12, Trace ID Register 12

The TRCIDR12 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR12 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR12[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR12 are RES0.

Attributes

TRCIDR12 is a 32-bit register.

Field descriptions

NUMCONDKEY, bits [31:0]
When TRCIDR0.TRCCOND == '1':

Indicates the number of conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing TRCIDR12

TRCIDR12 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x190	TRCIDR12

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR13, Trace ID Register 13

The TRCIDR13 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR13 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR13[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR13 are RES0.

Attributes

TRCIDR13 is a 32-bit register.

Field descriptions

NUMCONDSPC, bits [31:0]
When TRCIDR0.TRCCOND == '1':

Indicates the number of special conditional instruction right-hand keys. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing TRCIDR13

TRCIDR13 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x194	TRCIDR13

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR2, Trace ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR2 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR2[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR2 are RES0.

Attributes

TRCIDR2 is a 32-bit register.

Field descriptions

WFXMODE, bit [31]

Indicates whether WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions:

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFXMODE	Meaning
0b0	WFI, WFIT, WFE, and WFET instructions are not classified as P0 instructions.
0b1	WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions.

Access to this field is RO.

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDOPT	Meaning
0b00	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.
0b01	Virtual context identifier selection supported. TRCCONFIGR.VMIDOPT is implemented.
0b10	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b00000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b00000 then this field is 0b10.

Access to this field is RO.

CCSIZE, bits [28:25]
When TRCIDR0.TRCCCI == '1':

Indicates the size of the cycle counter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCSIZE	Meaning
0b0000	The cycle counter is 12 bits in length.
0b0001	The cycle counter is 13 bits in length.
0b0010	The cycle counter is 14 bits in length.
0b0011	The cycle counter is 15 bits in length.
0b0100	The cycle counter is 16 bits in length.
0b0101	The cycle counter is 17 bits in length.
0b0110	The cycle counter is 18 bits in length.
0b0111	The cycle counter is 19 bits in length.
0b1000	The cycle counter is 20 bits in length.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]
When TRCIDR0.TRCDATA != '00':

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DVSIZE	Meaning
0b00000	Data value tracing not implemented.
0b00100	Data value tracing has a maximum of 32-bit data values.
0b01000	Data value tracing has a maximum of 64-bit data values.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]
When TRCIDR0.TRCDATA != '00':

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DASIZE	Meaning
0b00000	Data address tracing not implemented.
0b00100	Data address tracing has a maximum of 32-bit data addresses.
0b01000	Data address tracing has a maximum of 64-bit data addresses.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDSIZE	Meaning
0b00000	Virtual context identifier tracing is not supported.
0b00001	8-bit Virtual context identifier size.
0b00010	16-bit Virtual context identifier size.
0b00100	32-bit Virtual context identifier size.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

Access to this field is RO.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CIDSIZE	Meaning
0b00000	Context identifier tracing is not supported.
0b00100	32-bit Context identifier size.

All other values are reserved.

This field reads as 0b00100.

Access to this field is RO.

IASIZE, bits [4:0]

Virtual instruction address size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IASIZE	Meaning
0b00100	Maximum of 32-bit instruction address size.
0b01000	Maximum of 64-bit instruction address size.

All other values are reserved.

This field reads as 0b01000.

Access to this field is RO.

Accessing TRCIDR2

TRCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1E8	TRCIDR2

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR3, Trace ID Register 3

The TRCIDR3 characteristics are:

Purpose

Returns the base architecture of the trace unit.

Configuration

External register TRCIDR3 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR3[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR3 are RES0.

Attributes

TRCIDR3 is a 32-bit register.

Field descriptions

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NOOVERFLOW	Meaning
0b0	Overflow prevention is not implemented.
0b1	Overflow prevention is implemented.

If TRCIDR3.STALLCTL == 0 then this field is 0.

Access to this field is RO.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

NUMPROC	Meaning
0b00000	The trace unit can trace one PE.

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

Access to this field is RO.

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSSTALL	Meaning
0b0	Stalling of the PE is not permitted.
0b1	Stalling of the PE is permitted.

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

Access to this field is RO.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

STALLCTL	Meaning
0b0	Stalling of the PE is not implemented.
0b1	Stalling of the PE is implemented.

Access to this field is RO.

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYNCPR	Meaning
0b0	TRCSYNCPR is read/write so software can change the synchronization period.
0b1	TRCSYNCPR is read-only so the synchronization period is fixed.

This field reads as 0.

Access to this field is RO.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is not implemented.
0b1	Forced tracing of System Error exceptions is implemented.

This field reads as 1.

Access to this field is RO.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL2	Meaning
0b0	Non-secure EL2 is not implemented.
0b1	Non-secure EL2 is implemented.

Access to this field is RO.

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL1	Meaning
0b0	Non-secure EL1 is not implemented.
0b1	Non-secure EL1 is implemented.

Access to this field is RO.

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL0	Meaning
0b0	Non-secure EL0 is not implemented.
0b1	Non-secure EL0 is implemented.

Access to this field is RO.

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL3	Meaning
0b0	EL3 is not implemented.
0b1	EL3 is implemented.

Access to this field is RO.

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL2	Meaning
0b0	Secure EL2 is not implemented.
0b1	Secure EL2 is implemented.

Access to this field is RO.

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL1	Meaning
0b0	Secure EL1 is not implemented.
0b1	Secure EL1 is implemented.

Access to this field is RO.

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL0	Meaning
0b0	Secure EL0 is not implemented.
0b1	Secure EL0 is implemented.

Access to this field is RO.

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]
When TRCIDR0.TRCCCI == '0':

Indicates the minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

Reads as 0x000.

Access to this field is RO.

When TRCIDR0.TRCCCI == '1':

Indicates the minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCITMIN	Meaning
0x001..0xFFF	The minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

The minimum value of this field is 0x001.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing TRCIDR3

TRCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1EC	TRCIDR3

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR4, Trace ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR4 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR4[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR4 are RES0.

Attributes

TRCIDR4 is a 32-bit register.

Field descriptions

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMVMIDC	Meaning
0b0000..0b1000	The number of Virtual Context Identifier Comparators in this implementation.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b0000.

Access to this field is RO.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMCIDC	Meaning
0b0000..0b1000	The number of Context Identifier Comparators in this implementation.

All other values are reserved.

Access to this field is RO.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMSSCC	Meaning
0b0000..0b1000	The number of Single-shot Comparator Controls in this implementation.

All other values are reserved.

Access to this field is RO.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMRSPAIR	Meaning
0b0000	This implementation has zero resource selector pairs.
0b0001..0b1111	The number of resource selector pairs in this implementation, minus one.

All other values are reserved.

Access to this field is RO.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMPC	Meaning
0b0000..0b1000	The number of PE Comparator Inputs in this implementation.

All other values are reserved.

Access to this field is RO.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]
When TRCIDR4.NUMACPAIRS != '0000':

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SUPPDAC	Meaning
0b0	Data address comparisons not implemented.
0b1	Data address comparisons implemented.

This field reads as 0b0.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMDVC	Meaning
0b0000..0b1000	The number of data value comparators in this implementation.

All other values are reserved.

This field reads as 0b0000.

Access to this field is RO.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMACPAIRS	Meaning
0b0000..0b1000	The number of Address Comparator pairs in this implementation.

All other values are reserved.

Access to this field is RO.

Accessing TRCIDR4

TRCIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F0	TRCIDR4

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR5, Trace ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR5 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR5[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR5 are RES0.

Attributes

TRCIDR5 is a 32-bit register.

Field descriptions

OE, bit [31]

Indicates support for the ETE Trace Output Enable.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OE	Meaning
0b0	ETE Trace Output Enable is not implemented.
0b1	ETE Trace Output Enable is implemented.

When FEAT_ETEv1p3 is implemented and when any IMPLEMENTATION DEFINED trace output interface is implemented, this field is 1.

Access to this field is RO.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMCNTR	Meaning
0b000..0b100	The number of Counters implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

Access to this field is RO.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMSEQSTATE	Meaning
0b000	The Sequencer is not implemented.
0b100	Four Sequencer states are implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

Access to this field is RO.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LPOVERRIDE	Meaning
0b0	The trace unit does not support Low-power Override Mode.
0b1	The trace unit supports Low-power Override Mode.

Access to this field is RO.

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ATBTRIG	Meaning
0b0	The implementation does not support ATB triggers.
0b1	The implementation supports ATB triggers.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0.

Access to this field is RO.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRACEIDSIZE	Meaning
0b000000	The external trace interface is not implemented.
0b000111	The implementation supports a 7-bit trace ID.

All other values are reserved.

Note

AMBA ATB requires a 7-bit trace ID width.

Access to this field is RO.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMEXTINSEL	Meaning
0b000..0b100	The number of External Input Selector resources implemented.

All other values are reserved.

Access to this field is RO.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

NUMEXTIN	Meaning
0b111111111	Unified PMU event selection.

All other values are reserved.

Access to this field is RO.

Accessing TRCIDR5

TRCIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F4	TRCIDR5

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR6, Trace ID Register 6

The TRCIDR6 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR6 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR6[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR6 are RES0.

Attributes

TRCIDR6 is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [2]

Indicates if Realm EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_RL_EL2	Meaning
0b0	Realm EL2 is not implemented.
0b1	Realm EL2 is implemented.

Access to this field is RO.

EXLEVEL_RL_EL1, bit [1]

Indicates if Realm EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_RL_EL1	Meaning
0b0	Realm EL1 is not implemented.
0b1	Realm EL1 is implemented.

Access to this field is RO.

EXLEVEL_RL_EL0, bit [0]

Indicates if Realm EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_RL_EL0	Meaning
0b0	Realm EL0 is not implemented.
0b1	Realm EL0 is implemented.

Access to this field is RO.

Accessing TRCIDR6

TRCIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1F8	TRCIDR6

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR7, Trace ID Register 7

The TRCIDR7 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR7 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR7[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR7 are RES0.

Attributes

TRCIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCIDR7

TRCIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1FC	TRCIDR7

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR8, Trace ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

Configuration

External register TRCIDR8 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR8[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR8 are RES0.

Attributes

TRCIDR8 is a 32-bit register.

Field descriptions

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCIDR8

TRCIDR8 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x180	TRCIDR8

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIDR9, Trace ID Register 9

The TRCIDR9 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

External register TRCIDR9 bits [31:0] are architecturally mapped to AArch64 System register TRCIDR9[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIDR9 are RES0.

Attributes

TRCIDR9 is a 32-bit register.

Field descriptions

NUMP0KEY, bits [31:0]
When TRCIDR0.TRCDATA != '00':

Indicates the number of P0 right-hand keys. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing TRCIDR9

TRCIDR9 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x184	TRCIDR9

Accessible as follows:

- When OSLockStatus() or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCIMSPEC0, Trace IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

External register TRCIMSPEC0 bits [31:0] are architecturally mapped to AArch64 System register TRCIMSPEC0[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIMSPEC0 are RES0.

Attributes

TRCIMSPEC0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

EN, bits [7:4]
When TRCIMSPEC0.SUPPORT != '0000':

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

EN	Meaning
0b0000	The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported.
0b0001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0111	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1000	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1111	The trace unit behavior is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0000'.

Otherwise:

Reserved, RES0.

SUPPORT, bits [3:0]

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SUPPORT	Meaning
0b0000	No IMPLEMENTATION DEFINED features are supported.
0b0001	IMPLEMENTATION DEFINED features are supported.
0b0010	IMPLEMENTATION DEFINED features are supported.
0b0011	IMPLEMENTATION DEFINED features are supported.
0b0100	IMPLEMENTATION DEFINED features are supported.
0b0101	IMPLEMENTATION DEFINED features are supported.
0b0110	IMPLEMENTATION DEFINED features are supported.
0b0111	IMPLEMENTATION DEFINED features are supported.
0b1000	IMPLEMENTATION DEFINED features are supported.
0b1001	IMPLEMENTATION DEFINED features are supported.
0b1010	IMPLEMENTATION DEFINED features are supported.
0b1011	IMPLEMENTATION DEFINED features are supported.
0b1100	IMPLEMENTATION DEFINED features are supported.
0b1101	IMPLEMENTATION DEFINED features are supported.
0b1110	IMPLEMENTATION DEFINED features are supported.
0b1111	IMPLEMENTATION DEFINED features are supported.

Use of nonzero values requires written permission from Arm.

Access to this field is RO.

Accessing TRCIMSPEC0

TRCIMSPEC0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1C0	TRCIMSPEC0

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCIMSPEC<n>, Trace IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

External register TRCIMSPEC<n> bits [31:0] are architecturally mapped to AArch64 System register TRCIMSPEC<n>[31:0].

This register is present only when an implementation implements TRCIMSPEC<n>, FEAT_ETE is implemented, and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are RES0.

Attributes

TRCIMSPEC<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing TRCIMSPEC<n>

TRCIMSPEC<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x1C0 + (4 * n)	TRCIMSPEC<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCITCTRL, Trace Integration Mode Control Register

The TRCITCTRL characteristics are:

Purpose

A component can use TRCITCTRL to dynamically switch between functional mode and integration mode. In integration mode, topology detection is enabled. After switching to integration mode and performing integration tests or topology detection, reset the system to ensure correct behavior of CoreSight and other connected system components.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCITCTRL are RES0.

Attributes

TRCITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]
When topology detection or integration functionality is implemented:

Integration Mode Enable.

IME	Meaning
0b0	Component functional mode.
0b1	Component integration mode. Support for topology detection and integration testing is enabled.

Otherwise:

Reserved, RES0.

Accessing TRCITCTRL

External debugger accesses to this register are IMPLEMENTATION DEFINED when the trace unit is not in the Idle state.

TRCITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xF00	TRCITCTRL

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCITEEDCR, Instrumentation Trace Extension External Debug Control Register

The TRCITEEDCR characteristics are:

Purpose

Controls instrumentation trace filtering.

Configuration

External register TRCITEEDCR bits [31:0] are architecturally mapped to AArch64 System register TRCITEEDCR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and FEAT_ITE is implemented. Otherwise, direct accesses to TRCITEEDCR are RES0.

Attributes

TRCITEEDCR is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

RL, bit [6]
When FEAT_RME is implemented:

Instrumentation Trace in Realm state.

RL	Meaning
0b0	Instrumentation trace prohibited in Realm state.
0b1	Instrumentation trace permitted in Realm state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

This field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [5]
When Secure state is implemented:

Instrumentation Trace in Secure state.

S	Meaning
0b0	Instrumentation trace prohibited in Secure state.
0b1	Instrumentation trace permitted in Secure state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

When FEAT_RME is not implemented, this field is used in conjunction with TRCCONFIGR.ITO, TRCITEEDCR.E3, and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Secure state.

When FEAT_RME is implemented, this field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NS, bit [4]
When Non-secure state is implemented:

Instrumentation Trace in Non-secure state.

NS	Meaning
0b0	Instrumentation trace prohibited in Non-secure state.
0b1	Instrumentation trace permitted in Non-secure state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

This field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [3]
When EL3 is implemented:

Instrumentation Trace Enable at EL3.

E3	Meaning
0b0	Instrumentation trace prohibited at EL3.
0b1	Instrumentation trace permitted at EL3.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

When FEAT_RME is not implemented, TRCITEEDCR.E3 is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.S to control whether Instrumentation trace is permitted or prohibited at EL3.

When FEAT_RME is implemented, TRCITEEDCR.E3 is used in conjunction with TRCCONFIGR.ITO to control whether Instrumentation trace is permitted or prohibited at EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E<m>, bit [m], for m = 2 to 0

Instrumentation Trace Enable at EL<m>.

E<m>	Meaning
0b0	Instrumentation trace prohibited at EL<m>.
0b1	Instrumentation trace permitted at EL<m>.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

This bit is used in conjunction with TRCCONFIGR.ITO, TRCITEEDCR.NS, TRCITEEDCR.S, and TRCITEEDCR.RL to control whether Instrumentation trace is permitted or prohibited at EL<m> in the specified Security states.

TRCITEEDCR.E<2> is RES0 if EL2 is not implemented in any Security states.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCITEEDCR

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCITEEDCR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x048	TRCITEEDCR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCLAR, Trace Lock Access Register

The TRCLAR characteristics are:

Purpose

Used to lock and unlock the Software Lock.

Note

ETE does not implement the Software Lock.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and ETE Software Lock is implemented. Otherwise, direct accesses to TRCLAR are RES0.

Attributes

TRCLAR is a 32-bit register.

Field descriptions

KEY, bits [31:0]
When ETE Software Lock is implemented:

Software Lock Key.

A value of 0xC5ACCE55 unlocks the Software Lock.

Any other value locks the Software Lock.

Otherwise:

Reserved, RES0.

Accessing TRCLAR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLAR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB0	TRCLAR

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

TRCLSR, Trace Lock Status Register

The TRCLSR characteristics are:

Purpose

Indicates whether the Software Lock is implemented, and the current status of the Software Lock.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCLSR are RES0.

Attributes

TRCLSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Software lock size.

Reads as 0b0.

Access to this field is RO.

SLK, bit [1]

The current Software Lock status.

SLK	Meaning
0b0	Software Lock is unlocked.
0b1	Software Lock is locked. Writes to the other registers in this component, except for the TRCLAR, are ignored.

This field reads as 0.

SLI, bit [0]

Indicates whether the Software Lock is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock is not implemented. Writes to the TRCLAR are ignored.
0b1	Software Lock is implemented.

This field reads as 0.

Access to this field is RO.

Accessing TRCLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCLSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFB4	TRCLSR

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

Purpose

Returns the status of the Trace OS Lock.

Configuration

External register TRCOSLSR bits [31:0] are architecturally mapped to AArch64 System register TRCOSLSR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCOSLSR are RES0.

Attributes

TRCOSLSR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OSLM	Meaning
0b000	Trace OS Lock is not implemented.
0b010	Trace OS Lock is implemented.
0b100	Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.

All other values are reserved.

When FEAT_ETE is implemented, the values 0b000 and 0b010 are not permitted.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Access to this field is RO.

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

When FEAT_ETE is implemented, this field indicates the state of the PE OS Lock.

When FEAT_ETMv4 is implemented, this field indicates the state of the Trace OS Lock.

Accessing TRCOSLSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCOSLSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x304	TRCOSLSR

Accessible as follows:

- When !AllowExternalTraceAccess(addrdesc) or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPDCR, Trace PowerDown Control Register

The TRCPDCR characteristics are:

Purpose

Requests the system to provide power to the trace unit.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPDCR are RES0.

Attributes

TRCPDCR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

PU, bit [3]

Power Up Request.

PU	Meaning
0b0	The system can remove power from the trace unit core power domain, or requests for power to the trace unit core power domain are implemented outside of the trace unit.
0b1	The system must provide power to the trace unit core power domain.

This field is RES0.

Bits [2:0]

Reserved, RES0.

Accessing TRCPDCR

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDCR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x310	TRCPDCR

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCPDSR, Trace PowerDown Status Register

The TRCPDSR characteristics are:

Purpose

Indicates the power status of the trace unit.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPDSR are RES0.

Attributes

TRCPDSR is a 32-bit register.

Field descriptions

Bits [31:6]

Reserved, RES0.

OSLK, bit [5]

OS Lock Status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

Note

This field indicates the state of the PE OS Lock.

Bits [4:2]

Reserved, RES0.

STICKYPD, bit [1]

Sticky powerdown status. Indicates whether the trace register state is valid.

STICKYPD	Meaning
0b0	The state of TRCOSLSR and the trace registers are valid.
0b1	The state of TRCOSLSR and the trace registers might not be valid.

This field is set to 1 if the power to the trace unit core power domain is removed and the trace unit register state is not valid.

The STICKYPD field is read-sensitive. On a read of the TRCPDSR, this field is cleared to 0 after the register has been read.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RC/WI.

POWER, bit [0]

Power Status.

POWER	Meaning
0b0	The trace unit core power domain is not powered. All trace unit registers are not accessible and they all return an error response.
0b1	The trace unit core power domain is powered. Trace unit registers are accessible.

Access to this field is RAO/WI.

Accessing TRCPDSR

External debugger accesses to this register are unaffected by the OS Lock.

TRCPDSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x314	TRCPDSR

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR0, Trace Peripheral Identification Register 0

The TRCPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR0 are RES0.

Attributes

TRCPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - TRCPIDR1.PART_1 contains part number bits [11:8].
  - TRCPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - TRCPIDR1.PART_1 contains part number bits [15:12].
  - TRCPIDR0.PART_0 contains part number bits [11:4].
  - TRCPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, TRCPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCPIDR0

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE0	TRCPIDR0

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR1, Trace Peripheral Identification Register 1

The TRCPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR1 are RES0.

Attributes

TRCPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- TRCPIDR1.DES_0: JEP106 identification code bits[3:0].
- TRCPIDR2.DES_1: JEP106 identification code bits[6:4].
- TRCPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - TRCPIDR1.PART_1 contains part number bits [11:8].
  - TRCPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - TRCPIDR1.PART_1 contains part number bits [15:12].
  - TRCPIDR0.PART_0 contains part number bits [11:4].
  - TRCPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, TRCPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCPIDR1

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE4	TRCPIDR1

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR2, Trace Peripheral Identification Register 2

The TRCPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR2 are RES0.

Attributes

TRCPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- TRCPIDR2.REVISION indicates the 4-bit revision number.
- TRCPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- TRCPIDR2.REVISION indicates the 4-bit major revision number.
- TRCPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- TRCPIDR2.REVISION contains part number bits [3:0].
- TRCPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- TRCPIDR1.DES_0: JEP106 identification code bits[3:0].
- TRCPIDR2.DES_1: JEP106 identification code bits[6:4].
- TRCPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCPIDR2

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFE8	TRCPIDR2

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR3, Trace Peripheral Identification Register 3

The TRCPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR3 are RES0.

Attributes

TRCPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- TRCPIDR2.REVISION indicates the 4-bit revision number.
- TRCPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- TRCPIDR2.REVISION indicates the 4-bit major revision number.
- TRCPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- TRCPIDR2.REVISION contains part number bits [3:0].
- TRCPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

TRCPIDR3.CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

TRCPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCPIDR3

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFEC	TRCPIDR3

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR4, Trace Peripheral Identification Register 4

The TRCPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR4 are RES0.

Attributes

TRCPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIZE	Meaning
0b0000	One of the following is true: • The component uses a single 4KB block. • The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.
0b0001..0b1111	The component occupies $2^{\text{TRCPIDR4.SIZE}}$ 4KB blocks.

Using this field to indicate the size of the component is deprecated. This field might not correctly indicate the size of the component. Arm recommends that software determine the size of the component from the Unique Component Identifier fields, and other IMPLEMENTATION DEFINED registers in the component.

This field has the value 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- TRCPIDR1.DES_0: JEP106 identification code bits[3:0].
- TRCPIDR2.DES_1: JEP106 identification code bits[6:4].
- TRCPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCPIDR4

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD0	TRCPIDR4

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR5, Trace Peripheral Identification Register 5

The TRCPIDR5 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR5 are RES0.

Attributes

TRCPIDR5 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR5

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR5 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD4	TRCPIDR5

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR6, Trace Peripheral Identification Register 6

The TRCPIDR6 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR6 are RES0.

Attributes

TRCPIDR6 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR6

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR6 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFD8	TRCPIDR6

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPIDR7, Trace Peripheral Identification Register 7

The TRCPIDR7 characteristics are:

Purpose

Provides discovery information about the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPIDR7 are RES0.

Attributes

TRCPIDR7 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing TRCPIDR7

External debugger accesses to this register are unaffected by the OS Lock.

TRCPIDR7 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0xFDC	TRCPIDR7

Accessible as follows:

- When !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

TRCPRGCTLR, Trace Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

External register TRCPRGCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCPRGCTLR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCPRGCTLR are RES0.

Attributes

TRCPRGCTLR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

EN, bit [0]

Trace unit enable.

EN	Meaning
0b0	The trace unit is disabled.
0b1	The trace unit is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Accessing TRCPRGCTLR

Must be programmed.

TRCPRGCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x004	TRCPRGCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCQCTLR, Trace Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

External register TRCQCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCQCTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR0.QFILT == '1'. Otherwise, direct accesses to TRCQCTLR are RES0.

Attributes

TRCQCTLR is a 32-bit register.

Field descriptions

Bits [31:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

MODE	Meaning
0b0	Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.
0b1	Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines is not selected.
0b1	The address range that Address Range Comparator <m> defines is selected.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCQCTLR

Must be programmed if TRCCONFIGR.QE != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCQCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x044	TRCQCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCRSCTLR<n>, Trace Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

External register TRCRSCTLR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCRSCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and (UInt(TRCIDR4.NUMRSPAIR) + 1) * 2 > n. Otherwise, direct accesses to TRCRSCTLR<n> are RES0.

Resource selector 0 always returns FALSE.

Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 32-bit register.

Field descriptions

Bits [31:22]

Reserved, RES0.

PAIRINV, bit [21]
When n is even:

Controls whether the combined result from a resource selector pair is inverted.

PAIRINV	Meaning
0b0	Do not invert the combined output of the 2 resource selectors.
0b1	Invert the combined output of the 2 resource selectors.

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> Reserved.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

INV	Meaning
0b0	Do not invert the output of this selector.
0b1	Invert the output of this selector.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

GROUP	Meaning	SELECT
0b0000	External Input Selectors.	SELECT encoding for External Input Selectors
0b0001	PE Comparator Inputs.	SELECT encoding for PE Comparator Inputs
0b0010	Counters and Sequencer.	SELECT encoding for Counters and Sequencer
0b0011	Single-shot Comparator Controls.	SELECT encoding for Single-shot Comparator Controls
0b0100	Single Address Comparators.	SELECT encoding for Single Address Comparators
0b0101	Address Range Comparators.	SELECT encoding for Address Range Comparators
0b0110	Context Identifier Comparators.	SELECT encoding for Context Identifier Comparators
0b0111	Virtual Context Identifier Comparators.	SELECT encoding for Virtual Context Identifier Comparators

All other values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

EXTIN[<m>]	Meaning
0b0	Ignore EXTIN <m>.
0b1	Select EXTIN <m>.

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

PECOMP[<m>]	Meaning
0b0	Ignore PE Comparator Input <m>.
0b1	Select PE Comparator Input <m>.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

SEQUENCER[<m>]	Meaning
0b0	Ignore Sequencer state <m>.
0b1	Select Sequencer state <m>.

This bit is RES0 if m >= TRCIDR5.NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

COUNTERS[<m>]	Meaning
0b0	Ignore Counter <m>.
0b1	Select Counter <m> is zero.

This bit is RES0 if m >= TRCIDR5.NUMCNTR.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

SINGLE_SHOT[<m>]	Meaning
0b0	Ignore Single-shot Comparator Control <m>.
0b1	Select Single-shot Comparator Control <m>.

This bit is RES0 if m >= TRCIDR4.NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

SAC[<m>]	Meaning
0b0	Ignore Single Address Comparator <m>.
0b1	Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators

Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

ARC[<m>]	Meaning
0b0	Ignore Address Range Comparator <m>.
0b1	Select Address Range Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

CID[<m>]	Meaning
0b0	Ignore Context Identifier Comparator <m>.
0b1	Select Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMCIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators

Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

VMID[<m>]	Meaning
0b0	Ignore Virtual Context Identifier Comparator <m>.
0b1	Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMVMIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- TRCCNTCTLR<a>.RLDEVENT.TYPE == 0 and TRCCNTCTLR<a>.RLDEVENT.SEL == n.
- TRCCNTCTLR<a>.RLDEVENT.TYPE == 1 and TRCCNTCTLR<a>.RLDEVENT.SEL == n/2.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 0 and TRCCNTCTLR<a>.CNTEVENT.SEL == n.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 1 and TRCCNTCTLR<a>.CNTEVENT.SEL == n/2.
- TRCEVENTCTL0R.EVENT0.TYPE == 0 and TRCEVENTCTL0R.EVENT0.SEL == n.
- TRCEVENTCTL0R.EVENT0.TYPE == 1 and TRCEVENTCTL0R.EVENT0.SEL == n/2.
- TRCEVENTCTL0R.EVENT1.TYPE == 0 and TRCEVENTCTL0R.EVENT1.SEL == n.
- TRCEVENTCTL0R.EVENT1.TYPE == 1 and TRCEVENTCTL0R.EVENT1.SEL == n/2.
- TRCEVENTCTL0R.EVENT2.TYPE == 0 and TRCEVENTCTL0R.EVENT2.SEL == n.
- TRCEVENTCTL0R.EVENT2.TYPE == 1 and TRCEVENTCTL0R.EVENT2.SEL == n/2.
- TRCEVENTCTL0R.EVENT3.TYPE == 0 and TRCEVENTCTL0R.EVENT3.SEL == n.
- TRCEVENTCTL0R.EVENT3.TYPE == 1 and TRCEVENTCTL0R.EVENT3.SEL == n/2.
- TRCSEQEVR<a>.B.TYPE == 0 and TRCSEQEVR<a>.B.SEL = n.
- TRCSEQEVR<a>.B.TYPE == 1 and TRCSEQEVR<a>.B.SEL = n/2.
- TRCSEQEVR<a>.F.TYPE == 0 and TRCSEQEVR<a>.F.SEL = n.
- TRCSEQEVR<a>.F.TYPE == 1 and TRCSEQEVR<a>.F.SEL = n/2.
- TRCSEQRSTEVR.RST.TYPE == 0 and TRCSEQRSTEVR.RST.SEL == n.
- TRCSEQRSTEVR.RST.TYPE == 1 and TRCSEQRSTEVR.RST.SEL == n/2.
- TRCTSCTLR.EVENT.TYPE == 0 and TRCTSCTLR.EVENT.SEL == n.
- TRCTSCTLR.EVENT.TYPE == 1 and TRCTSCTLR.EVENT.SEL == n/2.

- TRCVICTLR.EVENT.TYPE == 0 and TRCVICTLR.EVENT.SEL == n.
- TRCVICTLR.EVENT.TYPE == 1 and TRCVICTLR.EVENT.SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCRSCTLR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x200 + (4 * n)	TRCRSCTLR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCRSR, Trace Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

External register TRCRSR bits [31:0] are architecturally mapped to AArch64 System register TRCRSR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCRSR are RES0.

Attributes

TRCRSR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

TA	Meaning
0b0	Tracing is not active.
0b1	Tracing is active.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

EVENT[<m>]	Meaning
0b0	An ETEEvent <m> has not occurred.
0b1	An ETEEvent <m> has occurred while the resources were in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When TRCIDR4.NUMRSPAIR == '0000', access to this field is RES0 .
- Access to this field is RES0 if all the following are true:
  - TRCIDR4.NUMRSPAIR != '0000'.
  - m > UInt(TRCIDR0.NUMEVENT).
- Otherwise, access to this field is RW.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

EXTIN[<m>]	Meaning
0b0	An event selected by External Input Selector <m> has not occurred.
0b1	At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR5.NUMEXTINSEL), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCRSR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x028	TRCRSR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSEQEVR<n>, Trace Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

External register TRCSEQEVR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSEQEVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR5.NUMSEQSTATE != '000'. Otherwise, direct accesses to TRCSEQEVR<n> are RES0.

Attributes

TRCSEQEVR<n> is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

B_TYPE, bit [15]

Backward field. Selects an event that causes the Sequencer to move from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14, then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

Chooses the type of Resource Selector.

B_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Backward field. Selects an event that causes the Sequencer to move from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14, then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Forward field. Selects an event that causes the Sequencer to move from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12, then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

Chooses the type of Resource Selector.

F_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Forward field. Selects an event that causes the Sequencer to move from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12, then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQEVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x100 + (4 * n)	TRCSEQEVR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSEQRSTEVR, Trace Sequencer Reset Control Register

The TRCSEQRSTEVR characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configuration

External register TRCSEQRSTEVR bits [31:0] are architecturally mapped to AArch64 System register TRCSEQRSTEVR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR5.NUMSEQSTATE != '000'. Otherwise, direct accesses to TRCSEQRSTEVR are RES0.

Attributes

TRCSEQRSTEVR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

RST_TYPE, bit [7]

Reset field. Selects an event that causes the Sequencer to move to state 0.

Chooses the type of Resource Selector.

RST_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQRSTEVR.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQRSTEVR.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEVR.RST.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Reset field. Selects an event that causes the Sequencer to move to state 0.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEVR.RST.TYPE controls whether TRCSEQRSTEVR.RST.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQRSTEVR

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSEQRSTEVR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x118	TRCSEQRSTEVR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSEQSTR, Trace Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

External register TRCSEQSTR bits [31:0] are architecturally mapped to AArch64 System register TRCSEQSTR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR5.NUMSEQSTATE != '000'. Otherwise, direct accesses to TRCSEQSTR are RES0.

Attributes

TRCSEQSTR is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

STATE	Meaning
0b00	State 0.
0b01	State 1.
0b10	State 2.
0b11	State 3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSEQSTR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x11C	TRCSEQSTR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSSCCR<n>, Trace Single-shot Comparator Control Register <n>, n = 0 - 7

The TRCSSCCR<n> characteristics are:

Purpose

Controls the corresponding Single-shot Comparator Control resource.

Configuration

External register TRCSSCCR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSSCCR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCCR<n> are RES0.

Attributes

TRCSSCCR<n> is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

RST	Meaning
0b0	The Single-shot Comparator Control is in single-shot mode.
0b1	The Single-shot Comparator Control is in multi-shot mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

ARC[<m>]	Meaning
0b0	The Address Range Comparator <m>, is not selected for Single-shot control.
0b1	The Address Range Comparator <m>, is selected for Single-shot control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

SAC[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected for Single-shot control.
0b1	The Single Address Comparator <m>, is selected for Single-shot control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCSSCCR<n>

Must be programmed if any TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSSCCR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x280 + (4 * n)	TRCSSCCR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSSCSR<n>, Trace Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

External register TRCSSCSR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSSCSR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCSR<n> are RES0.

Attributes

TRCSSCSR<n> is a 32-bit register.

Field descriptions

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by TRCSSCCR<n>.ARC, TRCSSCCR<n>.SAC, and TRCSSPCICR<n>.PC.

STATUS	Meaning
0b0	No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register.
0b1	One or more matches has occurred. If TRCSSCCR<n>.RST == 0 then: • There is only one match and no more matches are possible. • Software must reset this field to 0 to re-enable the Single-shot Comparator Control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

PENDING	Meaning
0b0	No match has occurred.
0b1	One or more matches has occurred.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

PC	Meaning
0b0	This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.
0b1	This Single-shot Comparator Control supports PE Comparator Inputs.

Access to this field is RO.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DV	Meaning
0b0	This Single-shot Comparator Control does not support data value comparisons.
0b1	This Single-shot Comparator Control supports data value comparisons.

This field reads as 0.

Access to this field is RO.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DA	Meaning
0b0	This Single-shot Comparator Control does not support data address comparisons.
0b1	This Single-shot Comparator Control supports data address comparisons.

This field reads as 0.

Access to this field is RO.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

INST	Meaning
0b0	This Single-shot Comparator Control does not support instruction address comparisons.
0b1	This Single-shot Comparator Control supports instruction address comparisons.

This field reads as 1.

Access to this field is RO.

Accessing TRCSSCSR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSCSR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x2A0 + (4 * n)	TRCSSCSR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSSPCICR<n>, Trace Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7

The TRCSSPCICR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

External register TRCSSPCICR<n> bits [31:0] are architecturally mapped to AArch64 System register TRCSSPCICR<n>[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, UInt(TRCIDR4.NUMSSCC) > n, UInt(TRCIDR4.NUMPC) > 0, and TRCSSCSR<n>.PC == '1'. Otherwise, direct accesses to TRCSSPCICR<n> are RES0.

Attributes

TRCSSPCICR<n> is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PC[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs for Single-shot control.

PC[<m>]	Meaning
0b0	The single PE Comparator Input <m>, is not selected as for Single-shot control.
0b1	The single PE Comparator Input <m>, is selected as for Single-shot control.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSPCICR<n>

Must be programmed if implemented and any TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCSSPCICR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x2C0 + (4 * n)	TRCSSPCICR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSTALLCTLR, Trace Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

External register TRCSTALLCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCSTALLCTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR3.STALLCTL == '1'. Otherwise, direct accesses to TRCSTALLCTLR are RES0.

Attributes

TRCSTALLCTLR is a 32-bit register.

Field descriptions

Bits [31:14]

Reserved, RES0.

NOOVERFLOW, bit [13]
When TRCIDR3.NOOVERFLOW == '1':

Trace overflow prevention.

NOOVERFLOW	Meaning
0b0	Trace unit buffer overflow prevention is disabled.
0b1	Trace unit buffer overflow prevention is enabled.

Note

Enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

ISTALL	Meaning
0b0	The trace unit must not stall the PE.
0b1	The trace unit can stall the PE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note

For some implementations, invasion might occur at the minimal invasion level.

One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a nonzero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSTALLCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x02C	TRCSTALLCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configuration

External register TRCSTATR bits [31:0] are architecturally mapped to AArch64 System register TRCSTATR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCSTATR are RES0.

Attributes

TRCSTATR is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

PMSTABLE	Meaning
0b0	The programmers' model is not stable.
0b1	The programmers' model is stable.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - TRCPRGCTLR.EN == '1'.
  - !OSLockStatus().
- Otherwise, access to this field is RO.

IDLE, bit [0]

Idle status.

IDLE	Meaning
0b0	The trace unit is not idle.
0b1	The trace unit is idle.

Accessing TRCSTATR

TRCSTATR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x00C	TRCSTATR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

TRCSYNCPR, Trace Synchronization Period Register

The TRCSYNCPR characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

External register TRCSYNCPR bits [31:0] are architecturally mapped to AArch64 System register TRCSYNCPR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCSYNCPR are RES0.

Attributes

TRCSYNCPR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

PERIOD	Meaning
0b00000	Trace protocol synchronization is disabled.
0b01000	Trace protocol synchronization request occurs after 2^8 bytes of trace.
0b01001	Trace protocol synchronization request occurs after 2^9 bytes of trace.
0b01010	Trace protocol synchronization request occurs after 2^{10} bytes of trace.
0b01011	Trace protocol synchronization request occurs after 2^{11} bytes of trace.
0b01100	Trace protocol synchronization request occurs after 2^{12} bytes of trace.
0b01101	Trace protocol synchronization request occurs after 2^{13} bytes of trace.
0b01110	Trace protocol synchronization request occurs after 2^{14} bytes of trace.
0b01111	Trace protocol synchronization request occurs after 2^{15} bytes of trace.
0b10000	Trace protocol synchronization request occurs after 2^{16} bytes of trace.
0b10001	Trace protocol synchronization request occurs after 2^{17} bytes of trace.
0b10010	Trace protocol synchronization request occurs after 2^{18} bytes of trace.
0b10011	Trace protocol synchronization request occurs after 2^{19} bytes of trace.
0b10100	Trace protocol synchronization request occurs after 2^{20} bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCPR

Must be programmed if TRCIDR3.SYNCPR == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCSYNCPR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x034	TRCSYNCPR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

Purpose

Sets the trace ID for instruction trace.

Configuration

External register TRCTRACEIDR bits [31:0] are architecturally mapped to AArch64 System register TRCTRACEIDR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCTRACEIDR are RES0.

Attributes

TRCTRACEIDR is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRACEIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTRACEIDR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x040	TRCTRACEIDR

Accessible as follows:

- When OSLockStatus(), or !IsTraceCorePowered(), or !AllowExternalTraceAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCTSCTLR, Trace Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

External register TRCTSCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCTSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and TRCIDR0.TSSIZE != '00000'. Otherwise, direct accesses to TRCTSCTLR are RES0.

Attributes

TRCTSCTLR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

EVENT_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != '0000':

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]
When TRCIDR4.NUMRSPAIR != '0000':

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCTSCTLR

Must be programmed if TRCCONFIGR.TS == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCTSCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x030	TRCTSCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCVICTLR, Trace ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

External register TRCVICTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVICTLR[31:0].

This register is present only when FEAT_ETE is implemented and FEAT_TRC_EXT is implemented. Otherwise, direct accesses to TRCVICTLR are RES0.

Attributes

TRCVICTLR is a 32-bit register.

Field descriptions

Bits [31:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]
When FEAT_RME is implemented:

Filter instruction trace for EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]
When FEAT_RME is implemented:

Filter instruction trace for EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]
When FEAT_RME is implemented:

Filter instruction trace for EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]
When Non-secure EL2 is implemented:

Filter instruction trace for EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]
When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [20]
When Non-secure EL0 is implemented:

Filter instruction trace for EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The trace unit generates instruction trace for EL0 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL0 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]
When EL3 is implemented:

Filter instruction trace for EL3.

EXLEVEL_S_EL3	Meaning
0b0	The trace unit generates instruction trace for EL3.
0b1	The trace unit does not generate instruction trace for EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]
When Secure EL2 is implemented:

Filter instruction trace for EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]
When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]
When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

EXLEVEL_S_EL0	Meaning
0b0	The trace unit generates instruction trace for EL0 in Secure state.
0b1	The trace unit does not generate instruction trace for EL0 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]
When TRCIDR3.TRCERR == '1':

Controls the forced tracing of System Error exceptions.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is disabled.
0b1	Forced tracing of System Error exceptions is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

TRCRESET	Meaning
0b0	Forced tracing of PE Resets is disabled.
0b1	Forced tracing of PE Resets is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

SSSTATUS	Meaning
0b0	Stopped State. The ViewInst start/stop function is in the stopped state.
0b1	Started State. The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPRGCTLR.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RES1 if all the following are true:
  - TRCIDR4.NUMACPAIRS == '0000'.
  - TRCIDR4.NUMPC == '0000'.
- Otherwise, access to this field is RW.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != '0000':

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

Bits[4:0]
When TRCIDR4.NUMRSPAIR != '0000':

EVENT_SEL, bits [4:0] of bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == '0000':

Reserved, bits [4:0] of bits [4:0]

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

TRCVICTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x080	TRCVICTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCVIIECTLR, Trace ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

Purpose

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

Configuration

External register TRCVIIECTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVIIECTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVIIECTLR are RES0.

Attributes

TRCVIIECTLR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

EXCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Bits [15:8]

Reserved, RES0.

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

INCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCVIIECTLR

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIIECTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x084	TRCVIIECTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCVIPCSSCTLR, Trace ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

Purpose

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

Configuration

External register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVIPCSSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMPC) > 0. Otherwise, direct accesses to TRCVIPCSSCTLR are RES0.

Attributes

TRCVIPCSSCTLR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with the ViewInst start/stop function for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The PE Comparator Input <m> is not selected as a stop resource.
0b1	The PE Comparator Input <m> is selected as a stop resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMPC), access to this field is RES0 .
- Otherwise, access to this field is RW.

Bits [15:8]

Reserved, RES0.

START[<m>], bit [m], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with the ViewInst start/stop function for the purpose of starting trace.

START[<m>]	Meaning
0b0	The PE Comparator Input <m> is not selected as a start resource.
0b1	The PE Comparator Input <m> is selected as a start resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMPC), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCVIPCSSCTLR

Must be programmed if TRCIDR4.NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVIPCSSCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x08C	TRCVIPCSSCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCVISSCTLR, Trace ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

External register TRCVISSCTLR bits [31:0] are architecturally mapped to AArch64 System register TRCVISSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVISSCTLR are RES0.

Attributes

TRCVISSCTLR is a 32-bit register.

Field descriptions

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The Single Address Comparator <m> is not selected as a stop resource.
0b1	The Single Address Comparator <m> is selected as a stop resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is RES0 .
- Otherwise, access to this field is RW.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function for the purpose of starting trace.

START[<m>]	Meaning
0b0	The Single Address Comparator <m> is not selected as a start resource.
0b1	The Single Address Comparator <m> is selected as a start resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCVISSCTLR

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVISSCTLR can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x088	TRCVISSCTLR

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCVMIDCCTLR0, Trace Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTLR0 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=0-3.

Configuration

External register TRCVMIDCCTLR0 bits [31:0] are architecturally mapped to AArch64 System register TRCVMIDCCTLR0[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x0, and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR0 are RES0.

Attributes

TRCVMIDCCTLR0 is a 32-bit register.

Field descriptions

COMP3[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 3:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR0

If software uses the TRCVMIDCVR<n> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTLR0 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x688	TRCVMIDCCTLR0

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCVMIDCCTLR1, Trace Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTLR1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=4-7.

Configuration

External register TRCVMIDCCTLR1 bits [31:0] are architecturally mapped to AArch64 System register TRCVMIDCCTLR1[31:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x4, and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR1 are RES0.

Attributes

TRCVMIDCCTLR1 is a 32-bit register.

Field descriptions

COMP7[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR1

If software uses the TRCVMIDCVR<n> registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

TRCVMIDCCTLR1 can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x68C	TRCVMIDCCTLR1

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

TRCVMIDCVR<n>, Trace Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

Purpose

Contains the Virtual Context Identifier Comparator value.

Configuration

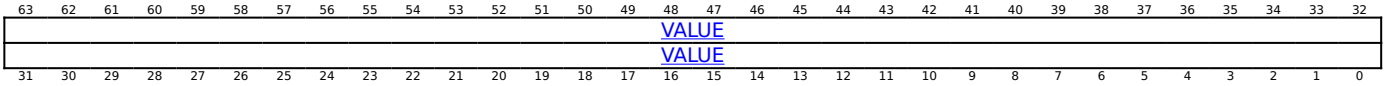
External register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to AArch64 System register TRCVMIDCVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, FEAT_TRC_EXT is implemented, and UInt(TRCIDR4.NUMVMIDC) > n. Otherwise, direct accesses to TRCVMIDCVR<n> are RES0.

Attributes

TRCVMIDCVR<n> is a 64-bit register.

Field descriptions



VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- TRCRSCTLR<a>.GROUP == 0b0111 and TRCRSCTLR<a>.VMID[n] == 1.
- TRCACATR<a>.CONTEXTTYPE == 0b10 or 0b11 and TRCACATR<a>.CONTEXT == n.

TRCVMIDCVR<n> can be accessed through the external debug interface:

Component	Offset	Instance
ETE	0x640 + (8 * n)	TRCVMIDCVR<n>

Accessible as follows:

- When OSLockStatus(), or !AllowExternalTraceAccess(addrdesc), or !IsTraceCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

AMCFGR, Activity Monitors Configuration Register

The AMCFGR characteristics are:

Purpose

Global configuration register for the activity monitors.

Provides information on supported features, the number of counter groups implemented, the total number of activity monitor event counters implemented, and the size of the counters. AMCFGR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCFGR bits [31:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[31:0] when FEAT_AMU_EXT32 is implemented.

External register AMCFGR bits [63:0] are architecturally mapped to AArch64 System register AMCFGR_EL0[63:0] when FEAT_AMU_EXT64 is implemented.

External register AMCFGR bits [31:0] are architecturally mapped to AArch32 System register AMCFGR[31:0].

It is IMPLEMENTATION DEFINED whether AMCFGR is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCFGR are RES0.

Attributes

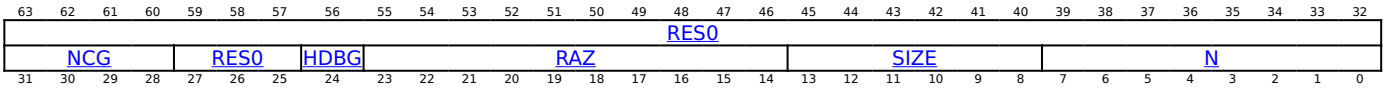
AMCFGR is a:

- 64-bit register when FEAT_AMU_EXT64 is implemented
- 32-bit register otherwise

This register is part of the AMU block.

Field descriptions

When FEAT_AMU_EXT64 is implemented:



Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCG	Meaning
0b0000	One counter group implemented.
0b0001	Two counter groups implemented.

All other values are reserved.

Access to this field is RO.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HDBG	Meaning
0b0	AMCR.HDBG is RES0.
0b1	AMCR.HDBG is read/write.

Access to this field is RO.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of the activity monitor event counters, minus one.

The counters are 64-bit, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is RO.

N, bits [7:0]

Defines the number of activity monitor event counters implemented in all groups, minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCG	Meaning
0b0000	One counter group implemented.
0b0001	Two counter groups implemented.

All other values are reserved.

Access to this field is RO.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported.

This feature must be supported, and so this bit is 0b1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HDBG	Meaning
0b0	AMCR.HDBG is RES0.
0b1	AMCR.HDBG is read/write.

Access to this field is RO.

Bits [23:14]

Reserved, RAZ.

SIZE, bits [13:8]

Defines the size of the activity monitor event counters, minus one.

The counters are 64-bit, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. The counters are at doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is RO.

N, bits [7:0]

Defines the number of activity monitor event counters implemented in all groups, minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMCFGR

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0xE00 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0xE00 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCGCR, Activity Monitors Counter Group Configuration Register

The AMCGCR characteristics are:

Purpose

Provides information on the number of activity monitor event counters implemented within each counter group.

Configuration

External register AMCGCR bits [31:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[31:0] when FEAT_AMU_EXT32 is implemented.

External register AMCGCR bits [63:0] are architecturally mapped to AArch64 System register AMCGCR_EL0[63:0] when FEAT_AMU_EXT64 is implemented.

External register AMCGCR bits [31:0] are architecturally mapped to AArch32 System register AMCGCR[31:0].

It is IMPLEMENTATION DEFINED whether AMCGCR is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCGCR are RES0.

Attributes

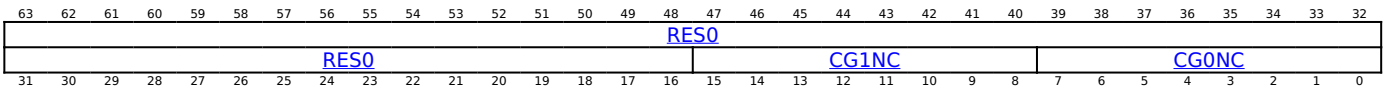
AMCGCR is a:

- 64-bit register when FEAT_AMU_EXT64 is implemented
- 32-bit register otherwise

This register is part of the AMU block.

Field descriptions

When FEAT_AMU_EXT64 is implemented:



Bits [63:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is RO.

Otherwise:

Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Counter Group 1 Number of Counters. The number of counters in the auxiliary counter group.

In an implementation that includes FEAT_AMUv1, the permitted range of values is 0 to 16.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CG0NC, bits [7:0]

Counter Group 0 Number of Counters. The number of counters in the architected counter group.

Reads as 0x04.

Access to this field is RO.

Accessing AMCGCR

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0xCE0 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0xCE0 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCIDR0, Activity Monitors Component Identification Register 0

The AMCIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMCIDR0 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMCIDR0, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCIDR0 are RES0.

Attributes

AMCIDR0 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing AMCIDR0

Accesses to this register use the following encodings:

Accessible at offset 0xFF0 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCIDR1, Activity Monitors Component Identification Register 1

The AMCIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMCIDR1 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMCIDR1, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCIDR1 are RES0.

Attributes

AMCIDR1 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is RO.

Accessing AMCIDR1

Accesses to this register use the following encodings:

Accessible at offset 0xFF4 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

AMCIDR2, Activity Monitors Component Identification Register 2

The AMCIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMCIDR2 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMCIDR2, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCIDR2 are RES0.

Attributes

AMCIDR2 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing AMCIDR2

Accesses to this register use the following encodings:

Accessible at offset 0xFF8 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCIDR3, Activity Monitors Component Identification Register 3

The AMCIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Component identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMCIDR3 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMCIDR3, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCIDR3 are RES0.

Attributes

AMCIDR3 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing AMCIDR3

Accesses to this register use the following encodings:

Accessible at offset 0xFFC from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCNTEN, Activity Monitors Count Set and Clear Register

The AMCNTEN characteristics are:

Purpose

Control bits for the architected and auxiliary activity monitors event counters, AMEVCNTR0<n>. and AMEVCNTR1<n>.

Configuration

It is IMPLEMENTATION DEFINED whether AMCNTEN is implemented in the Core power domain or in the Debug power domain.

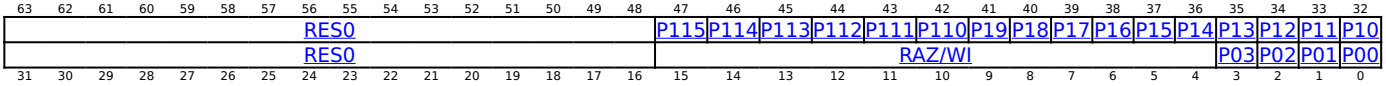
This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT64 is implemented. Otherwise, direct accesses to AMCNTEN are RES0.

Attributes

AMCNTEN is a 64-bit register.

This register is part of the AMU block.

Field descriptions



Bits [63:48]

Reserved, RES0.

P1<n>, bit [n+32], for n = 15 to 0

Activity monitor event counter control bit for AMEVCNTR1<n>.

Possible values of each bit are:

P1<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled.
0b1	When read, means that AMEVCNTR1<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression `0x00000000`.

Accessing this field has the following behavior:

- When n >= UInt(AMU.AMCGCR.CG1NC), access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P0<n>, bit [n], for n = 3 to 0

Activity monitor event counter control bit for AMEVCNTR0<n>.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P0<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression `0x00000000`.

Accessing this field has the following behavior:

- When n >= 4, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing AMCNTEN

If there are no auxiliary monitor event counters implemented, reads of AMCNTEN[63:32] are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings:

Accessible at offset 0xC10 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCNTENCLR, Activity Monitors Count Enable Clear Register

The AMCNTENCLR characteristics are:

Purpose

Disable control bits for the architected and auxiliary activity monitors event counters, AMEVCNTR0<n> and AMEVCNTR1<n>.

Configuration

External register AMCNTENCLR bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

External register AMCNTENCLR bits [63:32] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

It is IMPLEMENTATION DEFINED whether AMCNTENCLR is implemented in the Core power domain or in the Debug power domain.

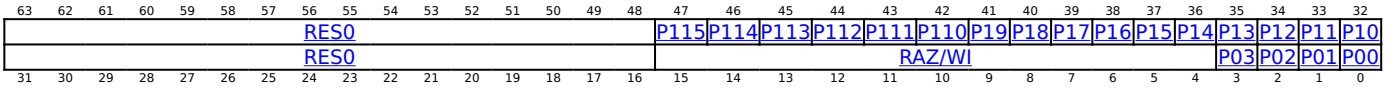
This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT64 is implemented. Otherwise, direct accesses to AMCNTENCLR are RES0.

Attributes

AMCNTENCLR is a 64-bit register.

This register is part of the AMU block.

Field descriptions



Bits [63:48]

Reserved, RES0.

P1<n>, bit [n+32], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Possible values of each bit are:

P1<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled.
0b1	When read, means that AMEVCNTR1<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= UInt(AMU.AMCGCR.CG1NC), access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P0<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P0<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= 4, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing AMCNTENCLR

If there are no auxiliary monitor event counters implemented, reads of AMCNTENCLR[63:32] are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings:

Accessible at offset 0xC20 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

AMCNTENCLR0, Activity Monitors Count Enable Clear Register 0

The AMCNTENCLR0 characteristics are:

Purpose

Disable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

Configuration

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET0[31:0].

External register AMCNTENCLR0 bits [31:0] are architecturally mapped to External register AMCNTENSET0[31:0].

It is IMPLEMENTATION DEFINED whether AMCNTENCLR0 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT32 is implemented. Otherwise, direct accesses to AMCNTENCLR0 are RES0.

Attributes

AMCNTENCLR0 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter disable bit for AMEVCNTR0<n>.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= 4, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing AMCNTENCLR0

Accesses to this register use the following encodings:

Accessible at offset 0xC20 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCNTENCLR1, Activity Monitors Count Enable Clear Register 1

The AMCNTENCLR1 characteristics are:

Purpose

Disable control bits for the auxiliary activity monitors event counters, AMEVCNTR1<n>.

Configuration

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR1_EL0[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR1[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET1[31:0].

External register AMCNTENCLR1 bits [31:0] are architecturally mapped to External register AMCNTENSET1[31:0].

It is IMPLEMENTATION DEFINED whether AMCNTENCLR1 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCNTENCLR1 are RES0.

Attributes

AMCNTENCLR1 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter disable bit for AMEVCNTR1<n>.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled.
0b1	When read, means that AMEVCNTR1<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= UInt(AMU.AMCGCR.CG1NC), access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing AMCNTENCLR1

If there are no auxiliary monitor event counters implemented, reads of AMCNTENCLR1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings:

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0xC24 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCNTENSET, Activity Monitors Count Enable Set Register

The AMCNTENSET characteristics are:

Purpose

Enable control bits for the architected and auxiliary activity monitors event counters, AMEVCNTR0<n> and AMEVCNTR1<n>.

Configuration

External register AMCNTENSET bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENSET bits [63:32] are architecturally mapped to AArch64 System register AMCNTENSET1_EL0[31:0].

It is IMPLEMENTATION DEFINED whether AMCNTENSET is implemented in the Core power domain or in the Debug power domain.

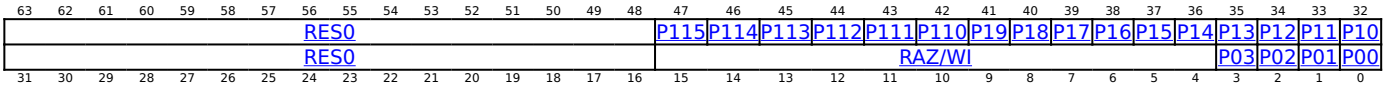
This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT64 is implemented. Otherwise, direct accesses to AMCNTENSET are RES0.

Attributes

AMCNTENSET is a 64-bit register.

This register is part of the AMU block.

Field descriptions



Bits [63:48]

Reserved, RES0.

P1<n>, bit [n+32], for n = 15 to 0

Activity monitor event counter enable bit for AMEVCNTR1<n>.

Possible values of each bit are:

P1<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled.
0b1	When read, means that AMEVCNTR1<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= UInt(AMU.AMCGCR.CG1NC), access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P0<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for AMEVCNTR0<n>.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P0<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= 4, access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Accessing AMCNTENSET

If there are no auxiliary monitor event counters implemented, reads of AMCNTENSET[63:32] are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings:

Accessible at offset 0xC00 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCNTENSET0, Activity Monitors Count Enable Set Register 0

The AMCNTENSET0 characteristics are:

Purpose

Enable control bits for the architected activity monitors event counters, AMEVCNTR0<n>.

Configuration

External register AMCNTENSET0 bits [31:0] are architecturally mapped to External register AMCNTENCLR0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENCLR0_EL0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch64 System register AMCNTENSET0_EL0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENCLR0[31:0].

External register AMCNTENSET0 bits [31:0] are architecturally mapped to AArch32 System register AMCNTENSET0[31:0].

It is IMPLEMENTATION DEFINED whether AMCNTENSET0 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT32 is implemented. Otherwise, direct accesses to AMCNTENSET0 are RES0.

Attributes

AMCNTENSET0 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:16]

Reserved, RES0.

Bits [15:4]

Reserved, RAZ/WI.

This field is reserved for additional architected activity monitor event counters, which Arm might define in a future version of the Activity Monitors architecture.

P<n>, bit [n], for n = 3 to 0

Activity monitor event counter enable bit for AMEVCNTR0<n>.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters. In an implementation that includes FEAT_AMUv1, the number of architected activity monitor event counters is 4.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR0<n> is disabled.
0b1	When read, means that AMEVCNTR0<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= 4, access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Accessing AMCNTENSET0

Accesses to this register use the following encodings:

Accessible at offset 0xC00 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

Bits [31:16]

Reserved, RES0.

P<n>, bit [n], for n = 15 to 0

Activity monitor event counter enable bit for AMEVCNTR1<n>.

Possible values of each bit are:

P<n>	Meaning
0b0	When read, means that AMEVCNTR1<n> is disabled.
0b1	When read, means that AMEVCNTR1<n> is enabled.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression 0x00000000.

Accessing this field has the following behavior:

- When n >= UInt(AMU.AMCGCR.CG1NC), access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Accessing AMCNTENSET1

If there are no auxiliary monitor event counters implemented, reads of AMCNTENSET1 are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

There are no implemented auxiliary activity monitor event counters when AMCFGR.NCG == 0b0000.

Accesses to this register use the following encodings:

Accessible at offset 0xC04 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMCR, Activity Monitors Control Register

The AMCR characteristics are:

Purpose

Global control register for the activity monitors implementation. AMCR is applicable to both the architected and the auxiliary counter groups.

Configuration

External register AMCR bits [31:0] are architecturally mapped to AArch64 System register AMCR_EL0[31:0] when FEAT_AMU_EXT32 is implemented.

External register AMCR bits [63:0] are architecturally mapped to AArch64 System register AMCR_EL0[63:0] when FEAT_AMU_EXT64 is implemented.

External register AMCR bits [31:0] are architecturally mapped to AArch32 System register AMCR[31:0].

It is IMPLEMENTATION DEFINED whether AMCR is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMCR are RES0.

Attributes

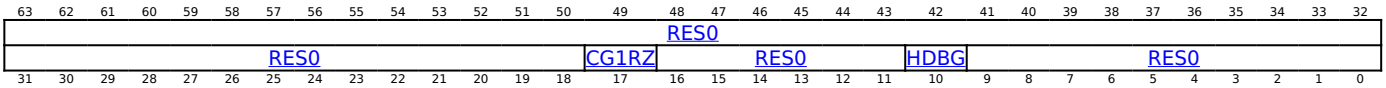
AMCR is a:

- 64-bit register when FEAT_AMU_EXT64 is implemented
- 32-bit register otherwise

This register is part of the AMU block.

Field descriptions

When FEAT_AMU_EXT64 is implemented:



Bits [63:18]

Reserved, RES0.

CG1RZ, bit [17]
When FEAT_AMUv1p1 is implemented:

Counter Group 1 Read Zero.

CG1RZ	Meaning
0b0	System register reads of AMEVCNTR1<n> return the event count at all implemented and enabled Exception levels.
0b1	If the current Exception level is the highest implemented Exception level, System register reads of AMEVCNTR1<n> return the event count. Otherwise, reads of AMEVCNTR1<n> return a zero value.

Note

Reads from the memory-mapped view of AMEVCNTR1<n> are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Otherwise:

Bits [31:18]

Reserved, RES0.

CG1RZ, bit [17]
When FEAT_AMUv1p1 is implemented:

Counter Group 1 Read Zero.

CG1RZ	Meaning
0b0	System register reads of AMEVCNTR1<n> return the event count at all implemented and enabled Exception levels.
0b1	If the current Exception level is the highest implemented Exception level, System register reads of AMEVCNTR1<n> return the event count. Otherwise, reads of AMEVCNTR1<n> return a zero value.

Note

Reads from the memory-mapped view of AMEVCNTR1<n> are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [16:11]

Reserved, RES0.

HDBG, bit [10]

This bit controls whether activity monitor counting is halted when the PE is halted in Debug state.

HDBG	Meaning
0b0	Activity monitors do not halt counting when the PE is halted in Debug state.
0b1	Activity monitors halt counting when the PE is halted in Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [9:0]

Reserved, RES0.

Accessing AMCR

Accesses to this register use the following encodings:

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0xE04 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0xE10 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMDEVAFF, Activity Monitors Device Affinity Register

The AMDEVAFF characteristics are:

Purpose

Copy of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

It is IMPLEMENTATION DEFINED whether AMDEVAFF is implemented in the Core power domain or in the Debug power domain.

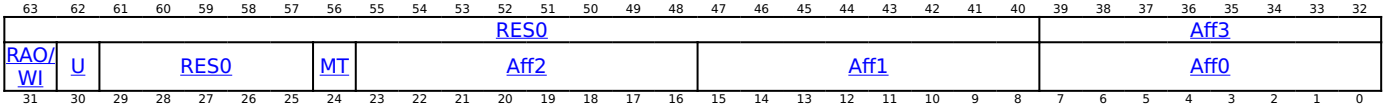
This register is present only when FEAT_AMUv1 is implemented, FEAT_AMU_EXT64 is implemented, and an implementation implements AMDEVAFF1. Otherwise, direct accesses to AMDEVAFF are RES0.

Attributes

AMDEVAFF is a 64-bit register.

This register is part of the AMU block.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMDEVAFF

Accesses to this register use the following encodings:

Accessible at offset 0xFA8 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMDEVAFF0, Activity Monitors Device Affinity Register 0

The AMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

It is IMPLEMENTATION DEFINED whether AMDEVAFF0 is implemented in the Core power domain or in the Debug power domain.

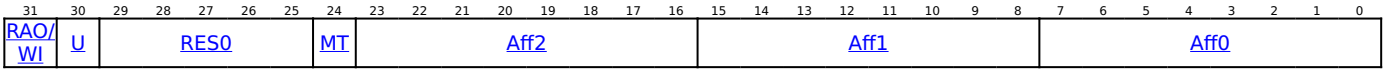
This register is present only when FEAT_AMUv1 is implemented, FEAT_AMU_EXT32 is implemented, and an implementation implements AMDEVAFF0. Otherwise, direct accesses to AMDEVAFF0 are RES0.

Attributes

AMDEVAFF0 is a 32-bit register.

This register is part of the AMU block.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMDEVAFF0

Accesses to this register use the following encodings:

Accessible at offset 0xFA8 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMDEVAFF1, Activity Monitors Device Affinity Register 1

The AMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the AMU component relates to.

Configuration

It is IMPLEMENTATION DEFINED whether AMDEVAFF1 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, FEAT_AMU_EXT32 is implemented, and an implementation implements AMDEVAFF1. Otherwise, direct accesses to AMDEVAFF1 are RES0.

Attributes

AMDEVAFF1 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of AMDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMDEVAFF1

Accesses to this register use the following encodings:

Accessible at offset 0xFAC from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMDEVARCH, Activity Monitors Device Architecture Register

The AMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the AMU component.

Configuration

It is IMPLEMENTATION DEFINED whether AMDEVARCH is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMDEVARCH, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMDEVARCH are RES0.

Attributes

AMDEVARCH is a 32-bit register.

This register is part of the AMU block.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architect of the component. For Activity Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the AMDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

REVISION	Meaning
0b0000	Architecture revision is AMUv1.

All other values are reserved.

Access to this field is RO.

ARCHID, bits [15:0]

Defines this part to be an AMU component. For architectures defined by Arm this is further subdivided.

For AMU:

- Bits [15:12] are the architecture version, also identified as AMDEVARCH.ARCHVER.
- Bits [11:0] are the architecture part number, also identified as AMDEVARCH.ARCHPART.

AMDEVARCH.ARCHVER = 0x0, which corresponds to AMU architecture version AMUv1.

If FEAT_AMU_EXT32 is implemented, AMDEVARCH is 0xA66.

If FEAT_AMU_EXT64 is implemented, AMDEVARCH is 0xA67.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHID	Meaning
0x0A66	AMUv1, with FEAT_AMU_EXT32 implemented.
0x0A67	AMUv1, with FEAT_AMU_EXT64 implemented.

Access to this field is RO.

Accessing AMDEVARCH

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0xFBC from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0xFBC from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMDEVTYPE, Activity Monitors Device Type Register

The AMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

It is IMPLEMENTATION DEFINED whether AMDEVTYPE is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMDEVTYPE, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMDEVTYPE are RES0.

Attributes

AMDEVTYPE is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype.

SUB	Meaning
0b0001	Component within a PE.

Access to this field is RO.

MAJOR, bits [3:0]

Major type.

MAJOR	Meaning
0b0110	Performance monitor component.

Access to this field is RO.

Accessing AMDEVTYPE

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0xFCC from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0xFCC from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMEVCNTR0<n>, Activity Monitors Event Counter Registers 0, n = 0 - 3

The AMEVCNTR0<n> characteristics are:

Purpose

Provides access to the architected activity monitor event counters.

Configuration

External register AMEVCNTR0<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR0<n>_EL0[63:0].

External register AMEVCNTR0<n> bits [31:0] are architecturally mapped to AArch32 System register AMEVCNTR0<n>[31:0].

It is IMPLEMENTATION DEFINED whether AMEVCNTR0<n> is implemented in the Core power domain or in the Debug power domain.

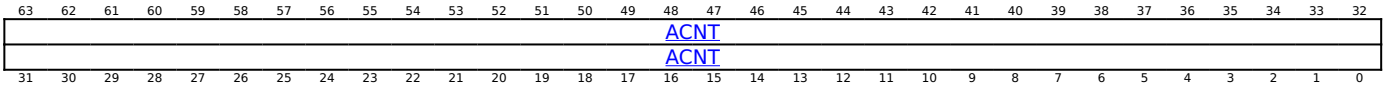
This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMEVCNTR0<n> are RES0.

Attributes

AMEVCNTR0<n> is a 64-bit register.

This register is part of the AMU block.

Field descriptions



ACNT, bits [63:0]

Architected activity monitor event counter n.

Value of architected activity monitor event counter n, where n is the number of this register and is a number from 0 to 3.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression `0x0000000000000000`.

Accessing AMEVCNTR0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVCNTR0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

[63:0] Accessible at offset 0x000 + (8 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

[63:0] Accessible at offset 0x000 + (8 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMEVCNTR1<n>, Activity Monitors Event Counter Registers 1, n = 0 - 15

The AMEVCNTR1<n> characteristics are:

Purpose

Provides access to the auxiliary activity monitor event counters.

Configuration

External register AMEVCNTR1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVCNTR1<n>_EL0[63:0].

External register AMEVCNTR1<n> bits [31:0] are architecturally mapped to AArch32 System register AMEVCNTR1<n>[31:0].

It is IMPLEMENTATION DEFINED whether AMEVCNTR1<n> is implemented in the Core power domain or in the Debug power domain.

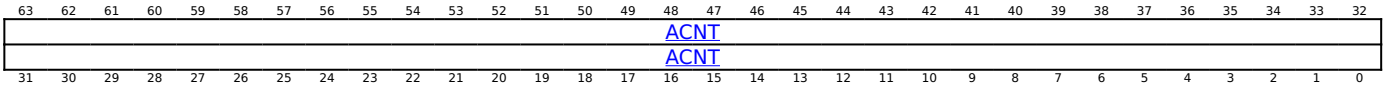
This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMEVCNTR1<n> are RES0.

Attributes

AMEVCNTR1<n> is a 64-bit register.

This register is part of the AMU block.

Field descriptions



ACNT, bits [63:0]

Auxiliary activity monitor event counter n.

Value of auxiliary activity monitor event counter n, where n is the number of this register and is a number from 0 to 15.

The reset behavior of this field is:

- On an AMU reset, this field resets to the expression `0x0000000000000000`.

Accessing AMEVCNTR1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVCNTR1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

[63:0] Accessible at offset 0x100 + (8 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

[63:0] Accessible at offset 0x100 + (8 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMEVTYPER0<n>, Activity Monitors Event Type Registers 0, n = 0 - 3

The AMEVTYPER0<n> characteristics are:

Purpose

Provides information on the events that an architected activity monitor event counter AMEVCNTR0<n> counts.

Configuration

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[31:0] when FEAT_AMU_EXT32 is implemented.

External register AMEVTYPER0<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVTYPER0<n>_EL0[63:0] when FEAT_AMU_EXT64 is implemented.

External register AMEVTYPER0<n> bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER0<n>[31:0].

It is IMPLEMENTATION DEFINED whether AMEVTYPER0<n> is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMEVTYPER0<n> are RES0.

Attributes

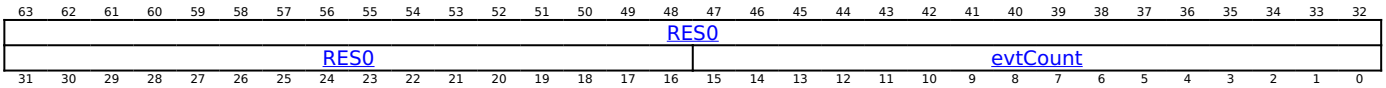
AMEVTYPER0<n> is a:

- 64-bit register when FEAT_AMU_EXT64 is implemented
- 32-bit register otherwise

This register is part of the AMU block.

Field descriptions

When FEAT_AMU_EXT64 is implemented:



Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles.	When n == 0
0x4004	Constant frequency cycles.	When n == 1
0x0008	Instructions retired.	When n == 2
0x4005	Memory stall cycles.	When n == 3

Access to this field is RO.

Otherwise:

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the architected activity monitor event counter AMEVCNTR0<n>. The value of this field is architecturally mandated for each architected counter.

The following table shows the mapping between required event numbers and the corresponding counters:

evtCount	Meaning	Applies when
0x0011	Processor frequency cycles.	When n == 0
0x4004	Constant frequency cycles.	When n == 1
0x0008	Instructions retired.	When n == 2
0x4005	Memory stall cycles.	When n == 3

Access to this field is RO.

Accessing AMEVTYPER0<n>

If <n> is greater than or equal to the number of architected activity monitor event counters, reads of AMEVTYPER0<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG0NC identifies the number of architected activity monitor event counters.

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0x400 + (8 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0x400 + (4 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMEVTYPER1<n>, Activity Monitors Event Type Registers 1, n = 0 - 15

The AMEVTYPER1<n> characteristics are:

Purpose

Provides information on the events that an auxiliary activity monitor event counter AMEVCNTR1<n> counts.

Configuration

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch64 System register AMEVTYPER1<n>_EL0[31:0] when FEAT_AMU_EXT32 is implemented.

External register AMEVTYPER1<n> bits [63:0] are architecturally mapped to AArch64 System register AMEVTYPER1<n>_EL0[63:0] when FEAT_AMU_EXT64 is implemented.

External register AMEVTYPER1<n> bits [31:0] are architecturally mapped to AArch32 System register AMEVTYPER1<n>[31:0].

It is IMPLEMENTATION DEFINED whether AMEVTYPER1<n> is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMEVTYPER1<n> are RES0.

Attributes

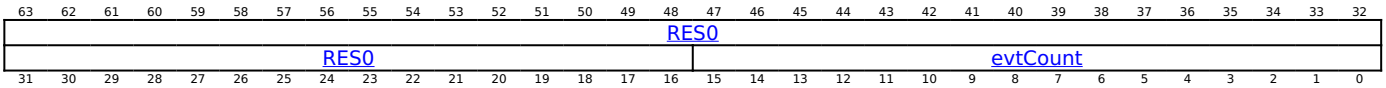
AMEVTYPER1<n> is a:

- 64-bit register when FEAT_AMU_EXT64 is implemented
- 32-bit register otherwise

This register is part of the AMU block.

Field descriptions

When FEAT_AMU_EXT64 is implemented:



Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Bits [31:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count. The event number of the event that is counted by the auxiliary activity monitor event counter AMEVCNTR1<n>.

It is IMPLEMENTATION DEFINED what values are supported by each counter.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing AMEVTYPER1<n>

If <n> is greater than or equal to the number of auxiliary activity monitor event counters, reads of AMEVTYPER1<n> are RAZ. Software must treat reserved accesses as RES0. See 'Access requirements for reserved and unallocated registers'.

Note

AMCGCR.CG1NC identifies the number of auxiliary activity monitor event counters.

Accesses to this register use the following encodings:

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0x480 + (4 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0x500 + (8 * n) from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMIIDR, Activity Monitors Implementation Identification Register

The AMIIDR characteristics are:

Purpose

Defines the implementer and revisions of the AMU.

Configuration

It is IMPLEMENTATION DEFINED whether AMIIDR is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMIIDR are RES0.

Attributes

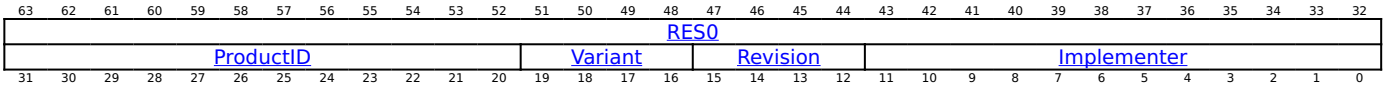
AMIIDR is a:

- 64-bit register when FEAT_AMU_EXT64 is implemented
- 32-bit register otherwise

This register is part of the AMU block.

Field descriptions

When FEAT_AMU_EXT64 is implemented:



Bits [63:32]

Reserved, RES0.

ProductID, bits [31:20]

Part number of the AMU, bits [11:0]. The part number is selected by the designer of the component.

Matches the part number represented in the Peripheral ID registers AMPIDRn, if those registers are present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by AMIIDR.ProductID, or the major revision of the component. When defining a major revision, AMIIDR.Variant and AMIIDR.Revision together form the revision number of the component, with this field being the most significant part. When a component is changed, AMIIDR.Variant or AMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, AMIIDR.Revision should be set to 0b0000.

Arm recommends this field matches the AMPIDR2.REVISION field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

AMIIDR.Variant and AMIIDR.Revision together form the revision number of the component, with this field being the least significant part. When a component is changed, AMIIDR.Variant or AMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If AMIIDR.Variant field is increased, this field should be set to 0b0000, otherwise the value in this field should be increased.

Arm recommends this field matches the AMPIDR3.REVAND field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the AMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for AMIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If AMPIDR4 is implemented, AMPIDR4.DES_2 matches bits [11:8] of this field.

If AMPIDR2 is implemented, AMPIDR2.DES_1 matches bits [6:4] of this field.

If AMPIDR1 is implemented, AMPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

ProductID, bits [31:20]

Part number of the AMU, bits [11:0]. The part number is selected by the designer of the component.

Matches the part number represented in the Peripheral ID registers AMPIDRn, if those registers are present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by AMIIDR.ProductID, or the major revision of the component. When defining a major revision, AMIIDR.Variant and AMIIDR.Revision together form the revision number of the component, with this field being the most significant part. When a component is changed, AMIIDR.Variant or AMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, AMIIDR.Revision should be set to 0b0000.

Arm recommends this field matches the AMPIDR2.REVISION field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

AMIIDR.Variant and AMIIDR.Revision together form the revision number of the component, with this field being the least significant part. When a component is changed, AMIIDR.Variant or AMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If AMIIDR.Variant field is increased, this field should be set to 0b0000, otherwise the value in this field should be increased.

Arm recommends this field matches the AMPIDR3.REVAND field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the AMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for AMIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If AMPIDR4 is implemented, AMPIDR4.DES_2 matches bits [11:8] of this field.

If AMPIDR2 is implemented, AMPIDR2.DES_1 matches bits [6:4] of this field.

If AMPIDR1 is implemented, AMPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMIIDR

Accesses to this register use the following encodings:

When FEAT_AMU_EXT64 is implemented

Accessible at offset 0xE08 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

When FEAT_AMU_EXT32 is implemented

Accessible at offset 0xE08 from AMU

- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMPIDR0, Activity Monitors Peripheral Identification Register 0

The AMPIDR0 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMPIDR0 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMPIDR0, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMPIDR0 are RES0.

Attributes

AMPIDR0 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - AMPIDR1.PART_1 contains part number bits [11:8].
  - AMPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - AMPIDR1.PART_1 contains part number bits [15:12].
  - AMPIDR0.PART_0 contains part number bits [11:4].
  - AMPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, AMPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMPIDR0

Accesses to this register use the following encodings:

Accessible at offset 0xFE0 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMPIDR1, Activity Monitors Peripheral Identification Register 1

The AMPIDR1 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMPIDR1 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMPIDR1, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMPIDR1 are RES0.

Attributes

AMPIDR1 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- AMPIDR1.DES_0: JEP106 identification code bits[3:0].
- AMPIDR2.DES_1: JEP106 identification code bits[6:4].
- AMPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - AMPIDR1.PART_1 contains part number bits [11:8].
  - AMPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - AMPIDR1.PART_1 contains part number bits [15:12].
  - AMPIDR0.PART_0 contains part number bits [11:4].
  - AMPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, AMPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMPIDR1

Accesses to this register use the following encodings:

Accessible at offset 0xFE4 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMPIDR2, Activity Monitors Peripheral Identification Register 2

The AMPIDR2 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMPIDR2 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMPIDR2, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMPIDR2 are RES0.

Attributes

AMPIDR2 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- AMPIDR2.REVISION indicates the 4-bit revision number.
- AMPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- AMPIDR2.REVISION indicates the 4-bit major revision number.
- AMPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- AMPIDR2.REVISION contains part number bits [3:0].
- AMPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- AMPIDR1.DES_0: JEP106 identification code bits[3:0].
- AMPIDR2.DES_1: JEP106 identification code bits[6:4].
- AMPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMPIDR2

Accesses to this register use the following encodings:

Accessible at offset 0xFE8 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMPIDR3, Activity Monitors Peripheral Identification Register 3

The AMPIDR3 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMPIDR3 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMPIDR3, and FEAT_AMU_EXT is implemented. Otherwise, direct accesses to AMPIDR3 are RES0.

Attributes

AMPIDR3 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- AMPIDR2.REVISION indicates the 4-bit revision number.
- AMPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- AMPIDR2.REVISION indicates the 4-bit major revision number.
- AMPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- AMPIDR2.REVISION contains part number bits [3:0].
- AMPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

AMPIDR3.CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component

modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

AMPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMPIDR3

Accesses to this register use the following encodings:

Accessible at offset 0xFEC from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMPIDR4, Activity Monitors Peripheral Identification Register 4

The AMPIDR4 characteristics are:

Purpose

Provides information to identify an activity monitors component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

It is IMPLEMENTATION DEFINED whether AMPIDR4 is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_AMUv1 is implemented, an implementation implements AMPIDR4, and FEAT_AMU_EXT. Otherwise, direct accesses to AMPIDR4 are RES0.

Attributes

AMPIDR4 is a 32-bit register.

This register is part of the AMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- AMPIDR1.DES_0: JEP106 identification code bits[3:0].
- AMPIDR2.DES_1: JEP106 identification code bits[6:4].
- AMPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing AMPIDR4

Accesses to this register use the following encodings:

Accessible at offset 0xFD0 from AMU

- When ImpDefBool("AMU CoreSight management registers ignore access controls"), accesses to this register are RO.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Secure, and AMROOTCR().RA IN {'001', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Realm, and AMROOTCR().RA IN {'010', '000'}, accesses to this register are RAZ/WI.
- When FEAT_RME is implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMROOTCR().RA != '011', accesses to this register are RAZ/WI.
- When FEAT_RME is not implemented, FEAT_AMU_EXTACR is implemented, an access is Non-secure, and AMSCR().NSRA == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

AMROOTCR, Activity Monitors Root Control Register

The AMROOTCR characteristics are:

Purpose

Control register for Root, Realm, Secure, and Non-secure access to External AMU registers.

Configuration

It is IMPLEMENTATION DEFINED whether AMROOTCR is implemented in the Core power domain or in the Debug power domain.

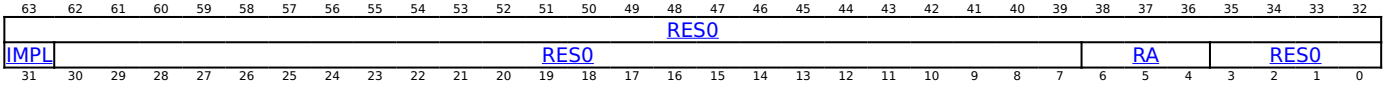
This register is present only when FEAT_AMU_EXTACR is implemented and FEAT_RME is implemented. Otherwise, direct accesses to AMROOTCR are RES0.

Attributes

AMROOTCR is a 64-bit register.

This register is part of the AMU block.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPL, bit [31]

IMPL	Meaning
0b1	Indicates AMROOTCR is present.

Access to this field is RAO/WI.

Bits [30:7]

Reserved, RES0.

RA, bits [6:4]

Register Access to all External Activity Monitors registers.

RA	Meaning
0b000	Root register access is enabled. Access from other address spaces is disabled, meaning accesses to all External AMU registers are RAZ/WI.
0b001	Root and Realm register access is enabled. Access from other address spaces is disabled, meaning accesses to all External AMU registers are RAZ/WI.
0b010	Root and Secure register access is enabled. Access from other address spaces is disabled, meaning accesses to all External AMU registers are RAZ/WI.
0b011	Root, Secure, Non-secure and Realm register access is enabled.

Other values are reserved.

For the CoreSight management registers, 0xFA8 to 0xFFC, it is IMPLEMENTATION DEFINED whether these registers are RO or RAZ/WI when register access is disabled by this field.

Bits [3:0]

Reserved, RES0.

Accessing AMROOTCR

Accesses to this register use the following encodings:

Accessible at offset 0xE48 from AMU

- When an access is Root, accesses to this register are RW.
- Otherwise, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

AMSCR, Activity Monitors Secure Control Register

The AMSCR characteristics are:

Purpose

Control register for Secure, and Non-secure access to External AMU registers.

Configuration

It is IMPLEMENTATION DEFINED whether AMSCR is implemented in the Core power domain or in the Debug power domain.

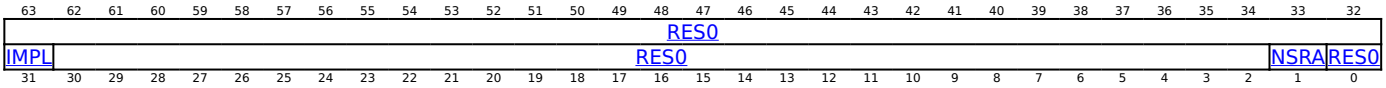
This register is present only when FEAT_AMU_EXTACR is implemented and FEAT_RME is not implemented. Otherwise, direct accesses to AMSCR are RES0.

Attributes

AMSCR is a 64-bit register.

This register is part of the AMU block.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPL, bit [31]

IMPL	Meaning
0b1	Indicates AMSCR is present.

Access to this field is RAO/WI.

Bits [30:2]

Reserved, RES0.

NSRA, bit [1]

Register Access to all External Activity Monitors registers.

NSRA	Meaning
0b0	Non-secure access is disabled, RAZ/WI.
0b1	Non-Secure access is enabled.

Bit [0]

Reserved, RES0.

Accessing AMSCR

Accesses to this register use the following encodings:

Accessible at offset 0xE40 from AMU

- When an access is Secure or an access is Root, accesses to this register are RW.
- Otherwise, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

AMU

The AMU characteristics are:

Attributes

AMU is a block of size: 4096 bytes

Contents

Offset	Name	Accessor condition	Register condition	Most permissive access
0x000 + (8 * n) for n in 16:0	AMEVCNTR0<n>	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented	RO
0x000 + (8 * n) for n in 16:0	AMEVCNTR0<n>	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented	RO

0xFE0	AMPIDR0	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR0, and FEAT_AMU_EXT is implemented	RO
0xFE4	AMPIDR1	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR1, and FEAT_AMU_EXT is implemented	RO
0xFE8	AMPIDR2	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR2, and FEAT_AMU_EXT is implemented	RO
0xFEC	AMPIDR3	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR3, and FEAT_AMU_EXT is implemented	RO
0xFF0	AMCIDR0	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR0, and FEAT_AMU_EXT is implemented	RO
0xFF4	AMCIDR1	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR1, and FEAT_AMU_EXT is implemented	RO
0xFF8	AMCIDR2	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR2, and FEAT_AMU_EXT is implemented	RO
0xFFC	AMCIDR3	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR3, and FEAT_AMU_EXT is implemented	RO

Direct accesses to other offsets in this block are RES0.

GIC_PMEVFILT2R<n>, GIC PMU Event Filter 2 Register, n = 0 - 63

The GIC_PMEVFILT2R<n> characteristics are:

Purpose

GIC PMU Event Filter 2 Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to GIC_PMEVFILT2R<n> are RAZ/WI.

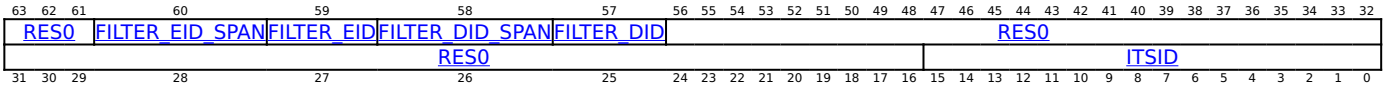
Attributes

GIC_PMEVFILT2R<n> is a 64-bit register.

This register is part of the GIC_PMU_FRAME block.

Field descriptions

When GIC_PMEVTYPER<n>.PMEVTYPE IN {'01x'}:



Bits [63:61]

Reserved, RES0.

FILTER_EID_SPAN, bit [60]
When GIC_PMEVTYPER<n>.FS == '1', GIC_PMEVTYPER<n>.FSPAN == '1', and FILTER_EID == 1:

Controls if filtering using EventID uses exact matching or matches a range of values.

If the ITS being monitored only implements support for 1 bit of EventID, this field is treated as 0.

See 'GIC Performance Monitoring Units' for more information.

FILTER_EID_SPAN	Meaning
0b0	GIC_PMEVFILTR<n>.EVENT_ID filters EventID on an exact match.
0b1	GIC_PMEVFILTR<n>.EVENT_ID filters EventID on a range of values.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_EID, bit [59]
When GIC_PMEVTYPER<n>.FS == '1' and FILTER_DID == 1:

Controls whether filtering using EventID is enabled.

Filtering on EventID is only supported when also filtering on DeviceID.

See 'GIC Performance Monitoring Units' for more information.

FILTER_EID	Meaning
0b0	Count events from all EventIDs for the matched DeviceIDs.
0b1	Count events that match the DeviceID and EventID filter programming.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_DID_SPAN, bit [58]
When GIC_PMEVTYPER<n>.FS == '1', GIC_PMEVTYPER<n>.FSPAN == '1', and FILTER_DID == 1:

Controls if filtering using DeviceID uses exact matching or matches a range of values.

If the ITS being monitored only implements support for 1 bit of DeviceID, this field is treated as 0.

See 'GIC Performance Monitoring Units' for more information.

FILTER_DID_SPAN	Meaning
0b0	GIC_PMEVFILTR<n>.DEVICE_ID filters DeviceID on an exact match.
0b1	GIC_PMEVFILTR<n>.DEVICE_ID filters DeviceID on a range of values.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_DID, bit [57]
When GIC_PMEVTYPER<n>.FS == '1':

Controls whether filtering using DeviceID is enabled.

FILTER_DID	Meaning
0b0	Count events from all DeviceIDs.
0b1	Count events that match the DeviceID filter programming.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [56:16]

Reserved, RES0.

ITSID, bits [15:0]

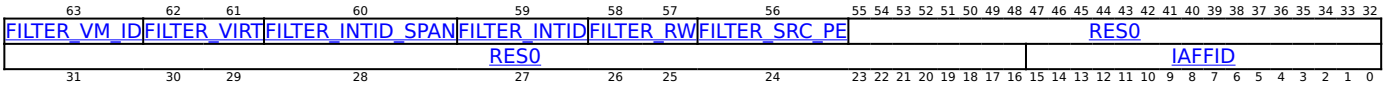
Events from the ITS that match this value are counted.

If the agent being monitored does not contain more than one ITS, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

When GIC_PMEVTYPER<n>.PMEVTYPE IN {'00x'}:



FILTER_VM_ID, bit [63]
When GIC_PMEVTYPER<n>.FS == '1' and FILTER_VIRT == '01':

Controls whether counting of virtual events is filtered based on their VM ID.

When an event is selected that does not support filtering on virtual events, this field is RES0 and has no impact on the counted events.

FILTER_VM_ID	Meaning
0b0	Events translated to virtual interrupt events are not filtered on VM ID.
0b1	Events translated to virtual interrupt events are only counted if the VM ID matches the value specified in GIC_PMEVFILTR<n>.VM_ID.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_VIRT, bits [62:61]
When GIC_PMEVTYPER<n>.FS == '1':

Controls whether counting of events is filtered based on whether they are virtual or physical.

When an event is selected that does not support filtering on virtual events, this field is RES0 and has no impact on the counted events.

FILTER_VIRT	Meaning
0b00	Physical and virtual interrupt events are counted.
0b01	Only virtual interrupt events are counted.
0b10	Only physical interrupt events are counted.

Values not defined are reserved.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_INTID_SPAN, bit [60]
When GIC_PMEVTYPER<n>.FS == '1', GIC_PMEVTYPER<n>.FSPAN == '1', and FILTER_INTID == 1:

Controls if filtering using INTID uses exact matching or matches a range of INTID.ID values.

When an event is selected that does not support filtering on INTID, this field is RES0 and has no impact on the counted events.

See 'GIC Performance Monitoring Units' for more information.

FILTER_INTID_SPAN	Meaning
0b0	GIC_PMEVFILTR<n>.ID filters INTID.ID on an exact match.
0b1	GIC_PMEVFILTR<n>.ID filters INTID.ID on a range of values.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_INTID, bit [59]
When GIC_PMEVTYPER<n>.FS == '1':

Controls whether filtering using INTID is enabled.

When an event is selected that does not support filtering on INTID, this field is RES0 and has no impact on the counted events.

FILTER_INTID	Meaning
0b0	Count interrupt events for all INTIDs.
0b1	Count interrupt events that match the GIC_PMEVFILTR<n>.INTID filter programming.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_RW, bits [58:57]
When GIC_PMEVTYPER<n>.FS == '1':

Controls whether counting of events is filtered based on whether they are read or write events.

When an event is selected that does not support filtering on reads or writes, this field is RES0 and has no impact on the counted events.

FILTER_RW	Meaning
0b00	Both read and write events are counted.
0b01	Only read events are counted.
0b10	Only write events are counted.

Values not defined are reserved.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

FILTER_SRC_PE, bit [56]
When GIC_PMEVTYPER<n>.FS == '1':

Controls whether filtering of PE commands using source PE IAFFID is enabled.

When an event is selected that does not support filtering on source PE IAFFID, this field is RES0 and has no impact on the counted events.

FILTER_SRC_PE	Meaning
0b0	Count PE commands from all PEs.
0b1	Count PE commands sent from PEs whose IAFFID match the GIC_PMEVFILTR<n>.IAFFID filter value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:16]

Reserved, RES0.

IAFFID, bits [15:0]
When GIC_PMEVTYPER<n>.FS == '1' and FILTER_SRC_PE == 1:

When filtering on source PE IAFFID, only PE commands from a PE whose IAFFID matches this value are counted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing GIC_PMEVFILT2R<n>

Accesses to this register use the following encodings:

Accessible at offset 0x800 + (8 * n) from GIC_PMU_FRAME

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GIC_PMEVFILTR<n>, GIC PMU Event Filter Register, n = 0 - 63

The GIC_PMEVFILTR<n> characteristics are:

Purpose

GIC PMU Event Filter Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to GIC_PMEVFILTR<n> are RAZ/WI.

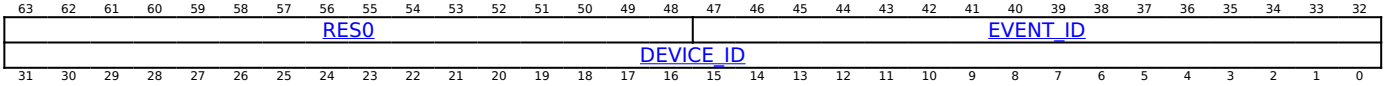
Attributes

GIC_PMEVFILTR<n> is a 64-bit register.

This register is part of the GIC_PMU_FRAME block.

Field descriptions

When GIC_PMEVTYPER<n>.PMEVTYPE IN {'01x'}:



Bits [63:48]

Reserved, RES0.

EVENT_ID, bits [47:32]

When filtering by EventID, the EventIDs that match this value are counted.

When GIC_PMEVFILT2R<n>.FILTER_EID is 0, this field is IGNORED.

When GIC_PMEVFILT2R<n>.FILTER_EID is 1, GIC_PMEVFILT2R<n>.FILTER_EID_SPAN controls how the EventID is matched against this value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

DEVICE_ID, bits [31:0]

When filtering by DeviceID, the DeviceIDs that match this value are counted.

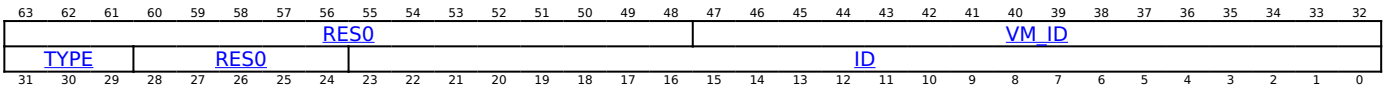
When GIC_PMEVFILT2R<n>.FILTER_DID is 0, this field is IGNORED.

When GIC_PMEVFILT2R<n>.FILTER_DID is 1, GIC_PMEVFILT2R<n>.FILTER_DID_SPAN controls how the DeviceID is matched against this value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

When GIC_PMEVTYPER<n>.PMEVTYPE IN {'00x'}:



Bits [63:48]

Reserved, RES0.

VM_ID, bits [47:32]
When GIC_PMEVFILT2R<n>.FILTER_VM_ID == '1':

When filtering on VM_ID only events that are translated to virtual interrupt events matching this VM_ID are counted.

When an event is selected that does not support filtering on VM ID, this field is RES0 and has no impact on the counted events.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

TYPE, bits [31:29]
When GIC_PMEVFILT2R<n>.FILTER_INTID == '1':

Type of the interrupt.

When an event is selected that does not support filtering on INTID, this field is RES0 and has no impact on the counted events.

TYPE	Meaning
0b010	LPI
0b011	SPI

Values not defined above are reserved.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [28:24]

Reserved, RES0.

ID, bits [23:0]
When GIC_PMEVFILT2R<n>.FILTER_INTID == '1':

The ID of the interrupt.

ID and TYPE together form an INTID.

The monitored IRS may implement fewer than 24 bits of ID. Unimplemented upper bits are RES0.

When GIC_PMEVFILT2R<n>.FILTER_INTID is 1, GIC_PMEVFILT2R<n>.FILTER_INTID_SPAN controls how the INTID is matched against this value.

When an event is selected that does not support filtering on INTID, this field is RES0 and has no impact on the counted events.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing GIC_PMEVFILTR<n>

Accesses to this register use the following encodings:

Accessible at offset 0xA00 + (8 * n) from GIC_PMU_FRAME

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GIC_PMEVTYPER<n>, GIC PMU Event Type Select Register, n = 0 - 63

The GIC_PMEVTYPER<n> characteristics are:

Purpose

GIC PMU Event Type Select Register

Configuration

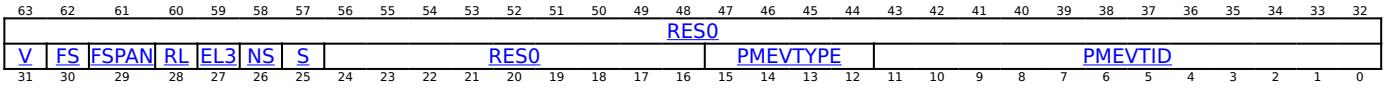
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to GIC_PMEVTYPER<n> are RAZ/WI.

Attributes

GIC_PMEVTYPER<n> is a 64-bit register.

This register is part of the GIC_PMU_FRAME block.

Field descriptions



Bits [63:32]

Reserved, RES0.

V, bit [31]

Whether PMEVTYPE and PMEVTID select a valid event.

V	Meaning
0b0	The event selected by PMEVTYPE and PMEVTID is invalid.
0b1	The event selected by PMEVTYPE and PMEVTID is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Access to this field is RO.

FS, bit [30]

Whether filtering is supported for the event selected in GIC_PMEVTID.

When V is 0, the value of this field is UNKNOWN.

FS	Meaning
0b0	Filtering for the selected event is not supported.
0b1	Filtering for the selected event is supported.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Access to this field is RO.

FSPAN, bit [29]

Whether filtering using a range of values is supported for the event selected in GIC_PMEVTID. See 'GIC Performance Monitoring Units' for more information about filtering on a range of values.

When V is 0 or FS is 0, the value of this field is UNKNOWN.

FSPAN	Meaning
0b0	Filtering using a range of values is not supported.
0b1	Filtering using a range of values is supported.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Access to this field is RO.

RL, bit [28]
When GIC_PMIDR0.OACE == '1' and GIC_PMIDR0.DOM_RL == '1':

Configures matching the Realm Interrupt Domain.

RL	Meaning
0b0	Events or characteristics attributable to the Realm Interrupt Domain are unaffected by this bit.
0b1	Do not count events or monitor characteristics attributable to the Realm Interrupt Domain.

This bit is ignored by the PMU when the PMU is not allowed to observe events or characteristics attributable to Realm operation of the agent being monitored.

Accessing this bit has the following behavior:

- This bit reads-as-zero if the PMU is never allowed to observe events or characteristics attributable to Realm operation of the agent being monitored.
- Otherwise, this bit is read/write.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

EL3, bit [27]
When GIC_PMIDR0.OACE == '1' and GIC_PMIDR0.DOM_EL3 == '1':

Configures matching the EL3 Interrupt Domain.

EL3	Meaning
0b0	Events or characteristics attributable to the EL3 Interrupt Domain are unaffected by this bit.
0b1	Do not count events or monitor characteristics attributable to the EL3 Interrupt Domain.

This bit is ignored by the PMU when the PMU is not allowed to observe events or characteristics attributable to EL3 operation of the agent being monitored.

Accessing this bit has the following behavior:

- This bit reads-as-zero if the PMU is never allowed to observe events or characteristics attributable to EL3 operation of the agent being monitored.
- Otherwise, this bit is read/write.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

NS, bit [26]
When GIC_PMIDR0.OACE == '1' and GIC_PMIDR0.DOM_NS == '1':

Configures matching the Non-secure Interrupt Domain.

NS	Meaning
0b0	Events or characteristics attributable to the Non-secure Interrupt Domain are unaffected by this bit.
0b1	Do not count events or monitor characteristics attributable to the Non-secure Interrupt Domain.

This bit is ignored by the PMU when the PMU is not allowed to observe events or characteristics attributable to Non-secure operation of the agent being monitored.

Accessing this bit has the following behavior:

- This bit reads-as-zero if the PMU is never allowed to observe events or characteristics attributable to Non-secure operation of the agent being monitored.
- Otherwise, this bit is read/write.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [25]
When GIC_PMIDR0.OACE == '1' and GIC_PMIDR0.DOM_S == '1':

Configures matching the Secure Interrupt Domain.

S	Meaning
0b0	Events or characteristics attributable to the Secure Interrupt Domain are unaffected by this bit.
0b1	Do not count events or monitor characteristics attributable to the Secure Interrupt Domain.

This bit is ignored by the PMU when the PMU is not allowed to observe events or characteristics attributable to Secure operation of the agent being monitored.

Accessing this bit has the following behavior:

- This bit reads-as-zero if the PMU is never allowed to observe events or characteristics attributable to Secure operation of the agent being monitored.
- Otherwise, this bit is read/write.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:16]

Reserved, RES0.

PMEVTYPE, bits [15:12]

The performance monitor event type.

The value in this field selects the event for the type selected in PMEVTYPE.

Values not defined are reserved.

PMEVTYPE	Meaning
0b0000	Architected IRS event.
0b0001	IMPLEMENTATION DEFINED IRS event.
0b0010	Architected ITS event.
0b0011	IMPLEMENTATION DEFINED ITS event.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

PMEVTID, bits [11:0]

The performance monitor event ID.

The value in this field selects the event for the type selected in PMEVTYPE.

If the value in this field combined with the value in PMEVTYPE selects an invalid event, all other fields in this register are IGNORED.

If less than 16 bits of event ID is implemented, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing GIC_PMEVTYPER<n>

Accesses to this register use the following encodings:

Accessible at offset 0x400 + (8 * n) from GIC_PMU_FRAME

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GIC_PMIDR0, GIC PMU Identification Register 0

The GIC_PMIDR0 characteristics are:

Purpose

GIC PMU Identification Register 0. Contains read-only fields with information about the GIC PMU.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to GIC_PMIDR0 are RAZ/WI.

Attributes

GIC_PMIDR0 is a 32-bit register.

This register is part of the GIC_PMU_FRAME block.

Field descriptions

Bits [31:7]

Reserved, RES0.

DOM_RL, bit [6]

Whether a component in the agent being monitored supports the Realm Interrupt Domain.

DOM_RL	Meaning
0b0	The Realm Interrupt Domain is not supported by any component in the agent being monitored.
0b1	The Realm Interrupt Domain is supported by a component in the agent being monitored.

DOM_EL3, bit [5]

Whether a component in the agent being monitored supports the EL3 Interrupt Domain.

DOM_EL3	Meaning
0b0	The EL3 Interrupt Domain is not supported by any component in the agent being monitored.
0b1	The EL3 Interrupt Domain is supported by a component in the agent being monitored.

DOM_NS, bit [4]

Whether a component in the agent being monitored supports the Non-secure Interrupt Domain.

DOM_NS	Meaning
0b0	The Non-secure Interrupt Domain is not supported by any component in the agent being monitored.
0b1	The Non-secure Interrupt Domain is supported by a component in the agent being monitored.

DOM_S, bit [3]

Whether a component in the agent being monitored supports the Secure Interrupt Domain.

DOM_S	Meaning
0b0	The Secure Interrupt Domain is not supported by any component in the agent being monitored.
0b1	The Secure Interrupt Domain is supported by a component in the agent being monitored.

OACE, bit [2]

Whether the PMU implements the observability and access control extension.

OACE	Meaning
0b0	The PMU does not implement the observability and access control extension.
0b1	The PMU implements the observability and access control extension.

ITS_PMU, bit [1]

Whether this PMU counts events from an ITS.

This field can be interpreted in combination with IRS_PMU to determine the GIC PMU configuration.

See 'GIC Performance Monitoring Unit (PMU)' for more information.

ITS_PMU	Meaning
0b0	This PMU does not count events from an ITS.
0b1	This PMU counts events from at least one ITS.

IRS_PMU, bit [0]

Whether this PMU counts events from an IRS.

This field can be interpreted in combination with ITS_PMU to determine the GIC PMU configuration.

See 'GIC Performance Monitoring Unit (PMU)' for more information.

IRS_PMU	Meaning
0b0	This PMU does not count events from an IRS.
0b1	This PMU counts events from an IRS.

Accessing GIC_PMIDR0

Accesses to this register use the following encodings:

Accessible at offset 0xD80 from GIC_PMU_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GIC_PMU_FRAME, GIC PMU register frame

The GIC_PMU_FRAME characteristics are:

Purpose

Contains GIC PMU registers.

The GIC PMU register frame is accessible in each PAS corresponding to an Interrupt Domain that the PMU can count events for.

The base address of the GIC PMU register frame is distinct from any other GIC register frame.

The base address of the GIC PMU register frame is aligned to 64KB.

Configuration

This block is present only when FEAT_GICv5_EXT is implemented.

Attributes

GIC_PMU_FRAME is a block of size: 64KB

Contents

Offset	Name	Accessor condition	Register condition	Most permissive access
0x400 + (8 * n) for n in 63:0	GIC_PMEVTYPER<n>	-	When FEAT_GICv5_EXT is implemented	RW
0x800 + (8 * n) for n in 63:0	GIC_PMEVFILT2R<n>	-	When FEAT_GICv5_EXT is implemented	RW
0xA00 + (8 * n) for n in 63:0	GIC_PMEVFILTR<n>	-	When FEAT_GICv5_EXT is implemented	RW
0xD80	GIC_PMIDR0	-	When FEAT_GICv5_EXT is implemented	RO

Direct accesses to other offsets in this block are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

IRS_CONFIG_FRAME, IRS configuration register frame

The IRS_CONFIG_FRAME characteristics are:

Purpose

Contains control registers for an IRS for an Interrupt Domain.

An IRS configuration register frame is present for each supported Interrupt Domain on each IRS.

This register frame is accessible in the PAS associated with the Interrupt Domain.

It is IMPLEMENTATION DEFINED whether this register frame is also accessible in the MPPAS at the same address.

The base address is distinct from the base address of any other GIC register frame, including the configuration register frames for other Interrupt Domains on all IRSs.

The base address is aligned to 64KB.

Configuration

This block is present only when FEAT_GICv5_EXT is implemented.

Attributes

IRS_CONFIG_FRAME is a block of size: 64KB

Contents

Offset	Name	Accessor condition	Register condition	Most permissive access
0x0000	IRS_IDR0	-	When FEAT_GICv5_EXT is implemented	RO
0x0004	IRS_IDR1	-	When FEAT_GICv5_EXT is implemented	RO
0x0008	IRS_IDR2	-	When FEAT_GICv5_EXT is implemented	RO
0x000C	IRS_IDR3	-	When FEAT_GICv5_EXT is implemented	RO
0x0010	IRS_IDR4	-	When FEAT_GICv5_EXT is implemented	RO
0x0014	IRS_IDR5	-	When FEAT_GICv5_EXT is implemented	RO
0x0018	IRS_IDR6	-	When FEAT_GICv5_EXT is implemented	RO
0x001C	IRS_IDR7	-	When FEAT_GICv5_EXT is implemented	RO
0x0040	IRS_IIDR	-	When FEAT_GICv5_EXT is implemented	RO

0x0084	IRS_CR1	-	When FEAT_GICv5_EXT is implemented	RW
0x00C0	IRS_SYNCR	-	When FEAT_GICv5_EXT is implemented	WO
0x00C4	IRS_SYNC_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x0100	IRS_SPI_VMR	-	When FEAT_GICv5_EXT is implemented	RW
0x0108	IRS_SPI_SELR	-	When FEAT_GICv5_EXT is implemented	WO
0x010C	IRS_SPI_DOMAINR	-	When FEAT_GICv5_EXT is implemented	RW
0x0110	IRS_SPI_RESAMPLER	-	When FEAT_GICv5_EXT is implemented	WO

0x0114	IRS_SPI_CFGR	-	When FEAT_GICv5_EXT is implemented	RW
0x0118	IRS_SPI_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x0140	IRS_PE_SELR	-	When FEAT_GICv5_EXT is implemented	WO
0x0144	IRS_PE_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x0148	IRS_PE_CR0	-	When FEAT_GICv5_EXT is implemented	RW
0x0180	IRS_IST_BASER	-	When FEAT_GICv5_EXT is implemented	RW
0x0190	IRS_IST_CFGR	-	When FEAT_GICv5_EXT is implemented	RW
0x0194	IRS_IST_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x01C0	IRS_MAP_L2_ISTR	-	When FEAT_GICv5_EXT is implemented	WO
0x0200	IRS_VMT_BASER	-	When FEAT_GICv5_EXT is implemented	RW
0x0210	IRS_VMT_CFGR	-	When FEAT_GICv5_EXT is implemented	RW
0x0214	IRS_VMT_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x0240	IRS_VPE_SELR	-	When FEAT_GICv5_EXT is implemented	RW
0x0248	IRS_VPE_DBR	-	When FEAT_GICv5_EXT is implemented	RW
0x0250	IRS_VPE_HPPIR	-	When FEAT_GICv5_EXT is implemented	RO
0x0258	IRS_VPE_CR0	-	When FEAT_GICv5_EXT is implemented	RW
0x025C	IRS_VPE_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x0280	IRS_VM_DBR	-	When FEAT_GICv5_EXT is implemented	RW
0x0288	IRS_VM_SELR	-	When FEAT_GICv5_EXT is implemented	WO
0x028C	IRS_VM_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x02C0	IRS_VMAP_L2_VMTR	-	When FEAT_GICv5_EXT is implemented	RW
0x02C8	IRS_VMAP_VMR	-	When FEAT_GICv5_EXT is implemented	RW
0x02D0	IRS_VMAP_VISTR	-	When FEAT_GICv5_EXT is implemented	RW
0x02D8	IRS_VMAP_L2_VISTR	-	When FEAT_GICv5_EXT is implemented	RW
0x02E0	IRS_VMAP_VPER	-	When FEAT_GICv5_EXT is implemented	RW
0x0300	IRS_SAVE_VMR	-	When FEAT_GICv5_EXT is implemented	RW
0x0308	IRS_SAVE_VM_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x0340	IRS_MEC_IDR	-	When FEAT_GICv5_EXT is implemented	RO
0x0344	IRS_MEC_MECID_R	-	When FEAT_GICv5_EXT is implemented	RW
0x0380	IRS_MPAM_IDR	-	When FEAT_GICv5_EXT is implemented	RO
0x0384	IRS_MPAM_PARTID_R	-	When FEAT_GICv5_EXT is implemented	RW
0x03C0	IRS_SWERR_STATUSR	-	When FEAT_GICv5_EXT is implemented	RW
0x03C8	IRS_SWERR_SYNDROMER0	-	When FEAT_GICv5_EXT is implemented	RO

0x03D0	IRS_SWERR_SYNDROMER1	-	When FEAT_GICv5_EXT is implemented	RO
0x0E00 + (4 * n) for n in 63:0	-	-	-	ImplementationDefined

Direct accesses to other offsets in this block are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

IRS_AIDR, IRS Architecture Identification Register

The IRS_AIDR characteristics are:

Purpose

IRS Architecture Identification Register. Identifies the GIC architecture version to which the implementation conforms.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_AIDR are RAZ/WI.

Attributes

IRS_AIDR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:12]

Reserved, RES0.

Component, bits [11:8]

GIC component

Component	Meaning
0b0000	IRS
0b0001	ITS
0b0010	IWB

ArchMajorRev, bits [7:4]

Major Architecture revision.

ArchMajorRev	Meaning
0b0000	GICv5.x

ArchMinorRev, bits [3:0]

Minor Architecture revision.

ArchMinorRev	Meaning
0b0000	GICv5.0

Accessing IRS_AIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0044 from IRS_CONFIG_FRAME

Accesses to this register are RO.

IRS_CR0, IRS Control Register 0

The IRS_CR0 characteristics are:

Purpose

IRS Control Register 0.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_CR0 are RAZ/WI.

Attributes

IRS_CR0 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:2]

Reserved, RES0.

IDLE, bit [1]

Whether the transition between enabled and disabled states of the IRS for the Interrupt Domain is complete.

IDLE	Meaning
0b0	The effects of updating IRSEN are not guaranteed to have completed.
0b1	The effects of updating IRSEN are have completed.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

IRSEN, bit [0]

Controls whether the IRS Forwards and Recalls candidate HPPIs to PEs for the Interrupt Domain.

This field is Guarded by IRS_CR0.IDLE.

IRSEN	Meaning
0b0	The IRS is disabled for the Interrupt Domain.
0b1	The IRS is enabled for the Interrupt Domain.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Accessing this field has the following behavior:

- When IRS_CR0.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Accessing IRS_CR0

Accesses to this register use the following encodings:

Accessible at offset 0x0080 from IRS_CONFIG_FRAME

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_CR1, IRS Control Register 1

The IRS_CR1 characteristics are:

Purpose

IRS Configuration Register 1

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_CR1 are RAZ/WI.

Attributes

IRS_CR1 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

VPED_WA, bit [15]
When IRS_IDR0.VIRT == '1':

Write-Allocate hint for the VPE descriptors.

VPED_WA	Meaning
0b0	No Write-Allocate.
0b1	Write-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

VPED_RA, bit [14]
When IRS_IDR0.VIRT == '1':

Read-Allocate hint for the VPE descriptors.

VPED_RA	Meaning
0b0	No Read-Allocate.
0b1	Read-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

VMD_WA, bit [13]
When IRS_IDR0.VIRT == '1':

Write-Allocate hint for the VM descriptors.

VMD_WA	Meaning
0b0	No Write-Allocate.
0b1	Write-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

VMD_RA, bit [12]
When IRS_IDR0.VIRT == '1':

Read-Allocate hint for the VM descriptors.

VMD_RA	Meaning
0b0	No Read-Allocate.
0b1	Read-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

VPET_WA, bit [11]
When IRS_IDR0.VIRT == '1':

Write-Allocate hint for the VPE table.

VPET_WA	Meaning
0b0	No Write-Allocate.
0b1	Write-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

VPET_RA, bit [10]
When IRS_IDR0.VIRT == '1':

Read-Allocate hint for the VPE table.

VPET_RA	Meaning
0b0	No Read-Allocate.
0b1	Read-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

VMT_WA, bit [9]
When IRS_IDR0.VIRT == '1':

Write-Allocate hint for the VM table.

VMT_WA	Meaning
0b0	No Write-Allocate.
0b1	Write-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

VMT_RA, bit [8]
When IRS_IDR0.VIRT == '1':

Read-Allocate hint for the VM table.

VMT_RA	Meaning
0b0	No Read-Allocate.
0b1	Read-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

IST_WA, bit [7]

Write-Allocate hint for ISTs.

When IRS_IDR0.VIRT is 1, this control applies to the virtual ISTs as well as the physical IST.

IST_WA	Meaning
0b0	No Write-Allocate.
0b1	Write-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

IST_RA, bit [6]

Read-Allocate hint for ISTs.

When IRS_IDR0.VIRT is 1, this control applies to the virtual ISTs as well as the physical IST.

IST_RA	Meaning
0b0	No Read-Allocate.
0b1	Read-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

IC, bits [5:4]

Controls the Inner Cacheability attribute used when the IRS accesses tables as a requester.

IC	Meaning
0b00	Non-cacheable.
0b01	Write-Back Cacheable.
0b10	Write-Through Cacheable.
0b11	Reserved, treated as 0b00.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

OC, bits [3:2]

Controls the Outer Cacheability attribute used when the IRS accesses tables as a requester.

OC	Meaning
0b00	Non-cacheable.
0b01	Write-Back Cacheable.
0b10	Write-Through Cacheable.
0b11	Reserved, treated as 0b00.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

SH, bits [1:0]

Controls the Shareability attribute used when the IRS accesses tables as a requester.

SH	Meaning
0b00	Non-shareable.
0b01	Reserved, treated as 0b00.
0b10	Outer Shareable.
0b11	Inner Shareable.

When IRS_CR1.OC is 0b00 and IRS_CR1.IC is 0b00, this field is IGNORED and behaves as Outer Shareable.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_CR1

Accesses to this register use the following encodings:

Accessible at offset 0x0084 from IRS_CONFIG_FRAME

- When IRS_IST_BASER.VALID == '1' or IRS_IST_STATUSR.IDLE == '0', accesses to this register are RO.
- When IRS_VMT_BASER.VALID == '1' or IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_IDR0, IRS Identification Register 0

The IRS_IDR0 characteristics are:

Purpose

IRS Identification Register 0. Contains read-only fields with information about the IRS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR0 are RAZ/WI.

Attributes

IRS_IDR0 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

IRSID, bits [31:16]

Unique identifier for this IRS in the system.

This value is the same across all Interrupt Domains for this IRS.

Bits [15:13]

Reserved, RES0.

SWE, bit [12]

Software error reporting support in the Interrupt Domain.

SWE	Meaning
0b0	Software error reporting is not supported.
0b1	Software error reporting is supported.

Support for Software error reporting is optional.

MPAM, bit [11]

Memory Partitioning And Monitoring (MPAM) support.

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

Support for MPAM is optional.

MEC, bit [10]
When IRS_IDR0.INT_DOM == '11':

Support for Memory Encryption Contexts (MEC) for the Realm Interrupt Domain.

MEC	Meaning
0b0	Memory Encryption Contexts are not supported.
0b1	Memory Encryption Contexts are supported.

Support for MEC is optional.

Otherwise:

Reserved, RES0.

SETLPI, bit [9]
When IRS_IDR2.LPI == '1':

Whether the IRS implements the IRS SETLPI register.

The IRS SETLPI register allows an MSI to set a physical LPI Pending without translation by an ITS.

SETLPI	Meaning
0b0	The IRS does not implement the IRS SETLPI register.
0b1	The IRS implements the IRS SETLPI register.

Otherwise:

Reserved, RES0.

VIRT_ONE_N, bit [8]

Whether virtual 1ofN is supported.

VIRT_ONE_N	Meaning
0b0	Virtual 1ofN is not supported.
0b1	Virtual 1ofN is supported.

This field is RES0, if any of the following are true:

- Virt is 0.
- ONE_N is 0.

ONE_N, bit [7]

ONE_N	Meaning
0b0	1ofN is not supported.
0b1	1ofN is supported.

VIRT, bit [6]

This field is RES0 for the EL3 Interrupt Domain

VIRT	Meaning
0b0	Virtualization is not supported.
0b1	Virtualization is supported.

PA_RANGE, bits [5:2]

Physical Address range supported.

The physical address range corresponds to the system physical address size.

The value of this field is the same for all Interrupt Domains across all IRSs in the system.

PA_RANGE	Meaning
0b0000	32 bits, 4GB
0b0001	36 bits, 64GB
0b0010	40 bits, 1TB
0b0011	42 bits, 4TB
0b0100	44 bits, 16TB
0b0101	48 bits, 256TB
0b0110	52 bits, 4PB
0b0111	56 bits, 64PB

Values not defined above are reserved.

INT_DOM, bits [1:0]

The Interrupt Domain that the register frame containing this register controls.

INT_DOM	Meaning
0b00	Secure
0b01	Non-secure
0b10	EL3
0b11	Realm

Accessing IRS_IDR0

Accesses to this register use the following encodings:

Accessible at offset 0x0000 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IDR1, IRS Identification Register 1

The IRS_IDR1 characteristics are:

Purpose

IRS Identification Register 1. Contains read-only fields with information about the IRS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR1 are RAZ/WI.

Attributes

IRS_IDR1 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:23]

Reserved, RES0.

PRI_BITS, bits [22:20]

The number of priority bits implemented, minus one.

PRI_BITS	Meaning
0b000	1 bit of priority.
0b001	2 bits of priority.
0b010	3 bits of priority.
0b011	4 bits of priority.
0b100	5 bits of priority.

Values not defined above are reserved.

When fewer than 5 bits are implemented, the lower order priority bits are RES0.

IAFFID_BITS, bits [19:16]

Number of bits of IAFFID supported - 1.

Unimplemented upper bits of IAFFID are RES0 when sending and receiving commands between a PE and the IRS, and when a level 2 ISTE becomes valid.

PE_CNT, bits [15:0]

The number of PEs connected to this IRS.

Accessing IRS_IDR1

Accesses to this register use the following encodings:

Accessible at offset 0x0004 from IRS_CONFIG_FRAME

Accesses to this register are RO.

IRS_IDR2, IRS Identification Register 2

The IRS_IDR2 characteristics are:

Purpose

IRS Identification Register 2. Contains read-only fields with information about the IRS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR2 are RAZ/WI.

Attributes

IRS_IDR2 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:20]

Reserved, RES0.

ISTMD_SZ, bits [19:15]

Describes the minimum number of INTID.ID bits which requires a level 2 ISTE size of 16 bytes to store metadata.

When the configured number of INTID.ID bits is smaller than ISTMD_SZ, the minimum required size of a level 2 ISTE is 8 bytes.

When the configured number of INTID.ID bits is larger than or equal to ISTMD_SZ, the minimum required size of a level 2 ISTE is 16 bytes.

When ISTMD is 0, this field is RES0.

ISTMD, bit [14]

Whether the IST entries contain metadata storage.

When the IST entires contain metadata storage, the size of a level 2 ISTE is 8 bytes or 16 bytes.

The size of an IST entry containing metadata depends on the configured ID range and the values reported in ISTMD_SZ.

ISTMD	Meaning
0b0	The IST entries do not require storage for metadata and the size of a level 2 ISTE is 4 bytes.
0b1	The IST entries require storage for metadata and the size of a level 2 ISTE is 8 bytes or 16 bytes.

IST_L2SZ, bits [13:11]
When IRS_IDR2.IST_LEVELS == '1':

Supported level 2 IST sizes when a 2-level IST structure is used.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IST_L2SZ	Meaning
0b001	Level 2 IST sizes supported: 4KB
0b010	Level 2 IST sizes supported: 16KB
0b011	Level 2 IST sizes supported: 4KB and 16KB
0b100	Level 2 IST sizes supported: 64KB
0b101	Level 2 IST sizes supported: 4KB and 64KB
0b110	Level 2 IST sizes supported: 16KB and 64KB
0b111	Level 2 IST sizes supported: 4KB, 16KB, and 64KB

Values not defined above are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

IST_LEVELS, bit [10]
When IRS_IDR2.LPI == '1' or IRS_IDR0.VIRT == '1':

Whether a 2-level structure is supported for the physical and virtual ISTs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IST_LEVELS	Meaning
0b0	Only a single level linear structure is supported.
0b1	2-level structure is supported in addition to the linear structure.

Access to this field is RO.

Otherwise:

Reserved, RES0.

MIN_LPI_ID_BITS, bits [9:6]
When IRS_IDR2.LPI == '1' or IRS_IDR0.VIRT == '1':

The minimum number of LPI_ID_BITS supported.

The maximum value supported for this field is 14.

When physical LPIs are not supported, this field reports the minimal supported number of virtual LPI ID bits that can be configured for each VM.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

LPI, bit [5]

Whether physical LPIs are implemented.

When physical LPIs are not supported, the physical IST registers are not implemented.

The value reported in this field has no impact on the support for virtual LPIs.

ID_BITS, bits [4:0]

The maximum number of INTID.ID bits that the IRS supports.

The maximum supported value of this field is 24.

Accessing IRS_IDR2

Accesses to this register use the following encodings:

Accessible at offset 0x0008 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IDR3, IRS Identification Register 3

The IRS_IDR3 characteristics are:

Purpose

IRS Identification Register 3. Contains read-only fields with information about the IRS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR3 are RAZ/WI.

Attributes

IRS_IDR3 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:11]

Reserved, RES0.

VMT_LEVELS, bit [10]
When IRS_IDR0.VIRT == '1':

Levels supported for the VM table.

VMT_LEVELS	Meaning
0b0	Only a single level linear structure is supported.
0b1	2-level structure is supported in addition to the linear structure.

Otherwise:

Reserved, RES0.

VM_ID_BITS, bits [9:5]
When IRS_IDR0.VIRT == '1':

The maximum number of VM ID bits that the IRS supports.

The minimum supported value of this field is 8 and the maximum supported value is 16.

Otherwise:

Reserved, RES0.

VMD_SZ, bits [4:1]
When IRS_IDR0.VIRT == '1':

Specifies the size in bytes of a VM descriptor.

Each VM descriptor is 2^(VMD_SZ) bytes.

The minimum valid value for this field is 3 and the maximum valid value is 12.

This corresponds to a minimum descriptor size of 8 bytes and a maximum descriptor size of 4096 bytes.

Otherwise:

Reserved, RES0.

VMD, bit [0]
When IRS_IDR0.VIRT == '1':

Whether each VM requires an IMPLEMENTATION DEFINED memory area.

VMD	Meaning
0b0	The VMs do not require VM descriptor areas.
0b1	Each VM requires a VM descriptor area.

Otherwise:

Reserved, RES0.

Accessing IRS_IDR3

Accesses to this register use the following encodings:

Accessible at offset 0x000C from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IDR4, IRS Identification Register 4

The IRS_IDR4 characteristics are:

Purpose

IRS Identification Register 4. Contains read-only fields with information about the IRS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR4 are RAZ/WI.

Attributes

IRS_IDR4 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:10]

Reserved, RES0.

VPE_ID_BITS, bits [9:6]

The number of VPE ID bits supported - 1.

The minimum supported value of this field is 7.

Accessing this field has the following behavior:

- When IRS_IDR0.VIRT == '0', access to this field is RES0 .
- Otherwise, access to this field is RO.

VPED_SZ, bits [5:0]

Specifies the size in bytes of a VPE Descriptor.

Each VPE Descriptor is 2^(VPED_SZ) bytes.

The minimum valid value for this field is 3 and the maximum valid value is 12.

This corresponds to a minimum descriptor size of 8 bytes and a maximum descriptor size of 4096 bytes.

Accessing this field has the following behavior:

- When IRS_IDR0.VIRT == '0', access to this field is RES0 .
- Otherwise, access to this field is RO.

Accessing IRS_IDR4

Accesses to this register use the following encodings:

Accessible at offset 0x0010 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IDR5, IRS Identification Register 5

The IRS_IDR5 characteristics are:

Purpose

IRS Identification Register 5. Contains read-only fields with information about the IRS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR5 are RAZ/WI.

Attributes

IRS_IDR5 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:25]

Reserved, RES0.

SPI_RANGE, bits [24:0]

The total number of SPIs in the system.

The maximum value reported in this field is 2^24.

The number reported in this register is the same across all Interrupt Domains and across all IRSs in a system.

Accessing IRS_IDR5

Accesses to this register use the following encodings:

Accessible at offset 0x0014 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IDR6, IRS Identification Register 6

The IRS_IDR6 characteristics are:

Purpose

IRS Identification Register 6. Contains read-only fields with information about the range of SPI INTIDs managed by this IRS.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR6 are RAZ/WI.

Attributes

IRS_IDR6 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:25]

Reserved, RES0.

SPI_IRS_RANGE, bits [24:0]

The number of SPI INTID.ID managed on this IRS.

The value reported in this field is less than or equal to the value reported in IRS_IDR5.SPI_RANGE.

If IRS_IDR5.SPI_RANGE is 0, this field is RES0.

Accessing IRS_IDR6

Accesses to this register use the following encodings:

Accessible at offset 0x0018 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IDR7, IRS Identification Register 7

The IRS_IDR7 characteristics are:

Purpose

IRS Identification Register 7. Contains read-only fields with information about the minimum SPI INTID.ID value implemented on this IRS.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IDR7 are RAZ/WI.

Attributes

IRS_IDR7 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:24]

Reserved, RES0.

SPI_BASE, bits [23:0]

The minimum SPI INTID.ID implemented on this IRS.

If IRS_IDR5.SPI_RANGE is 0 or IRS_IDR6.SPI_IRS_RANGE is 0, this field is RES0.

Accessing IRS_IDR7

Accesses to this register use the following encodings:

Accessible at offset 0x001C from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IIDR, IRS Implementer Identification Register

The IRS_IIDR characteristics are:

Purpose

IRS Implementer Identification Register. Provides information about the implementation and implementer of the GIC, and architecture version supported.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IIDR are RAZ/WI.

Attributes

IRS_IIDR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

ProductID, bits [31:20]

IMPLEMENTATION DEFINED value identifying the GIC part

When the IRS_PIDR0-IRS_PIDR1 registers are present, Arm expects that the IRS_PIDR0.PART_0 and IRS_PIDR1.PART_1 fields match the value of IRS_IIDR.ProductID.

If required, however, an implementation is permitted to provide values for the IRS_PIDR0.PART_0 and IRS_PIDR1.PART_1 fields that do not match the value of IRS_IIDR.ProductID

Variant, bits [19:16]

IMPLEMENTATION DEFINED value used to distinguish product variants, or major revisions of the product

Revision, bits [15:12]

IMPLEMENTATION DEFINED value used to distinguish minor revisions of the product

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the GIC

For an Arm implementation, the JEP106 code is 0x43B

When the CoreSight ID registers are implemented, Arm expects that the JEP106 identification code in the IRS_PIDR1-IRS_PIDR4 registers matches that reported in IRS_IIDR.

Accessing IRS_IIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0040 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_IST_BASER, IRS IST Base Address Register

The IRS_IST_BASER characteristics are:

Purpose

IRS IST Base Address Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IST_BASER are RAZ/WI.

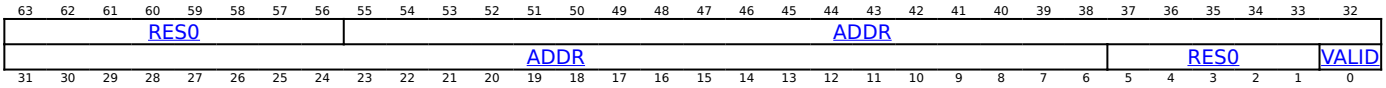
The effects of a write to this register are not guaranteed to have completed before IRS_IST_STATUSR.IDLE is 1.

Attributes

IRS_IST_BASER is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:6]

Bits[55:6] of the base physical address of the IST.

This field is Guarded by IRS_IST_BASER.VALID.

When IRS_IST_CFGR.STRUCTURE is 0, ADDR points to a linear IST and all of the following are true:

- Bits[N:0] of the resulting address are 0 where N depends on the ISTSZ and LPI_ID_BITS fields in IRS_IST_CFGR as follows:

  N = Max(5, (ISTSZ + 1) + LPI_ID_BITS).

- This means that the level 2 ISTE array is aligned to the size of the array or to a 64-byte boundary when its size is smaller than 64 bytes.

When IRS_IST_CFGR.STRUCTURE is 1, ADDR points to the level 1 table in a 2-level IST and all of the following are true:

- Bits[N:0] of the resulting address are 0 where N depends on L2SZ, ISTSZ, and LPI_ID_BITS in IRS_IST_CFGR as follows:

  N = Max(5, LPI_ID_BITS - ((10 - ISTSZ) + (2 * L2SZ)) + 2)

- This means that the level 1 IST is aligned to the size of the level 1 table or to a 64-byte boundary when its size is smaller than 64 bytes.

See 'The interrupt state table (IST)' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information.

Access to any level of the IST and any additional memory accesses occurring as a result of the address in this field are performed using the PAS of the Interrupt Domain where this register is accessed.

In implementations that support fewer than 56 bits of physical address, any unimplemented upper bits are RES0. The number of implemented address bits is reported in IRS_IDR0.PA_RANGE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_IST_BASER.VALID == '1', access to this field is RO.
- Otherwise, access to this field is RW.

Bits [5:1]

Reserved, RES0.

VALID, bit [0]

Whether the ADDR points to a valid IST.

VALID	Meaning
0b0	The IST address is not valid.
0b1	The IST address is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Accessing IRS_IST_BASER

Accesses to this register use the following encodings:

Accessible at offset 0x0180 from IRS_CONFIG_FRAME

- When IRS_IDR2.LPI == '0', accesses to this register are RAZ/WI.
- When IRS_IST_STATUSR.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_IST_CFGR, IRS IST Configuration Register

The IRS_IST_CFGR characteristics are:

Purpose

IRS IST Configuration Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IST_CFGR are RAZ/WI.

Attributes

IRS_IST_CFGR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:17]

Reserved, RES0.

STRUCTURE, bit [16]

Whether the IST uses a linear or 2-level structure.

STRUCTURE	Meaning
0b0	A linear IST structure is used.
0b1	A 2-level IST structure is used.

When IRS_IDR2.IST_LEVELS is 0, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [15:9]

Reserved, RES0.

ISTSZ, bits [8:7]

The size of each level 2 ISTE.

If this field is programmed to specify a size smaller than the minimum required size or programmed to a reserved value, it is treated as having the value corresponding to the minimum required size for all other purposes than a direct read of the register.

See 'The interrupt state table (IST)' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information about the minimum required size.

ISTSZ	Meaning
0b00	The size of a level 2 ISTE is 4 bytes.
0b01	The size of a level 2 ISTE is 8 bytes.
0b10	The size of a level 2 ISTE is 16 bytes.

Values not defined above are reserved.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

L2SZ, bits [6:5]

Level 2 IST size when a 2-level IST structure is used.

L2SZ	Meaning
0b00	The level 2 IST size is 4KB.
0b01	The level 2 IST size is 16KB.
0b10	The level 2 IST size is 64KB.

Values not defined above are reserved.

IRS_IDR2.IST_L2SZ reports the supported values.

If LPI_ID_BITS <= ((10 - ISTSZ) + (2 * L2SZ)) and STRUCTURE is 1, all of the following are true:

- The IST consists of a single L1_ISTE and a single level 2 IST.
- The level 2 IST contains (2 ^ LPI_ID_BITS) entries.
- The IRS Domain is allowed to access the full level 2 IST size as specified by L2SZ.

Arm recommends that STRUCTURE is 0 when LPI_ID_BITS <= ((10 - ISTSZ) + (2 * L2SZ)).

See 'The interrupt state table (IST)' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information.

If programming a reserved value or an unsupported value, the IRS Domain behavior is CONSTRAINED UNPREDICTABLE to any behavior which could be achieved by programming a valid and supported value.

When STRUCTURE is 0, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

LPI_ID_BITS, bits [4:0]

The number of LPIs for the IRS Domain.

The IST contains 2^(LPI_ID_BITS) level 2 IST entries in total.

The minimum value for this field is IRS_IDR2.MIN_LPI_ID_BITS.

If programmed to a value smaller than the minimum, the field is treated as having the minimum value for all other purposes than reading back the field.

The maximum value for this field is IRS_IDR2.ID_BITS.

If this field is programmed to a value larger than the maximum, it is treated as having the maximum value for all other purposes than a direct read of the register. The maximum value is reported in IRS_IDR2.ID_BITS.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_IST_CFGR

Accesses to this register use the following encodings:

Accessible at offset 0x0190 from IRS_CONFIG_FRAME

- When IRS_IDR2.LPI == '0', accesses to this register are RAZ/WI.
- When IRS_IST_BASER.VALID == '1' or IRS_IST_STATUSR.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

IRS_IST_STATUSR, IRS Physical IST Management Status Register

The IRS_IST_STATUSR characteristics are:

Purpose

IRS Physical IST Management Status Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_IST_STATUSR are RAZ/WI.

Attributes

IRS_IST_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Whether the effects of any of the following writes are complete:

- A write that updates IRS_IST_BASER.VALID.
- A write to IRS_MAP_L2_ISTR.ID.

IDLE	Meaning
0b0	The effects of the write are not complete.
0b1	The effects of the write are complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

Accessing IRS_IST_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x0194 from IRS_CONFIG_FRAME

- When IRS_IDR2.LPI == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_MAP_L2_ISTR, IRS Map Physical Level 2 IST Register

The IRS_MAP_L2_ISTR characteristics are:

Purpose

IRS Map Physical Level 2 IST Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_MAP_L2_ISTR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_IST_STATUSR.IDLE is 1.

Attributes

IRS_MAP_L2_ISTR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

A write to this register makes the specified physical level 2 IST valid.

There are no effects of a write to this register, if any of the following are true:

- The physical IST is invalid.
- The physical IST uses a linear structure.
- The LPI INTID.ID is outside the configured physical LPI range.
- The level 2 IST is already valid.

Bits [31:24]

Reserved, RES0.

ID, bits [23:0]

An LPI INTID.ID covered by the level 1 ISTE corresponding to the level 2 IST that is made valid.

If unimplemented upper bits of the INTID.ID are not zero, it is IMPLEMENTATION DEFINED whether the upper bits are treated as 0 or the interrupt message is ignored by the IRS.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Accessing IRS_MAP_L2_ISTR

Accesses to this register use the following encodings:

Accessible at offset 0x01C0 from IRS_CONFIG_FRAME

- When IRS_IDR2.LPI == '0', accesses to this register are RAZ/WI.
- When IRS_IST_STATUSR.IDLE == '0', accesses to this register are UNKNOWN/WI.
- When IRS_IST_BASER.VALID == '0', accesses to this register are UNKNOWN/WI.
- When IRS_IST_CFGR.STRUCTURE == '0', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IRS_MEC_IDR, IRS MEC Identification Register

The IRS_MEC_IDR characteristics are:

Purpose

IRS MEC Identification Register. Contains read-only fields with information about the IRS support for MEC.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_MEC_IDR are RAZ/WI.

Attributes

IRS_MEC_IDR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:4]

Reserved, RES0.

MECIDSIZE, bits [3:0]
When IRS_IDR0.MEC == '1':

The number of bits minus one of MECID supported by the IRS.

The maximum permitted value is 0xF which indicates a MECID width of 16 bits.

The value 0x0 is a valid encoding and indicates that one bit of MECID is supported.

Otherwise:

Reserved, RES0.

Accessing IRS_MEC_IDR

Accesses to this register use the following encodings:

Accessible at offset 0x0340 from IRS_CONFIG_FRAME

- When IRS_IDR0.INT_DOM != '11', accesses to this register are RAZ/WI.
- When IRS_IDR0.MEC != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_MEC_MECID_R, IRS MEC MECID Register for the Realm PAS

The IRS_MEC_MECID_R characteristics are:

Purpose

IRS MEC MECID Register for the Realm PAS.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_MEC_MECID_R are RAZ/WI.

Attributes

IRS_MEC_MECID_R is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

MECID, bits [15:0]

MECID for IRS access to Realm PA space for:

- Accesses to physical and virtual IST entries.
- Accesses to VM table entries and VPE table entrie.
- Accesses to VM descriptors and VPE descriptors.

Bits above the supported MECID size, indicated in IRS_MEC_IDR.MECIDSIZE are RES0.

If MECIDSIZE is less than 0xF, the IRS treats bits [15:MECIDSIZE+1] of this field as zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_MEC_MECID_R

Accesses to this register use the following encodings:

Accessible at offset 0x0344 from IRS_CONFIG_FRAME

- When IRS_IDR0.INT_DOM != '11', accesses to this register are RAZ/WI.
- When IRS_IDR0.MEC != '1', accesses to this register are RAZ/WI.
- When IRS_IST_BASER.VALID == '1' or IRS_IST_STATUSR.IDLE == '0', accesses to this register are RO.
- When IRS_VMT_BASER.VALID == '1' or IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_MPAM_IDR, IRS MPAM Identification Register

The IRS_MPAM_IDR characteristics are:

Purpose

IRS MPAM Identification Register. Contains read-only fields with information about the IRS support for MPAM.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_MPAM_IDR are RAZ/WI.

Attributes

IRS_MPAM_IDR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:25]

Reserved, RES0.

HAS_MPAM_SP, bit [24]

Whether the IRS has support for MPAM PARTID space selection for the Interrupt Domain.

If HAS_MPAM_SP is 1, the IRS uses the MPAM PARTID specified by IRS_MPAM_PARTID_R.MPAM_SP.

If HAS_MPAM_SP is 0, the following PARTID space is used for IRS accesses to memory:

- Accesses made for the Secure Interrupt Domain use the Secure PARTID space.
- Accesses made for the Non-secure Interrupt Domain use the Non-secure PARTID space.
- Accesses made for the EL3 Interrupt Domain use the Root or Secure PARTID space.
- Accesses made for the Realm Interrupt Domain use the Realm PARTID space.

The value of this field is the same across all Interrupt Domains for an IRS.

PMG_MAX, bits [23:16]

The maximum PMG value that is permitted to be used for the IRS for the Interrupt Domain.

The PMG bit width is defined as the bit position of the most significant 1 in PMG_MAX[7:0], plus one, or is defined as zero if PMG_MAX is zero.

For example, if PMG_MAX == 0x0F, the PMG bit width is 4.

This field is permitted to be zero-sized.

PARTID_MAX, bits [15:0]

The maximum PARTID value that is permitted to be used for the IRS for the Interrupt Domain.

The PARTID bit width is defined as the bit position of the most significant 1 in PARTID_MAX[15:0], plus one, or is defined as zero if PARTID_MAX is zero.

For example, if PARTID_MAX == 0x0034, the PARTID bit width is 6.

This field is permitted to be zero-sized, but Arm recommends that it is non-zero when MPAM is implemented.

Accessing IRS_MPAM_IDR

Accesses to this register use the following encodings:

Accessible at offset 0x0380 from IRS_CONFIG_FRAME

- When IRS_IDR0.MPAM != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

IRS_MPAM_PARTID_R, IRS MPAM PARTID and PMG Register

The IRS_MPAM_PARTID_R characteristics are:

Purpose

IRS MPAM PARTID and PMG Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_MPAM_PARTID_R are RAZ/WI.

Attributes

IRS_MPAM_PARTID_R is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

IDLE, bit [31]

Whether the effects of the previous write to this register are complete.

IDLE	Meaning
0b0	The effects of the previous write to this register are not complete.
0b1	The effects of the previous write to this register are complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

Bits [30:26]

Reserved, RES0.

MPAM_SP, bits [25:24]
When IRS_MPAM_IDR.HAS_MPAM_SP == '1' and IRS_IDR0.INT_DOM == '00':

MPAM PARTID space for the IRS for the Secure Interrupt Domain.

This field is Guarded by IRS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b00	Secure PARTID space.
0b01	Non-secure PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the IRS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When IRS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

When IRS_MPAM_IDR.HAS_MPAM_SP == '1' and IRS_IDR0.INT_DOM == '01':

MPAM PARTID space for the IRS for the Non-secure Interrupt Domain.

This field is Guarded by IRS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b01	Non-secure PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the IRS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When IRS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

When IRS_MPAM_IDR.HAS_MPAM_SP == '1' and IRS_IDR0.INT_DOM == '10':

MPAM PARTID space for the IRS for the EL3 Interrupt Domain.

This field is Guarded by IRS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b00	Secure PARTID space.
0b01	Non-secure PARTID space.
0b10	Root PARTID space.
0b11	Realm PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the IRS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When IRS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

When IRS_MPAM_IDR.HAS_MPAM_SP == '1' and IRS_IDR0.INT_DOM == '11':

MPAM PARTID space for the IRS for the Realm Interrupt Domain.

This field is Guarded by IRS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b01	Non-secure PARTID space.
0b11	Realm PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the IRS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When IRS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

PMG, bits [23:16]

PMG for accesses to memory by the IRS for the Interrupt Domain.

Bits above the supported PMG bit width, as indicated by IRS_MPAM_IDR.PMG_MAX, are RES0.

If a value greater than IRS_MPAM_IDR.PMG_MAX is programmed, an UNKNOWN PMG is used.

This field is Guarded by IRS_MPAM_PARTID_R.IDLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to '00000000'.

Accessing this field has the following behavior:

- When IRS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

PARTID, bits [15:0]

PARTID for accesses to memory by the IRS for the Interrupt Domain.

Bits above the supported PARTID bit width, as indicated by IRS_MPAM_IDR.PARTID_MAX, are RES0.

If a value greater than IRS_MPAM_IDR.PARTID_MAX is programmed, an UNKNOWN PARTID is used.

This field is Guarded by IRS_MPAM_PARTID_R.IDLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0000000000000000'.

Accessing this field has the following behavior:

- When IRS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Accessing IRS_MPAM_PARTID_R

Accesses to this register use the following encodings:

Accessible at offset 0x0384 from IRS_CONFIG_FRAME

- When IRS_IDR0.MPAM != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_PE_CR0, IRS PE Control Register 0

The IRS_PE_CR0 characteristics are:

Purpose

IRS PE Control Register 0.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_PE_CR0 are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_PE_STATUSR.IDLE is 1.

Following a write to this register, IRS_PE_STATUSR.V is updated.

Attributes

IRS_PE_CR0 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

The fields in this register provide access to the configuration of the PE specified in the last write to IRS_PE_SELR.

The PE configuration applies to the IRS Domain corresponding to the IRS configuration register frame that this register is accessed in.

Bits [31:1]

Reserved, RES0.

DPS, bit [0]
When IRS_IDR0.ONE_N == '1':

Disable 1ofN PE selection.

DPS	Meaning
0b0	1ofN PE selection is enabled. An interrupt configured to use the 1ofN Routing mode is permitted to select this PE.
0b1	1ofN PE selection is disabled. An interrupt configured to use the 1ofN Routing mode is not permitted to select this PE.

This field determines whether the selected PE is permitted to be selected for 1ofN interrupt delivery.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing IRS_PE_CR0

Accesses to this register use the following encodings:

Accessible at offset 0x0148 from IRS_CONFIG_FRAME

- When IRS_PE_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_PE_SELR, IRS PE Selection Register

The IRS_PE_SELR characteristics are:

Purpose

IRS PE Selection Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_PE_SELR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_PE_STATUSR.IDLE is 1.

Attributes

IRS_PE_SELR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

IAFFID, bits [15:0]

PE interrupt Affinity ID.

Selects a PE whose configuration can be accessed via IRS_PE_CR0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_PE_SELR

Accesses to this register use the following encodings:

Accessible at offset 0x0140 from IRS_CONFIG_FRAME

- When IRS_PE_STATUSR.IDLE == '0', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IRS_PE_STATUSR, IRS PE Status Register

The IRS_PE_STATUSR characteristics are:

Purpose

IRS PE Status Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_PE_STATUSR are RAZ/WI.

Attributes

IRS_PE_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

The fields in this register return information about the PE specified in the last write to IRS_PE_SELR and the status of the last write to IRS_PE_CR0.

Bits [31:3]

Reserved, RES0.

ONLINE, bit [2]

Whether the PE is online or offline.

When the IRS determines that there is a candidate HPPI for the PE and the PE is offline the IRS generates a Wake Request to the PE.

When the IRS determines that there is a candidate HPPI for the PE and the PE is online the IRS Forwards the candidate HPPI to the PE.

When {V, IDLE} is not '0b11', the value of this field is UNKNOWN.

ONLINE	Meaning
0b0	The PE is offline.
0b1	The PE is online.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

V, bit [1]

Whether the value last written to IRS_PE_SELR selected a valid PE.

When IDLE is 0, the value of this field is UNKNOWN.

V	Meaning
0b0	The PE selected using IRS_PE_SELR is not valid.
0b1	The PE selected using IRS_PE_SELR is valid.

This field resets to 0 to indicate that there was no write to IRS_PE_SELR that selected a valid PE since the IRS was reset.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

IDLE, bit [0]

Following a write to IRS_PE_SELR, when this field returns 1 and V is 1, a read from IRS_PE_CR0 returns the configuration value for the PE when the accesses are performed on the same IRS.

Following a write to IRS_PE_CR0, when this field returns 1, the effects of the write have completed.

IDLE	Meaning
0b0	The effects of writing to IRS_PE_SELR and IRS_PE_CR0 are not guaranteed to be complete.
0b1	The effects of writing to IRS_PE_SELR and IRS_PE_CR0 are complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Accessing IRS_PE_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x0144 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_SAVE_VM_STATUSR, IRS Save VM Status Register

The IRS_SAVE_VM_STATUSR characteristics are:

Purpose

IRS Save VM Status Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SAVE_VM_STATUSR are RAZ/WI.

Attributes

IRS_SAVE_VM_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

The fields in this register return information about the last write to IRS_SAVE_VMR.

Bits [31:2]

Reserved, RES0.

Q, bit [1]

Reports whether the VM specified by IRS_SAVE_VMR.VM_ID was in the Quiesced state at the time of the most recent write to IRS_SAVE_VMR.S that set it to 1, and whether it remained in the Quiesced state until one of the following occurs:

- The operation that saves the state and configuration of virtual interrupts to the virtual ISTs is complete and IDLE is 1.
- A write sets IRS_SAVE_VMR.Q to 1 and IDLE is 1.

This field is UNKNOWN, if any of the following are true:

- From the time the value in IRS_SAVE_VMR.VM_ID was last changed, there has not been a write that set IRS_SAVE_VMR.S to 1.
- The VM ID specifies an invalid VM.
- IDLE is 0.

See 'Save and restore of virtual interrupts' for more information.

Q	Meaning
0b0	The VM is not Quiesced.
0b1	The VM is Quiesced.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

IDLE, bit [0]

Reports the status of the last write to IRS_SAVE_VMR.

IDLE	Meaning
0b0	The effects of the last write to IRS_SAVE_VMR are not guaranteed to be complete.
0b1	The effects of the last write to IRS_SAVE_VMR are complete.

This field resets to 1 to allow initial writes to registers Guarded by this field. Because there has been no write at reset, this does not imply that any invalidate operation is complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Accessing IRS_SAVE_VM_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x0308 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_SAVE_VMR, IRS Save VM Register

The IRS_SAVE_VMR characteristics are:

Purpose

IRS Save VM Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SAVE_VMR are RAZ/WI.

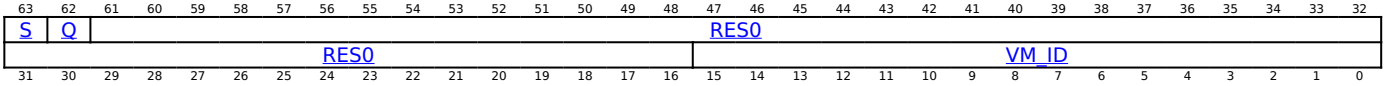
The effects of a write to this register are not guaranteed to have completed before IRS_SAVE_VM_STATUSR.IDLE is 1.

Attributes

IRS_SAVE_VMR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



S, bit [63]

Writing 1 to this field initiates the operation to save the state and configuration of virtual interrupts for the VM identified by VM_ID to the virtual ISTs.

The operation is complete when IRS_SAVE_VMSTATUSR.IDLE is 1. At that point, IRS_SAVE_VMSTATUSR.Q indicates whether the VM remained in the Quiesced state throughout the operation.

S	Meaning
0b0	The write has no effect on the virtual ISTs.
0b1	The write saves the state of virtual interrupts to the virtual ISTs.

Access to this field is WO/UNKNOWN.

Q, bit [62]

Writing 1 to this field queries whether the VM specified by VM_ID is Quiesced on all IRSs since the last write that set S to 1 and returns the result in IRS_SAVE_VM_STATUSR.Q when IRS_SAVE_VM_STATUSR.IDLE is 1.

When a write sets S to 1, the value written to this field is IGNORED.

Following a write that updates VM_ID, if there has been no write that set S to 1, the value returned in IRS_SAVE_VM_STATUSR.Q is UNKNOWN.

Q	Meaning
0b0	The write has no effect on the value returned in IRS_SAVE_VM_STATUSR.Q.
0b1	The write queries whether the VM is Quiesced on all IRSs since the last write that set S to 1.

Access to this field is WO/UNKNOWN.

Bits [61:16]

Reserved, RES0.

VM_ID, bits [15:0]

The VM ID specifying the VM whose virtual interrupt state should be written to the ISTs.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_SAVE_VMR

Accesses to this register use the following encodings:

Accessible at offset 0x0300 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_SAVE_VM_STATUSR.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_SPI_CFGR, IRS SPI Configuration Register

The IRS_SPI_CFGR characteristics are:

Purpose

IRS SPI Configuration Register.

Allows software to read and update the configuration of the SPI selected by IRS_SPI_SELR.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SPI_CFGR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_SPI_STATUSR.IDLE is 1.

Following a write to this register, IRS_SPI_STATUSR.V is updated.

Attributes

IRS_SPI_CFGR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

This register is updated after a write to IRS_SPI_SELR when IRS_SPI_STATUSR.{V, IDLE} is {1, 1}.

Bits [31:1]

Reserved, RES0.

TM, bit [0]

The Trigger mode of the SPI.

TM	Meaning
0b0	Edge-triggered
0b1	Level-sensitive

It is IMPLEMENTATION DEFINED whether access to this field for the selected SPI is RW or RO.

Note: This field controls the type of event generated by SPI signals. This is a separate control from the INTID Handling mode.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_SPI_CFGR

Accesses to this register use the following encodings:

Accessible at offset 0x0114 from IRS_CONFIG_FRAME

- When IRS_SPI_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_SPI_DOMAINR, IRS SPI Interrupt Domain Configuration Register

The IRS_SPI_DOMAINR characteristics are:

Purpose

IRS SPI Interrupt Domain Configuration Register.

Allows software to read and update the Interrupt Domain assignment of the SPI selected by IRS_SPI_SELR.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SPI_DOMAINR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_SPI_STATUSR.IDLE is 1.

Following a write to this register, IRS_SPI_STATUSR.V is updated.

Attributes

IRS_SPI_DOMAINR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

This register is updated after a write to IRS_SPI_SELR when IRS_SPI_STATUSR.{V, IDLE} is {1, 1}.

Bits [31:2]

Reserved, RES0.

DOMAIN, bits [1:0]

Configures the Interrupt Domain associated with the SPI.

Some SPIs may be statically assigned to a Domain, in which case this field always returns the statically assigned Domain for the SPI.

To check if a SPI can be dynamically assigned to a Domain, software must read back the value in this field after attempting an update to establish if the update was successful once IRS_SPI_STATUSR.IDLE is 1.

DOMAIN	Meaning
0b00	Secure
0b01	Non-secure
0b10	EL3
0b11	Realm

Programming an Interrupt Domain not supported by the IRS results in CONSTRAINED UNPREDICTABLE behavior with the following options:

- The SPI behaves as if it is not assigned to any Interrupt Domain.
- The SPI is treated as being assigned to another supported Interrupt Domain for all other purposes than reading back this field

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_SPI_DOMAINR

Accesses to this register use the following encodings:

Accessible at offset 0x010C from IRS_CONFIG_FRAME

- When IRS_IDR0.INT_DOM != '10', accesses to this register are RAZ/WI.
- When IRS_SPI_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_SPI_RESAMPLER, IRS SPI Resample Register

The IRS_SPI_RESAMPLER characteristics are:

Purpose

IRS SPI Resample Register.

Resample an SPI signal.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SPI_RESAMPLER are RAZ/WI.

Attributes

IRS_SPI_RESAMPLER is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

This register allows resampling an SPI.

Bits [31:24]

Reserved, RES0.

SPI_ID, bits [23:0]

SPI INTID.ID of the SPI to resample.

Following a write to this register, if all of the following are true, the SPI is resampled:

- The SPI is managed on this IRS.
- The SPI can be accessed in this IRS Domain.

Otherwise, the write to this register has no effect.

See 'Physical SPIs' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_SPI_RESAMPLER

Accesses to this register use the following encodings:

Accessible at offset 0x0110 from IRS_CONFIG_FRAME

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IRS_SPI_SELR, IRS SPI Selection Register

The IRS_SPI_SELR characteristics are:

Purpose

IRS SPI Selection Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SPI_SELR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_SPI_STATUSR.IDLE is 1.

Attributes

IRS_SPI_SELR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:24]

Reserved, RES0.

ID, bits [23:0]

Selects the SPI that the following registers access:

- IRS_SPI_CFGR
- IRS_SPI_DOMAINR
- IRS_SPI_VMR

Only implemented SPIs with INTID.ID in the range from IRS_IDR7.SPI_BASE to (IRS_IDR7.SPI_BASE + IRS_IDR6.SPI_IRS_RANGE - 1) may be selected.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_SPI_SELR

Accesses to this register use the following encodings:

Accessible at offset 0x0108 from IRS_CONFIG_FRAME

- When IRS_SPI_STATUSR.IDLE == '0', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IRS_SPI_STATUSR, IRS SPI Status Register

The IRS_SPI_STATUSR characteristics are:

Purpose

IRS SPI Status Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SPI_STATUSR are RAZ/WI.

Attributes

IRS_SPI_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:2]

Reserved, RES0.

V, bit [1]

Whether the value last written to IRS_SPI_SELR selects a valid SPI that is managed on this IRS and can be accessed in this IRS Domain.

This field is updated if and only if a write occurs to any of the following registers in this IRS Domain:

- IRS_SPI_CFGR
- IRS_SPI_SELR
- IRS_SPI_VMR

Following a write to any of the above registers, if this field returns 0, the write to the register has no effects other than updating the values in this register.

SPIs with INTID.ID in the range described by IRS_IDR7.SPI_BASE and IRS_IDR6.SPI_IRS_RANGE are managed on this IRS.

If the in IRS_SPI_SELR specifies an SPI and all of the following are true, this field returns 1:

- The selected SPI is implemented.
- The selected SPI is managed by this IRS.
- The selected SPI is assigned to this IRS Domain or this IRS Domain is the EL3 IRS Domain.

Otherwise, this field returns 0.

When IDLE is 0, the value of this field is UNKNOWN.

V	Meaning
0b0	The SPI selected using IRS_SPI_SELR is not a valid SPI that is managed on this IRS and can be accessed in this IRS Domain.
0b1	The SPI selected using IRS_SPI_SELR is a valid SPI that is managed on this IRS and can be accessed in this IRS Domain.

This field resets to 0 to indicate that there was no write to IRS_SPI_SELR that selected a valid SPI that is managed on this IRS since the IRS was reset.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

IDLE, bit [0]

Whether writes to any of the following registers have completed:

- IRS_SPI_CFGR
- IRS_SPI_DOMAINR
- IRS_SPI_SELR

- IRS_SPI_VMR

Following a write to IRS_SPI_SELR, when {IDLE, V} is {1, 1}, a read from any of the other registers returns the configuration value for the SPI.

Following a write to any of the registers listed above, on this IRS, when {IDLE, V} is {1, 1}, the effects of the write are complete.

IDLE	Meaning
0b0	The effects of writing to the SPI selection and configuration registers are not guaranteed to have completed.
0b1	The effects of writing to the SPI selection and configuration registers have completed.

This field resets to 1 to allow initial writes to registers Guarded by this field. Because there has been no write at reset, this does not imply that any invalidate operation is complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Accessing IRS_SPI_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x0118 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_SPI_VMR, IRS SPI VM Assignment Register

The IRS_SPI_VMR characteristics are:

Purpose

IRS SPI VM Assignment Register.

Allows software to read and update the VM assignment of the SPI selected by IRS_SPI_SELR.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SPI_VMR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_SPI_STATUSR.IDLE is 1.

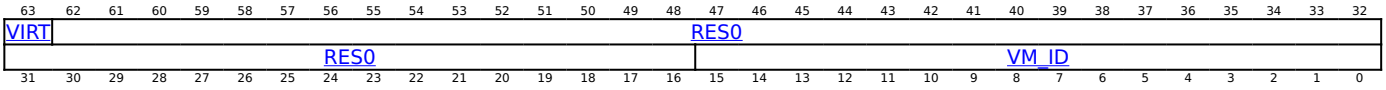
Following a write to this register, IRS_SPI_STATUSR.V is updated.

Attributes

IRS_SPI_VMR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



This register is updated after a write to IRS_SPI_SELR when IRS_SPI_STATUSR.{V, IDLE} is {1, 1}.

VIRT, bit [63]

Whether the SPI selected by IRS_SPI_SELR is assigned as a virtual SPI to the VM.

VIRT	Meaning
0b0	The SPI is not assigned to a VM.
0b1	The SPI is assigned to the VM specified by VM_ID.

Bits [62:16]

Reserved, RES0.

VM_ID, bits [15:0]

Identifies the VM.

On a read, when VIRT is 0, the value of this field is UNKNOWN.

On a write, if the existing value of VIRT is 1, the write to this field is IGNORED.

Accessing IRS_SPI_VMR

When the value of VIRT in the register is 1, meaning that the selected SPI is assigned to a VM, any write that does not set VIRT to 0 is ignored.

To assign an SPI to a different VM, the SPI must first be unassigned from the old VM, and then subsequently assigned to the new VM.

Accesses to this register use the following encodings:

Accessible at offset 0x0100 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_SPI_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- When !IsSPIDVISupported(IRS_SPI_SELR.ID), accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

IRS_SWERR_STATUSR, IRS Software Error Status Register

The IRS_SWERR_STATUSR characteristics are:

Purpose

IRS Software Error Status Register. Specifies whether a software error has been reported. If an error is reported, it contains syndrome information for the error.

Configuration

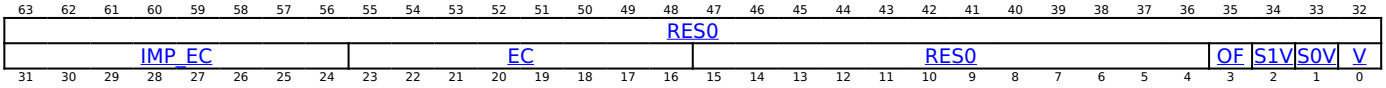
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SWERR_STATUSR are RAZ/WI.

Attributes

IRS_SWERR_STATUSR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMP_EC, bits [31:24]

IMPLEMENTATION DEFINED error code when IRS_SWERR_STATUS.EC == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RES0 if any the following are true:
  - IRS_SWERR_STATUSR.V == '0'.
  - IRS_SWERR_STATUSR.EC != '0'.
- Otherwise, access to this field is RO.

EC, bits [23:16]

Specifies the error code that software can use to triage and handle the error.

EC	Meaning
0x00	An error was reported because of an IMPLEMENTATION DEFINED reason.
0x01	Failed access to L1_ISTE due to an external abort.
0x02	Failed access to L2_ISTE due to an external abort.
0x03	Failed access to L1_VMTE due to an external abort.
0x04	Failed access to L2_VMTE due to an external abort.
0x05	Failed access to VPE Table due to an external abort.
0x06	Failed access to VPE descriptor due to an external abort.
0x07	Failed access to VM descriptor due to an external abort.
0x08	A physical LPI could not be processed because IRS_IST_BASER.VALID is 0.
0x09	A physical LPI could not be processed because L1_ISTE.VALID is 0.
0x0A	A physical LPI was not processed because the LPI INTID.ID > (2 ^ IRS_IST_CFGR.LPI_ID_BITS) - 1.
0x0B	A virtual interrupt could not be processed because L1_ISTE.VALID is 0
0x0C	A virtual interrupt could not be processed because L1_VMTE.VALID is 0.
0x0D	A virtual interrupt could not be processed because L2_VMTE.VALID is 0.
0x0E	A virtual LPI was not processed because L2_VMTE.LPI_IST_VALID is 0.
0x0F	A virtual SPI was not processed because L2_VMTE.SPI_IST_VALID is 0.
0x10	A virtual LPI was not processed because the LPI INTID.ID > (2 ^ L2_VMTE.LPI_ID_BITS) - 1.
0x11	A virtual SPI was not processed because the SPI INTID.ID > (2 ^ L2_VMTE.SPI_ID_BITS) - 1.
0x12	A virtual LPI signaled by an ITS was not processed because the VM ID > (2 ^ IRS_VMT_CFGR.VM_ID_BITS) - 1.
0x13	A virtual interrupt was not processed because the VPE ID > (2 ^ L2_VMTE.VPE_ID_BITS) - 1.
0x14	A virtual interrupt was signaled in a non-EL3 Interrupt Domain by an ITS, or via the GIC VDPEND system instruction, and the interrupt was unreachable because IRS_IDR0.VIRT is 0 or the VM was invalid.
0x15	A physical interrupt whose Routing mode is Targeted specified an invalid IAFFID.
0x16	A virtual interrupt whose Routing mode is Targeted specified a VPE ID that is < 2 ^ L2_VMTE.VPE_ID_BITS but invalid otherwise.
0x17	The IRS was trying to signal a VPE doorbell but the VPE doorbell INTID is unreachable.

0x19	The IRS has detected corrupt metadata in the L2_ISTE.
0x1A	The IRS has detected corrupt metadata in a VPE descriptor.
0x1B	The IRS has detected corrupt metadata in a VM descriptor.
0x1C	IRS_MAP_L2_ISTR was written when IRS_IST_STATUSR.IDLE == 0.
0x1D	IRS_VMAP_L2_VMTR was written when IRS_VMT_STATUSR.IDLE == 0.
0x1E	IRS_VMAP_VMR was written when IRS_VMT_STATUSR.IDLE == 0.
0x1F	IRS_VMAP_VISTR was written when IRS_VMT_STATUSR.IDLE == 0.
0x20	IRS_VMAP_L2_VISTR was written when IRS_VMT_STATUSR.IDLE == 0.
0x21	IRS_VMAP_VPER was written when IRS_VMT_STATUSR.IDLE == 0.
0x22	IRS_IST_BASER was written when IRS_IST_STATUSR.IDLE == 0.
0x23	IRS_PE_SELR was written when IRS_PE_STATUSR.IDLE == 0.
0x24	IRS_SAVE_VMR was written when IRS_SAVE_VM_STATUSR.IDLE == 0.
0x25	IRS_SPI_SELR was written when IRS_SPI_STATUSR.IDLE == 0.
0x26	IRS_SYNCR was written when IRS_SYNC_STATUSR.IDLE == 0.
0x27	IRS_VM_SELR was written when IRS_VM_STATUSR.IDLE == 0.
0x28	IRS_VMT_BASER was written when IRS_VMT_STATUSR.IDLE == 0.
0x29	IRS_VPE_SELR was written when IRS_VPE_STATUSR.IDLE == 0.
0x2A	The IRS has detected that L2_ISTE.IRM is 1 and 1ofN is not supported.
0x2B	A resample request for an SPI from a write to IRS_SPI_RESAMPLER failed.

All other values are reserved.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Bits [15:4]

Reserved, RES0.

OF, bit [3]

Specifies whether multiple software errors have been detected.

When this field is 1, the syndrome information reports information about the error that last caused IRS_SWERR_STATUSR.V to transition from 0 to 1.

OF	Meaning
0b0	No errors have been detected, since the error that was reported when IRS_SWERR_STATUSR.V last transitioned from 0 to 1.
0b1	At least one error has been detected, since the error that was reported when IRS_SWERR_STATUSR.V last transitioned from 0 to 1.

When clearing IRS_SWERR_STATUSR.V to 0, if this field is nonzero, software writes 1 to clear this field to zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

S1V, bit [2]

Specifies whether IRS_SWERR_SYNDROMER1 is valid.

S1V	Meaning
0b0	IRS_SWERR_SYNDROMER1 is not valid.
0b1	IRS_SWERR_SYNDROMER1 is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

S0V, bit [1]

Specifies whether IRS_SWERR_SYNDROMER0 is valid.

S0V	Meaning
0b0	IRS_SWERR_SYNDROMER0 is not valid.
0b1	IRS_SWERR_SYNDROMER0 is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

V, bit [0]

Specifies whether other fields in this register are valid and at least one software error has been reported.

V	Meaning
0b0	IRS_SWERR_STATUSR is not valid.
0b1	IRS_SWERR_STATUSR is valid.

Software writes 1 to this field to clear it to zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Access to this field is W1C.

Accessing IRS_SWERR_STATUSR

After reading IRS_SWERR_STATUSR, software clears the valid fields in the register to allow new errors to be reported.

However, between reading the register and clearing the valid fields, a new error might have overwritten the register.

To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

This is done by ensuring a write to the register is ignored if all of the following are true:

- Any of IRS_SWERR_STATUSR.{V, OF} are nonzero before the write.
- The write does not clear the nonzero IRS_SWERR_STATUSR.{V, OF} fields to zero by writing ones to the applicable field or fields.

Accesses to this register use the following encodings:

Accessible at offset 0x03C0 from IRS_CONFIG_FRAME

- When IRS_IDR0.SWE != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_SWERR_SYNDROMER0, IRS Software Error Syndrome Register 0

The IRS_SWERR_SYNDROMER0 characteristics are:

Purpose

IRS Software Error Syndrome Register 0. Records IRS specific software error syndrome information.

Configuration

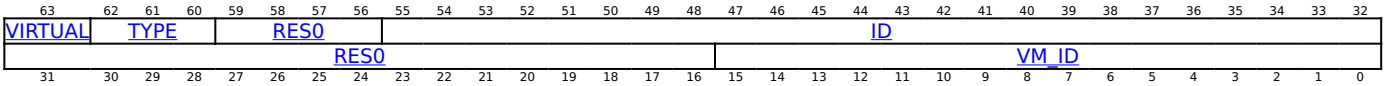
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SWERR_SYNDROMER0 are RAZ/WI.

Attributes

IRS_SWERR_SYNDROMER0 is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



VIRTUAL, bit [63]

Specifies whether the error syndrome information is for a physical or virtual interrupt.

VIRTUAL	Meaning
0b0	The error syndrome information is for a physical interrupt
0b1	The error syndrome information is for a virtual interrupt

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

TYPE, bits [62:60]

The type of the interrupt for which an error was detected.

TYPE	Meaning
0b010	LPI
0b011	SPI

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [59:56]

Reserved, RES0.

ID, bits [55:32]

ID of the interrupt for which an error was detected.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [31:16]

Reserved, RES0.

VM_ID, bits [15:0]

Bits[15:0] of the VM ID of the virtual interrupt that could not be routed by the IRS as described below.

- For a virtual LPI, this is the VM ID specified in the incoming interrupt event.
- For a virtual SPI, this is the VM ID to which the virtual SPI was assigned.

When VIRTUAL is 0, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_SWERR_SYNDROMER0

Accesses to this register use the following encodings:

Accessible at offset 0x03C8 from IRS_CONFIG_FRAME

- When IRS_IDR0.SWE != '1', accesses to this register are RAZ/WI.
- When IRS_SWERR_STATUSR.V == '1' and IRS_SWERR_STATUSR.S0V == '1', accesses to this register are RO.
- Otherwise, accesses to this register are UNKNOWN/WI.

2025-12-10 16:11:30, 2025-12_rel

IRS_SWERR_SYNDROMER1, IRS Software Error Syndrome Register 1

The IRS_SWERR_SYNDROMER1 characteristics are:

Purpose

IRS Software Error Syndrome Register 1. Records IRS specific software error syndrome information.

Configuration

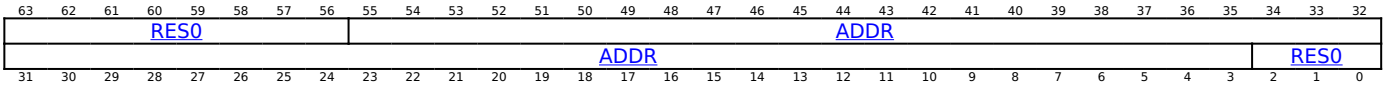
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SWERR_SYNDROMER1 are RAZ/WI.

Attributes

IRS_SWERR_SYNDROMER1 is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:3]

Bits[55:3] of the physical address of a translation structure associated with the detected error.

The address in this field is associated with the PAS of the Interrupt Domain where the error is detected.

In implementations that support fewer than 56 bits of physical address, any unimplemented upper bits are RES0. The number of implemented address bits is reported in IRS_IDR0.PA_RANGE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [2:0]

Reserved, RES0.

Accessing IRS_SWERR_SYNDROMER1

Accesses to this register use the following encodings:

Accessible at offset 0x03D0 from IRS_CONFIG_FRAME

- When IRS_IDR0.SWE != '1', accesses to this register are RAZ/WI.
- When IRS_SWERR_STATUSR.V == '1' and IRS_SWERR_STATUSR.S1V == '1', accesses to this register are RO.
- Otherwise, accesses to this register are UNKNOWN/WI.

2025-12-10 16:11:30, 2025-12_rel

IRS_SYNC_STATUSR, IRS Synchronize Interrupt Events Status Register

The IRS_SYNC_STATUSR characteristics are:

Purpose

IRS Synchronize Interrupt Events Status Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SYNC_STATUSR are RAZ/WI.

Attributes

IRS_SYNC_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Whether the effects of the last write to IRS_SYNCR have completed.

IDLE	Meaning
0b0	The effects of writing to IRS_SYNCR not guaranteed to have completed.
0b1	The effects of writing to IRS_SYNCR have completed.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

Accessing IRS_SYNC_STATUSR

This register is read-only.

Accesses to this register use the following encodings:

Accessible at offset 0x00C4 from IRS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_SYNCR, IRS Synchronize Interrupt Events Register

The IRS_SYNCR characteristics are:

Purpose

IRS Synchronize Interrupt Events Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SYNCR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_SYNC_STATUSR.IDLE is 1.

Attributes

IRS_SYNCR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

SYNC, bit [31]

Writing 1 to this field requests synchronization of interrupt events for the IRS Domain.

Writing 0 to this field has no effect.

See 'IRS synchronization requests' for more information.

SYNC	Meaning
0b0	Ignored.
0b1	Issue synchronization request.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [30:0]

Reserved, RES0.

Accessing IRS_SYNCR

Accesses to this register use the following encodings:

Accessible at offset 0x00C0 from IRS_CONFIG_FRAME

- When IRS_SYNC_STATUSR.IDLE == '0', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IRS_VM_DBR, IRS VM 1ofN Doorbell Configuration Register

The IRS_VM_DBR characteristics are:

Purpose

IRS VM 1ofN Doorbell Configuration Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VM_DBR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_VM_STATUSR.IDLE is 1.

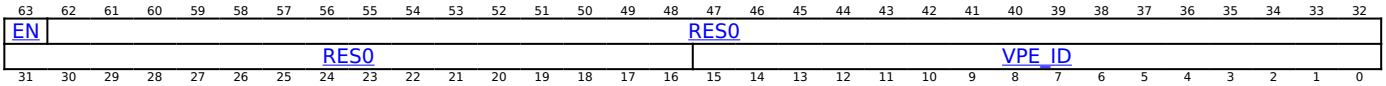
Following a write to this register, IRS_VM_STATUSR.V is updated

Attributes

IRS_VM_DBR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



The fields in this register return information about the VM selected in IRS_VM_SELR.

This register is updated after a write to IRS_VM_SELR when IRS_VM_STATUSR.{V, IDLE} is {1, 1}.

EN, bit [63]

Whether the doorbell settings are valid for the VM.

EN	Meaning
0b0	1ofN doorbells are disabled for the VM.
0b1	1ofN doorbells are enabled for the VM.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [62:16]

Reserved, RES0.

VPE_ID, bits [15:0]

The VPE ID of the 1ofN VPE doorbell target.

See 'VPE doorbells for 1ofN interrupts' for more information.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_VM_DBR

Accesses to this register use the following encodings:

Accessible at offset 0x0280 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0' or IRS_IDR0.VIRT_ONE_N == '0', accesses to this register are RAZ/WI.
- When IRS_VM_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RW.

IRS_VM_SELR, IRS VM Selection Register

The IRS_VM_SELR characteristics are:

Purpose

IRS VM Selection Register.

Selects a VM whose 1ofN doorbell configuration can be accessed via IRS_VM_DBR.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VM_SELR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_VM_STATUSR.IDLE is 1.

Attributes

IRS_VM_SELR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

VM_ID, bits [15:0]

Identifies the VM.

Accessing IRS_VM_SELR

Accesses to this register use the following encodings:

Accessible at offset 0x0288 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0' or IRS_IDR0.VIRT_ONE_N == '0', accesses to this register are RAZ/WI.
- When IRS_VM_STATUSR.IDLE == '0', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IRS_VM_STATUSR, IRS VM Status Register

The IRS_VM_STATUSR characteristics are:

Purpose

IRS VM Status Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VM_STATUSR are RAZ/WI.

Attributes

IRS_VM_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:2]

Reserved, RES0.

V, bit [1]

Whether IRS_VM_SELR selects a valid VM.

This field is updated if and only if any of following occur:

- A write to IRS_VM_DBR.
- A write to IRS_VM_SELR

When IDLE is 0, the value of this field is UNKNOWN.

V	Meaning
0b0	The VM selected using IRS_VM_SELR is not valid.
0b1	The VM selected using IRS_VM_SELR is valid.

This field resets to 0 to indicate that there was no write to IRS_VM_SELR that selected a valid VM since the IRS was reset.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

IDLE, bit [0]

When this field returns 1 and V is 1, a read from IRS_VM_CR0 returns the VM configuration for the selected VM.

Following a write to IRS_VM_CR0, when this field returns 1 and V is 1, the effects of the write have completed:

IDLE	Meaning
0b0	The effects of writing to the VM selection and configuration registers are not guaranteed to have completed.
0b1	The effects of writing to the VM selection and configuration registers have completed.

This field resets to 1 to allow initial writes to registers Guarded by this field. Because there has been no write at reset, this does not imply that any invalidate operation is complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Accessing IRS_VM_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x028C from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0' or IRS_IDR0.VIRT_ONE_N == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_VMAP_L2_VISTR, IRS Map Level 2 Virtual IST Register

The IRS_VMAP_L2_VISTR characteristics are:

Purpose

IRS Map Level 2 Virtual IST Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMAP_L2_VISTR are RAZ/WI.

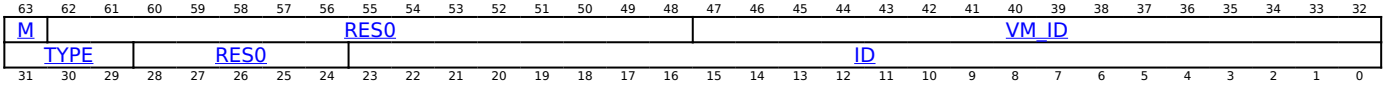
The effects of a write to this register are not guaranteed to have completed before IRS_VMT_STATUSR.IDLE is 1.

Attributes

IRS_VMAP_L2_VISTR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



M, bit [63]

Writing 1 to this field makes the virtual level 2 IST specified by TYPE and ID for the VM specified by VM_ID valid.

M	Meaning
0b0	The write to this field has no effect.
0b1	The write to this field makes the specified virtual level 2 IST valid.

There are no effects to the virtual IST on a write to this register, if any of the following are true:

- The VM specified by VM_ID is invalid.
- The virtual IST is invalid.
- The virtual IST uses a linear format.
- The INTID.ID is outside the configured virtual interrupt range for the specified VM.
- The level 2 IST is valid.
- The write to this register does not set this field to 1.

If this field is not set to 1 on a write to this register, updates to any other field in this register has no effect beyond updating the value of that field.

Access to this field is WO/UNKNOWN.

Bits [62:48]

Reserved, RES0.

VM_ID, bits [47:32]

The VM ID specifying the VM for which a virtual level 2 IST is being made valid.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

TYPE, bits [31:29]

Whether the operation applies to the virtual LPI IST or virtual SPI IST.

Values not defined are reserved.

When programming a reserved value, it is CONSTRAINED UNPREDICTABLE whether the invalidate is IGNORED or an UNKNOWN value is used for this field.

TYPE	Meaning
0b010	LPI
0b011	SPI

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Bits [28:24]

Reserved, RES0.

ID, bits [23:0]

An INTID.ID covered by the level 1 ISTE corresponding to the level 2 IST that is made valid.

If unimplemented upper bits of the INTID.ID are not zero, it is CONSTRAINED UNPREDICTABLE whether the upper bits are treated as 0 or a request to invalidate is IGNORED.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Accessing IRS_VMAP_L2_VISTR

Accesses to this register use the following encodings:

Accessible at offset 0x02D8 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RO.
- When IRS_VMT_BASER.VALID == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VMAP_L2_VMTR, IRS Map Level 2 VM Table Register

The IRS_VMAP_L2_VMTR characteristics are:

Purpose

IRS Map Level 2 VM Table Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMAP_L2_VMTR are RAZ/WI.

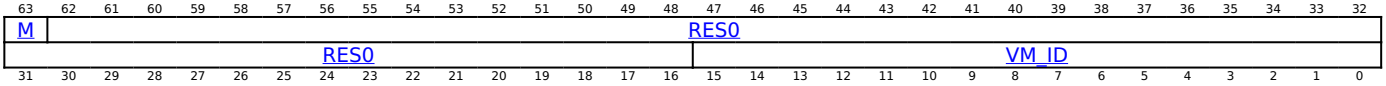
The effects of a write to this register are not guaranteed to have completed before IRS_VMT_STATUSR.IDLE is 1.

Attributes

IRS_VMAP_L2_VMTR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



M, bit [63]

Writing 1 to this field makes the level 2 VM table specified by VM_ID valid.

M	Meaning
0b0	The write to this field has no effect.
0b1	The write to this field makes the specified level 2 VM table valid.

There are no effects to the VM table on a write to this register, if any of the following are true:

- The VM table is invalid.
- The VM table uses a linear structure.
- The VM ID specified by VM_ID is outside the configured VM ID range.
- The level 2 VM table is valid.
- The write to this register does not set this field to 1.

If this field is not set to 1 on a write to this register, updates to any other field in this register has no effect beyond updating the value of that field.

Access to this field is WO/UNKNOWN.

Bits [62:16]

Reserved, RES0.

VM_ID, bits [15:0]

The VM ID specifying the level 2 VM table being made valid.

Accessing IRS_VMAP_L2_VMTR

Accesses to this register use the following encodings:

Accessible at offset 0x02C0 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_CFGR.STRUCTURE == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_BASER.VALID == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

IRS_VMAP_VISTR, IRS Map Virtual IST Register

The IRS_VMAP_VISTR characteristics are:

Purpose

IRS Map Virtual IST Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMAP_VISTR are RAZ/WI.

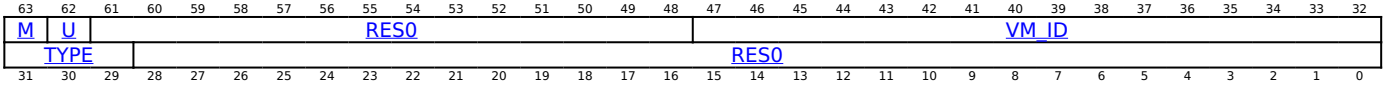
The effects of a write to this register are not guaranteed to have completed before IRS_VMT_STATUSR.IDLE is 1.

Attributes

IRS_VMAP_VISTR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



M, bit [63]

Writing 1 to this field makes the virtual IST specified by TYPE for the VM specified by VM_ID valid or invalid as specified by U.

M	Meaning
0b0	The write to this field has no effect.
0b1	The write to this field makes the specified virtual IST valid.

There are no effects to the validity of the virtual IST on a write to this register, if any of the following are true:

- The VM specified by VM_ID is invalid.
- The VM ID is outside the configured VM ID range.
- The virtual IST is valid and U is 0.
- The virtual IST is invalid and U is 1.
- The write to this register does not set this field to 1.

If this field is not set to 1 on a write to this register, updates to any other field in this register has no effect beyond updating the value of that field.

Access to this field is WO/UNKNOWN.

U, bit [62]

Whether a write that sets M to 1 makes the specified virtual IST valid or invalid.

U	Meaning
0b0	A write that sets M to 1 makes the specified virtual IST valid.
0b1	A write that sets M to 1 makes the specified virtual IST invalid.

Bits [61:48]

Reserved, RES0.

VM_ID, bits [47:32]

The VM ID specifying the VM for which a virtual IST is being made valid.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

TYPE, bits [31:29]

Whether the operation applies to the virtual LPI IST or virtual SPI IST.

Values not defined are reserved.

When programming a reserved value, it is CONSTRAINED UNPREDICTABLE whether the invalidate is IGNORED or an UNKNOWN value is used for this field.

TYPE	Meaning
0b010	LPI
0b011	SPI

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Bits [28:0]

Reserved, RES0.

Accessing IRS_VMAP_VISTR

Accesses to this register use the following encodings:

Accessible at offset 0x02D0 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RO.
- When IRS_VMT_BASER.VALID == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VMAP_VMR, IRS Map VM Register

The IRS_VMAP_VMR characteristics are:

Purpose

IRS Map VM Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMAP_VMR are RAZ/WI.

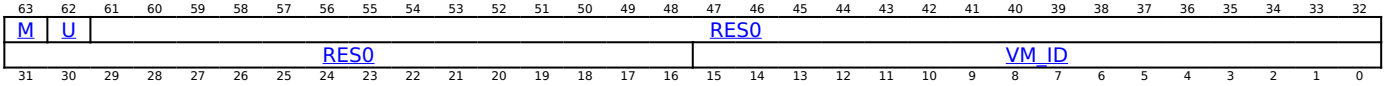
The effects of a write to this register are not guaranteed to have completed before IRS_VMT_STATUSR.IDLE is 1.

Attributes

IRS_VMAP_VMR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



M, bit [63]

Writing 1 to this field makes the VM specified by VM_ID valid or invalid as specified by U.

M	Meaning
0b0	The write to this field has no effect.
0b1	The write to this field makes the specified VM valid or invalid.

There are no effects to the validity of the VM on a write to this register, if any of the following are true:

- The level 2 VM table containing the entry corresponding to the VM specified by VM_ID is invalid.
- The VM ID is outside the configured VM ID range.
- The VM valid and U is 0.
- The VM invalid and U is 1.
- The write to this register does not set this field to 1.

If this field is not set to 1 on a write to this register, updates to any other field in this register has no effect beyond updating the value of that field.

Access to this field is WO/UNKNOWN.

U, bit [62]

Whether a write that sets M to 1 makes the specified VM valid or invalid.

U	Meaning
0b0	A write that sets M to 1 makes the specified VM valid.
0b1	A write that sets M to 1 makes the specified VM invalid.

Bits [61:16]

Reserved, RES0.

VM_ID, bits [15:0]

The VM ID specifying the VM being made valid or invalid.

Accessing IRS_VMAP_VMR

Accesses to this register use the following encodings:

Accessible at offset 0x02C8 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_BASER.VALID == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VMAP_VPER, IRS Map VPE Register

The IRS_VMAP_VPER characteristics are:

Purpose

IRS Map VPE Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMAP_VPER are RAZ/WI.

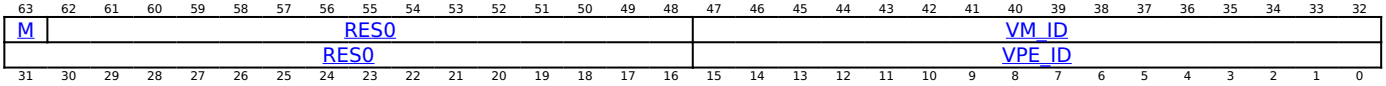
The effects of a write to this register are not guaranteed to have completed before IRS_VMT_STATUSR.IDLE is 1.

Attributes

IRS_VMAP_VPER is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



M, bit [63]

Writing 1 to this field makes the VPE specified by VM_ID and VPE_ID valid.

M	Meaning
0b0	The write to this field has no effect.
0b1	The write to this field makes the specified VPE valid.

There are no effects to the validity of the VPE on a write to this register, if any of the following are true:

- The VM specified by VM_ID is invalid.
- The VM ID is outside the configured VM ID range.
- The VPE ID is outside the configured VPE range for the VM.
- The VPE is valid.
- The write to this register does not set this field to 1.

If this field is not set to 1 on a write to this register, updates to any other field in this register has no effect beyond updating the value of that field.

Access to this field is WO/UNKNOWN.

Bits [62:48]

Reserved, RES0.

VM_ID, bits [47:32]

Identifies the VM.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Bits [31:16]

Reserved, RES0.

VPE_ID, bits [15:0]

Identifies the VPE.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Accessing IRS_VMAP_VPER

Accesses to this register use the following encodings:

Accessible at offset 0x02E0 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RO.
- When IRS_VMT_BASER.VALID == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VMT_BASER, IRS VM Table Base Address Register

The IRS_VMT_BASER characteristics are:

Purpose

IRS VM Table Base Address Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMT_BASER are RAZ/WI.

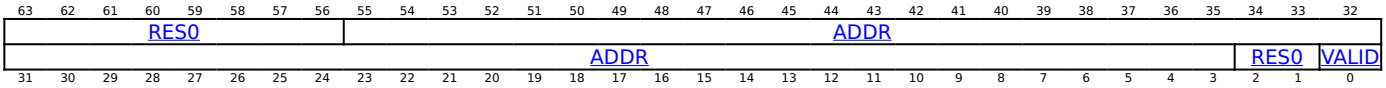
The effects of a write to this register are not guaranteed to have completed before IRS_VMT_STATUSR.IDLE is 1.

Attributes

IRS_VMT_BASER is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:3]

Bits[55:3] of the VM table base physical address.

This field is Guarded by IRS_VMT_BASER.VALID.

When IRS_VMT_CFGR.STRUCTURE is 0, ADDR points to a linear VM table and all of the following are true:

- Bits[N:0] of the resulting address are 0 where N = 4 + IRS_VMT_CFGR.VM_ID_BITS.
- This means that the level 2 VMTE array is aligned to the size of the array.

When IRS_VMT_CFGR.STRUCTURE is 1, ADDR points to the level 1 table in a 2-level VM table and all of the following are true:

- Bits[N:0] of the resulting address are 0 where N depends on VM_ID_BITS in IRS_VMT_CFGR as follows:

  N = Max(2, VM_ID_BITS - 7 + 2)

- This means that the level 1 VMT is aligned to the size of the level 1 VMTE array.

Access to any level of the VM table and any additional memory accesses occurring as a result of the address in this field are performed using the PAS of the IRS Domain where this register is accessed.

In implementations that support fewer than 56 bits of physical address, any unimplemented upper bits are RES0. The number of implemented address bits is reported in IRS_IDR0.PA_RANGE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_VMT_BASER.VALID == '1', access to this field is RO.
- Otherwise, access to this field is RW.

Bits [2:1]

Reserved, RES0.

VALID, bit [0]

Whether the ADDR points to a valid VM table.

VALID	Meaning
0b0	The VM table address is not valid.
0b1	The VM table address is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Accessing IRS_VMT_BASER

Accesses to this register use the following encodings:

Accessible at offset 0x0200 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VMT_CFGR, IRS VM Table Configuration Register

The IRS_VMT_CFGR characteristics are:

Purpose

IRS VM Table Configuration Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMT_CFGR are RAZ/WI.

Attributes

IRS_VMT_CFGR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:17]

Reserved, RES0.

STRUCTURE, bit [16]

Whether the VM table uses a linear or 2-level structure.

STRUCTURE	Meaning
0b0	A linear VM table structure is used.
0b1	A 2-level VM table structure is used.

If VM_ID_BITS < 8 and STRUCTURE is 1, all of the following are true:

- The IST consists of a single level 1 VM table entry and a single level 2 VM table.
- The level 2 VM table contains (2 ^ VM_ID_BITS) entries.
- The IRS is allowed to access the full 4KB level 2 VM table.

Arm recommends that STRUCTURE is 0 when VM_ID_BITS < 8.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [15:5]

Reserved, RES0.

VM_ID_BITS, bits [4:0]

The number of VM_ID bits for the IRS Domain.

If this field is programmed to a value larger than the maximum, it is treated as having the maximum value for all other purposes than a direct read of the register. The maximum value is reported in IRS_IDR3.VM_ID_BITS.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IRS_VMT_CFGR

Accesses to this register use the following encodings:

Accessible at offset 0x0210 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.

• When IRS_VMT_BASER.VALID == '1' or IRS_VMT_STATUSR.IDLE == '0', accesses to this register are RO.
• Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VMT_STATUSR, IRS Virtualization Data Structures Management Status Register

The IRS_VMT_STATUSR characteristics are:

Purpose

IRS Virtualization Data Structures Management Status Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VMT_STATUSR are RAZ/WI.

Attributes

IRS_VMT_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Whether the effects of any of the following writes are complete:

- A write that updates IRS_VMT_BASER.VALID.
- A write that sets IRS_VMAP_L2_VMTR.M to 1.
- A write that sets IRS_VMAP_VMR.M to 1.
- A write that sets IRS_VMAP_VPER.M to 1.
- A write that sets IRS_VMAP_VISTR.M to 1.
- A write that sets IRS_VMAP_L2_VISTR.M to 1.

IDLE	Meaning
0b0	The effects a write to any of the virtualization data structure management registers are not complete
0b1	The effects a write to any of the virtualization data structure management registers are complete

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

Accessing IRS_VMT_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x0214 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_VPE_CR0, IRS VPE Control Register 0

The IRS_VPE_CR0 characteristics are:

Purpose

IRS VPE Control Register 0

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VPE_CR0 are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_VPE_STATUSR.IDLE is 1.

Following a write to this register, IRS_VPE_STATUSR.V is updated.

Attributes

IRS_VPE_CR0 is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

This register is updated after a write that sets IRS_VPE_SELR.S to 1 when IRS_VPE_STATUSR.{V, IDLE} is {1, 1}.

Bits [31:1]

Reserved, RES0.

DPS, bit [0]
When IRS_IDR0.VIRT_ONE_N == '1':

Disable 1ofN PE selection.

DPS	Meaning
0b0	1ofN PE selection is enabled. A virtual interrupt configured to use the 1ofN Routing mode is permitted to select this VPE.
0b1	1ofN PE selection is disabled. A virtual interrupt configured to use the 1ofN Routing mode is not permitted to select this VPE.

This field determines whether the selected VPE is permitted to be selected for 1ofN interrupt delivery.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing IRS_VPE_CR0

Accesses to this register use the following encodings:

Accessible at offset 0x0258 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VPE_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VPE_DBR, IRS VPE Doorbell Settings Register

The IRS_VPE_DBR characteristics are:

Purpose

IRS VPE Doorbell Settings Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VPE_DBR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before IRS_VPE_STATUSR.IDLE is 1.

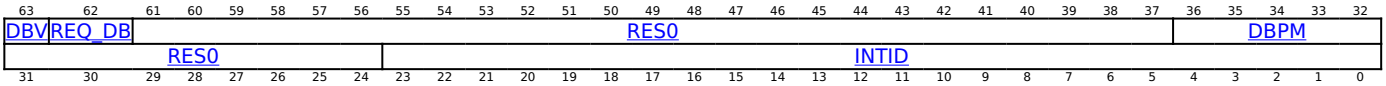
Following a write to this register, IRS_VPE_STATUSR.V is updated.

Attributes

IRS_VPE_DBR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



This register is updated after a write that sets IRS_VPE_SELR.S to 1 when IRS_VPE_STATUSR.{V, IDLE} is {1, 1}.

DBV, bit [63]

Whether the doorbell settings for the VPE are valid.

DBV	Meaning
0b0	The doorbell settings for the VPE are not valid.
0b1	The doorbell settings for the VPE are valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

REQ_DB, bit [62]

Whether a doorbell is requested for the VPE.

When a VPE doorbell is requested for the VPE, the doorbell event is generated when the VPE doorbell conditions are met.

See 'VPE doorbells' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information.

REQ_DB	Meaning
0b0	A doorbell is not requested for the VPE
0b1	A doorbell is requested for the VPE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_VPE_DBR.DBV == '1', access to this field is RW.
- Otherwise, access to this field is WO/UNKNOWN.

Bits [61:37]

Reserved, RES0.

DBPM, bits [36:32]

Doorbell priority mask.

This field specifies the minimum priority for a virtual interrupt to trigger the VPE's doorbell.

Accessing this field has the following behavior:

- When IRS_VPE_DBR.REQ_DB == '1', access to this field is RW.
- Otherwise, access to this field is WO/UNKNOWN.

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

If IRS_IDR2.LPI is 1, this field specifies the LPI INTID.ID of the VPE doorbell.

The number of ID bits implemented is reported in IRS_IDR2.ID_BITS. Unimplemented upper bits are RES0.

If IRS_IDR2.LPI is 0, this field is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IRS_VPE_DBR.DBV == '1', access to this field is RW.
- Otherwise, access to this field is WO/UNKNOWN.

Accessing IRS_VPE_DBR

Accesses to this register use the following encodings:

Accessible at offset 0x0248 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VPE_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VPE_HPPIR, IRS VPE HPPI Register

The IRS_VPE_HPPIR characteristics are:

Purpose

IRS VPE HPPI Register.

Configuration

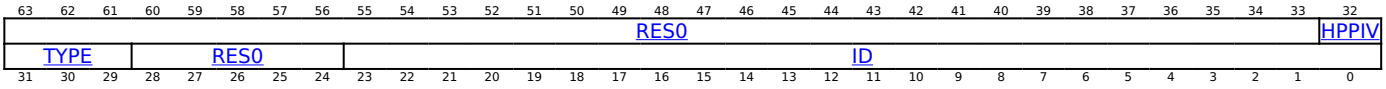
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VPE_HPPIR are RAZ/WI.

Attributes

IRS_VPE_HPPIR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



This register reports information about the candidate HPPI for the VPE selected by IRS_VPE_SELR.

This register is updated after a write that sets IRS_VPE_SELR.S to 1 when IRS_VPE_STATUSR.{V, IDLE} is {1, 1}.

If there is a change in the HPPI for the VPE following the write that set IRS_VPE_SELR.S to 1, it is IMPLEMENTATION DEFINED whether the old or the new HPPI is reported in this register.

Bits [63:33]

Reserved, RES0.

HPPIV, bit [32]

Whether there is a candidate HPPI for the VPE.

HPPIV	Meaning
0b0	Invalid: There is no candidate HPPI for the VPE.
0b1	VALID: There is a candidate HPPI for the VPE.

When the value of this field is 1, ID and TYPE together form the INTID of the candidate HPPI for the VPE.

TYPE, bits [31:29]

The encoding of this field depends upon the value in HPPIV as described below:

- If HPPIV is 0, this field is RES0.
- If HPPIV is 1, this field contains valid information.

TYPE	Meaning
0b010	LPI
0b011	SPI

Values not defined above are reserved.

Bits [28:24]

Reserved, RES0.

ID, bits [23:0]

The encoding of this field depends upon the value in HPPIV as described below:

- If HPPIV is 0, this field is RES0.
- If HPPIV is 1, this field contains valid information.

Accessing IRS_VPE_HPPIR

Accesses to this register use the following encodings:

Accessible at offset 0x0250 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VPE_STATUSR.[V,IDLE] != '11', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_VPE_SELR, IRS VPE Selection Register

The IRS_VPE_SELR characteristics are:

Purpose

IRS VPE Selection Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VPE_SELR are RAZ/WI.

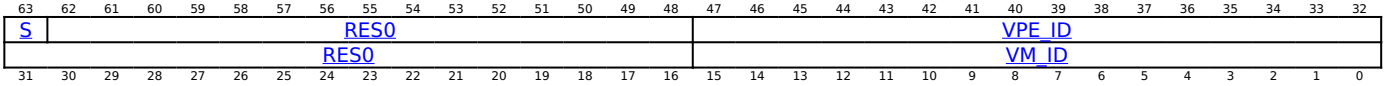
The effects of a write to this register are not guaranteed to have completed before IRS_VPE_STATUSR.IDLE is 1.

Attributes

IRS_VPE_SELR is a 64-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions



S, bit [63]

Writing 1 to this field selects a VPE whose configuration can be accessed via the following registers:

- IRS_VPE_DBR
- IRS_VPE_HPPIR
- IRS_VPE_CR0

S	Meaning
0b0	The write to this register has no effect.
0b1	The write to this register selects a VPE.

If this field is not set to 1 on a write to this register, updates to any other field in this register has no effect beyond updating the value of that field.

This means that if IRS_VPE_STATUSR.V is updated as a result of a write to another register, the value returned reflects the VPE selected when this field was set to 1.

Access to this field is WO/UNKNOWN.

Bits [62:48]

Reserved, RES0.

VPE_ID, bits [47:32]

Identifies the VPE.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Bits [31:16]

Reserved, RES0.

VM_ID, bits [15:0]

Identifies the VM.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Accessing IRS_VPE_SELR

Accesses to this register use the following encodings:

Accessible at offset 0x0240 from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- When IRS_VPE_STATUSR.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IRS_VPE_STATUSR, IRS VPE Status Register

The IRS_VPE_STATUSR characteristics are:

Purpose

IRS VPE Status Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_VPE_STATUSR are RAZ/WI.

Attributes

IRS_VPE_STATUSR is a 32-bit register.

This register is part of the IRS_CONFIG_FRAME block.

Field descriptions

Bits [31:2]

Reserved, RES0.

V, bit [1]

Whether the value last written to IRS_VPE_SELR selects a valid VPE.

This field is updated if and only if any of following occur:

- A write to IRS_VPE_CR0.
- A write to IRS_VPE_DBR.
- A write that sets IRS_VPE_SELR.S to 1.

When IDLE is 0, the value of this field is UNKNOWN.

V	Meaning
0b0	The VPE selected using IRS_VPE_SELR is not valid.
0b1	The VPE selected using IRS_VPE_SELR is valid.

This field resets to 0 to indicate that there was no write to IRS_VPE_SELR that selected a valid VPE that is managed on this IRS since the IRS was reset.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

IDLE, bit [0]

A write that sets IRS_VPE_SELR.S to 1 is complete when this field is 1.

When this field is 1 and V is 1, a read from any of the following registers returns values for the selected VPE:

- IRS_VPE_DBR.
- IRS_VPE_HPPIR.
- IRS_VPE_CR0.

Following a write to one of the following registers, when this field returns 1, the effects of the write have completed:

- IRS_VPE_DBR.
- IRS_VPE_CR0.

IDLE	Meaning
0b0	The effects of the last write that set IRS_VPE_SELR.S to 1 and any write to VPE configuration registers are not guaranteed to be complete.
0b1	The effects of the last write that set IRS_VPE_SELR.S to 1 and any write to VPE configuration registers are complete.

This field resets to 1 to allow initial writes to registers Guarded by this field. Because there has been no write at reset, this does not imply that any invalidate operation is complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Accessing IRS_VPE_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x025C from IRS_CONFIG_FRAME

- When IRS_IDR0.VIRT == '0', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IRS_SETLPI_FRAME, IRS SETLPI register frame

The IRS_SETLPI_FRAME characteristics are:

Purpose

Contains the IRS_SETLPIR register used to generate a SET_EDGE message for an LPI without going through an ITS.

An IRS SETLPI register frame is present for each supported Interrupt Domain on each IRS where IRS_IDR0.SETLPI is 1.

Arm strongly recommends that this register frame is not accessible by PEs. This is because a write to this register can require the IRS access to memory, leading to in-out dependencies than can potentially lead to deadlocks in the system. If this register frame is not accessible by PEs, the behavior on an attempted access from a PE is IMPLEMENTATION DEFINED and is likely to result in an External abort.

This register frame is only accessible in the PAS associated with the Interrupt Domain.

The base address is distinct from addresses of registers accessible in any other PAS.

The base address is aligned to 64KB.

Configuration

This block is present only when IRS_IDR0.SETLPI == '1' and FEAT_GICv5_EXT is implemented.

Attributes

IRS_SETLPI_FRAME is a block of size: 64KB

Contents

Offset	Name	Accessor condition	Register condition	Most permissive access
0x0000	IRS_SETLPIR	-	When FEAT_GICv5_EXT is implemented	WO

Direct accesses to other offsets in this block are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

IRS_SETLPIR, IRS SET LPI Register

The IRS_SETLPIR characteristics are:

Purpose

IRS SETLPI Register.

A write to this register generates a SET_EDGE message for the LPI ID specified as part of the write.

Configuration

This register is present only when IRS_IDR0.SETLPI == '1', FEAT_GICv5_EXT is implemented, and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IRS_SETLPIR are RAZ/WI.

Attributes

IRS_SETLPIR is a 32-bit register.

This register is part of the IRS_SETLPI_FRAME block.

Field descriptions

Bits [31:24]

Reserved, RES0.

ID, bits [23:0]

Bits[23:0] of the LPI INTID.ID to set generate a SET_EDGE message for.

If unimplemented upper bits of the INTID.ID are not zero, it is IMPLEMENTATION DEFINED whether the upper bits are treated as 0 or the interrupt message is ignored by the IRS.

Accessing IRS_SETLPIR

Writes to this register are ignored if the IRS is not enabled for the Interrupt Domain.

Accesses to this register use the following encodings:

Accessible at offset 0x0000 from IRS_SETLPI_FRAME

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

ITS_CONFIG_FRAME, ITS configuration register frame

The ITS_CONFIG_FRAME characteristics are:

Purpose

Contains control registers for an ITS Domain.

An ITS configuration register frame is present for each supported ITS Domain.

This register frame is accessible in the PAS associated with the ITS Domain.

It is IMPLEMENTATION DEFINED whether this register frame is also accessible in the MPPAS at the same address.

The base address is distinct from the base address of any other GIC register frame, including the ITS configuration register frames for other ITS Domains.

The base address is aligned to 64KB.

Configuration

This block is present only when FEAT_GICv5_EXT is implemented.

Attributes

ITS_CONFIG_FRAME is a block of size: 64KB

Contents

Offset	Name	Accessor condition	Register condition	Most permissive access
0x0000	ITS_IDR0	-	When FEAT_GICv5_EXT is implemented	RO
0x0004	ITS_IDR1	-	When FEAT_GICv5_EXT is implemented	RO
0x0008	ITS_IDR2	-	When FEAT_GICv5_EXT is implemented	RO
0x0040	ITS_IIDR	-	When FEAT_GICv5_EXT is implemented	RO
0x0044	ITS_AIDR	-	When FEAT_GICv5_EXT is implemented	RO
0x0080	ITS_CR0	-	When FEAT_GICv5_EXT is implemented	RW
0x0084	ITS_CR1	-	When FEAT_GICv5_EXT is implemented	RW
0x00C0	ITS_DT_BASER	-	When FEAT_GICv5_EXT is implemented	RW
0x00D0	ITS_DT_CFGR	-	When FEAT_GICv5_EXT is implemented	RW
0x0100	ITS_DIDR	-	When FEAT_GICv5_EXT is implemented	RW
0x0108	ITS_EIDR	-	When FEAT_GICv5_EXT is implemented	RW
0x010C	ITS_INV_EVENTR	-	When FEAT_GICv5_EXT is implemented	WO
0x0110	ITS_INV_DEVICER	-	When FEAT_GICv5_EXT is implemented	WO
0x0114	ITS_READ_EVENTR	-	When FEAT_GICv5_EXT is implemented	WO
0x0118	ITS_READ_EVENT_DATAR	-	When FEAT_GICv5_EXT is implemented	RO
0x0120	ITS_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x0140	ITS_SYNCR	-	When FEAT_GICv5_EXT is implemented	WO
0x0148	ITS_SYNC_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO

0x0180	ITS_GEN_EVENT_DIDR	-	When FEAT_GICv5_EXT is implemented	RW
0x0188	ITS_GEN_EVENT_EIDR	-	When FEAT_GICv5_EXT is implemented	RW
0x018C	ITS_GEN_EVENTR	-	When FEAT_GICv5_EXT is implemented	WO
0x0190	ITS_GEN_EVENT_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x01C0	ITS_MEC_IDR	-	When FEAT_GICv5_EXT is implemented	RO
0x01C4	ITS_MEC_MECID_R	-	When FEAT_GICv5_EXT is implemented	RW
0x0200	ITS_MPAM_IDR	-	When FEAT_GICv5_EXT is implemented	RO
0x0204	ITS_MPAM_PARTID_R	-	When FEAT_GICv5_EXT is implemented	RW

Direct accesses to other offsets in this block are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

ITS_AIDR, ITS Architecture Identification Register

The ITS_AIDR characteristics are:

Purpose

ITS Architecture Identification Register. Identifies the GIC architecture version to which the implementation conforms.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_AIDR are RAZ/WI.

Attributes

ITS_AIDR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:12]

Reserved, RES0.

Component, bits [11:8]

GIC component

Component	Meaning
0b0000	IRS
0b0001	ITS
0b0010	IWB

ArchMajorRev, bits [7:4]

Major Architecture revision.

ArchMajorRev	Meaning
0b0000	GICv5.x

ArchMinorRev, bits [3:0]

Minor Architecture revision.

ArchMinorRev	Meaning
0b0000	GICv5.0

Accessing ITS_AIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0044 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_CR0, ITS Configuration Register 0

The ITS_CR0 characteristics are:

Purpose

ITS Configuration Register 0

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_CR0 are RAZ/WI.

Attributes

ITS_CR0 is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:2]

Reserved, RES0.

IDLE, bit [1]

Whether the transition between enabled and disabled states of the ITS Domain is complete.

IDLE	Meaning
0b0	The effects of updating ITSEN are not guaranteed to have completed.
0b1	The effects of updating ITSEN have completed.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

ITSEN, bit [0]

Controls if the ITS Domain is enabled and whether it can generate interrupt messages to an IRS for the Interrupt Domain.

This field is Guarded by ITS_CR0.IDLE.

ITSEN	Meaning
0b0	Disabled. The ITS does not generate any interrupt messages for the Interrupt Domain
0b1	Enabled. The ITS may generate interrupt messages for the Interrupt Domain

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Accessing this field has the following behavior:

- When ITS_CR0.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Accessing ITS_CR0

Accesses to this register use the following encodings:

Accessible at offset 0x0080 from ITS_CONFIG_FRAME

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_CR1, ITS Configuration Register 1

The ITS_CR1 characteristics are:

Purpose

ITS Configuration Register 1

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_CR1 are RAZ/WI.

Attributes

ITS_CR1 is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:8]

Reserved, RES0.

ITT_RA, bit [7]

Read-Allocate hint for the interrupt translation tables.

ITT_RA	Meaning
0b0	No Read-Allocate.
0b1	Read-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

DT_RA, bit [6]

Read-Allocate hint for the device table.

DT_RA	Meaning
0b0	No Read-Allocate.
0b1	Read-Allocate.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

IC, bits [5:4]

Controls the Inner Cacheability attribute used when the ITS accesses tables as a requester.

IC	Meaning
0b00	Non-cacheable.
0b01	Write-Back Cacheable.
0b10	Write-Through Cacheable.
0b11	Reserved, treated as 0b00.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

OC, bits [3:2]

Controls the Outer Cacheability attribute used when the ITS accesses tables as a requester.

OC	Meaning
0b00	Non-cacheable
0b01	Write-Back Cacheable.
0b10	Write-Through Cacheable.
0b11	Reserved, treated as 0b00.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

SH, bits [1:0]

Controls the Shareability attribute used when the ITS accesses tables as a requester.

SH	Meaning
0b00	Non-shareable.
0b01	Reserved, treated as 0b00.
0b10	Outer Shareable.
0b11	Inner Shareable.

When ITS_CR1.OC is 0b00 and ITS_CR1.IC is 0b00, this field is IGNORED and behaves as Outer Shareable.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing ITS_CR1

Accesses to this register use the following encodings:

Accessible at offset 0x0084 from ITS_CONFIG_FRAME

- When ITS_CR0.ITSEN == '1' or ITS_CR0.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

ITS_DIDR, ITS DeviceID Register

The ITS_DIDR characteristics are:

Purpose

ITS DeviceID Register.

This register is used to specify the DeviceID for the following requests:

- Invalidation of cached information for DeviceIDs issued by a write to ITS_INV_DEVICER.
- Invalidation of cached information for EventIDs issued by a write to ITS_INV_EVENTR.
- Requesting the read of the translation for an event by a write to ITS_READ_EVENTR.

Configuration

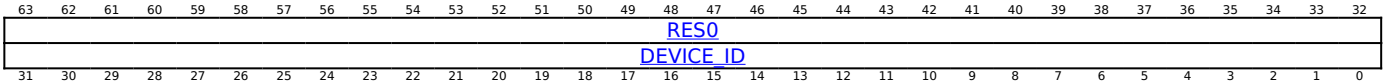
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_DIDR are RAZ/WI.

Attributes

ITS_DIDR is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



Bits [63:32]

Reserved, RES0.

DEVICE_ID, bits [31:0]

The DeviceID as it should apply to a cache invalidation or reading an event translation request.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing ITS_DIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0100 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_STATUSR.IDLE != '1', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_DT_BASER, ITS Device Table Base Address Register

The ITS_DT_BASER characteristics are:

Purpose

ITS Device Table Base Address Register

Configuration

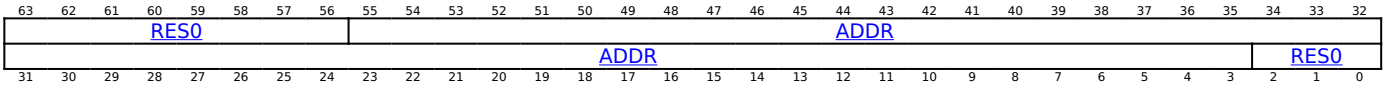
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_DT_BASER are RAZ/WI.

Attributes

ITS_DT_BASER is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:3]

Bits[55:3] of the DT base physical address.

When ITS_DT_CFGR.STRUCTURE is 0, ADDR points to a linear DT and all of the following are true:

- Bits[N:0] of the resulting address are 0 where N = 2 + ITS_DT_CFGR.DEVICEID_BITS.
- This means that the level 2 DTE array is aligned to the size of the array.

When ITS_DT_CFGR.STRUCTURE is 1, ADDR points to the level 1 table in a 2-level DT and all of the following are true:

- Bits[N:0] of the resulting address are 0 where N depends on L2SZ and DEVICEID_BITS in ITS_DT_CFGR as follows:

  Max(2, DEVICEID_BITS - (9 + (2 * L2SZ)) + 2)

- This means that the level 1 DT is aligned to the size of the table.

Access to any level of the DT and any additional memory accesses occurring as a result of the address in this field are performed using the PAS of the ITS Domain where this register is accessed.

In implementations that support fewer than 56 bits of physical address, any unimplemented upper bits are RES0. The number of implemented address bits is reported in ITS_IDR0.PA_RANGE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [2:0]

Reserved, RES0.

Accessing ITS_DT_BASER

Accesses to this register use the following encodings:

Accessible at offset 0x00C0 from ITS_CONFIG_FRAME

- When ITS_CR0.ITSEN == '1' or ITS_CR0.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_DT_CFGR, ITS Device Table Base Address Configuration Register

The ITS_DT_CFGR characteristics are:

Purpose

ITS Device Table Base Address Configuration Register

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_DT_CFGR are RAZ/WI.

Attributes

ITS_DT_CFGR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:17]

Reserved, RES0.

STRUCTURE, bit [16]

Whether the device table uses a linear or 2-level structure.

If ITS_IDR1.DT_LEVELS is 0, this field is RES0.

STRUCTURE	Meaning
0b0	A linear device table structure is used.
0b1	A 2-level device table structure is used.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [15:8]

Reserved, RES0.

L2SZ, bits [7:6]

Level 2 device table size when a 2-level device table structure is used.

L2SZ	Meaning
0b00	A level 2 device table is maximum 4KB and resolves 9 bits of DeviceID.
0b01	A level 2 device table is maximum 16KB and resolves 11 bits of DeviceID.
0b10	A level 2 device table is maximum 64KB and resolves 13 bits of DeviceID.

Values not defined above are reserved.

If DEVICEID_BITS <= (9 + (2 * L2SZ)) and STRUCTURE is 1, the DT consists of a single L1_DTE and a single L2_DT.

The L2_DT contains (2 ^ DEVICEID_BITS) entries.

When the value of L1_DTE.SPAN is programmed to a value larger than DEVICEID_BITS, the ITS is allowed to access memory in the range specified by L1_DTE.SPAN.

Arm recommends that STRUCTURE is 0 when DEVICEID_BITS <= (9 + (2 * L2SZ)).

When programming a reserved value or an unsupported value, the ITS behavior is CONSTRAINED UNPREDICTABLE to any behavior which could be achieved by programming a valid and supported value.

When STRUCTURE is 0, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

DEVICEID_BITS, bits [5:0]

The number of DeviceID bits which can be translated for the accessing Security state by the ITS.

If this field is programmed to a value larger than the maximum, it is treated as having the maximum value for all other purposes than a direct read of the register. The maximum value is reported in ITS_IDR1.DEVICEID_BITS.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing ITS_DT_CFGR

Accesses to this register use the following encodings:

Accessible at offset 0x00D0 from ITS_CONFIG_FRAME

- When ITS_CR0.ITSEN == '1' or ITS_CR0.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_EIDR, ITS EventID Register

The ITS_EIDR characteristics are:

Purpose

ITS EventID Register.

This register is used to specify the EventID for the following requests:

- Invalidation of cached information for EventIDs issued by a write to ITS_INV_EVENTR.
- Requesting the read of the configuration for an event by a write to ITS_READ_EVENTR.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_EIDR are RAZ/WI.

Attributes

ITS_EIDR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

EVENT_ID, bits [15:0]

The EventID as it should apply to a cache invalidation or reading an event translation request.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Accessing ITS_EIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0108 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_STATUSR.IDLE != '1', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_GEN_EVENT_DIDR, ITS Generate Incoming Event DeviceID Register

The ITS_GEN_EVENT_DIDR characteristics are:

Purpose

ITS Generate Incoming Event DeviceID Register.

This register is used to specify the DeviceID in a request to the ITS to generate an incoming event. The EventID of the event is specified in the ITS_GEN_EVENT_EIDR register.

Configuration

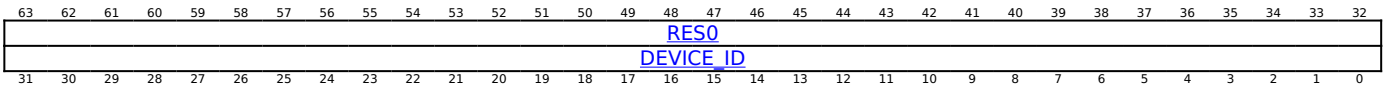
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_GEN_EVENT_DIDR are RAZ/WI.

Attributes

ITS_GEN_EVENT_DIDR is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



Bits [63:32]

Reserved, RES0.

DEVICE_ID, bits [31:0]

The DeviceID for the event generated as the result of a write to ITS_GEN_EVENTR.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Accessing ITS_GEN_EVENT_DIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0180 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_GEN_EVENT_STATUSR.IDLE != '1', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_GEN_EVENT_EIDR, ITS Generate Incoming Event EventID Register

The ITS_GEN_EVENT_EIDR characteristics are:

Purpose

ITS Generate Incoming Event EventID Register.

This register is used to specify the EventID in a request to the ITS to generate an incoming event. The DeviceID of the event is specified in the ITS_GEN_EVENT_DIDR register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_GEN_EVENT_EIDR are RAZ/WI.

Attributes

ITS_GEN_EVENT_EIDR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

EVENT_ID, bits [15:0]

EventID in the ITS Domain containing the register.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Accessing ITS_GEN_EVENT_EIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0188 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_GEN_EVENT_STATUSR.IDLE != '1', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_GEN_EVENT_STATUSR, ITS Generate Incoming Event Status Register

The ITS_GEN_EVENT_STATUSR characteristics are:

Purpose

ITS Generate Incoming Event Status Register.

Reports the status of a request to generate an incoming event via a write to the ITS_GEN_EVENTR register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_GEN_EVENT_STATUSR are RAZ/WI.

Attributes

ITS_GEN_EVENT_STATUSR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Reports whether the effects of the last write to ITS_GEN_EVENTR are complete.

IDLE	Meaning
0b0	The effects of the last write to ITS_GEN_EVENTR are not guaranteed to be complete.
0b1	The effects of the last write to ITS_GEN_EVENTR are complete.

The reset behavior of this field is:

- On a reset reset, this field resets to an UNKNOWN value.

Access to this field is RO.

Accessing ITS_GEN_EVENT_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x0190 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_GEN_EVENTR, ITS Generate Incoming Event Register

The ITS_GEN_EVENTR characteristics are:

Purpose

ITS Generate Incoming Event Register.

This register is used to generate a SET_EDGE event for the EventID specified in ITS_GEN_EVENT_EIDR and the DeviceID specified in ITS_GEN_EVENT_DIDR.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_GEN_EVENTR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before ITS_GEN_EVENT_STATUSR.IDLE is 1.

Attributes

ITS_GEN_EVENTR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

R, bit [31]

Request the ITS to generate an incoming event.

R	Meaning
0b0	The write has no effect on the ITS.
0b1	Generate an incoming event with the following information: • Event is associated with the Interrupt Domain associated with the PAS of the write. • The event is translated in the ITS Domain specified in TARGET_DOMAIN. • DeviceID is specified in the ITS_GEN_EVENT_DIDR register. • EventID is specified in the ITS_GEN_EVENT_EIDR register.

Bits [30:2]

Reserved, RES0.

TARGET_DOMAIN, bits [1:0]

Specifies the ITS Domain in which the incoming event is translated.

If the specified ITS Domain is not enabled, the write to this register does not generate an incoming event.

TARGET_DOMAIN	Meaning	Applies when
0b00	The incoming event is translated in the ITS Domain specified by ITS_IDR0.INT_DOM.	
0b01	The incoming event is translated in the Realm ITS Domain.	When ITS_IDR0.INT_DOM == '01'

Values not defined above are reserved.

Values corresponding to unimplemented Domains are reserved.

If a reserved value is programmed, the ITS behavior is CONSTRAINED UNPREDICTABLE to any behavior which could be achieved by programming a valid value.

Accessing ITS_GEN_EVENTR

Accesses to this register use the following encodings:

Accessible at offset 0x018C from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_GEN_EVENT_STATUSR.IDLE != '1', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

ITS_IDR0, ITS Identification Register 0

The ITS_IDR0 characteristics are:

Purpose

ITS Identification Register 0. Contains read-only fields with information about the ITS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_IDR0 are RAZ/WI.

Attributes

ITS_IDR0 is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

ITSID, bits [31:16]

Unique identifier for this ITS in the system.

This value is the same across all Interrupt Domains for this ITS.

Bits [15:9]

Reserved, RES0.

SWE, bit [8]

Software error reporting support in the Interrupt Domain.

SWE	Meaning
0b0	Software error reporting is not supported.
0b1	Software error reporting is supported.

Support for Software error reporting is optional.

MPAM, bit [7]

Memory Partitioning And Monitoring (MPAM) support.

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

Support for MPAM is optional.

MEC, bit [6]
When ITS_IDR0.INT_DOM == '11':

Support for Memory Encryption Contexts (MEC) for the Realm ITS Domain.

MEC	Meaning
0b0	Memory Encryption Contexts are not supported.
0b1	Memory Encryption Contexts are supported.

Support for MEC is optional.

Otherwise:

Reserved, RES0.

PA_RANGE, bits [5:2]

Physical Address range supported.

The physical address range corresponds to the system physical address size.

The value of this field is the same for all ITS Domains across all ITSs in the system

PA_RANGE	Meaning
0b0000	32 bits, 4GB
0b0001	36 bits, 64GB
0b0010	40 bits, 1TB
0b0011	42 bits, 4TB
0b0100	44 bits, 16TB
0b0101	48 bits, 256TB
0b0110	52 bits, 4PB
0b0111	56 bits, 64PB

Values not defined above are reserved.

INT_DOM, bits [1:0]

The ITS Domain that the register frame containing this register controls.

INT_DOM	Meaning
0b00	Secure
0b01	Non-secure
0b10	EL3
0b11	Realm

Accessing ITS_IDR0

Accesses to this register use the following encodings:

Accessible at offset 0x0000 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_IDR1, ITS Identification Register 1

The ITS_IDR1 characteristics are:

Purpose

ITS Identification Register 1. Contains read-only fields with information about the ITS GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_IDR1 are RAZ/WI.

Attributes

ITS_IDR1 is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:11]

Reserved, RES0.

L2SZ, bits [10:8]

Supported level 2 ITS table sizes when a 2-level table structure is used.

L2SZ	Meaning
0b1xx	Level 2 DT and ITT sizes supported: 64KiB
0bx1x	Level 2 DT and ITT sizes supported: 16KiB
0bxx1	Level 2 DT and ITT sizes supported: 4KiB

Values not defined above are reserved.

When both ITT_LEVELS and DT_LEVELS are 0, this field is RES0.

Arm strongly recommends that the ITS supports L2SZ value 0b111

ITT_LEVELS, bit [7]

Levels supported for the ITT.

ITT_LEVELS	Meaning
0b0	Only a linear ITT structure is supported
0b1	Both a 2-level and a linear ITT structure is supported.

DT_LEVELS, bit [6]

Levels supported for the device table.

DT_LEVELS	Meaning
0b0	Only a linear device table structure is supported
0b1	Both a 2-level and a linear device table structure is supported.

DEVICEID_BITS, bits [5:0]

The ITS can support translation of up to (2 ^ DEVICEID_BITS) DeviceIDs.

The maximum permitted value of this field is 32.

Accessing ITS_IDR1

Accesses to this register use the following encodings:

Accessible at offset 0x0004 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_IDR2, ITS Identification Register 2

The ITS_IDR2 characteristics are:

Purpose

ITS Identification Register 2. Contains read-only fields with information about how the ITS GIC component is implemented.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_IDR2 are RAZ/WI.

Attributes

ITS_IDR2 is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:7]

Reserved, RES0.

XDMN_EVENTS, bits [6:5]

Indicates whether the ITS Domain supports translation of events associated with other Interrupt Domains.

XDMN_EVENTS	Meaning	Applies when
0b00	The ITS Domain does not support translation of incoming events associated with other Interrupt Domains.	
0b01	The ITS Domain supports translation of incoming events associated with the Non-secure Interrupt Domain.	When ITS_IDR0.INT_DOM == '11'

Values not defined above are reserved.

EVENTID_BITS, bits [4:0]

The ITS can support translation of up to 2^(EVENTID_BITS) EventIDs.

The maximum permitted value of this field is 16.

Accessing ITS_IDR2

Accesses to this register use the following encodings:

Accessible at offset 0x0008 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_IIDR, ITS Implementer Identification Register

The ITS_IIDR characteristics are:

Purpose

ITS Implementer Identification Register. Provides information about the implementation and implementer of the GIC, and architecture version supported.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_IIDR are RAZ/WI.

Attributes

ITS_IIDR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

ProductID, bits [31:20]

IMPLEMENTATION DEFINED value identifying the GIC part

When the ITS_PIDR0-ITS_PIDR1 registers are present, Arm expects that the ITS_PIDR0.PART_0 and ITS_PIDR1.PART_1 fields match the value of ITS_IIDR.ProductID.

If required, however, an implementation is permitted to provide values for the ITS_PIDR0.PART_0 and ITS_PIDR1.PART_1 fields that do not match the value of ITS_IIDR.ProductID

Variant, bits [19:16]

IMPLEMENTATION DEFINED value used to distinguish product variants, or major revisions of the product

Revision, bits [15:12]

IMPLEMENTATION DEFINED value used to distinguish minor revisions of the product

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the GIC

For an Arm implementation, the JEP106 code is 0x43B

When the CoreSight ID registers are implemented, Arm expects that the JEP106 identification code in the ITS_PIDR1-ITS_PIDR4 registers matches that reported in ITS_IIDR.

Accessing ITS_IIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0040 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_INV_DEVICER, ITS Cache Invalidation Device Register

The ITS_INV_DEVICER characteristics are:

Purpose

ITS Cache Invalidation Device Register for a single device or a range of devices.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_INV_DEVICER are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before ITS_STATUSR.IDLE is 1.

Attributes

ITS_INV_DEVICER is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

I, bit [31]

Writing 1 to this field invalidates cached information from DTEs for the DeviceID specified in ITS_DIDR.DEVICE_ID.

I	Meaning
0b0	The write has no effect.
0b1	Invalidate cached information for the specified DeviceID.

Bits [30:6]

Reserved, RES0.

EVENTID_BITS, bits [5:1]

The range of EventIDs that the invalidation operation applies to for the specified DeviceID.

If this field is programmed to a value larger than the maximum, it is treated as having the maximum value for all other purposes than reading back the field.

The maximum value is reported in ITS_IDR2.EVENTID_BITS.

If ITS_INV_DEVICER.L1 is 1, the effective value of this field is the maximum value reported in ITS_IDR2.EVENTID_BITS.

L1, bit [0]

Controls which cached information the invalidation operation applies to.

When this field is 0, the operation invalidates cached information from the single level 2 DTE specified by ITS_DIDR.DEVICE_ID.

When this field is 1, the operation invalidates cached information from the level 1 DTE specified by ITS_DIDR.DEVICE_ID as well as any level 2 DTE covered by the range of DeviceIDs given by ITS_DT_CFGR.L2SZ for the DeviceID specified in ITS_DIDR.DEVICE_ID.

If ITS_DT_CFGR.STRUCTURE is 0, the effective value of this field is 0.

L1	Meaning
0b0	The cache invalidation operation invalidates information from the specified level 2 DTE.DEVICE_ID.
0b1	The cache invalidation operation invalidates information from the specified level 1 DTE and level 2 DTEs.

Accessing ITS_INV_DEVICER

Accesses to this register use the following encodings:

Accessible at offset 0x0110 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_STATUSR.IDLE != '1', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

ITS_INV_EVENTR, ITS Cache Invalidation Event Register

The ITS_INV_EVENTR characteristics are:

Purpose

ITS Cache Invalidation Event Register for a single event or a range of events.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_INV_EVENTR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before ITS_STATUSR.IDLE is 1.

Attributes

ITS_INV_EVENTR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

I, bit [31]

Writing 1 to this field invalidates cached information from ITTEs for the DeviceID and EventID specified in ITS_DIDR.DEVICE_ID and ITS_EIDR.EVENT_ID, respectively.

I	Meaning
0b0	The write has no effect.
0b1	Invalidate cached information for the specified DeviceID and EventID.

Bits [30:3]

Reserved, RES0.

ITT_L2SZ, bits [2:1]

The range of EventIDs that the invalidation operation applies to.

ITT_L2SZ	Meaning
0b00	The invalidate operation applies to cached information from any level 2 ITTE whose EventID bits [15:9] matches ITS_EIDR.EVENT_ID bits [15:9].
0b01	The invalidate operation applies to cached information from any level 2 ITTE whose EventID bits [15:11] matches ITS_EIDR.EVENT_ID bits [15:11].
0b10	The invalidate operation applies to cached information from any level 2 ITTE whose EventID bits [15:13] matches ITS_EIDR.EVENT_ID bits [15:13].

If ITS_INV_EVENTR.L1 is 0, this field is IGNORED.

Values not defined are reserved.

When programming a reserved value or an unsupported value, the ITS behavior is CONSTRAINED UNPREDICTABLE to any behavior which could be achieved by programming a valid and supported value.

L1, bit [0]

Controls which cached information the invalidation operation applies to.

When this field is 0, the operation invalidates cached information from the single level 2 ITTE specified by ITS_DIDR.DEVICE_ID and ITS_EIDR.EVENT_ID.

When this field is 1, the operation invalidates cached information from the level 1 ITTE specified by ITS_DIDR.DEVICE_ID and ITS_EIDR.EVENT_ID as well as any level 2 ITTE covered by the range of EventIDs given by ITS_EIDR.EVENT_ID and ITT_L2SZ for the DeviceID specified in ITS_DIDR.DEVICE_ID.

L1	Meaning
0b0	The cache invalidation operation invalidates information from the specified level 2 ITTE.
0b1	The cache invalidation operation invalidates information from the specified level 1 ITTE and level 2 ITTEs.

Accessing ITS_INV_EVENTR

Accesses to this register use the following encodings:

Accessible at offset 0x010C from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_STATUSR.IDLE != '1', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

ITS_MEC_IDR, ITS MEC Identification Register

The ITS_MEC_IDR characteristics are:

Purpose

ITS MEC Identification Register. Contains read-only fields with information about the ITS support for MEC.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_MEC_IDR are RAZ/WI.

Attributes

ITS_MEC_IDR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:4]

Reserved, RES0.

MECIDSIZE, bits [3:0]
When ITS_IDR0.MEC == '1':

The number of bits minus one of MECID supported by the ITS.

The maximum permitted value is 0xF which indicates a MECID width of 16 bits.

The value 0x0 is a valid encoding and indicates that one bit of MECID is supported.

Otherwise:

Reserved, RES0.

Accessing ITS_MEC_IDR

Accesses to this register use the following encodings:

Accessible at offset 0x01C0 from ITS_CONFIG_FRAME

- When ITS_IDR0.INT_DOM != '11', accesses to this register are RAZ/WI.
- When ITS_IDR0.MEC != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_MEC_MECID_R, ITS MEC MECID Register for the Realm PAS

The ITS_MEC_MECID_R characteristics are:

Purpose

ITS MEC MECID Register for the Realm PAS.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_MEC_MECID_R are RAZ/WI.

Attributes

ITS_MEC_MECID_R is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

MECID, bits [15:0]

MECID for ITS access to Realm PA space for:

- Fetches of device table entries.
- Fetches of interrupt translation table entries.

Bits above the supported MECID size, indicated in ITS_MEC_IDR.MECIDSIZE are RES0.

If MECIDSIZE is less than 0xF, the ITS treats bits [15:MECIDSIZE+1] of this field as zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing ITS_MEC_MECID_R

Accesses to this register use the following encodings:

Accessible at offset 0x01C4 from ITS_CONFIG_FRAME

- When ITS_IDR0.INT_DOM != '11', accesses to this register are RAZ/WI.
- When ITS_IDR0.MEC != '1', accesses to this register are RAZ/WI.
- When ITS_CR0.ITSEN == '1' or ITS_CR0.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_MPAM_IDR, ITS MPAM Identification Register

The ITS_MPAM_IDR characteristics are:

Purpose

ITS MPAM Identification Register. Contains read-only fields with information about the ITS support for MPAM.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_MPAM_IDR are RAZ/WI.

Attributes

ITS_MPAM_IDR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:25]

Reserved, RES0.

HAS_MPAM_SP, bit [24]

Whether the ITS Domain has support for MPAM PARTID space selection.

If HAS_MPAM_SP is 1, the ITS uses the MPAM PARTID specified by ITS_MPAM_PARTID_R.MPAM_SP.

If HAS_MPAM_SP is 0, the following PARTID space is used for ITS accesses to memory:

- Accesses made by the Secure ITS Domain use the Secure PARTID space.
- Accesses made by the Non-secure ITS Domain use the Non-secure PARTID space.
- Accesses made by the EL3 ITS Domain use the Root or Secure PARTID space.
- Accesses made by the Realm ITS Domain use the Realm PARTID space.

The value of this field is the same across all ITS Domains for an ITS.

PMG_MAX, bits [23:16]

The maximum PMG value that is permitted to be used in the ITS Domain.

The PMG bit width is defined as the bit position of the most significant 1 in PMG_MAX[7:0], plus one, or is defined as zero if PMG_MAX is zero.

For example, if PMG_MAX == 0x0F, the PMG bit width is 4.

This field is permitted to be zero-sized.

PARTID_MAX, bits [15:0]

The maximum PARTID value that is permitted to be used in the ITS Domain.

The PARTID bit width is defined as the bit position of the most significant 1 in PARTID_MAX[15:0], plus one, or is defined as zero if PARTID_MAX is zero.

For example, if PARTID_MAX == 0x0034, the PARTID bit width is 6.

This field is permitted to be zero-sized, but Arm recommends that it is non-zero when MPAM is implemented.

Accessing ITS_MPAM_IDR

Accesses to this register use the following encodings:

Accessible at offset 0x0200 from ITS_CONFIG_FRAME

- When ITS_IDR0.MPAM != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

ITS_MPAM_PARTID_R, ITS MPAM PARTID and PMG Register

The ITS_MPAM_PARTID_R characteristics are:

Purpose

ITS MPAM PARTID and PMG Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_MPAM_PARTID_R are RAZ/WI.

Attributes

ITS_MPAM_PARTID_R is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

IDLE, bit [31]

Whether the effects of the previous write to this register are complete.

Following a write to this register, when this field is 1, the new values written to this register is guaranteed to be used for subsequent memory accesses by the ITS.

IDLE	Meaning
0b0	The effects of the previous write to this register are not complete.
0b1	The effects of the previous write to this register are complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

Bits [30:26]

Reserved, RES0.

MPAM_SP, bits [25:24]
When ITS_MPAM_IDR.HAS_MPAM_SP == '1' and ITS_IDR0.INT_DOM == '00':

MPAM PARTID space for the Secure ITS Domain.

This field is Guarded by ITS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b00	Secure PARTID space.
0b01	Non-secure PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the ITS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When ITS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

When ITS_MPAM_IDR.HAS_MPAM_SP == '1' and ITS_IDR0.INT_DOM == '01':

MPAM PARTID space for the Non-secure ITS Domain.

This field is Guarded by ITS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b01	Non-secure PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the ITS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When ITS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

When ITS_MPAM_IDR.HAS_MPAM_SP == '1' and ITS_IDR0.INT_DOM == '10':

MPAM PARTID space for the EL3 ITS Domain.

This field is Guarded by ITS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b00	Secure PARTID space.
0b01	Non-secure PARTID space.
0b10	Root PARTID space.
0b11	Realm PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the ITS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When ITS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

When ITS_MPAM_IDR.HAS_MPAM_SP == '1' and ITS_IDR0.INT_DOM == '11':

MPAM PARTID space for the Realm ITS Domain.

This field is Guarded by ITS_MPAM_PARTID_R.IDLE.

MPAM_SP	Meaning
0b01	Non-secure PARTID space.
0b11	Realm PARTID space.

Values not defined above are reserved.

Programming a reserved value results in the ITS using an UNKNOWN PARTID space.

The reset behavior of this field is:

- On a GIC reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When ITS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

PMG, bits [23:16]

PMG for accesses to memory by the ITS Domain.

Bits above the supported PMG bit width, as indicated by ITS_MPAM_IDR.PMG_MAX, are RES0.

If a value greater than ITS_MPAM_IDR.PMG_MAX is programmed, an UNKNOWN PMG is used.

This field is Guarded by ITS_MPAM_PARTID_R.IDLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to '00000000'.

Accessing this field has the following behavior:

- When ITS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

PARTID, bits [15:0]

PARTID for accesses to memory by the ITS Domain.

Bits above the supported PARTID bit width, as indicated by ITS_MPAM_IDR.PARTID_MAX, are RES0.

If a value greater than ITS_MPAM_IDR.PARTID_MAX is programmed, an UNKNOWN PARTID is used.

This field is Guarded by ITS_MPAM_PARTID_R.IDLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0000000000000000'.

Accessing this field has the following behavior:

- When ITS_MPAM_PARTID_R.IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Accessing ITS_MPAM_PARTID_R

Accesses to this register use the following encodings:

Accessible at offset 0x0204 from ITS_CONFIG_FRAME

- When ITS_IDR0.MPAM != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_READ_EVENT_DATAR, ITS Read Event Data Register

The ITS_READ_EVENT_DATAR characteristics are:

Purpose

ITS Read Event Data Register.

This register is used to return translation information for an EventID and DeviceID specified in ITS_EIDR and ITS_DIDR registers, respectively.

Configuration

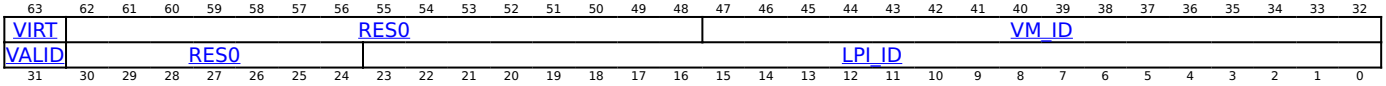
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_READ_EVENT_DATAR are RAZ/WI.

Attributes

ITS_READ_EVENT_DATAR is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



VIRT, bit [63]
When ITS_IDR0.INT_DOM != '10':

Specifies if the interrupt message generated by the ITS to the IRS in response to this event is for a physical or a virtual interrupt.

VIRT	Meaning
0b0	The interrupt message generated by the ITS is for a physical interrupt
0b1	The interrupt message generated by the ITS is for a virtual interrupt

If VALID is 0, the value of this field is UNKNOWN.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

VM_ID, bits [47:32]

Bits[15:0] of the VM ID passed to the IRS as part of the interrupt message targeting virtual interrupts.

If VIRT is 0, this field is RES0.

If VALID 0, the value of this field is UNKNOWN.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

VALID, bit [31]

Specifies whether the ITS has valid translation information for the specified EventID and DeviceID.

VALID	Meaning
0b0	The EventID does not have a valid translation.
0b1	The EventID has a valid translation.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [30:24]

Reserved, RES0.

LPI_ID, bits [23:0]

Bits[23:0] of the LPI ID for the specified EventID.

If unimplemented upper bits of the LPI_ID are not zero, it is IMPLEMENTATION DEFINED whether the upper bits are treated as 0 or the interrupt message is ignored by the IRS.

If VALID 0, the value of this field is UNKNOWN.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing ITS_READ_EVENT_DATAR

Accesses to this register use the following encodings:

Accessible at offset 0x0118 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_STATUSR.IDLE != '1', accesses to this register are UNKNOWN/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_READ_EVENTR, ITS Read Event Request Register

The ITS_READ_EVENTR characteristics are:

Purpose

ITS Read Event Request Register.

This register is used to read the translation information for an EventID and DeviceID specified in ITS_EIDR and ITS_DIDR registers, respectively.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_READ_EVENTR are RAZ/WI.

The effects of a write to this register are not guaranteed to have completed before ITS_STATUSR.IDLE is 1.

Attributes

ITS_READ_EVENTR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

R, bit [31]

Request ITS to read event translation information.

R	Meaning
0b0	The write has no effect on the ITS.
0b1	Read the translation information for the specified DeviceID and EventID into ITS_READ_EVENT_DATAR.

Bits [30:0]

Reserved, RES0.

Accessing ITS_READ_EVENTR

Accesses to this register use the following encodings:

Accessible at offset 0x0114 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_STATUSR.IDLE != '1', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

ITS_STATUSR, ITS Status Register

The ITS_STATUSR characteristics are:

Purpose

ITS Status Register.

Reports whether the effects of the last write to all of the following registers are complete:

- ITS_INV_DEVICER.
- ITS_INV_EVENTR.
- ITS_READ_EVENTR.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_STATUSR are RAZ/WI.

Attributes

ITS_STATUSR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Reports the status of the last write to all of the following registers:

- ITS_INV_DEVICER.
- ITS_INV_EVENTR.
- ITS_READ_EVENTR.

IDLE	Meaning
0b0	The effects of the last write are not guaranteed to be complete.
0b1	The effects of the last write are guaranteed to be complete.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Access to this field is RO.

Accessing ITS_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x0120 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_SWERR_STATUSR, ITS Software Error Status Register

The ITS_SWERR_STATUSR characteristics are:

Purpose

ITS Software Error Status Register. Specifies whether a software error has been reported. If an error is reported, it contains syndrome information for the error.

Configuration

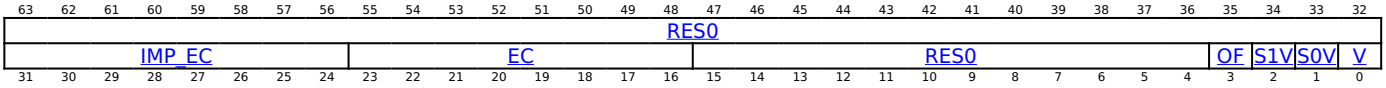
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_SWERR_STATUSR are RAZ/WI.

Attributes

ITS_SWERR_STATUSR is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMP_EC, bits [31:24]

IMPLEMENTATION DEFINED error code when ITS_SWERR_STATUS.EC == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RES0 if any the following are true:
  - ITS_SWERR_STATUSR.V == '0'.
  - ITS_SWERR_STATUSR.EC != '0'.
- Otherwise, access to this field is RO.

EC, bits [23:16]

Specifies the error code that software can use to triage and handle the error.

EC	Meaning
0x00	An error was reported because of an IMPLEMENTATION DEFINED reason.
0x01	Failed lookup of L1_DTE due to an external abort.
0x02	Failed lookup of L2_DTE due to an external abort.
0x03	Failed lookup of L1_ITTE due to an external abort.
0x04	Failed lookup of L2_ITTE due to an external abort.
0x05	An event could not be translated because L1_DTE.VALID is 0.
0x06	An event could not be translated because L2_DTE.VALID is 0.
0x07	An event could not be translated because L1_ITTE.VALID is 0.
0x08	An event could not be translated because L2_ITTE.VALID is 0.
0x09	An event could not be translated because the DeviceID > (2 ^ ITS_DT_CFGR.DEVICEID_BITS) - 1.
0x0A	An event could not be translated because the EventID > (2 ^ L2_DTE.EVENTID_BITS) - 1.
0x0B	An event could not be translated because the DeviceID exceeds the L1_DTE.SPAN.
0x0C	An event could not be translated because the EventID exceeds the L1_ITTE.SPAN.
0x0D	An event could not be translated because the event is associated with the Non-secure Interrupt Domain and L2_ITTE.DAC = 0. The error is reported in the Realm ITS Domain.
0x0E	ITS_GEN_EVENTR was written when ITS_GEN_EVENT_STATUSR.IDLE == 0.
0x0F	ITS_READ_EVENTR was written when ITS_STATUSR.IDLE == 0.
0x10	ITS_INV_DEVICER was written when ITS_STATUSR.IDLE == 0.
0x11	ITS_INV_EVENTR was written when ITS_STATUSR.IDLE == 0.
0x12	ITS_SYNCR was written when ITS_SYNC_STATUSR.IDLE == 0.
0x13	An event could not be translated because the EventID exceeds (2 ^ ITS_IDR2.EVENTID_BITS) - 1.
0x14	There was a write to an ITS translation register where bits [31:16] were not all zeros.

All other values are reserved.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When ITS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Bits [15:4]

Reserved, RES0.

OF, bit [3]

Specifies whether multiple software errors have been detected.

When this field is 1, the syndrome information reports information about the error that last caused ITS_SWERR_STATUSR.V to transition from 0 to 1.

OF	Meaning
0b0	No errors have been detected, since the error that was reported when ITS_SWERR_STATUSR.V last transitioned from 0 to 1.
0b1	At least one error has been detected, since the error that was reported when ITS_SWERR_STATUSR.V last transitioned from 0 to 1.

When clearing ITS_SWERR_STATUSR.V to 0, if this field is nonzero, software writes 1 to clear this field to zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When ITS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

S1V, bit [2]

Specifies whether ITS_SWERR_SYNDROMER1 is valid.

S1V	Meaning
0b0	ITS_SWERR_SYNDROMER1 is not valid.
0b1	ITS_SWERR_SYNDROMER1 is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When ITS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

S0V, bit [1]

Specifies whether ITS_SWERR_SYNDROMER0 is valid.

S0V	Meaning
0b0	ITS_SWERR_SYNDROMER0 is not valid.
0b1	ITS_SWERR_SYNDROMER0 is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When ITS_SWERR_STATUSR.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

V, bit [0]

Specifies whether ITS_SWERR_STATUSR is valid and at least one software error has been reported.

V	Meaning
0b0	ITS_SWERR_STATUSR is not valid.
0b1	ITS_SWERR_STATUSR is valid.

Software writes 1 to this field to clear it to zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Access to this field is W1C.

Accessing ITS_SWERR_STATUSR

After reading ITS_SWERR_STATUSR, software clears the valid fields in the register to allow new errors to be reported.

However, between reading the register and clearing the valid fields, a new error might have overwritten the register.

To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

This is done by ensuring a write to the register is ignored if all of the following are true:

- Any of ITS_SWERR_STATUSR.{V, OF} are nonzero before the write.
- The write does not clear the nonzero ITS_SWERR_STATUSR.{V, OF} fields to zero by writing ones to the applicable field or fields.

Accesses to this register use the following encodings:

Accessible at offset 0x0240 from ITS_CONFIG_FRAME

- When ITS_IDR0.SWE != '1', accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ITS_SWERR_SYNDROMER0, ITS Software Error Syndrome Register 0

The ITS_SWERR_SYNDROMER0 characteristics are:

Purpose

ITS Software Error Syndrome Register 0. Records ITS specific software error syndrome information.

Configuration

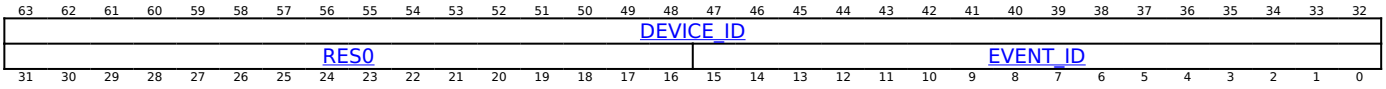
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_SWERR_SYNDROMER0 are RAZ/WI.

Attributes

ITS_SWERR_SYNDROMER0 is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



DEVICE_ID, bits [63:32]

The DeviceID for the incoming event that generated the software error.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [31:16]

Reserved, RES0.

EVENT_ID, bits [15:0]

The EventID for the incoming event that generated the software error.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing ITS_SWERR_SYNDROMER0

Accesses to this register use the following encodings:

Accessible at offset 0x0248 from ITS_CONFIG_FRAME

- When ITS_IDR0.SWE != '1', accesses to this register are RAZ/WI.
- When ITS_SWERR_STATUSR.V == '1' and ITS_SWERR_STATUSR.S0V == '1', accesses to this register are RO.
- Otherwise, accesses to this register are UNKNOWN/WI.

2025-12-10 16:11:30, 2025-12_rel

ITS_SWERR_SYNDROMER1, ITS Software Error Syndrome Register 1

The ITS_SWERR_SYNDROMER1 characteristics are:

Purpose

ITS Software Error Syndrome Register 1. Records ITS specific software error syndrome information.

Configuration

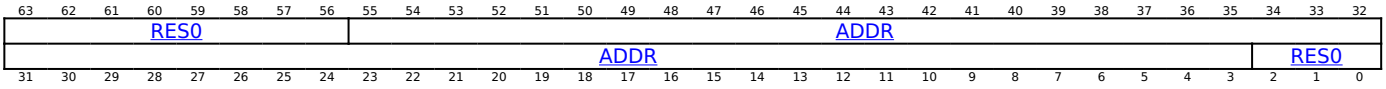
This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_SWERR_SYNDROMER1 are RAZ/WI.

Attributes

ITS_SWERR_SYNDROMER1 is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:3]

Bits[55:3] of the physical address of a translation structure associated with the detected error.

The address in this field is associated with the PAS of the ITS Domain where the error is detected.

In implementations that support fewer than 56 bits of physical address, any unimplemented upper bits are RES0. The number of implemented address bits is reported in ITS_IDR0.PA_RANGE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [2:0]

Reserved, RES0.

Accessing ITS_SWERR_SYNDROMER1

Accesses to this register use the following encodings:

Accessible at offset 0x0250 from ITS_CONFIG_FRAME

- When ITS_IDR0.SWE != '1', accesses to this register are RAZ/WI.
- When ITS_SWERR_STATUSR.V == '1' and ITS_SWERR_STATUSR.S1V == '1', accesses to this register are RO.
- Otherwise, accesses to this register are UNKNOWN/WI.

2025-12-10 16:11:30, 2025-12_rel

ITS_SYNC_STATUSR, ITS Synchronize Interrupt Events Status Register

The ITS_SYNC_STATUSR characteristics are:

Purpose

ITS Synchronize Interrupt Events Status Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_SYNC_STATUSR are RAZ/WI.

Attributes

ITS_SYNC_STATUSR is a 32-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Whether the effects of the last write to ITS_SYNCR have completed.

IDLE	Meaning
0b0	The effects of writing to ITS_SYNCR not guaranteed to have completed.
0b1	The effects of writing to ITS_SYNCR have completed.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

Accessing ITS_SYNC_STATUSR

This register is read-only.

Accesses to this register use the following encodings:

Accessible at offset 0x0148 from ITS_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ITS_SYNCR, ITS Synchronize Translation Events Register

The ITS_SYNCR characteristics are:

Purpose

ITS Synchronize Translation Events Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_SYNCR are RAZ/WI.

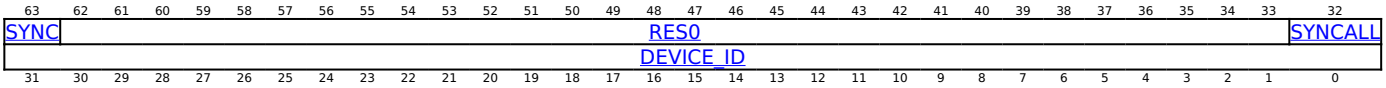
The effects of a write to this register are not guaranteed to have completed before ITS_SYNC_STATUSR.IDLE is 1.

Attributes

ITS_SYNCR is a 64-bit register.

This register is part of the ITS_CONFIG_FRAME block.

Field descriptions



SYNC, bit [63]

A synchronization request applies to the following Accepted events:

- Events that are generated from an IWB.
- Events that are generated from a system peripheral using an IMPLEMENTATION DEFINED mechanism.
- Events that are generated as a result of a write to ITS_GEN_EVENTR.
- Events that are generated as a result of a write to a register in an ITS translate register frame associated with the ITS Domain.

Writing 0 to this field has no effect.

SYNC	Meaning
0b0	The write is IGNORED.
0b1	The write issuess a synchronization request to the ITS Domain.

See 'ITS synchronization requests' for more information.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [62:33]

Reserved, RES0.

SYNCALL, bit [32]

Whether a synchronization request issued by writing 1 to SYNC applies to all Accepted ITS events or is only required to apply to those with specified DeviceID.

SYNCALL	Meaning
0b0	Synchronize only events for the specified DeviceID.
0b1	Synchronize all events for the ITS Domain.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

DEVICE_ID, bits [31:0]

An ITS synchronization request synchronized all Accepted ITS events with the specified DeviceID.

When SYNCALL is 1, this field is IGNORED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing ITS_SYNCR

Accesses to this register use the following encodings:

Accessible at offset 0x0140 from ITS_CONFIG_FRAME

- When ITS_CR0.[IDLE,ITSEN] != '11' or ITS_SYNC_STATUSR.IDLE != '1', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

ITS_TRANSLATE_FRAME, ITS translate register frame

The ITS_TRANSLATE_FRAME characteristics are:

Purpose

Contains translate registers used to generate translated interrupts for an ITS Domain.

One or more ITS translate register frames are present for each supported ITS Domain.

Arm strongly recommends that translate register frame is not accessible by PEs. This is because a write to an translate register may require the ITS access to memory, leading to in-out dependencies than can potentially lead to deadlocks in the system. The translate register frames may be mapped in stage 2 translation tables shared between an SMMU and a PE, and software in a VM may perform an access to any of the mapped translate register frames. If the translate register frames are not accessible by PEs, the behavior on an attempted access from a PE is IMPLEMENTATION DEFINED and is likely to result in an External abort. If the translate register frames are accessible by PEs, writes from each PE must use a unique DeviceID that cannot spoof a write originating from a different PE or requesting device.

Each translate register frame is only accessible in the PAS associated with the ITS Domain.

The base address of each translate register frame is distinct from addresses of registers accessible in any other PAS.

The base address of each translate register frame is aligned to 64KB.

Configuration

This block is present only when FEAT_GICv5_EXT is implemented.

Attributes

ITS_TRANSLATE_FRAME is a block of size: 64KB

Contents

Offset	Name	Accessor condition	Register condition	Most permissive access
0x0000	ITS_TRANSLATER	-	When FEAT_GICv5_EXT is implemented	WO
0x0008	ITS_RL_TRANSLATER	-	When FEAT_GICv5_EXT is implemented	WO

Direct accesses to other offsets in this block are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

ITS_RL_TRANSLATER, ITS Translate Event in Realm ITS Domain Register

The ITS_RL_TRANSLATER characteristics are:

Purpose

ITS Translate Event in Realm ITS Domain Register.

A write to this register that uses the Non-secure PAS, generates a SET_EDGE event for the DeviceID of the agent writing to the register and the EventID specified as part of the write.

The SET_EDGE event is associated with the Non-secure Interrupt Domain and processed by the ITS in the Realm ITS Domain.

If the translation of the SET_EDGE event is successful, a SET_EDGE interrupt event is generated for the IRS in the Realm Interrupt Domain

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_RL_TRANSLATER are RAZ/WI.

Attributes

ITS_RL_TRANSLATER is a 32-bit register.

This register is part of the ITS_TRANSLATE_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

EVENT_ID, bits [15:0]

The EventID to translate.

Accessing ITS_RL_TRANSLATER

This register is write-only.

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that a unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.

Writes to this register are IGNORED if any of the following are true:

- The Non-secure ITS Domain is not enabled.
- The Realm ITS Domain is not enabled.

See 'Interrupt translation service (ITS)' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information about ordering and completion requirements for writes to this register.

Accesses to this register use the following encodings:

Accessible at offset 0x0008 from ITS_TRANSLATE_FRAME

- When ITS_IDR0.INT_DOM == '01' and IsITSDomainImplemented(Realm), accesses to this register are WO.
- Otherwise, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

ITS_TRANSLATER, ITS Translate Event Register

The ITS_TRANSLATER characteristics are:

Purpose

ITS Translate Event Register.

A write to this register generates a SET_EDGE event for the DeviceID of the agent writing to the register and the EventID specified as part of the write.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to ITS_TRANSLATER are RAZ/WI.

Attributes

ITS_TRANSLATER is a 32-bit register.

This register is part of the ITS_TRANSLATE_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

EVENT_ID, bits [15:0]

The EventID to translate.

Accessing ITS_TRANSLATER

This register is write-only.

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that a unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.

Writes to this register are ignored if the ITS Domain is not enabled.

See 'Interrupt translation service (ITS)' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information about ordering and completion requirements for writes to this register.

Accesses to this register use the following encodings:

Accessible at offset 0x0000 from ITS_TRANSLATE_FRAME

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IWB_CONFIG_FRAME, IWB configuration registers frame

The IWB_CONFIG_FRAME characteristics are:

Purpose

Contains control registers for an IWB.

The base address is aligned to 64KB.

Access to this register frame in a PAS associated with an unimplemented Interrupt Domain is CONSTRAINED UNPREDICTABLE with a choice of:

- The access is RAZ/WI
- The access is made to an implemented Interrupt Domain as follows:
  - An access in the Realm PAS is translated to an access in the Non-secure Interrupt Domain
  - An access in the Secure PAS is translated to an access in the Non-secure Interrupt Domain
  - An access in the Root PAS is translated to an access in the MPPAS of the IWB

Configuration

This block is present only when FEAT_GICv5_EXT is implemented.

Attributes

IWB_CONFIG_FRAME is a block of size: 64KB

Contents

Offset	Name	Accessor condition	Register condition	Most permissive access
0x0000	IWB_IDR0	-	When FEAT_GICv5_EXT is implemented	RO
0x0040	IWB_IIDR	-	When FEAT_GICv5_EXT is implemented	RO
0x0044	IWB_AIDR	-	When FEAT_GICv5_EXT is implemented	RO
0x0080	IWB_CR0	-	When FEAT_GICv5_EXT is implemented	RW
0x00C0	IWB_WENABLE_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x00C4	IWB_WDOMAIN_STATUSR	-	When FEAT_GICv5_EXT is implemented	RO
0x00C8	IWB_WRESAMPLER	-	When FEAT_GICv5_EXT is implemented	WO
0x0E00 + (4 * n) for n in 63:0	-	-	-	ImplementationDefined
0x2000 + (4 * n) for n in 2047:0	IWB_WENABLER<n>	-	When FEAT_GICv5_EXT is implemented	RW
0x4000 + (4 * n) for n in 2047:0	IWB_WTMR<n>	-	When FEAT_GICv5_EXT is implemented	RW
0x8000 + (4 * n) for n in 4095:0	IWB_WDOMAINR<n>	-	When FEAT_GICv5_EXT is implemented	RW

Direct accesses to other offsets in this block are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

IWB_AIDR, IWB Architecture Identification Register

The IWB_AIDR characteristics are:

Purpose

IWB Architecture Identification Register. Identifies the GIC architecture version to which the implementation conforms.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_AIDR are RAZ/WI.

Attributes

IWB_AIDR is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

Bits [31:12]

Reserved, RES0.

Component, bits [11:8]

GIC component

Component	Meaning
0b0000	IRS
0b0001	ITS
0b0010	IWB

ArchMajorRev, bits [7:4]

Major Architecture revision.

ArchMajorRev	Meaning
0b0000	GICv5.x

ArchMinorRev, bits [3:0]

Minor Architecture revision.

ArchMinorRev	Meaning
0b0000	GICv5.0

Accessing IWB_AIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0044 from IWB_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IWB_CR0, IWB Control Register 0

The IWB_CR0 characteristics are:

Purpose

IWB Control Register 0.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_CR0 are RAZ/WI.

Attributes

IWB_CR0 is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

Bits [31:2]

Reserved, RES0.

IDLE, bit [1]

Whether the transition between enabled and disabled states of the IWB is complete.

IDLE	Meaning
0b0	The effects of updating IWBEN are not guaranteed to have completed.
0b1	The effects of updating IWBEN have completed.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Access to this field is RO.

IWBEN, bit [0]

Controls if the IWB is enabled.

This field is Guarded by IWB_CR0.IDLE.

IWBEN	Meaning
0b0	Disabled. The IWB does not generate any events its destination.
0b1	Enabled. The IWB may generate events to its destination.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Accessing this field has the following behavior:

- When IWB_CR0.IDLE == '0', access to this field is RO.
- When !IsAccessIWBMPPAS(), access to this field is RO.
- Otherwise, access to this field is RW.

Accessing IWB_CR0

Accesses to this register use the following encodings:

Accessible at offset 0x0080 from IWB_CONFIG_FRAME

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IWB_IDR0, IWB ID register 0

The IWB_IDR0 characteristics are:

Purpose

IWB ID register 0. Contains read-only fields with information about the IWB GIC component.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_IDR0 are RAZ/WI.

Attributes

IWB_IDR0 is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

Bits [31:15]

Reserved, RES0.

INT_DOMS, bits [14:11]

The Interrupt Domains supported by the IWB.

INT_DOMS	Meaning
0b0001	Only the Secure Interrupt Domain is supported
0b0010	Only the Non-secure Interrupt Domain is supported
0b0111	The EL3, Secure and Non-secure Interrupt Domains are supported
0b1110	The EL3, Realm, and Non-secure Interrupt Domains are supported
0b1111	The EL3, Realm, Secure, and Non-secure Interrupt Domains are supported

All values not listed are reserved.

IW_RANGE, bits [10:0]

Indicates the number of implemented wire control registers.

The number is reported as the highest numbered wire control field as multiple of 32 minus one.

For example:

- A value of 0 means that the IWB supports register accesses to control wires 0-31
- A value of 1 means that the IWB supports register accesses to control wires 0-63
- ...and so on until 0-65535.

Accessing IWB_IDR0

Accesses to this register use the following encodings:

Accessible at offset 0x0000 from IWB_CONFIG_FRAME

Accesses to this register are RO.

IWB_IIDR, IWB Implementer Identification Register

The IWB_IIDR characteristics are:

Purpose

IWB Implementer Identification Register. Provides information about the implementation and implementer of the GIC, and architecture version supported.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_IIDR are RAZ/WI.

Attributes

IWB_IIDR is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

ProductID, bits [31:20]

IMPLEMENTATION DEFINED value identifying the GIC part

When the IWB_PIDR0-IWB_PIDR1 registers are present, Arm expects that the IWB_PIDR0.PART_0 and IWB_PIDR1.PART_1 fields match the value of IWB_IIDR.ProductID.

If required, however, an implementation is permitted to provide values for the IWB_PIDR0.PART_0 and IWB_PIDR1.PART_1 fields that do not match the value of IWB_IIDR.ProductID

Variant, bits [19:16]

IMPLEMENTATION DEFINED value used to distinguish product variants, or major revisions of the product

Revision, bits [15:12]

IMPLEMENTATION DEFINED value used to distinguish minor revisions of the product

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the GIC

For an Arm implementation, the JEP106 code is 0x43B

When the CoreSight ID registers are implemented, Arm expects that the JEP106 identification code in the IWB_PIDR1-IWB_PIDR4 registers matches that reported in IWB_IIDR.

Accessing IWB_IIDR

Accesses to this register use the following encodings:

Accessible at offset 0x0040 from IWB_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IWB_WDOMAIN_STATUSR, IWB Wire Assignment Status Register for an Interrupt Domain

The IWB_WDOMAIN_STATUSR characteristics are:

Purpose

IWB Wire Assignment Status Register for an Interrupt Domain.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_WDOMAIN_STATUSR are RAZ/WI.

Attributes

IWB_WDOMAIN_STATUSR is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Tracks status of writes to IWB_WDOMAINR<n> on this IWB.

IDLE	Meaning
0b0	A write to IWB_WDOMAINR<n> is in progress.
0b1	No write to IWB_WDOMAINR<n> is in progress.

Accessing IWB_WDOMAIN_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x00C4 from IWB_CONFIG_FRAME

- When IsAccessIWBMPPAS(), accesses to this register are RO.
- Otherwise, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

IWB_WDOMAINR<n>, IWB Wire Interrupt Domain Selection Register, n = 0 - 4095

The IWB_WDOMAINR<n> characteristics are:

Purpose

IWB Wire Interrupt Domain Selection Register. Allows software to configure the Interrupt Domain that wires n 16 through ((n 16) + 15) are assigned to.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_WDOMAINR<n> are RAZ/WI.

The number of implemented IWB_WDOMAINR<n> registers is (IWB_IDR0.IW_RANGE + 1) * 2.

The effects of a write to this register are not guaranteed to have completed until IWB_WDOMAIN_STATUSR.IDLE is 1.

Attributes

IWB_WDOMAINR<n> is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

31 30	29 28	27 26	25 24	23 22	21 20	19 18	17 16	15 14	13 12	11 10	9 8	7 6	5 4	3 2	1 0
WDOM15	WDOM14	WDOM13	WDOM12	WDOM11	WDOM10	WDOM9	WDOM8	WDOM7	WDOM6	WDOM5	WDOM4	WDOM3	WDOM2	WDOM1	WDOM0

WDOM<x>, bits [2x+1:2x], for x = 15 to 0

Configures the Interrupt Domain that wire ((16 * n) + x) is assigned to.

Programming an Interrupt Domain not supported by the IWB results in CONSTRAINED UNPREDICTABLE behavior with the following options:

- No signals are generated by the IWB for a wire assigned to an unsupported Interrupt Domain.
- The wire is treated as being assigned to another supported Interrupt Domain and a read of this field returns the Interrupt Domain the wire is assigned to.

Access to control fields for wires which are not implemented are RAZ/WI.

WDOM<x>	Meaning
0b00	Secure
0b01	Non-secure
0b10	EL3
0b11	Realm

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When IsWireDomainRO((n * 16) + x), access to this field is RO.
- Otherwise, access to this field is RW.

Accessing IWB_WDOMAINR<n>

When the Interrupt Domain assigned of a wire is fixed, access to the corresponding field is RO.

This register can only be accessed through the MPPAS of the IWB.

Accesses to this register use the following encodings:

Accessible at offset 0x8000 + (4 * n) from IWB_CONFIG_FRAME

- When IWB_CR0.IDLE == '0', accesses to this register are RO.
- When !IsAccessIWBMPPAS(), accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IWB_WENABLE_STATUSR, IWB Wire Enable Status Register for an Interrupt Domain

The IWB_WENABLE_STATUSR characteristics are:

Purpose

IWB Wire Enable Status Register for an Interrupt Domain.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_WENABLE_STATUSR are RAZ/WI.

Attributes

IWB_WENABLE_STATUSR is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IDLE, bit [0]

Tracks status of writes to IWB_WENABLER<n> on this IWB where the writes used the same PAS that was used to access this register.

IDLE	Meaning
0b0	A write to IWB_WENABLER<n> using the PAS that was used to access this register is in progress.
0b1	No write to IWB_WENABLER<n> using the PAS that was used to access this register is in progress.

Accessing IWB_WENABLE_STATUSR

Accesses to this register use the following encodings:

Accessible at offset 0x00C0 from IWB_CONFIG_FRAME

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

IWB_WENABLER<n>, IWB Wire Enable Register, n = 0 - 2047

The IWB_WENABLER<n> characteristics are:

Purpose

IWB Wire Enable Register. Allows software to configure if individual wires are enabled or disabled.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_WENABLER<n> are RAZ/WI.

The number of implemented IWB_WENABLER<n> registers is IWB_IDR0.IW_RANGE + 1.

The effects of a write to this register are not guaranteed to have completed before IWB_WENABLE_STATUSR.IDLE is 1.

Attributes

IWB_WENABLER<n> is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

WEN<x>, bit [x], for x = 31 to 0

Configures if wire ((32 * n) + x) is enabled or disabled.

Access to control fields for wires which are not implemented are RAZ/WI.

WEN<x>	Meaning
0b0	Wire disabled
0b1	Wire enabled

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsWireAccessible(n, x), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing IWB_WENABLER<n>

When accessed using the MPPAS of the IWB, all fields are RW.

When accessed using any other PAS, a field is RW if all of the following are true:

- The wire corresponding to the field is assigned to an Interrupt Domain that is implemented by the IWB.
- The PAS corresponding to the access is same as the PAS associated with the Interrupt Domain to which the wire is assigned.

Otherwise, the field is RAZ/WI for that access.

Accesses to this register use the following encodings:

Accessible at offset 0x2000 + (4 * n) from IWB_CONFIG_FRAME

- When IWB_CR0.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

IWB_WRESAMPLER, IWB Wire Resample Register

The IWB_WRESAMPLER characteristics are:

Purpose

IWB Wire Resample Register.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_WRESAMPLER are RAZ/WI.

Attributes

IWB_WRESAMPLER is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

Bits [31:16]

Reserved, RES0.

IWI, bits [15:0]

Input Wire Index. Specifies the wire to resample.

Following a write to this register, if all of the following are true, the wire is resampled:

- The access to this register is performed using the PAS associated with the Interrupt Domain that the wire is assigned to or the MPPAS of the IWB.
- The specified wire is enabled.

If the specified wire is disabled, the write to this register has no effect.

See 'IWB wire control registers' for more information.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing IWB_WRESAMPLER

Accesses to this register use the following encodings:

Accessible at offset 0x00C8 from IWB_CONFIG_FRAME

- When IWB_CR0.IDLE == '0', accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

IWB_WTMR<n>, IWB Wire Trigger Mode Register, n = 0 - 2047

The IWB_WTMR<n> characteristics are:

Purpose

IWB Wire Trigger Mode Register. Allows software to configure if the wire signal is level-sensitive or edge-triggered.

Configuration

This register is present only when FEAT_GICv5_EXT is implemented and FEAT_GICv5_EXT is implemented. Otherwise, direct accesses to IWB_WTMR<n> are RAZ/WI.

The number of implemented IWB_WTMR<n> registers is IWB_IDR0.IW_RANGE + 1.

Attributes

IWB_WTMR<n> is a 32-bit register.

This register is part of the IWB_CONFIG_FRAME block.

Field descriptions

TM<x>, bit [x], for x = 31 to 0

Configures if wire ((32 * n) + x) is level-sensitive or edge-triggered.

When the wire is configured as level-sensitive, a CLEAR event is sent to the ITS when the wire signal is de-asserted, and a SET_LEVEL event is sent to the ITS when the wire signal is asserted.

When the wire is configured as edge-triggered, only SET_EDGE event are generated to the ITS and only when the wire changes from de-asserted to asserted.

When IsWireConfigRO(n * 32 + x) is 0, this field resets to 0.

Access to control fields for wires which are not implemented are RAZ/WI.

TM<x>	Meaning
0b0	Edge-triggered
0b1	Level-sensitive

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if any the following are true:
  - !IsWireAccessible(n, x).
  - IsWireConfigRO((n * 32) + x).
- Otherwise, access to this field is RW.

Accessing IWB_WTMR<n>

When the Trigger mode of a wire is software programmable, all of the following are true:

- When accessed using the MPPAS of the IWB, all fields are RW.
- When accessed using any other PAS, a field is RW if all of the following are true:
- The wire corresponding to the field is assigned to an Interrupt Domain that is implemented by the IWB.
- The PAS corresponding to the access is same as the PAS associated with the Interrupt Domain to which the wire is assigned.

Otherwise, the field is RO for that access.

Accesses to this register use the following encodings:

Accessible at offset 0x4000 + (4 * n) from IWB_CONFIG_FRAME

- When IWB_CR0.IDLE == '0', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

Direct accesses to other offsets in this block are RES0.

PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMAUTHSTATUS are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. Arm recommends that this register is implemented.

Attributes

PMAUTHSTATUS is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Not implemented.

All other values are reserved.

Access to this field is RO.

NSNID, bits [3:2]

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Not implemented.

All other values are reserved.

Access to this field is RO.

Accessing PMAUTHSTATUS

Accesses to this register use the following encodings:

Accessible at offset 0xFB8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented.

External register PMCCFILTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCFILTR_EL0[63:0] when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented.

External register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are RES0.

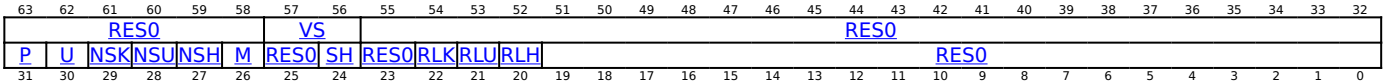
PMCCFILTR_EL0 is in the Core power domain.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:58]

Reserved, RES0.

VS, bits [57:56]
When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting cycles in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of cycles.
0b01	The PE does not count cycles in Streaming SVE mode.
0b10	The PE does not count cycles in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting cycles in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL1.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL1 is further controlled by PMCCFILTR_EL0.NSK.

If FEAT_RME is implemented, then counting cycles in Realm EL1 is further controlled by PMCCFILTR_EL0.RLK.

If EL3 is implemented, then counting cycles in EL3 is further controlled by PMCCFILTR_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting cycles in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL0.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL0 is further controlled by PMCCFILTR_EL0.NSU.

If FEAT_RME is implemented, then counting cycles in Realm EL0 is further controlled by PMCCFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 filtering. Controls counting cycles in Non-secure EL1. If PMCCFILTR_EL0.NSK is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL1.

NSK	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in Non-secure EL1.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in Non-secure EL1. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 filtering. Controls counting cycles in Non-secure EL0. If PMCCFILTR_EL0.NSU is not equal to PMCCFILTR_EL0.U, then the PE does not count cycles in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL0.

NSU	Meaning
0b0	When PMCCFILTR_EL0.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.U == 1, the PE does not count cycles in Non-secure EL0.
0b1	When PMCCFILTR_EL0.U == 0, the PE does not count cycles in Non-secure EL0. When PMCCFILTR_EL0.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 filtering. Controls counting cycles in EL2.

NSH	Meaning
0b0	The PE does not count cycles in EL2.
0b1	This mechanism has no effect on filtering of cycles.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting cycles in Secure EL2 is further controlled by PMCCFILTR_EL0.SH.

If FEAT_RME is implemented, then counting cycles in Realm EL2 is further controlled by PMCCFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]
When EL3 is implemented and FEAT_AA64 is implemented:

EL3 filtering. Controls counting cycles in EL3. If PMCCFILTR_EL0.M is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in EL3. Otherwise, this mechanism has no effect on filtering of cycles in EL3.

M	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in EL3.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in EL3. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]
When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting cycles in Secure EL2. If PMCCFILTR_EL0.SH is equal to PMCCFILTR_EL0.NSH, then the PE does not count cycles in Secure EL2. Otherwise, this mechanism has no effect on filtering of cycles in Secure EL2.

SH	Meaning
0b0	When PMCCFILTR_EL0.NSH == 0, the PE does not count cycles in Secure EL2. When PMCCFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of cycles.
0b1	When PMCCFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.NSH == 1, the PE does not count cycles in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is RES0 .

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting cycles in Realm EL1. If PMCCFILTR_EL0.RLK is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in Realm EL1. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL1.

RLK	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in Realm EL1.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in Realm EL1. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting cycles in Realm EL0. If PMCCFILTR_EL0.RLU is not equal to PMCCFILTR_EL0.U, then the PE does not count cycles in Realm EL0. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL0.

RLU	Meaning
0b0	When PMCCFILTR_EL0.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.U == 1, the PE does not count cycles in Realm EL0.
0b1	When PMCCFILTR_EL0.U == 0, the PE does not count cycles in Realm EL0. When PMCCFILTR_EL0.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]
When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting cycles in Realm EL2. If PMCCFILTR_EL0.RLH is equal to PMCCFILTR_EL0.NSH, then the PE does not count cycles in Realm EL2. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL2.

RLH	Meaning
0b0	When PMCCFILTR_EL0.NSH == 0, the PE does not count cycles in Realm EL2. When PMCCFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of cycles.
0b1	When PMCCFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.NSH == 1, the PE does not count cycles in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

If FEAT_PMUv3_EXT32 is implemented, and any of the following apply, then bits [63:32] of this register are accessible at offset 0xA7C:

- FEAT_PMUv3_TH is implemented.
- FEAT_PMUv3p8 is implemented.
- FEAT_PMUv3_SME is implemented.

Otherwise accesses at this offset are IMPLEMENTATION DEFINED.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x47C from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.

- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x4F8 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented and (FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented, or FEAT_PMUv3_SME is implemented)

[63:32] Accessible at offset 0xA7C from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMCCIDSR, CONTEXTIDR_ELx Sample Register

The PMCCIDSR characteristics are:

Purpose

PC Sample-based Profiling Extension register that contains the sampled value of CONTEXTIDR_EL1 and CONTEXTIDR_EL2, captured on reading PMPCSR.

Configuration

External register PMCCIDSR bits [31:0] are architecturally mapped to External register PMVCIDSR[31:0].

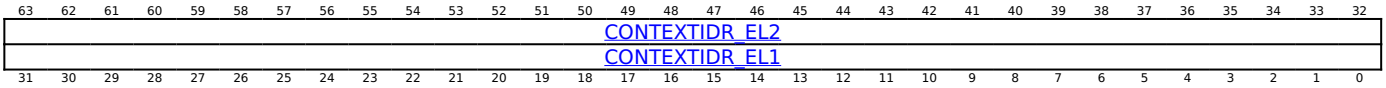
This register is present only when FEAT_PMUv3_EXT64 is implemented and FEAT_PCSRv8p2 is implemented.

Attributes

PMCCIDSR is a 64-bit register.

This register is part of the PMU block.

Field descriptions



CONTEXTIDR_EL2, bits [63:32]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to this field is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether this field is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and this register samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.

Because the value written to this register is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether this register is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCCIDSR

If FEAT_PCSRv8p2 and FEAT_PMUv3_EXT32 are implemented, then the same content is present in the same locations, and can be accessed using PMCID2SR[31:0] and PMCID1SR[31:0].

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

Accessible at offset 0x228 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. For more information, see 'Time as measured by the Performance Monitors cycle counter'.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTR_EL0[63:0].

External register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are RES0.

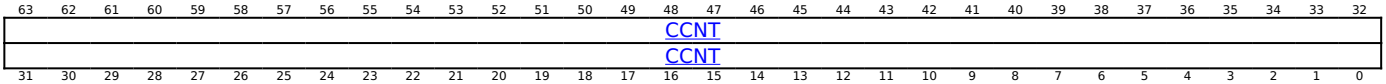
PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x0F8 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x0F8 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented

[63:32] Accessible at offset 0x0FC from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMCCNTSVR_EL1, Performance Monitors Cycle Count Saved Value Register

The PMCCNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Cycle counter, PMCCNTR_EL0.

Configuration

External register PMCCNTSVR_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMCCNTSVR_EL1[63:0].

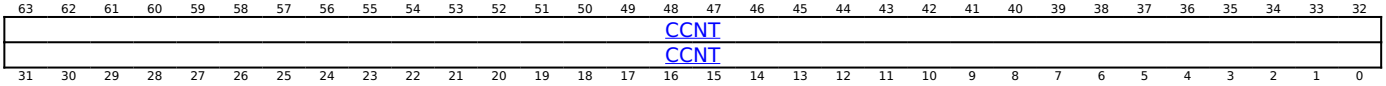
This register is present only when FEAT_PMUv3_SS is implemented and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCCNTSVR_EL1 are RES0.

Attributes

PMCCNTSVR_EL1 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



CCNT, bits [63:0]

Sampled Cycle Count. The value of PMCCNTR_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTSVR_EL1

Accesses to this register use the following encodings:

Accessible at offset 0x6F8 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMSSAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCCR, PMU Configuration Control Register

The PMCCR characteristics are:

Purpose

Contains PMU configuration controls.

Configuration

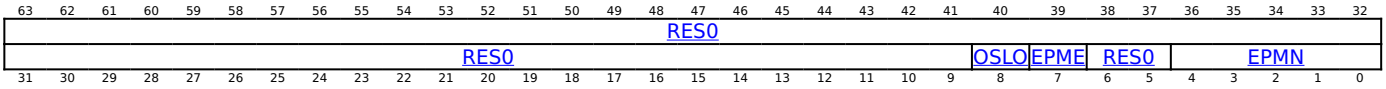
This register is present only when FEAT_PMUv3_EXTPMN is implemented. Otherwise, direct accesses to PMCCR are RES0.

Attributes

PMCCR is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:9]

Reserved, RES0.

OSLO, bit [8]
When FEAT_PMUv3_EXTPMN is implemented:

OS Lock Override.

OSLO	Meaning
0b0	No external access to any Performance Monitor register is affected by this control.
0b1	For the purpose of determining the access permissions of Performance Monitor registers, an external access that is a Most secure access ignores OSLSR_EL1.OSLK.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EPME, bit [7]
When FEAT_PMUv3_EXTPMN is implemented:

External Enable.

EPME	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are the event counters in the third range.

Other event counters, PMCCNTR_EL0, and, if FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 are not affected by this field.

If the Effective value of PMCCR.EPMN is equal to NUM_PMU_COUNTERS, then this field has no effect.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EPMN, bits [4:0]
When FEAT_PMUv3_EXTPMN is implemented:

Defines the number of event counters PMEVCNTR<n>_EL0 and, if FEAT_PMUv3_SS is implemented, snapshot registers PMEVCNTSVR<n>_EL1, that are reserved for external use.

PMCCR.EPMN divides the event counters into event counters that are accessible from self-hosted software, and which might be further divided into first and second ranges by MDCR_EL2.HPMN, and a third range that is inaccessible from self-hosted software.

If PMCCR.EPMN is not 0 and is less than the number of PMU event counters implemented by the PE, NUM_PMU_COUNTERS, then event counters [0..(PMCCR.EPMN-1)] are in the first and second ranges, and event counters [PMCCR.EPMN..(NUM_PMU_COUNTERS-1)] are in the third range.

If PMCCR.EPMN is equal to NUM_PMU_COUNTERS, or FEAT_PMUv3_EXTPMN is not implemented, then all of the following apply:

- All counters are in the first and second ranges.
- No counters are in the third range.

If PMCCR.EPMN is zero, then all of the following apply:

- No counters are in the first and second ranges.
- All counters are in the third range.

All the following apply for an event counter PMEVCNTR<n>_EL0 in the third range:

- The counter is accessible to a Most secure access of PMEVCNTR<n>_EL0. That is, an external access which is one of the following:
  - Root access, when FEAT_RME is implemented.
  - Secure access, when FEAT_RME is not implemented and Secure state is implemented.
  - Non-secure access, otherwise.
- The counter is not accessible to other external accesses, or as the System register PMEVCNTR<n>_EL0 at any Exception level.
- The counter overflow flag PMOVSSET_EL0[n] is set on unsigned overflow of PMEVCNTR<n>_EL0[63:0].
- PMCCR.EPME and PMCNTENSET_EL0 enable operation of the event counter.

If FEAT_PMUv3_SS is implemented, then all of the following apply for an event counter snapshot register PMEVCNTSVR<n>_EL1 in the third range:

- The event counter snapshot register is accessible to a Most secure access of PMEVCNTSVR<n>_EL1.
- The event counter snapshot register is not accessible to other external accesses, or as the System register PMEVCNTSVR<n>_EL1 at any Exception level.

For information about counters in the first and second ranges, see the description of MDCR_EL2.HPMN.

Values greater than NUM_PMU_COUNTERS are reserved.

If this field is set to a reserved value, then the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by an external read of PMCCR.EPMN is UNKNOWN and less than or equal to 31.
- For the purpose of indirect reads of PMCCR.EPMN as a result of the following reads, the Effective value of PMCCR.EPMN is UNKNOWN and less than or equal to 31:
  - Direct reads of PMCR_EL0.N or PMCR.N.
  - Direct reads of MDCR_EL2.HPMN.
  - External reads of PMCFGR.N.
  - If FEAT_PMUv3_ICNTR is implemented, external reads of PMCGCR0.CG0NC.
- For all other purposes the Effective value of PMCCR.EPMN is UNKNOWN and less than or equal to NUM_PMU_COUNTERS.

If FEAT_PMUv3_EXTPMN is not implemented, then the Effective value of PMCCR.EPMN is NUM_PMU_COUNTERS.

The reset behavior of this field is:

- On a Cold reset, this field resets to the expression `NUM_PMU_COUNTERS`.

Otherwise:

Reserved, RES0.

Accessing PMCCR

Accesses to this register use the following encodings:

Accessible at offset 0xE58 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMCEID0, Performance Monitors Common Event Identification register 0

The PMCEID0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x0000 to 0x001F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Note

This view of the register was previously called PMCEID0_EL0.

Configuration

External register PMCEID0 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[31:0].

External register PMCEID0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMCEID0 are RES0.

PMCEID0 is in the Core power domain.

Attributes

PMCEID0 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8	ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID0

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

Accessible at offset 0xE20 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCEID1, Performance Monitors Common Event Identification register 1

The PMCEID1 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x020 to 0x03F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Note

This view of the register was previously called PMCEID1_EL0.

Configuration

External register PMCEID1 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[31:0].

External register PMCEID1 bits [31:0] are architecturally mapped to AArch32 System register PMCEID1[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented. Otherwise, direct accesses to PMCEID1 are RES0.

PMCEID1 is in the Core power domain.

Attributes

PMCEID1 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID1

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

Accessible at offset 0xE24 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCEID2, Performance Monitors Common Event Identification register 2

The PMCEID2 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Configuration

External register PMCEID2 bits [31:0] are architecturally mapped to AArch64 System register PMCEID0_EL0[63:32].

External register PMCEID2 bits [31:0] are architecturally mapped to AArch32 System register PMCEID2[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID2 are RES0.

PMCEID2 is in the Core power domain.

Attributes

PMCEID2 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (0x4000 + n).

For each bit:

IDhi<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID2

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

Accessible at offset 0xE28 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCEID3, Performance Monitors Common Event Identification register 3

The PMCEID3 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the range 0x4020 to 0x403F.

For more information about the Common events and the use of the PMCEIDn registers, see 'The PMU event number space and common events'.

Use of this register is deprecated.

Configuration

External register PMCEID3 bits [31:0] are architecturally mapped to AArch64 System register PMCEID1_EL0[63:32].

External register PMCEID3 bits [31:0] are architecturally mapped to AArch32 System register PMCEID3[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p1 is implemented. Otherwise, direct accesses to PMCEID3 are RES0.

PMCEID3 is in the Core power domain.

Attributes

PMCEID3 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

IDhi<n>, bit [n], for n = 31 to 0

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n> registers of that earlier version of the PMU architecture.

Accessing PMCEID3

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

Accessible at offset 0xE2C from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

Purpose

Contains PMU-specific configuration data.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCFGR are RES0.

PMCFGR is in the Core power domain.

Attributes

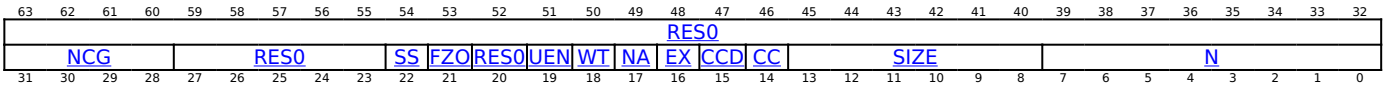
PMCFGR is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:



Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCG	Meaning
0b0000	One counter group implemented.
0b0001	Two counter groups implemented.

All other values are reserved.

FEAT_PMUv3_ICNTR implements the functionality identified by the value 0b0001.

Access to this field is RO.

Bits [27:23]

Reserved, RES0.

SS, bit [22]

Snapshot supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SS	Meaning
0b0	Snapshot mechanism not supported. The locations 0x600-0x7FC and 0xE30-0xE3C are IMPLEMENTATION DEFINED.
0b1	Snapshot mechanism supported. If FEAT_PMUv3_SS is implemented, then the following registers are implemented: • PMEVCNTSVR<n>_EL1. • PMCCNTSVR_EL1. • If FEAT_PMUv3_ICNTR is implemented, PMICNTSVR_EL1. • PMSSCR_EL1. Otherwise, locations 0x600-0x7FC and 0xE30-0xE3C contain IMPLEMENTATION DEFINED snapshot registers.

FEAT_PMUv3_SS implements the functionality identified by the value 1.

If FEAT_PMUv3_SS is not implemented, a PMU might include an IMPLEMENTATION DEFINED snapshot mechanism, including one using the IMPLEMENTATION DEFINED registers 0x600-0x7FC and 0xE30-0xE3C.

Access to this field is RO.

FZO, bit [21]

Freeze-on-overflow supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FZO	Meaning
0b0	Freeze-on-overflow mechanism is not supported. PMCR_EL0.FZO is RES0.
0b1	Freeze-on-overflow mechanism is supported. PMCR_EL0.FZO is RW.

FEAT_PMUv3p7 implements the functionality added by the value 0b1.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.

Access to this field is RO.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

Reads as 0b0.

Access to this field is RO.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is RO.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is RO.

EX, bit [16]

Export supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EX	Meaning
0b0	PMCR_EL0.X is RES0.
0b1	PMCR_EL0.X is read/write.

Access to this field is RO.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCD	Meaning
0b0	PMCR_EL0.D is RES0.
0b1	PMCR_EL0.D is read/write.

Access to this field is RO.

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as 0b1.

Access to this field is RO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8.0, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8.0, the counters are a doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is RO.

N, bits [7:0]

Number of counters accessible, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

N	Meaning
0x00	Only PMCCNTR_EL0 accessible.
0x01..0x20	Number of counters accessible, 2 to 33, minus one.

All other values are reserved.

If FEAT_PMUv3_ICNTR is implemented, then the value 0x00 is not permitted.

The count includes:

- The cycle counter, PMCCNTR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, the Instruction Counter, PMICNTR_EL0.

When FEAT_PMUv3_EXTPMN is implemented and the access to this register is not a Most secure access, the following apply:

- If FEAT_PMUv3_ICNTR is not implemented, this field reads as the Effective value of PMCCR.EPMN.
- If FEAT_PMUv3_ICNTR is implemented, this field reads as the Effective value of PMCCR.EPMN plus one.

Otherwise, the following apply:

- If FEAT_PMUv3_ICNTR is not implemented, this field reads as the number of event counters implemented.
- If FEAT_PMUv3_ICNTR is implemented, this field reads as the number of event counters implemented plus one.

For example, if PMCFGR.N == 0x07, then:

- There are eight counters in total.
- If FEAT_PMUv3_ICNTR is not implemented, this comprises 7 event counters and the cycle counter.
- If FEAT_PMUv3_ICNTR is implemented, this comprises 6 event counters, the cycle counter, and the instruction counter.

The maximum number of event counters is 31.

Access to this field is RO.

Otherwise:

NCG, bits [31:28]

Defines the number of counter groups implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCG	Meaning
0b0000	One counter group implemented.
0b0001	Two counter groups implemented.

All other values are reserved.

FEAT_PMUv3_ICNTR implements the functionality identified by the value 0b0001.

Access to this field is RO.

Bits [27:23]

Reserved, RES0.

SS, bit [22]

Snapshot supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SS	Meaning
0b0	Snapshot mechanism not supported. The locations 0x600-0x7FC and 0xE30-0xE3C are IMPLEMENTATION DEFINED.
0b1	Snapshot mechanism supported. If FEAT_PMUv3_SS is implemented, then the following registers are implemented: • PMEVCNTSVR<n>_EL1. • PMCCNTSVR_EL1. • If FEAT_PMUv3_ICNTR is implemented, PMICNTSVR_EL1. • PMSSCR_EL1. Otherwise, locations 0x600-0x7FC and 0xE30-0xE3C contain IMPLEMENTATION DEFINED snapshot registers.

FEAT_PMUv3_SS implements the functionality identified by the value 1.

If FEAT_PMUv3_SS is not implemented, a PMU might include an IMPLEMENTATION DEFINED snapshot mechanism, including one using the IMPLEMENTATION DEFINED registers 0x600-0x7FC and 0xE30-0xE3C.

Access to this field is RO.

FZO, bit [21]

Freeze-on-overflow supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FZO	Meaning
0b0	Freeze-on-overflow mechanism is not supported. PMCR_EL0.FZO is RES0.
0b1	Freeze-on-overflow mechanism is supported. PMCR_EL0.FZO is RW.

FEAT_PMUv3p7 implements the functionality added by the value 0b1.

From Armv8.7, if FEAT_PMUv3 is implemented, the only permitted value is 0b1.

Access to this field is RO.

Bit [20]

Reserved, RES0.

UEN, bit [19]

User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RAZ.

Reads as 0b0.

Access to this field is RO.

WT, bit [18]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is RO.

NA, bit [17]

This feature is not supported, so this bit is RAZ.

Reads as 0b0.

Access to this field is RO.

EX, bit [16]

Export supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EX	Meaning
0b0	PMCR_EL0.X is RES0.
0b1	PMCR_EL0.X is read/write.

Access to this field is RO.

CCD, bit [15]

Cycle counter has prescale.

This is RES1 if AArch32 is supported, and RAZ otherwise.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCD	Meaning
0b0	PMCR_EL0.D is RES0.
0b1	PMCR_EL0.D is read/write.

Access to this field is RO.

CC, bit [14]

Dedicated cycle counter (counter 31) supported.

Reads as 0b1.

Access to this field is RO.

SIZE, bits [13:8]

Size of counters, minus one. This field defines the size of the largest counter implemented by the Performance Monitors Unit.

From Armv8.0, the largest counter is 64-bits, so the value of this field is 0b111111.

This field is used by software to determine the spacing of the counters in the memory-map. From Armv8.0, the counters are a doubleword-aligned addresses.

Reads as 0b111111.

Access to this field is RO.

N, bits [7:0]

Number of counters accessible, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

N	Meaning
0x00	Only PMCCNTR_EL0 accessible.
0x01..0x20	Number of counters accessible, 2 to 33, minus one.

All other values are reserved.

If FEAT_PMUv3_ICNTR is implemented, then the value 0x00 is not permitted.

The count includes:

- The cycle counter, PMCCNTR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, the Instruction Counter, PMICNTR_EL0.

When FEAT_PMUv3_EXTPMN is implemented and the access to this register is not a Most secure access, the following apply:

- If FEAT_PMUv3_ICNTR is not implemented, this field reads as the Effective value of PMCCR.EPMN.
- If FEAT_PMUv3_ICNTR is implemented, this field reads as the Effective value of PMCCR.EPMN plus one.

Otherwise, the following apply:

- If FEAT_PMUv3_ICNTR is not implemented, this field reads as the number of event counters implemented.
- If FEAT_PMUv3_ICNTR is implemented, this field reads as the number of event counters implemented plus one.

For example, if PMCFGR.N == 0x07, then:

- There are eight counters in total.
- If FEAT_PMUv3_ICNTR is not implemented, this comprises 7 event counters and the cycle counter.
- If FEAT_PMUv3_ICNTR is implemented, this comprises 6 event counters, the cycle counter, and the instruction counter.

The maximum number of event counters is 31.

Access to this field is RO.

Accessing PMCFGR

Note

AllowExternalPMUAccess() has a new definition from Armv8.4. Refer to the Pseudocode definitions for more information.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0xE00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xE00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCGCR0, Counter Group Configuration Register 0

The PMCGCR0 characteristics are:

Purpose

Encodes the number of counters accessible.

Configuration

This register is present only when FEAT_PMUv3_ICNTR is implemented and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCGCR0 are RES0.

PMCGCR0 is in the Core power domain.

Attributes

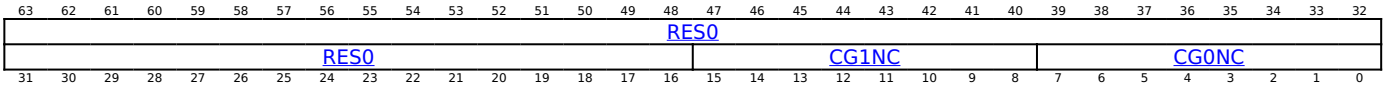
PMCGCR0 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:



Bits [63:16]

Reserved, RES0.

CG1NC, bits [15:8]

Number of counters in group 1, which comprises the instruction counter PMICNTR_EL0.

CG1NC	Meaning
0x01	PMICNTR_EL0 implemented.

Other values are reserved.

Access to this field is RO.

CG0NC, bits [7:0]

Number of counters in group 0, which comprises the event counters PMEVCNTR<n>_EL0 and the cycle counter PMCCNTR_EL0.

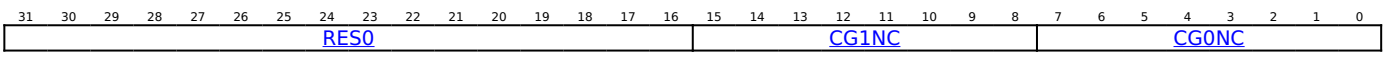
When FEAT_PMUv3_EXTPMN is implemented and the external access to this register is not a Most secure access, this field reads as the Effective value of PMCCR.EPMN plus one.

Otherwise, this field reads as the number of event counters implemented plus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:



Bits [31:16]

Reserved, RES0.

CG1NC, bits [15:8]

Number of counters in group 1, which comprises the instruction counter PMICNTR_EL0.

CG1NC	Meaning
0x01	PMICNTR_EL0 implemented.

Other values are reserved.

Access to this field is RO.

CG0NC, bits [7:0]

Number of counters in group 0, which comprises the event counters PMEVCNTR<n>_EL0 and the cycle counter PMCCNTR_EL0.

When FEAT_PMUv3_EXTPMN is implemented and the external access to this register is not a Most secure access, this field reads as the Effective value of PMCCR.EPMN plus one.

Otherwise, this field reads as the number of event counters implemented plus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMCGCR0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0xCE0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0xCE0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCID1SR, CONTEXTIDR_EL1 Sample Register

The PMCID1SR characteristics are:

Purpose

PC Sample-based Profiling Extension register that contains the sampled value of CONTEXTIDR_EL1, captured on reading PMPCSR[31:0].

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented.

PMCID1SR is in the Core power domain.

Attributes

PMCID1SR is a 32-bit register.

This register is part of the PMU block.

Field descriptions

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and this register samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.

Because the value written to this register is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether this register is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID1SR

If FEAT_PCSRv8p2 and FEAT_PMUv3_EXT64 are implemented, then the same content is present in the same locations, and can be accessed using PMCCIDSR[31:0] or PMCVIDSR[31:0].

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

Accessible at offset 0x208 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Accessible at offset 0x228 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCID2SR, CONTEXTIDR_EL2 Sample Register

The PMCID2SR characteristics are:

Purpose

PC Sample-based Profiling Extension register that contains the sampled value of CONTEXTIDR_EL2, captured on reading PMPCSR[31:0].

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented and FEAT_PCSRv8p2 is implemented.

PMCIDR2SR is in the Core power domain.

Attributes

PMCID2SR is a 32-bit register.

This register is part of the PMU block.

Field descriptions

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

Because the value written to this field is an indirect read of CONTEXTIDR_EL2, it is CONSTRAINED UNPREDICTABLE whether this field is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR_EL2.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMCID2SR

If FEAT_PMUv3_EXT64 is implemented, then the same content is present in the same location, and can be accessed using PMCCIDSR[63:32].

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

Accessible at offset 0x22C from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR0. Otherwise, direct accesses to PMCIDR0 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR0 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing PMCIDR0

Accesses to this register use the following encodings:

Accessible at offset 0xFF0 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR1. Otherwise, direct accesses to PMCIDR1 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is RO.

Accessing PMCIDR1

Accesses to this register use the following encodings:

Accessible at offset 0xFF4 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCIDR2, Performance Monitors Component Identification Register 2

The PMCIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR2. Otherwise, direct accesses to PMCIDR2 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR2 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing PMCIDR2

Accesses to this register use the following encodings:

Accessible at offset 0xFF8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Component Identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMCIDR3. Otherwise, direct accesses to PMCIDR3 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMCIDR3 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing PMCIDR3

Accesses to this register use the following encodings:

Accessible at offset 0xFFC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMCNTEN, Performance Monitors Count Enable register

The PMCNTEN characteristics are:

Purpose

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<n>.

Configuration

External register PMCNTEN bits [63:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[63:0].

External register PMCNTEN bits [63:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[63:0].

External register PMCNTEN bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

External register PMCNTEN bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

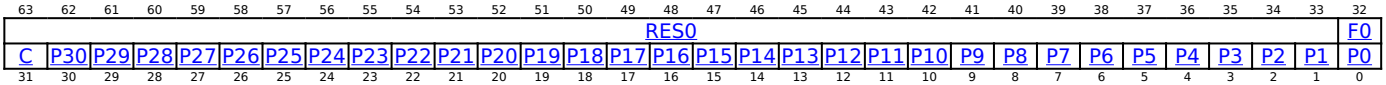
This register is present only when FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMCNTEN are RES0.

Attributes

PMCNTEN is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 counter enable. Enables the instruction counter.

F0	Meaning
0b0	PMICNTR_EL0 disabled.
0b1	PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 enable. Enables the cycle counter register. Possible values are:

C	Meaning
0b0	PMCCNTR_EL0 is disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

P<m>, bit [m], for m = 30 to 0

Event counter enable for PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 is disabled.
0b1	PMEVCNTR<m>_EL0 is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- Otherwise, access to this field is RW.

Accessing PMCNTEN

Accesses to this register use the following encodings:

Accessible at offset 0xC10 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear Register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Allows software to disable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which counters are enabled.

Configuration

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3p9 is not implemented, and FEAT_PMUv3_ICNTR is not implemented.

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3p9 is not implemented, and FEAT_PMUv3_ICNTR is not implemented.

External register PMCNTENCLR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMCNTENCLR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

External register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are RES0.

PMCNTENCLR_EL0 is in the Core power domain.

Attributes

PMCNTENCLR_EL0 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented:

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 disable. On writes, allows software to disable PMICNTR_EL0. On reads, returns the PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMICNTR_EL0 disabled.
0b1	PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 disable. On writes, allows software to disable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 disable. On writes, allows software to disable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Otherwise:

C, bit [31]

PMCCNTR_EL0 disable. On writes, allows software to disable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 disable. On writes, allows software to disable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMCNTENCLR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_ICNTR is implemented, or FEAT_PMUv3p9 is implemented

[63:0] Accessible at offset 0xC20 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXT32 is implemented and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3_ICNTR is not implemented, and FEAT_PMUv3p9 is not implemented

[31:0] Accessible at offset 0xC20 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMCNTENSET_EL0, Performance Monitors Count Enable Set Register

The PMCNTENSET_EL0 characteristics are:

Purpose

Allows software to enable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which counters are enabled.

Configuration

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3p9 is not implemented, and FEAT_PMUv3_ICNTR is not implemented.

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3p9 is not implemented, and FEAT_PMUv3_ICNTR is not implemented.

External register PMCNTENSET_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMCNTENSET_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

External register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are RES0.

PMCNTENSET_EL0 is in the Core power domain.

Attributes

PMCNTENSET_EL0 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 enable. On writes, allows software to enable PMICNTR_EL0. On reads, returns the PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMICNTR_EL0 disabled.
0b1	PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 enable. On writes, allows software to enable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 enable. On writes, allows software to enable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

C, bit [31]

PMCCNTR_EL0 enable. On writes, allows software to enable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 enable. On writes, allows software to enable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Accessing PMCNTENSET_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_ICNTR is implemented, or FEAT_PMUv3p9 is implemented

[63:0] Accessible at offset 0xC00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXT32 is implemented and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3_ICNTR is not implemented, and FEAT_PMUv3p9 is not implemented

[31:0] Accessible at offset 0xC00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Configures and controls the Performance Monitors counters.

Configuration

External register PMCR_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMCR_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented.

External register PMCR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMCR_EL0[31:0].

External register PMCR_EL0 bits [10:0] are architecturally mapped to AArch32 System register PMCR[10:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMCR_EL0 are RES0.

PMCR_EL0 is in the Core power domain.

This register is only partially mapped to the internal PMCR System register. An external agent must use other means to discover the information held in PMCR[31:11], such as accessing PMCFGR and the ID registers.

Attributes

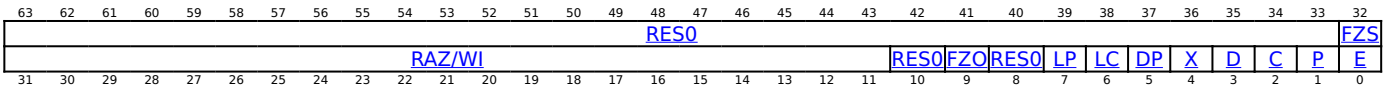
PMCR_EL0 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:



Bits [63:33]

Reserved, RES0.

FZS, bit [32]
When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ,E} is {1,1} and profiling is stopped.

FZS	Meaning
0b0	Do not freeze on a Statistical Profiling Buffer Management event.
0b1	Affected counters do not count following a Statistical Profiling Buffer Management event.

The pseudocode function SPEProfilingStopped describes when profiling is stopped.

The counters affected by this field are:

- The event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If FEAT_SPE_DPFZS is implemented and PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When FEAT_SPE_DPFZS is not implemented or PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA32 is implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]
When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Affected counters do not count when any of the following applies: • For any event counter PMEVCNTR<m>_EL0 in the first range, PMOVSCLR_EL0[m] is 1, and either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0. • FEAT_PMUv3_ICNTR is implemented, PMOVSCLR_EL0.F0 is 1, and either FEAT_SEBEP is not implemented or PMICFILTR_EL0.SYNC is 0.

The counters affected by this field are:

- The event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]
When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.P[n].

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

The counters affected by this field are the event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]
When FEAT_AA32 is implemented:

Long cycle counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.C.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

Arm deprecates use of PMCR_EL0.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]
When EL3 is implemented, or (FEAT_PMUv3p1 is implemented and EL2 is implemented), or FEAT_PMUv3p7 is implemented, or FEAT_SPE_DPFZS is implemented:

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD or HDCR.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. • If FEAT_SPE_DPFZS is implemented and event counting is frozen by PMCR_EL0.FZS, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. • If EL3 is implemented, MDCR_EL3.SPME or SDCR.SPME is 0, and one of FEAT_PMUv3p7 is not implemented, EL3 is using AArch32, or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state.

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited or frozen. For more information about event counter ranges, see MDCR_EL2.HPMN.

If FEAT_PMUv3p7 and FEAT_SPEv1p2 are implemented, meaning PMCR_EL0.FZS is implemented, and FEAT_SPE_DPFZS is not implemented, then cycle counting by PMCCNTR_EL0 is not affected by PMCR_EL0.FZS.

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]
When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If FEAT_ETE is implemented, this field does not affect the use of PMU events as an External Input by the trace unit.

If FEAT_ETMv4 is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]
When FEAT_AA32 is implemented:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If the Effective value of PMCR_EL0.LC is 1, then this field is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow field. The value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset.

P	Meaning
0b0	No action.
0b1	Reset all affected event counters PMEVCNTR<n>_EL0 to zero.

The event counters affected by this field are:

- If FEAT_PMUv3_EXTPMN is implemented and the access to this register is a Most secure access, all event counters.
- Otherwise, only event counters in the first and second ranges.

Writes to this field do not affect other event counters, the cycle counter PMCCNTR_EL0, or the instruction counter PMICNTR_EL0.

For more information about event counter ranges, see MDCR_EL2.HPMN.

Note

Resetting the event counters does not change the event counter overflow fields. If FEAT_PMUv3p5 is implemented, the values of MDCR_EL2.HLP or HDCR.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- The cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RAZ/WI																					RES0	FZO	RES0	LP	LC	DP	X	D	C	P	E

Bits [31:11]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

Bit [10]

Reserved, RES0.

FZO, bit [9]
When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Affected counters do not count when any of the following applies: • For any event counter PMEVCNTR<m>_EL0 in the first range, PMOVSCLR_EL0[m] is 1, and either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0. • FEAT_PMUv3_ICNTR is implemented, PMOVSCLR_EL0.F0 is 1, and either FEAT_SEBEP is not implemented or PMICFILTR_EL0.SYNC is 0.

The counters affected by this field are:

- The event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]
When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.P[n].

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

The counters affected by this field are the event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]
When FEAT_AA32 is implemented:

Long cycle counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.C.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

Arm deprecates use of PMCR_EL0.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]
When EL3 is implemented, or (FEAT_PMUv3p1 is implemented and EL2 is implemented), or FEAT_PMUv3p7 is implemented, or FEAT_SPE_DPFZS is implemented:

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD or HDCR.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. • If FEAT_SPE_DPFZS is implemented and event counting is frozen by PMCR_EL0.FZS, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented, EL3 is implemented and using AArch64, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. • If EL3 is implemented, MDCR_EL3.SPME or SDCR.SPME is 0, and one of FEAT_PMUv3p7 is not implemented, EL3 is using AArch32, or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state.

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited or frozen. For more information about event counter ranges, see MDCR_EL2.HPMN.

If FEAT_PMUv3p7 and FEAT_SPEv1p2 are implemented, meaning PMCR_EL0.FZS is implemented, and FEAT_SPE_DPFZS is not implemented, then cycle counting by PMCCNTR_EL0 is not affected by PMCR_EL0.FZS.

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]
When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If FEAT_ETE is implemented, this field does not affect the use of PMU events as an External Input by the trace unit.

If FEAT_ETMv4 is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]
When FEAT_AA32 is implemented:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If the Effective value of PMCR_EL0.LC is 1, then this field is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA64 is not implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow field. The value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset.

P	Meaning
0b0	No action.
0b1	Reset all affected event counters PMEVCNTR<n>_EL0 to zero.

The event counters affected by this field are:

- If FEAT_PMUv3_EXTPMN is implemented and the access to this register is a Most secure access, all event counters.
- Otherwise, only event counters in the first and second ranges.

Writes to this field do not affect other event counters, the cycle counter PMCCNTR_EL0, or the instruction counter PMICNTR_EL0.

For more information about event counter ranges, see MDCR_EL2.HPMN.

Note

Resetting the event counters does not change the event counter overflow fields. If FEAT_PMUv3p5 is implemented, the values of MDCR_EL2.HLP or HDCR.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- The cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PMCR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

Accessible at offset 0xE04 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT64 is implemented

Accessible at offset 0xE10 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMDEVAFF, Performance Monitors Device Affinity register

The PMDEVAFF characteristics are:

Purpose

Copy of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

This register is present only when FEAT_PMUv3_EXT64 is implemented.

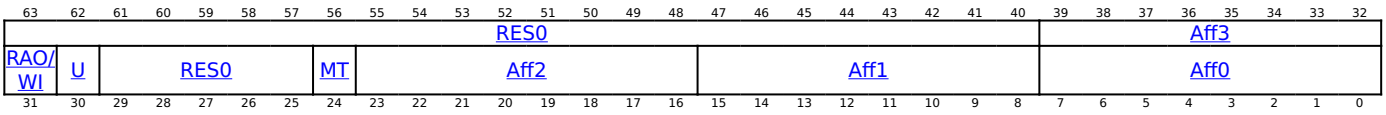
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVAFF is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMDEVAFF

If FEAT_PMUv3_EXT32 is implemented, then the same content is present in the same locations, and can be accessed using PMDEVAFF0[31:0] and PMDEVAFF1[31:0].

Accesses to this register use the following encodings:

Accessible at offset 0xFA8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented.

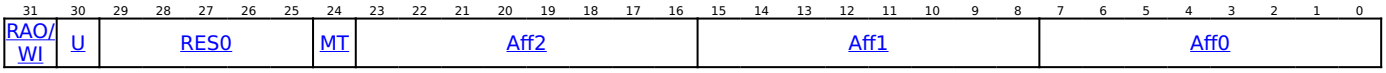
If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVAFF0 is a 32-bit register.

This register is part of the PMU block.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMDEVAFF0

If FEAT_PMUv3_EXT64 is implemented, then the same content is present in the same location, and can be accessed using PMDEVAFF[31:0].

Accesses to this register use the following encodings:

Accessible at offset 0xFA8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the Performance Monitor component relates to.

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVAFF1 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of PMDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMDEVAFF1

If FEAT_PMUv3_EXT64 is implemented, then the same content is present in the same location, and can be accessed using PMDEVAFF[63:32].

Accesses to this register use the following encodings:

Accessible at offset 0xFAC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the Performance Monitor component.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMDEVARCH are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVARCH is a 32-bit register.

This register is part of the PMU block.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architect of the component. For Performance Monitors, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the PMDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For Performance Monitors, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is RO.

ARCHVER, bits [15:12]
When UInt(PMU.PMDEVARCH.ARCHPART) == 0xA16 or UInt(PMU.PMDEVARCH.ARCHPART) == 0xA26:

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0010	Performance Monitors Extension version 3, PMUv3.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

Access to this field is RO.

Otherwise:

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	PC Sample-based Profiling version 2, FEAT_PCSRv8p2.

All other values are reserved.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHVER is PMDEVARCH.ARCHID[15:12].

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHPART	Meaning
0xA10	PC Sample-based Profiling, including the 32-bit programmers' model extension.
0xA16	Armv8-A PE performance monitors, including the 32-bit programmers' model extension.
0xA20	PC Sample-based Profiling, including the 64-bit programmers' model extension.
0xA26	Armv8-A PE performance monitors, including the 64-bit programmers' model extension.

FEAT_PMUv3_EXT32 implements the functionality described by the values 0xA10 and 0xA16.

FEAT_PMUv3_EXT64 implements the functionality described by the values 0xA20 and 0xA26.

The values 0xA10 and 0xA20 indicate that FEAT_PCSRv8p2 is implemented but the Performance Monitors Extension is not implemented.

PMDEVARCH.ARCHVER and PMDEVARCH.ARCHPART are also defined as a single field, PMDEVARCH.ARCHID, so that PMDEVARCH.ARCHPART is PMDEVARCH.ARCHID[11:0].

Access to this field is RO.

Accessing PMDEVARCH

Accesses to this register use the following encodings:

Accessible at offset 0xFBC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMDEVID, Performance Monitors Device ID register

The PMDEVID characteristics are:

Purpose

Provides information about features of the Performance Monitors implementation.

Configuration

This register is present only when (v8Ap2 or FEAT_PCSRv8p2 is implemented) and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMDEVID are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVID is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:12]

Reserved, RES0.

EXTPMN, bits [11:8]

Reserving PMU event counters for external agents.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXTPMN	Meaning
0b0000	PMUv3 Extension for reserving PMU event counters for external agents not implemented.
0b0001	PMUv3 Extension for reserving PMU event counters for external agents implemented.

All other values are reserved.

FEAT_PMUv3_EXTPMN implements the functionality identified by the value 0b0001.

Access to this field is RO.

PMSS, bits [7:4]

PMU Snapshot extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSS	Meaning
0b0000	PMU snapshot extension not implemented.
0b0001	PMU snapshot extension implemented.

All other values are reserved.

FEAT_PMUv3_SS implements the functionality identified by the value 0b0001.

Access to this field is RO.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using Performance Monitors registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the Performance Monitors register space.
0b0001	PC Sample-based Profiling Extension is implemented in the Performance Monitors register space.
0b0010	As 0b0001, and adds support for PMPCSCTL.

All other values are reserved.

FEAT_PCSRv8p2 implements the functionality identified by the value 0b0001.

FEAT_PCSRv8p9 implements the functionality identified by the value 0b0010.

If FEAT_PCSRv8p2 is not implemented, then the only permitted value is 0b0000.

From Armv8.2, when FEAT_PCSRv8p2 is implemented, the value 0b0000 is not permitted.

From Armv8.9, when FEAT_PCSRv8p9 is implemented, the value 0b0001 is not permitted.

Access to this field is RO.

Accessing PMDEVID

Accesses to this register use the following encodings:

Accessible at offset 0xFC8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's performance monitor interface.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMDEVTYPE. Otherwise, direct accesses to PMDEVTYPE are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Attributes

PMDEVTYPE is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is RO.

MAJOR, bits [3:0]

Major type.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MAJOR	Meaning
0b0000	Unspecified.
0b0110	Performance monitor component.

FEAT_PMUv3 implements the functionality described by the value 0b0110.

Access to this field is RO.

Accessing PMDEVTYPE

Accesses to this register use the following encodings:

Accessible at offset 0xFCC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter <n>, which counts events, where <n> is 0 to 30.

Configuration

External register PMEVCNTR<n>_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p5 is implemented.

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVCNTR<n>_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p5 is not implemented.

External register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are RES0.

PMEVCNTR<n>_EL0 is in the Core power domain.

Attributes

PMEVCNTR<n>_EL0 is a:

- 64-bit register when FEAT_PMUv3p5 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3p5 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
EVCNT																															
EVCNT																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EVCNT, bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

If the highest implemented Exception level is using AArch32, the optional external interface to the performance monitors is implemented, and the PMCR.LP and HDCR.HLP bits are RAZ/WI, then locations in the external interface to the performance monitors that map to PMEVCNTR<n>_EL0[63:32] return UNKNOWN values on reads.

If the implementation does not support AArch64, bits [63:32] of the event counters are not required to be implemented.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
EVCNT																															

EVCNT, bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

If FEAT_PMUv3p5 is not implemented, when IsCorePowered(), DoubleLockStatus(), OSLockStatus() or !AllowExternalPMUAccess(), 32-bit accesses to 0x004+8×n have a CONSTRAINED UNPREDICTABLE behavior.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x000 + (8 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p5 is implemented

[63:0] Accessible at offset 0x000 + (8 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p5 is not implemented

[31:0] Accessible at offset 0x000 + (8 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMEVCNTSVR<n>_EL1, Performance Monitors Event Count Saved Value Registers, n = 0 - 30

The PMEVCNTSVR<n>_EL1 characteristics are:

Purpose

Captures the PMU Event counter <n>, PMEVCNTR<n>_EL0.

Configuration

External register PMEVCNTSVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMEVCNTSVR<n>_EL1[63:0].

This register is present only when FEAT_PMUv3_SS is implemented and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMEVCNTSVR<n>_EL1 are RES0.

PMEVCNTSVR<n>_EL1 is in the Core power domain.

If event counter n is not implemented:

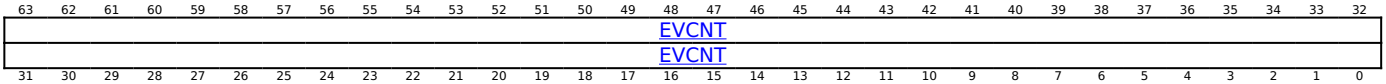
- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(addrdesc), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVCNTSVR<n>_EL1 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



EVCNT, bits [63:0]

Sampled Event Count. The value of PMEVCNTR<n>_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTSVR<n>_EL1

Accesses to this register use the following encodings:

Accessible at offset 0x600 + (8 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMSSAccess(addrdesc), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMEVFILT2R<n>, Performance Monitors Event Filter Registers, n = 0 - 63

The PMEVFILT2R<n> characteristics are:

Purpose

Provides additional IMPLEMENTATION DEFINED configuration controls for PMU counters.

Each PMEVFILT2R<n> register can provide additional configuration controls for a PMU counter, where:

- For values of n less than 31, if event counter n is implemented, then the controls are for PMU event counter <n>.
- For n equal to 31, the controls are for the cycle counter, PMCCNTR_EL0;
- For n equal to 32, if FEAT_PMUv3_ICNTR is implemented, the controls are for the instruction counter, PMICNTR_EL0;
- For all other values of n, PMEVFILT2R<n> is not implemented.

Although this mapping is recommended, it is not required and the function of each register is IMPLEMENTATION DEFINED.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMEVFILT2R<n>. Otherwise, direct accesses to PMEVFILT2R<n> are RES0.

PMEVFILT2R<n> is in the Core power domain.

If PMEVFILT2R<n> is not implemented:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

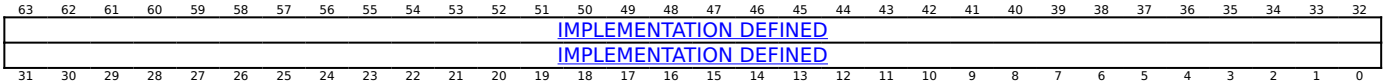
PMEVFILT2R<n> is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Otherwise:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing PMEVFILT2R<n>

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x800 + (4 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.

- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x800 + (8 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[31:0].

External register PMEVTYPER<n>_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMEVTYPER<n>_EL0[63:32] when FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented, or FEAT_PMUv3_EXT64 is implemented.

External register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are RES0.

PMEVTYPER<n>_EL0 is in the Core power domain.

If event counter n is not implemented:

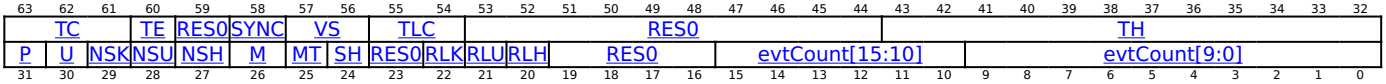
- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalPMUAccess(), accesses are RES0.
- Otherwise, it is CONSTRAINED UNPREDICTABLE whether accesses to this register are RES0 or generate an error response.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



TC, bits [63:61]
When FEAT_PMUv3_TH is implemented, (FEAT_PMUv3_EDGE is not implemented or PMU.PMEVTYPER<n>_EL0.TE == '0'), and (FEAT_PMUv3_TH2 is not implemented, or n is even, or PMU.PMEVTYPER<n>_EL0.TLC IN {'0x'}):

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- For odd values of n, V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled, then V[n-1] is zero. V[n-1] is not defined for even values of n.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b000	Not-equal. The counter increments by V_B[n] on each processor cycle when V_B[n] is not equal to TH[n].
0b001	Not-equal, count. The counter increments by 1 on each processor cycle when V_B[n] is not equal to TH[n].
0b010	Equals. The counter increments by V_B[n] on each processor cycle when V_B[n] is equal to TH[n].
0b011	Equals, count. The counter increments by 1 on each processor cycle when V_B[n] is equal to TH[n].
0b100	Greater-than-or-equal. The counter increments by V_B[n] on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b101	Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b110	Less-than. The counter increments by V_B[n] on each processor cycle when V_B[n] is less than TH[n].
0b111	Less-than, count. The counter increments by 1 on each processor cycle when V_B[n] is less than TH[n].

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC[2:1] is true:

- If PMEVTYPER<n>_EL0.TC[0] is 0, then the counter increments by V_B[n].
- If PMEVTYPER<n>_EL0.TC[0] is 1, then the counter increments by 1.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC[2:1] is false:

- If FEAT_PMUv3_TH2 is implemented, n is odd, and PMEVTYPER<n>_EL0.TLC is 0b01, then the counter increments by V[n-1].
- Otherwise, the counter does not increment.

If PMEVTYPER<n>_EL0.{TC, TLC, TH} are zero, then the threshold function is disabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3_TH2 is implemented, PMU.PMEVTYPER<n>_EL0.TE == '0', n is odd, and PMU.PMEVTYPER<n>_EL0.TLC == '10':

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled, then V[n-1] is zero.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b000	Not-equal. The counter increments by V[n-1] on each processor cycle when V_B[n] is not equal to TH[n].
0b010	Equals. The counter increments by V[n-1] on each processor cycle when V_B[n] is equal to TH[n].
0b100	Greater-than-or-equal. The counter increments by V[n-1] on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b110	Less-than. The counter increments by V[n-1] on each processor cycle when V_B[n] is less than TH[n].

All other values are reserved.

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is true, the counter increments by V[n-1].

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is false, the counter does not increment.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3_EDGE is implemented and PMU.PMEVTYPER<n>_EL0.TE == '1':

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- For odd values of n, V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled, then V[n-1] is zero. V[n-1] is not defined for even values of n.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b001	Equal to not-equal. The counter increments on each processor cycle when V_B[n] is not equal to TH[n] and V_B[n] was equal to TH[n] on the previous processor cycle.
0b010	Equal to/from not-equal. The counter increments on each processor cycle when either: • V_B[n] is not equal to TH[n] and V_B[n] was equal to TH[n] on the previous processor cycle. • V_B[n] is equal to TH[n] and V_B[n] was not equal to TH[n] on the previous processor cycle.
0b011	Not-equal to equal. The counter increments on each processor cycle when V_B[n] is equal to TH[n] and V_B[n] was not equal to TH[n] on the previous processor cycle.
0b101	Less-than to greater-than-or-equal. The counter increments on each processor cycle when V_B[n] is greater than or equal to TH[n] and V_B[n] was less than TH[n] on the previous processor cycle.
0b110	Less-than to/from greater-than-or-equal. The counter increments on each processor cycle when either: • V_B[n] is greater than or equal to TH[n] and V_B[n] was less than TH[n] on the previous processor cycle. • V_B[n] is less than TH[n] and V_B[n] was greater than or equal to TH[n] on the previous processor cycle.
0b111	Greater-than-or-equal to less-than. The counter increments on each processor cycle when V_B[n] is less than TH[n] and V_B[n] was greater than or equal to TH[n] on the previous processor cycle.

All other values are reserved.

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is true:

- If FEAT_PMUv3_TH2 is implemented, n is odd, and PMEVTYPER<n>_EL0.TLC is 0b10, then the counter increments by V[n-1].
- Otherwise, the counter increments by 1.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is false, the counter does not increment.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TE, bit [60]
When FEAT_PMUv3_EDGE is implemented:

Threshold Edge. Enables the edge condition. When PMEVTYPER<n>_EL0.TE is 1, the event counter increments on cycles when the result of the threshold condition changes. See PMEVTYPER<n>_EL0.TC for more information.

TE	Meaning
0b0	Threshold edge condition disabled.
0b1	Threshold edge condition enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [59]

Reserved, RES0.

SYNC, bit [58]
When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU Profiling exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU Profiling exception is enabled.
0b1	Synchronous PMU Profiling exception is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VS, bits [57:56]
When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting events in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of events.
0b01	The PE does not count events in Streaming SVE mode.
0b10	The PE does not count events in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLC, bits [55:54]
When FEAT_PMUv3_TH2 is implemented and n is odd:

Threshold Linking Control. Extends PMEVTYPER<n>_EL0.TC with additional controls for event linking. See PMEVTYPER<n>_EL0.TC.

TLC	Meaning
0b00	Threshold linking disabled.
0b01	Threshold linking enabled. If the threshold condition described by PMEVTYPER<n>_EL0.TC is false, the counter increments by V[n-1]. Otherwise, the counter increments as described by PMEVTYPER<n>_EL0.TC.
0b10	Threshold linking enabled. If the threshold condition described by PMEVTYPER<n>_EL0.TC is true, the counter increments by V[n-1]. Otherwise, the counter does not increment.

All other values are reserved.

See PMEVTYPER<n>_EL0.TC for more information

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:44]

Reserved, RES0.

TH, bits [43:32]
When FEAT_PMUv3_TH is implemented:

Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<n>_EL0.TC.

If PMEVTYPER<n>_EL0.{TC, TH} are both zero and either FEAT_PMUv3_TH2 is not implemented or PMEVTYPER<n>_EL0.TLC is also zero, then the threshold function is disabled.

If PMU.PMMIR_EL1.THWIDTH is less than 12, then bits PMEVTYPER<n>_EL0.TH[11:UInt(PMU.PMMIR_EL1.THWIDTH)] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{\text{UInt(PMU.PMMIR\_EL1.THWIDTH)}}$.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to the expression 0x000.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting events in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL1.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL1 is further controlled by PMEVTYPER<n>_EL0.NSK.

If FEAT_RME is implemented, then counting events in Realm EL1 is further controlled by PMEVTYPER<n>_EL0.RLK.

If EL3 is implemented, then counting events in EL3 is further controlled by PMEVTYPER<n>_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting events in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL0.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL0 is further controlled by PMEVTYPER<n>_EL0.NSU.

If FEAT_RME is implemented, then counting events in Realm EL0 is further controlled by PMEVTYPER<n>_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 filtering. Controls counting events in Non-secure EL1. If PMEVTYPER<n>_EL0.NSK is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL1.

NSK	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in Non-secure EL1.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in Non-secure EL1. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 filtering. Controls counting events in Non-secure EL0. If PMEVTYPER<n>_EL0.NSU is not equal to PMEVTYPER<n>_EL0.U, then the PE does not count events in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL0.

NSU	Meaning
0b0	When PMEVTYPER<n>_EL0.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.U == 1, the PE does not count events in Non-secure EL0.
0b1	When PMEVTYPER<n>_EL0.U == 0, the PE does not count events in Non-secure EL0. When PMEVTYPER<n>_EL0.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 filtering. Controls counting events in EL2.

NSH	Meaning
0b0	The PE does not count events in EL2.
0b1	This mechanism has no effect on filtering of events.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting events in Secure EL2 is further controlled by PMEVTYPER<n>_EL0.SH.

If FEAT_RME is implemented, then counting events in Realm EL2 is further controlled by PMEVTYPER<n>_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]
When EL3 is implemented and FEAT_AA64 is implemented:

EL3 filtering. Controls counting events in EL3. If PMEVTYPER<n>_EL0.M is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in EL3. Otherwise, this mechanism has no effect on filtering of events in EL3.

M	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in EL3.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in EL3. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]
When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Unless otherwise stated:

- If the event counts PE cycles when a stall condition is true and a second condition is true, then the counter counts Processor cycles when the stall condition is true for all of these PEs, and the second condition is true for any of these PEs.
- If the event counts PE cycles when any other condition is true, then the counter counts Processor cycles when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs.

For the stall events, the stall condition means the applicable condition described by the STALL, STALL_FRONTEND, or STALL_BACKEND event.

The second condition is any condition in addition to this.

For example, for the STALL_FRONTEND_L1I event, the stall condition is STALL_FRONTEND, and the second condition is when there is a demand instruction miss in the first level of instruction cache.

For the STALL, STALL_FRONTEND, and STALL_BACKEND events themselves, the second condition is the null TRUE condition.

See 'Multithreaded implementations' and 'Cycle event counting in multithreaded implementations'.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See ID_AA64DFR0_EL1.MTPMU.

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and disabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]
When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting events in Secure EL2. If PMEVTYPER<n>_EL0.SH is equal to PMEVTYPER<n>_EL0.NSH, then the PE does not count events in Secure EL2. Otherwise, this mechanism has no effect on filtering of events in Secure EL2.

SH	Meaning
0b0	When PMEVTYPER<n>_EL0.NSH == 0, the PE does not count events in Secure EL2. When PMEVTYPER<n>_EL0.NSH == 1, this mechanism has no effect on filtering of events.
0b1	When PMEVTYPER<n>_EL0.NSH == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.NSH == 1, the PE does not count events in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is RES0 .

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting events in Realm EL1. If PMEVTYPER<n>_EL0.RLK is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in Realm EL1. Otherwise, this mechanism has no effect on filtering of events in Realm EL1.

RLK	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in Realm EL1.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in Realm EL1. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting events in Realm EL0. If PMEVTYPER<n>_EL0.RLU is not equal to PMEVTYPER<n>_EL0.U, then the PE does not count events in Realm EL0. Otherwise, this mechanism has no effect on filtering of events in Realm EL0.

RLU	Meaning
0b0	When PMEVTYPER<n>_EL0.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.U == 1, the PE does not count events in Realm EL0.
0b1	When PMEVTYPER<n>_EL0.U == 0, the PE does not count events in Realm EL0. When PMEVTYPER<n>_EL0.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]
When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting events in Realm EL2. If PMEVTYPER<n>_EL0.RLH is equal to PMEVTYPER<n>_EL0.NSH, then the PE does not count events in Realm EL2. Otherwise, this mechanism has no effect on filtering of events in Realm EL2.

RLH	Meaning
0b0	When PMEVTYPER<n>_EL0.NSH == 0, the PE does not count events in Realm EL2. When PMEVTYPER<n>_EL0.NSH == 1, this mechanism has no effect on filtering of events.
0b1	When PMEVTYPER<n>_EL0.NSH == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.NSH == 1, the PE does not count events in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]
When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMU.PMEVCNTR<n>_EL0.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

If FEAT_PMUv3_EXT32 is implemented and any of the following apply, then bits [63:32] of this register are accessible at offset 0xA00 + (4*n):

- FEAT_PMUv3_TH is implemented.
- FEAT_PMUv3p8 is implemented.
- FEAT_PMUv3_SME is implemented.

Otherwise accesses at this offset are IMPLEMENTATION DEFINED.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x400 + (8 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x400 + (4 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented and (FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented, or FEAT_PMUv3_SME is implemented)

[63:32] Accessible at offset 0xA00 + (4 * n) from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXTPMN is implemented, IsRange3Counter(n), and !IsMostSecureAccess(addrdesc), accesses to this register are RAZ/WI.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMICFILTR_EL0, Performance Monitors Instruction Counter Filter Register

The PMICFILTR_EL0 characteristics are:

Purpose

Configures the Instruction Counter.

Configuration

External register PMICFILTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMICFILTR_EL0[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMICFILTR_EL0 are RES0.

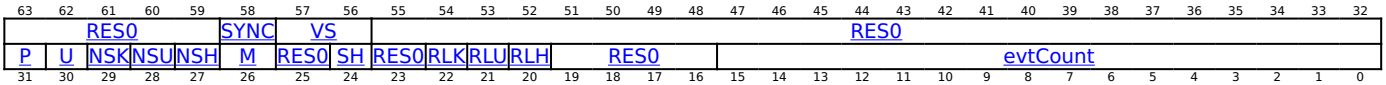
PMICFILTR_EL0 is in the Core power domain.

Attributes

PMICFILTR_EL0 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:59]

Reserved, RES0.

SYNC, bit [58]
When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU Profiling exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU Profiling exception is enabled.
0b1	Synchronous PMU Profiling exception is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VS, bits [57:56]
When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting instructions in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of instructions.
0b01	The PE does not count instructions in Streaming SVE mode.
0b10	The PE does not count instructions in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting instructions in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of instructions.
0b1	The PE does not count instructions in EL1.

If Secure and Non-secure states are implemented, then counting instructions in Non-secure EL1 is further controlled by PMICFILTR_EL0.NSK.

If FEAT_RME is implemented, then counting instructions in Realm EL1 is further controlled by PMICFILTR_EL0.RLK.

If EL3 is implemented, then counting instructions in EL3 is further controlled by PMICFILTR_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting instructions in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of instructions.
0b1	The PE does not count instructions in EL0.

If Secure and Non-secure states are implemented, then counting instructions in Non-secure EL0 is further controlled by PMICFILTR_EL0.NSU.

If FEAT_RME is implemented, then counting instructions in Realm EL0 is further controlled by PMICFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 filtering. Controls counting instructions in Non-secure EL1. If PMICFILTR_EL0.NSK is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of instructions in Non-secure EL1.

NSK	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in Non-secure EL1.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in Non-secure EL1. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 filtering. Controls counting instructions in Non-secure EL0. If PMICFILTR_EL0.NSU is not equal to PMICFILTR_EL0.U, then the PE does not count instructions in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of instructions in Non-secure EL0.

NSU	Meaning
0b0	When PMICFILTR_EL0.U == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.U == 1, the PE does not count instructions in Non-secure EL0.
0b1	When PMICFILTR_EL0.U == 0, the PE does not count instructions in Non-secure EL0. When PMICFILTR_EL0.U == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 filtering. Controls counting instructions in EL2.

NSH	Meaning
0b0	The PE does not count instructions in EL2.
0b1	This mechanism has no effect on filtering of instructions.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting instructions in Secure EL2 is further controlled by PMICFILTR_EL0.SH.

If FEAT_RME is implemented, then counting instructions in Realm EL2 is further controlled by PMICFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]
When EL3 is implemented:

EL3 filtering. Controls counting instructions in EL3. If PMICFILTR_EL0.M is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in EL3. Otherwise, this mechanism has no effect on filtering of instructions in EL3.

M	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in EL3.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in EL3. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]
When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting instructions in Secure EL2. If PMICFILTR_EL0.SH is equal to PMICFILTR_EL0.NSH, then the PE does not count instructions in Secure EL2. Otherwise, this mechanism has no effect on filtering of instructions in Secure EL2.

SH	Meaning
0b0	When PMICFILTR_EL0.NSH == 0, the PE does not count instructions in Secure EL2. When PMICFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of instructions.
0b1	When PMICFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.NSH == 1, the PE does not count instructions in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is RES0 .

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting instructions in Realm EL1. If PMICFILTR_EL0.RLK is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in Realm EL1. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL1.

RLK	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in Realm EL1.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in Realm EL1. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting instructions in Realm EL0. If PMICFILTR_EL0.RLU is not equal to PMICFILTR_EL0.U, then the PE does not count instructions in Realm EL0. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL0.

RLU	Meaning
0b0	When PMICFILTR_EL0.U == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.U == 1, the PE does not count instructions in Realm EL0.
0b1	When PMICFILTR_EL0.U == 0, the PE does not count instructions in Realm EL0. When PMICFILTR_EL0.U == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]
When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting instructions in Realm EL2. If PMICFILTR_EL0.RLH is equal to PMICFILTR_EL0.NSH, then the PE does not count instructions in Realm EL2. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL2.

RLH	Meaning
0b0	When PMICFILTR_EL0.NSH == 0, the PE does not count instructions in Realm EL2. When PMICFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of instructions.
0b1	When PMICFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.NSH == 1, the PE does not count instructions in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount, bits [15:0]

Event to count.

Reads as 0x0008.

Access to this field is RO.

Accessing PMICFILTR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x480 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x500 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented

[63:32] Accessible at offset 0xA80 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

PMICNTR_EL0, Performance Monitors Instruction Counter Register

The PMICNTR_EL0 characteristics are:

Purpose

If event counting is not prohibited and the instruction counter is enabled, the counter increments for each architecturally-executed instruction, according to the configuration specified by PMICFILTR_EL0.

Configuration

External register PMICNTR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMICNTR_EL0[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented. Otherwise, direct accesses to PMICNTR_EL0 are RES0.

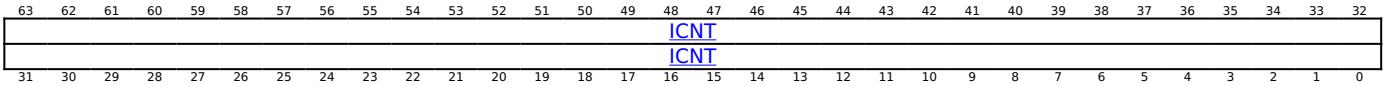
PMICNTR_EL0 is in the Core power domain.

Attributes

PMICNTR_EL0 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



ICNT, bits [63:0]

Instruction Counter.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTR_EL0

Accesses to this register use the following encodings:

Accessible at offset 0x100 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMICNTSVR_EL1, Performance Monitors Instruction Count Saved Value Register

The PMICNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Instruction counter, PMICNTR_EL0.

Configuration

External register PMICNTSVR_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMICNTSVR_EL1[63:0].

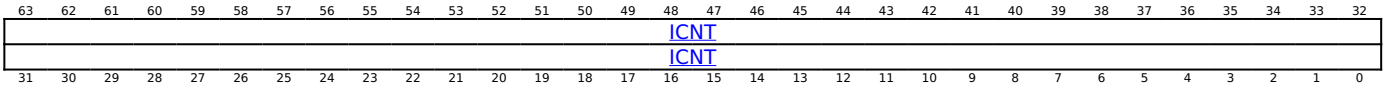
This register is present only when FEAT_PMUv3_ICNTR is implemented, FEAT_PMUv3_SS is implemented, and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMICNTSVR_EL1 are RES0.

Attributes

PMICNTSVR_EL1 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



ICNT, bits [63:0]

Sampled Instruction Count. The value of PMICNTR_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTSVR_EL1

Accesses to this register use the following encodings:

Accessible at offset 0x700 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMSSAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMIIDR, Performance Monitors Implementation Identification Register

The PMIIDR characteristics are:

Purpose

Provides discovery information about the Performance Monitor component.

Configuration

This register is present only when (FEAT_PMUv3_EXT32 is implemented and an implementation implements PMIIDR) or FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMIIDR are RES0.

Attributes

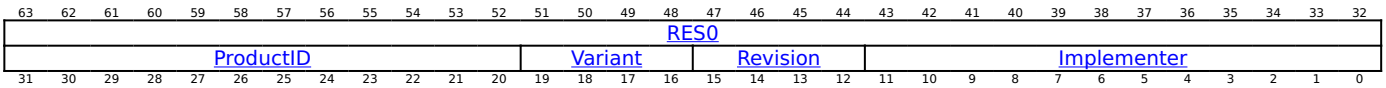
PMIIDR is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented:



Bits [63:32]

Reserved, RES0.

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

Matches the part number represented in the Peripheral ID registers PMPIDRn, if those registers are present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by PMIIDR.ProductID, or the major revision of the component.

When defining a major revision, PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the most significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, PMIIDR.Revision should be set to 0b0000.

Arm recommends this field matches the PMPIDR2.REVISION field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the least significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If PMIIDR.Variant field is increased, this field should be set to 0b0000, otherwise the value in this field should be increased.

Arm recommends this field matches the PMPIDR3.REVAND field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the PMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for PMIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If PMPIDR4 is implemented, PMPIDR4.DES_2 matches bits [11:8] of this field.

If PMPIDR2 is implemented, PMPIDR2.DES_1 matches bits [6:4] of this field.

If PMPIDR1 is implemented, PMPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

Matches the part number represented in the Peripheral ID registers PMPIDRn, if those registers are present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by PMIIDR.ProductID, or the major revision of the component.

When defining a major revision, PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the most significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If this field is increased, PMIIDR.Revision should be set to 0b0000.

Arm recommends this field matches the PMPIDR2.REVISION field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

PMIIDR.Variant and PMIIDR.Revision together form the revision number of the component, with this field being the least significant part.

When a component is changed, PMIIDR.Variant or PMIIDR.Revision is increased to ensure that software can differentiate between different revisions of the component. If PMIIDR.Variant field is increased, this field should be set to 0b0000, otherwise the value in this field should be increased.

Arm recommends this field matches the PMPIDR3.REVAND field, if present.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the PMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for PMIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If PMPIDR4 is implemented, PMPIDR4.DES_2 matches bits [11:8] of this field.

If PMPIDR2 is implemented, PMPIDR2.DES_1 matches bits [6:4] of this field.

If PMPIDR1 is implemented, PMPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMIIDR

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT is implemented

Accessible at offset 0xE08 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMINTEN, Performance Monitors Interrupt Enable register

The PMINTEN characteristics are:

Purpose

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<n>_EL0.

Configuration

External register PMINTEN bits [63:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[63:0].

External register PMINTEN bits [63:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[63:0].

External register PMINTEN bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

External register PMINTEN bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

This register is present only when FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMINTEN are RES0.

Attributes

PMINTEN is a 64-bit register.

This register is part of the PMU block.

Field descriptions

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Interrupt request on unsigned overflow of PMICNTR_EL0 enable.

F0	Meaning
0b0	Interrupt request on unsigned overflow of PMICNTR_EL0 disabled.
0b1	Interrupt request on unsigned overflow of PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 unsigned overflow interrupt request enable bit. Possible values are:

C	Meaning
0b0	The cycle counter overflow interrupt request is disabled.
0b1	The cycle counter overflow interrupt request is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.

- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

P<m>, bit [m], for m = 30 to 0

Event counter unsigned overflow interrupt request enable bit for PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	The PMEVCNTR<m>_EL0 event counter interrupt request is disabled.
0b1	The PMEVCNTR<m>_EL0 event counter interrupt request is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- Otherwise, access to this field is RW.

Accessing PMINTEN

Accesses to this register use the following encodings:

Accessible at offset 0xC50 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear Register

The PMINTENCLR_EL1 characteristics are:

Purpose

Allows software to disable the generation of interrupt requests or, when FEAT_EBEP is implemented, PMU Profiling exceptions on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which overflow interrupt requests or PMU Profiling exceptions are enabled.

Configuration

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMINTENCLR_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMINTENCLR_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

External register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are RES0.

PMINTENCLR_EL1 is in the Core power domain.

Attributes

PMINTENCLR_EL1 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enable status.

F0	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Otherwise:

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMINTENCLR_EL1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_ICNTR is implemented, or FEAT_PMUv3p9 is implemented

[63:0] Accessible at offset 0xC60 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXT32 is implemented and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3_ICNTR is not implemented, and FEAT_PMUv3p9 is not implemented

[31:0] Accessible at offset 0xC60 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set Register

The PMINTENSET_EL1 characteristics are:

Purpose

Allows software to enable the generation of interrupt requests or, when FEAT_EBEP is implemented, PMU Profiling exceptions on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which overflow interrupt requests or PMU Profiling exceptions are enabled.

Configuration

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMINTENSET_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMINTENSET_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

External register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are RES0.

PMINTENSET_EL1 is in the Core power domain.

Attributes

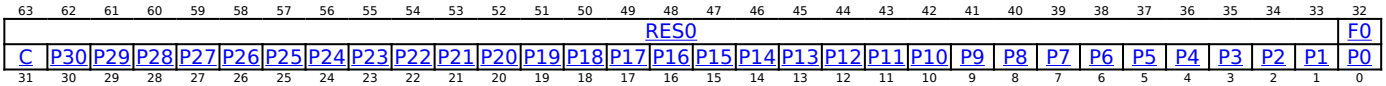
PMINTENSET_EL1 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented:



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enable status.

F0	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Otherwise:

Reserved, RES0.

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Accessing PMINTENSET_EL1

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_ICNTR is implemented, or FEAT_PMUv3p9 is implemented

[63:0] Accessible at offset 0xC40 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXT32 is implemented and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3_ICNTR is not implemented, and FEAT_PMUv3p9 is not implemented

[31:0] Accessible at offset 0xC40 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

Purpose

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMITCTRL. Otherwise, direct accesses to PMITCTRL are RES0.

Attributes

PMITCTRL is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.

Accessing PMITCTRL

Accesses to this register use the following encodings:

Accessible at offset 0xF00 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMLAR are RES0.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

This register is part of the PMU block.

Field descriptions

When PMU Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing PMLAR

Accesses to this register use the following encodings:

Accessible at offset 0xFB0 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

Purpose

Indicates the current status of the software lock for Performance Monitors registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMLSR are RES0.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE in the Core power domain.

If FEAT_DoPD is not implemented, this register is in the Debug power domain.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLSR is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required.

Reads as 0b0.

Access to this field is RO.

SLK, bit [1]
When PMU Software Lock is implemented and FEAT_DoPD is not implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing PMLSR

Accesses to this register use the following encodings:

Accessible at offset 0xFB4 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation.

Configuration

External register PMMIR bits [31:0] are architecturally mapped to AArch32 System register PMMIR[31:0].

External register PMMIR bits [31:0] are architecturally mapped to AArch64 System register PMMIR_EL1[31:0].

External register PMMIR bits [63:0] are architecturally mapped to AArch64 System register PMMIR_EL1[63:0] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are RES0.

PMMIR is in the Core power domain.

Attributes

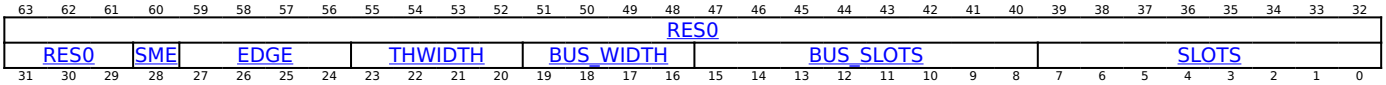
PMMIR is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented:



Bits [63:29]

Reserved, RES0.

SME, bit [28]

PMUv3 for SME. Adds support for the Streaming SVE mode filter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0	Streaming SVE mode filter not implemented.
0b1	Adds support for the Streaming SVE mode filter.

All other values are reserved.

FEAT_PMUv3_SME implements the functionality identified by the value 1.

Access to this field is RO.

EDGE, bits [27:24]

PMU event edge detection. With PMMIR_EL1.THWIDTH, indicates implementation of event counter thresholding features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.
0b0010	As 0b0001, and adds support for threshold value linking between a pair of counters.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, the only permitted value is 0b0000.

FEAT_PMUv3_EDGE implements the functionality identified by the value 0b0001.

FEAT_PMUv3_TH2 implements the functionality identified by the value 0b0010.

Access to this field is RO.

THWIDTH, bits [23:20]

PMEVTYPER<n>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<n>_EL0.TH field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<n>_EL0.TH is $2^{(PMMIR.THWIDTH)}$ minus one.

Access to this field is RO.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is RO.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Bits [31:29]

Reserved, RES0.

SME, bit [28]

PMUv3 for SME. Adds support for the Streaming SVE mode filter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0	Streaming SVE mode filter not implemented.
0b1	Adds support for the Streaming SVE mode filter.

All other values are reserved.

FEAT_PMUv3_SME implements the functionality identified by the value 1.

Access to this field is RO.

EDGE, bits [27:24]

PMU event edge detection. With PMMIR_EL1.THWIDTH, indicates implementation of event counter thresholding features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.
0b0010	As 0b0001, and adds support for threshold value linking between a pair of counters.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, the only permitted value is 0b0000.

FEAT_PMUv3_EDGE implements the functionality identified by the value 0b0001.

FEAT_PMUv3_TH2 implements the functionality identified by the value 0b0010.

Access to this field is RO.

THWIDTH, bits [23:20]

PMEVTYPER<n>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<n>_EL0.TH field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<n>_EL0.TH is $2^{(PMMIR.THWIDTH)}$ minus one.

Access to this field is RO.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is RO.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMMIR

If the Core power domain is off or in a low-power state, access to this register returns an Error.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented

[63:0] Accessible at offset 0xE40 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.

- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented

[31:0] Accessible at offset 0xE40 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

PMOVS, Performance Monitors Overflow Flag Status register

The PMOVS characteristics are:

Purpose

The unsigned overflow flags for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<n>.

Configuration

External register PMOVS bits [63:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[63:0].

External register PMOVS bits [63:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[63:0].

External register PMOVS bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

External register PMOVS bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

This register is present only when FEAT_PMUv3_EXT64 is implemented. Otherwise, direct accesses to PMOVS are RES0.

Attributes

PMOVS is a 64-bit register.

This register is part of the PMU block.

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 unsigned overflow flag.

F0	Meaning
0b0	PMICNTR_EL0 has not overflowed.
0b1	PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

C, bit [31]

Cycle counter unsigned overflow flag.

C	Meaning
0b0	The cycle counter has not overflowed since this bit was last cleared to 0.
0b1	The cycle counter has overflowed since this bit was last cleared to 0.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

P<m>, bit [m], for m = 30 to 0

Event counter unsigned overflow bit for PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed since this bit was last cleared to 0.
0b1	PMEVCNTR<m>_EL0 has overflowed since this bit was last cleared to 0.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

When FEAT_PMUv3_EXTPMN is implemented, MDCR_EL2.HLP and PMCR_EL0.LP are applicable only for event counters in the second and first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- Otherwise, access to this field is RW.

Accessing PMOVS

Accesses to this register use the following encodings:

Accessible at offset 0xC90 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMOVSCLR_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMOVSSET_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMOVSCLR_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

External register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are RES0.

PMOVSCLR_EL0 is in the Core power domain.

Attributes

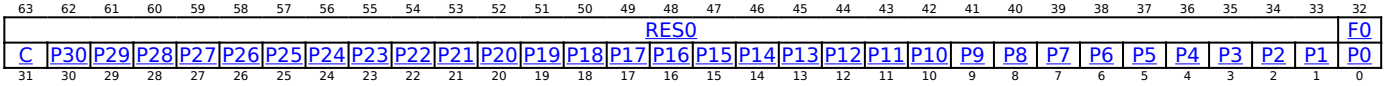
PMOVSCLR_EL0 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented:



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for PMICNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMICNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMICNTR_EL0.

F0	Meaning
0b0	PMICNTR_EL0 has not overflowed.
0b1	PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMCCNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMEVCNTR<m>_EL0 to 0. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

When FEAT_PMUv3_EXTPMN is implemented, MDCR_EL2.HLP and PMCR_EL0.LP are applicable only for event counters in the second and first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMCCNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMEVCNTR<m>_EL0 to 0. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

When FEAT_PMUv3_EXTPMN is implemented, MDCR_EL2.HLP and PMCR_EL0.LP are applicable only for event counters in the second and first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing PMOVSCLR_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_ICNTR is implemented, or FEAT_PMUv3p9 is implemented

[63:0] Accessible at offset 0xC80 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXT32 is implemented and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3_ICNTR is not implemented, and FEAT_PMUv3p9 is not implemented

[31:0] Accessible at offset 0xC80 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set Register

The PMOVSSET_EL0 characteristics are:

Purpose

Allows software to set the unsigned overflow flags for the following counters to 1:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

External register PMOVSSET_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMOVSSET_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMOVSSET_EL0 bits [63:32] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented.

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

External register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

This register is present only when FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are RES0.

PMOVSSET_EL0 is in the Core power domain.

Attributes

PMOVSSET_EL0 is a:

- 64-bit register when FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented
- 32-bit register otherwise

This register is part of the PMU block.

Field descriptions

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3p9 is implemented, or FEAT_PMUv3_ICNTR is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															F0

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for PMICNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMICNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMICNTR_EL0.

F0	Meaning
0b0	PMICNTR_EL0 has not overflowed.
0b1	PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Otherwise:

Reserved, RES0.

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMCCNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 set. On writes, allows software to set the unsigned overflow flag for PMEVCNTR<m>_EL0 to 1. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

When FEAT_PMUv3_EXTPMN is implemented, MDCR_EL2.HLP and PMCR_EL0.LP are applicable only for event counters in the second and first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Otherwise:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMCCNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 set. On writes, allows software to set the unsigned overflow flag for PMEVCNTR<m>_EL0 to 1. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

When FEAT_PMUv3_EXTPMN is implemented, MDCR_EL2.HLP and PMCR_EL0.LP are applicable only for event counters in the second and first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is W1S.

Accessing PMOVSSET_EL0

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_ICNTR is implemented, or FEAT_PMUv3p9 is implemented

[63:0] Accessible at offset 0xCC0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When FEAT_PMUv3_EXT32 is implemented and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

When FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3_ICNTR is not implemented, and FEAT_PMUv3p9 is not implemented

[31:0] Accessible at offset 0xCC0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

PMPCSCTL, PC Sample-based Profiling Control Register

The PMPCSCTL characteristics are:

Purpose

Controls the PC Sample-based Profiling feature.

Configuration

This register is present only when FEAT_PCSRv8p9 is implemented and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMPCSCTL are RES0.

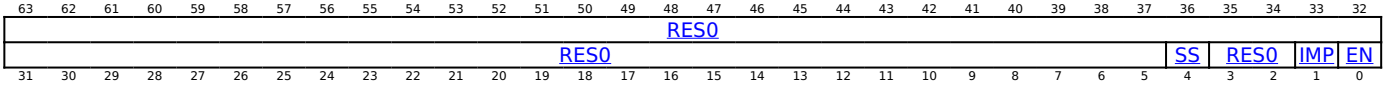
PMPCSCTL is in the Core power domain.

Attributes

PMPCSCTL is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:5]

Reserved, RES0.

SS, bit [4]
When FEAT_PMUv3_SS is implemented:

Sample on Snapshot.

Controls whether the following registers are sampled on a PMU snapshot Capture event:

- If FEAT_PMUv3_EXT32 is implemented: PMCID1SR, PMCID2SR, PMPCSR, and PMVIDSR.
- If FEAT_PMUv3_EXT64 is implemented: PMCCIDSR, PMPCSR, and PMVCIDSR.

SS	Meaning
0b0	Sample on Read.
0b1	Sample on Snapshot.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

IMP, bit [1]

Profiling enable implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IMP	Meaning
0b0	PMPCSCTL.EN reads-as-zero and ignores writes.
0b1	PMPCSCTL.EN is a read-write control bit.

Access to this field is RO.

EN, bit [0]
When PMU.PMPCSCTL.IMP == '1':

PC Sample-based Profiling Enable.

EN	Meaning
0b0	PC Sample-based Profiling is suspended.
0b1	PC Sample-based Profiling is active.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RAZ/WI.

Accessing PMPCSCTL

Accesses to this register use the following encodings:

Accessible at offset 0xE50 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMPCSR, Program Counter Sample Register

The PMPCSR characteristics are:

Purpose

PC Sample-based Profiling Extension register that holds a sampled instruction address value.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PCSRv8p2 is implemented. Otherwise, direct accesses to PMPCSR are RES0.

PMPCSR is in the Core power domain.

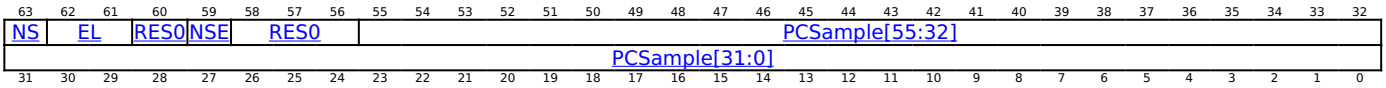
If FEAT_PMUv3_EXT32 is implemented, support for 64-bit atomic reads is IMPLEMENTATION DEFINED. If 64-bit atomic reads are implemented, a 64-bit read of PMPCSR has the same side-effect as a 32-bit read of PMCSR[31:0] followed by a 32-bit read of PMPCSR[63:32], returning the combined value. For example, if the PE is in Debug state, then a 64-bit atomic read returns bits[31:0] == 0xFFFFFFFF and bits[63:32] UNKNOWN.

Attributes

PMPCSR is a 64-bit register.

This register is part of the PMU block.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

Together with the NSE field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Otherwise:

Non-secure state sample. Indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [60]

Reserved, RES0.

NSE, bit [59]
When FEAT_RME is implemented:

Together with the NS field, indicates the Security state that is associated with the most recent PMPCSR sample or, when it is read as a single atomic 64-bit read, the current PMPCSR sample.

For a description of the values derived by evaluating NS and NSE together, see PMPCSR.NS.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PCSample[55:32], bits [55:32]

Bits[55:32] of the sampled instruction address value. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PCSample[31:0], bits [31:0]

Bits[31:0] of the sampled instruction address value.

PMPCSR[31:0] reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of PMPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

PMPCSR[31:0] reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of PMPCSR[31:0].

For the cases where a read of PMPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR to UNKNOWN values.

Otherwise, a read of PMPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR. The translation regime that PMPCSR samples can be determined from PMPCSR.{NS,EL}.

For a read of PMPCSR[31:0] from the memory-mapped interface, if PMLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and PMPCSR[63:32], PMCID1SR, PMCID2SR, and PMVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Note

A 32-bit access to PMPCSR[63:32] does not update the PC sample registers. Only a 64-bit access to PMPCSR[63:0] or a 32-bit access to PMPCSR[31:0] updates the PC sample registers. This includes the value a subsequent 32-bit read of PMPCSR[63:32] will return.

Accesses to this register use the following encodings:

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x200 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x200 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented

[63:32] Accessible at offset 0x204 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT64 is implemented

[63:0] Accessible at offset 0x220 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented

[31:0] Accessible at offset 0x220 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

When FEAT_PMUv3_EXT32 is implemented

[63:32] Accessible at offset 0x224 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR0. Otherwise, direct accesses to PMPIDR0 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - PMPIDR1.PART_1 contains part number bits [11:8].
  - PMPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - PMPIDR1.PART_1 contains part number bits [15:12].
  - PMPIDR0.PART_0 contains part number bits [11:4].
  - PMPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, PMPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR0

Accesses to this register use the following encodings:

Accessible at offset 0xFE0 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR1. Otherwise, direct accesses to PMPIDR1 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR1 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- PMPIDR1.DES_0: JEP106 identification code bits[3:0].
- PMPIDR2.DES_1: JEP106 identification code bits[6:4].
- PMPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - PMPIDR1.PART_1 contains part number bits [11:8].
  - PMPIDR0.PART_0 contains part number bits [7:0].

- For a component with a 16-bit part number:
    - PMPIDR1.PART_1 contains part number bits [15:12].
    - PMPIDR0.PART_0 contains part number bits [11:4].
    - PMPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, PMPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR1

Accesses to this register use the following encodings:

Accessible at offset 0xFE4 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR2. Otherwise, direct accesses to PMPIDR2 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR2 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- PMPIDR2.REVISION indicates the 4-bit revision number.
- PMPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- PMPIDR2.REVISION indicates the 4-bit major revision number.
- PMPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- PMPIDR2.REVISION contains part number bits [3:0].
- PMPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- PMPIDR1.DES_0: JEP106 identification code bits[3:0].
- PMPIDR2.DES_1: JEP106 identification code bits[6:4].
- PMPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR2

Accesses to this register use the following encodings:

Accessible at offset 0xFE8 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR3. Otherwise, direct accesses to PMPIDR3 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR3 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- PMPIDR2.REVISION indicates the 4-bit revision number.
- PMPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- PMPIDR2.REVISION indicates the 4-bit major revision number.
- PMPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- PMPIDR2.REVISION contains part number bits [3:0].
- PMPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

PMPIDR3.CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

PMPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR3

Accesses to this register use the following encodings:

Accessible at offset 0xFEC from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

This register is present only when FEAT_PMUv3_EXT is implemented and an implementation implements PMPIDR4. Otherwise, direct accesses to PMPIDR4 are RES0.

If FEAT_DoPD is implemented, this register is in the Core power domain. If FEAT_DoPD is not implemented, this register is in the Debug power domain.

This register is required for CoreSight compliance.

Attributes

PMPIDR4 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- PMPIDR1.DES_0: JEP106 identification code bits[3:0].
- PMPIDR2.DES_1: JEP106 identification code bits[6:4].
- PMPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMPIDR4

Accesses to this register use the following encodings:

Accessible at offset 0xFD0 from PMU

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMSSCR_EL1, Performance Monitors Snapshot Status and Capture Register

The PMSSCR_EL1 characteristics are:

Purpose

Holds status information about the captured counters and provides a mechanism for software to initiate a sample.

Configuration

External register PMSSCR_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMSSCR_EL1[63:0].

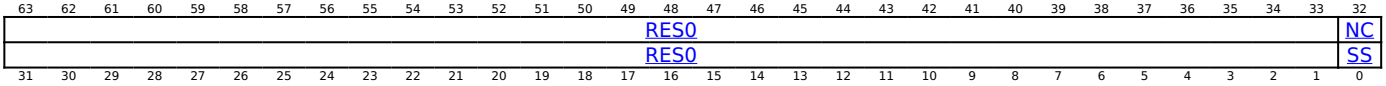
This register is present only when FEAT_PMUv3_SS is implemented and FEAT_PMUv3_EXT is implemented. Otherwise, direct accesses to PMSSCR_EL1 are RES0.

Attributes

PMSSCR_EL1 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:33]

Reserved, RES0.

NC, bit [32]

No Capture. Indicates whether the PMU counters have been captured.

NC	Meaning
0b0	PMU counters captured.
0b1	PMU counters not captured.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bits [31:1]

Reserved, RES0.

SS, bit [0]

Snapshot Capture and Status.

SS	Meaning
0b0	On a read, the Capture event has completed.
0b1	On a read, the Capture event has not completed. On a write, request a Capture event.

A write of 0 to this field is ignored.

It is CONSTRAINED UNPREDICTABLE whether a Capture event has completed if this field is modified when the Capture event is ongoing.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- When PMU capture events are disabled, access to this field is RO.
- Otherwise, access to this field is RW.

Accessing PMSSCR_EL1

Accesses to this register use the following encodings:

Accessible at offset 0xE30 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMSSAccess(addrdesc), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

PMSWINC_EL0, Performance Monitors Software Increment Register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

External register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

This register is present only when FEAT_PMUv3_EXT32 is implemented, FEAT_PMUv3p9 is not implemented, and an implementation implements PMSWINC_EL0.

PMSWINC_EL0 is in the Core power domain.

If this register is implemented, use of it is deprecated.

If 1 is written to bit [n] from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter n. This is consistent with not implementing the register in the external debug interface.

Attributes

PMSWINC_EL0 is a 32-bit register.

This register is part of the PMU block.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

Bit [31]

Reserved, RES0.

P<m>, bit [m], for m = 30 to 0

Event counter software increment bit for PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	No action. The write to this bit is ignored.
0b1	It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter m.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

Accessing PMSWINC_EL0

If FEAT_PMUv3p9 or FEAT_PMUv3_EXT64 are implemented, this location is used for accesses to PMZR_EL0.

Accesses to this register use the following encodings:

Accessible at offset 0xCA0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

PMVCIDSR, CONTEXTIDR_EL1 and VMID Sample Register

The PMVCIDSR characteristics are:

Purpose

PC Sample-based Profiling Extension register that contains the sampled CONTEXTIDR_EL1 and VMID values that are captured on reading PMPCSR.

Configuration

External register PMVCIDSR bits [31:0] are architecturally mapped to External register PMCCIDSR[31:0].

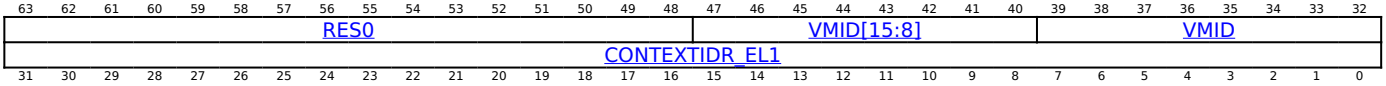
This register is present only when FEAT_PMUv3_EXT64 is implemented and FEAT_PCSRv8p2 is implemented.

Attributes

PMVCIDSR is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]
When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [39:32]

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - EL2 is disabled in the current Security state.
  - The PE is executing at EL2.
  - The PE is executing at EL0, and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

Because the value written to PMVIDSR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent PMPCSR sample. When the most recent PMPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register and this register samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent PMPCSR sample.

Because the value written to this register is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether this register is set to the original or new value if PMPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMVCIDSR

If FEAT_PCSRv8p2 and FEAT_PMUv3_EXT32 are implemented, then the same content is present in the same locations, and can be accessed using PMVIDSR[31:0] and PMCID1SR[31:0].

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

Accessible at offset 0x208 from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

PMVIDSR, VMID Sample Register

The PMVIDSR characteristics are:

Purpose

PC Sample-based Profiling Extension register that contains the sampled VMID value that is captured on reading PMPCSR[31:0].

Configuration

This register is present only when FEAT_PMUv3_EXT32 is implemented, FEAT_PCSRv8p2 is implemented, and EL2 is implemented.

PMVIDSR is in the Core power domain.

Attributes

PMVIDSR is a 32-bit register.

This register is part of the PMU block.

Field descriptions

Bits [31:16]

Reserved, RES0.

VMID[15:8], bits [15:8]
When FEAT_VMID16 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]

VMID sample. The VMID associated with the most recent PMPCSR sample. When the most recent PMPCSR sample was generated:

- This field is set to an UNKNOWN value if any of the following apply:
  - EL2 is disabled in the current Security state.
  - The PE is executing at EL2.
  - The PE is executing at EL0, and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

Because the value written to PMVIDSR is an indirect read of the VMID value, it is CONSTRAINED UNPREDICTABLE whether PMVIDSR is set to the original or new value if PMPCSR samples:

- An instruction that writes to the VMID value.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing PMVIDSR

If FEAT_PMUv3_EXT64 is implemented, then the same content is present in the same location, and can be accessed using PMVCIDSR[63:32].

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

Accesses to this register use the following encodings:

Accessible at offset 0x20C from PMU

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

PMZR_EL0, Performance Monitors Zero with Mask

The PMZR_EL0 characteristics are:

Purpose

Zero the set of counters specified by the mask written to PMZR_EL0.

Configuration

External register PMZR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMZR_EL0[63:0].

This register is present only when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p9 is implemented.

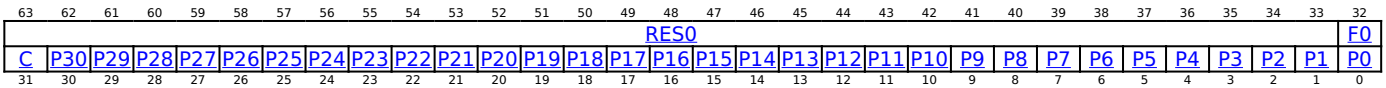
PMZR_EL0 is in the Core power domain.

Attributes

PMZR_EL0 is a 64-bit register.

This register is part of the PMU block.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Zero PMICNTR_EL0.

F0	Meaning
0b0	Write is ignored.
0b1	Set PMICNTR_EL0 to zero.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

Otherwise:

Reserved, RES0.

C, bit [31]

Zero PMCCNTR_EL0.

C	Meaning
0b0	Write is ignored.
0b1	Set PMCCNTR_EL0 to zero.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

P<m>, bit [m], for m = 30 to 0

Zero PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	Write is ignored.
0b1	Set PMEVCNTR<m>_EL0 to zero.

Accessing this field has the following behavior:

- When m >= NUM_PMU_COUNTERS, access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3_EXTPMN is implemented.
  - m >= UInt(EffectiveEPMN()).
  - !IsMostSecureAccess(addrdesc).
- When SoftwareLockStatus(addrdesc), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

Accessing PMZR_EL0

When FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p9 is not implemented, then this location might be used for PMSWINC_EL0. If PMSWINC_EL0 is not implemented, then accesses to this location are RES0.

Accesses to this register use the following encodings:

Accessible at offset 0xCA0 from PMU

- When DoubleLockStatus(), or !IsCorePowered(), or !AllowExternalPMUAccess(addrdesc), accesses to this register generate an error response.
- When (FEAT_PMUv3_EXTPMN is not implemented, or !IsMostSecureAccess(addrdesc), or PMCCR().OSLO == '0') and OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.
