TCRMASK_EL2, Translation Control Masking Register (EL2)

The TCRMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCRMASK_EL2 are UNDEFINED.

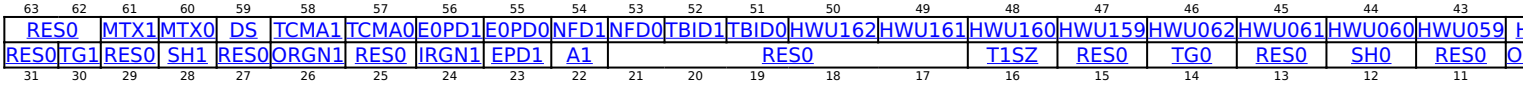
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCRMASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:62]

Reserved, RES0.

MTX1, bit [61]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX1.

MTX1	Meaning
0b0	TCR_EL2.MTX1 is writeable.
0b1	TCR_EL2.MTX1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX0.

MTX0	Meaning
0b0	TCR_EL2.MTX0 is writeable.
0b1	TCR_EL2.MTX0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]
When FEAT_LPA2 is implemented:

Mask bit for DS.

DS	Meaning
0b0	TCR_EL2.DS is writeable.
0b1	TCR_EL2.DS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCMA1.

TCMA1	Meaning
0b0	TCR_EL2.TCMA1 is writeable.
0b1	TCR_EL2.TCMA1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCMA0.

TCMA0	Meaning
0b0	TCR_EL2.TCMA0 is writeable.
0b1	TCR_EL2.TCMA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]
When FEAT_E0PD is implemented:

Mask bit for E0PD1.

E0PD1	Meaning
0b0	TCR_EL2.E0PD1 is writeable.
0b1	TCR_EL2.E0PD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]
When FEAT_E0PD is implemented:

Mask bit for E0PD0.

E0PD0	Meaning
0b0	TCR_EL2.E0PD0 is writeable.
0b1	TCR_EL2.E0PD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]
When FEAT_SVE is implemented:

Mask bit for NFD1.

NFD1	Meaning
0b0	TCR_EL2.NFD1 is writeable.
0b1	TCR_EL2.NFD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]
When FEAT_SVE is implemented:

Mask bit for NFD0.

NFD0	Meaning
0b0	TCR_EL2.NFD0 is writeable.
0b1	TCR_EL2.NFD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]
When FEAT_PAuth is implemented:

Mask bit for TBID1.

TBID1	Meaning
0b0	TCR_EL2.TBID1 is writeable.
0b1	TCR_EL2.TBID1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]
When FEAT_PAuth is implemented:

Mask bit for TBID0.

TBID0	Meaning
0b0	TCR_EL2.TBID0 is writeable.
0b1	TCR_EL2.TBID0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]
When FEAT_HPDS2 is implemented:

Mask bit for HWU162.

HWU162	Meaning
0b0	TCR_EL2.HWU162 is writeable.
0b1	TCR_EL2.HWU162 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]
When FEAT_HPDS2 is implemented:

Mask bit for HWU161.

HWU161	Meaning
0b0	TCR_EL2.HWU161 is writeable.
0b1	TCR_EL2.HWU161 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]
When FEAT_HPDS2 is implemented:

Mask bit for HWU160.

HWU160	Meaning
0b0	TCR_EL2.HWU160 is writeable.
0b1	TCR_EL2.HWU160 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]
When FEAT_HPDS2 is implemented:

Mask bit for HWU159.

HWU159	Meaning
0b0	TCR_EL2.HWU159 is writeable.
0b1	TCR_EL2.HWU159 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]
When FEAT_HPDS2 is implemented:

Mask bit for HWU062.

HWU062	Meaning
0b0	TCR_EL2.HWU062 is writeable.
0b1	TCR_EL2.HWU062 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]
When FEAT_HPDS2 is implemented:

Mask bit for HWU061.

HWU061	Meaning
0b0	TCR_EL2.HWU061 is writeable.
0b1	TCR_EL2.HWU061 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]
When FEAT_HPDS2 is implemented:

Mask bit for HWU060.

HWU060	Meaning
0b0	TCR_EL2.HWU060 is writeable.
0b1	TCR_EL2.HWU060 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]
When FEAT_HPDS2 is implemented:

Mask bit for HWU059.

HWU059	Meaning
0b0	TCR_EL2.HWU059 is writeable.
0b1	TCR_EL2.HWU059 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]
When FEAT_HPDS is implemented:

Mask bit for HPD1.

HPD1	Meaning
0b0	TCR_EL2.HPD1 is writeable.
0b1	TCR_EL2.HPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]
When FEAT_HPDS is implemented:

Mask bit for HPD0.

HPD0	Meaning
0b0	TCR_EL2.HPD0 is writeable.
0b1	TCR_EL2.HPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]
When FEAT_HAFDBS is implemented:

Mask bit for HD.

HD	Meaning
0b0	TCR_EL2.HD is writeable.
0b1	TCR_EL2.HD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]
When FEAT_HAF is implemented:

Mask bit for HA.

HA	Meaning
0b0	TCR_EL2.HA is writeable.
0b1	TCR_EL2.HA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Mask bit for TBI1.

TBI1	Meaning
0b0	TCR_EL2.TBI1 is writeable.
0b1	TCR_EL2.TBI1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Mask bit for TBI0.

TBI0	Meaning
0b0	TCR_EL2.TBI0 is writeable.
0b1	TCR_EL2.TBI0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

Mask bit for AS.

AS	Meaning
0b0	TCR_EL2.AS is writeable.
0b1	TCR_EL2.AS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [35:33]

Reserved, RES0.

IPS, bit [32]

Mask bit for IPS.

IPS	Meaning
0b0	TCR_EL2.IPS is writeable.
0b1	TCR_EL2.IPS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES0.

TG1, bit [30]

Mask bit for TG1.

TG1	Meaning
0b0	TCR_EL2.TG1 is writeable.
0b1	TCR_EL2.TG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

SH1, bit [28]

Mask bit for SH1.

SH1	Meaning
0b0	TCR_EL2.SH1 is writeable.
0b1	TCR_EL2.SH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [27]

Reserved, RES0.

ORGN1, bit [26]

Mask bit for ORGN1.

ORGN1	Meaning
0b0	TCR_EL2.ORGN1 is writeable.
0b1	TCR_EL2.ORGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [25]

Reserved, RES0.

IRGN1, bit [24]

Mask bit for IRGN1.

IRGN1	Meaning
0b0	TCR_EL2.IRGN1 is writeable.
0b1	TCR_EL2.IRGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Mask bit for EPD1.

EPD1	Meaning
0b0	TCR_EL2.EPD1 is writeable.
0b1	TCR_EL2.EPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Mask bit for A1.

A1	Meaning
0b0	TCR_EL2.A1 is writeable.
0b1	TCR_EL2.A1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [21:17]

Reserved, RES0.

T1SZ, bit [16]

Mask bit for T1SZ.

T1SZ	Meaning
0b0	TCR_EL2.T1SZ is writeable.
0b1	TCR_EL2.T1SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

TG0, bit [14]

Mask bit for TG0.

TG0	Meaning
0b0	TCR_EL2.TG0 is writeable.
0b1	TCR_EL2.TG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

SH0, bit [12]

Mask bit for SH0.

SH0	Meaning
0b0	TCR_EL2.SH0 is writeable.
0b1	TCR_EL2.SH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

ORGN0, bit [10]

Mask bit for ORGN0.

ORGN0	Meaning
0b0	TCR_EL2.ORGN0 is writeable.
0b1	TCR_EL2.ORGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

IRGN0, bit [8]

Mask bit for IRGN0.

IRGN0	Meaning
0b0	TCR_EL2.IRGN0 is writeable.
0b1	TCR_EL2.IRGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Mask bit for EPD0.

EPD0	Meaning
0b0	TCR_EL2.EPD0 is writeable.
0b1	TCR_EL2.EPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

T0SZ, bit [0]

Mask bit for T0SZ.

T0SZ	Meaning
0b0	TCR_EL2.T0SZ is writeable.
0b1	TCR_EL2.T0SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing TCRMASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCRMASK_EL2 or TCRMASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

TFSR_EL1, Tag Fault Status Register (EL1)

The TFSR_EL1 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL1 that are not taken precisely.

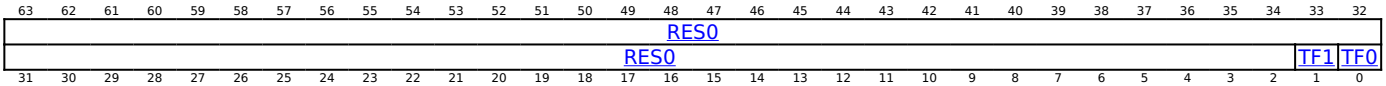
Configuration

This register is present only when FEAT_MTE_ASYNC is implemented. Otherwise, direct accesses to TFSR_EL1 are UNDEFINED.

Attributes

TFSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

TF1, bit [1]
When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TF0, bit [0]
When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TFSR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TFSR_EL1 or TFSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

TFSR_EL2, Tag Fault Status Register (EL2)

The TFSR_EL2 characteristics are:

Purpose

Holds accumulated Tag Check Faults occurring in EL2 that are not taken precisely.

Configuration

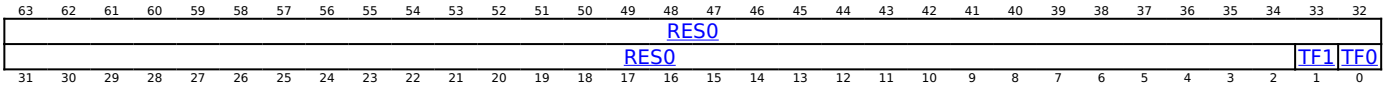
This register is present only when FEAT_MTE_ASYNC is implemented. Otherwise, direct accesses to TFSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TFSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

TF1, bit [1]
When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b1 occurs.

When the Effective value of HCR_EL2.E2H is not 1, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TF0, bit [0]
When FEAT_MTE_ASYNC is implemented:

Tag Check Fault. Asynchronously set to 1 when a Tag Check Fault using a virtual address with bit[55] == 0b0 occurs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TFSR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TFSR_EL2 or TFSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TFSR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0101	0b0110	0b000

TINDEX_EL1, TIndex (EL1)

The TINDEX_EL1 characteristics are:

Purpose

Allows access to the value of TIndex for EL1.

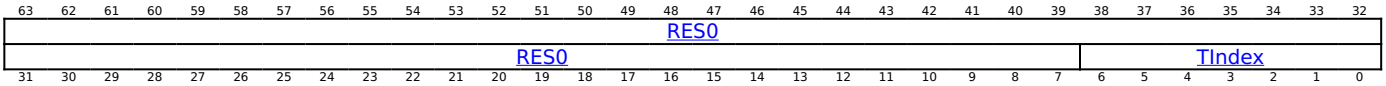
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TINDEX_EL1 are UNDEFINED.

Attributes

TINDEX_EL1 is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TIndex, bits [6:0]

The current value of TIndex for EL1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0000000'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing TINDEX_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TINDEX_EL1 or TINDEX_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TINDEX_EL1

TINDEX_EL3, TIndex (EL3)

The TINDEX_EL3 characteristics are:

Purpose

Allows access to the value of TIndex for EL3.

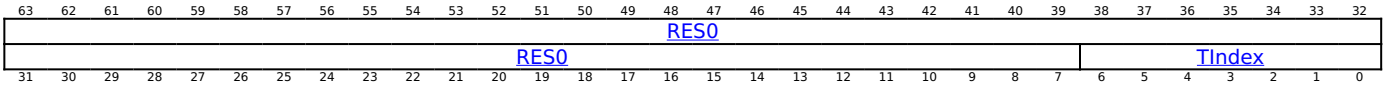
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TINDEX_EL3 are UNDEFINED.

Attributes

TINDEX_EL3 is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TIndex, bits [6:0]

The current value of TIndex for EL3.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0000000'.

Accessing TINDEX_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TINDEX_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b011

```

TLBI ALLE1, TLBI ALLE1NXS, TLB Invalidate All, EL1

The TLBI ALLE1, TLBI ALLE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation only applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE1, TLBI ALLE1NXS are UNDEFINED.

Attributes

TLBI ALLE1, TLBI ALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE1, TLBI ALLE1NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_ALL() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ALLE1{, <Xt>}

op0	op1	CRn	CRm	op2

0b01	0b100	0b1000	0b0111	0b100

```
if !IsFeatureImplemented(FEAT_AA64) then

TLBI ALLE1IS, TLBI ALLE1ISNXS, TLB Invalidate All, EL1, Inner Shareable

The TLBI ALLE1IS, TLBI ALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

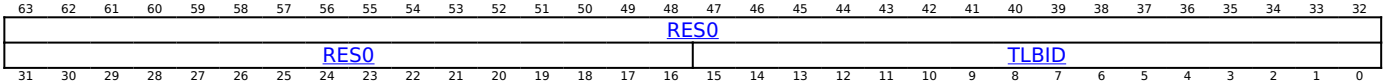
This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE1IS, TLBI ALLE1ISNXS are UNDEFINED.

Attributes

TLBI ALLE1IS, TLBI ALLE1ISNXS is a 64-bit System instruction.

Field descriptions

When FEAT_TLBID is implemented:



Bits [63:16]

TLBI ALLE1OS, TLBI ALLE1OSNXS, TLB Invalidate All, EL1, Outer Shareable

The TLBI ALLE1OS, TLBI ALLE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate an address using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate an address using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate an address using the Non-secure EL1&0 translation regime.

The invalidation applies to entries with any VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBI ALLE2, TLBI ALLE2NXS, TLB Invalidate All, EL2

The TLBI ALLE2, TLBI ALLE2NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any address using the Secure EL2&0 or EL2 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any address using the Non-secure EL2&0 or EL2 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any address using the Realm EL2&0 or EL2 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any address using the Secure EL2&0 or EL2 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any address using the Non-secure EL2&0 or EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE2, TLBI ALLE2NXS are UNDEFINED.

Attributes

TLBI ALLE2, TLBI ALLE2NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE2, TLBI ALLE2NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

TLBI ALLE2IS, TLBI ALLE2ISNXS, TLB Invalidate All, EL2, Inner Shareable

The TLBI ALLE2IS, TLBI ALLE2ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any address using the Secure EL2&0 or EL2 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any address using the Non-secure EL2&0 or EL2 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any address using the Realm EL2&0 or EL2 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any address using the Secure EL2&0 or EL2 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any address using the Non-secure EL2&0 or EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

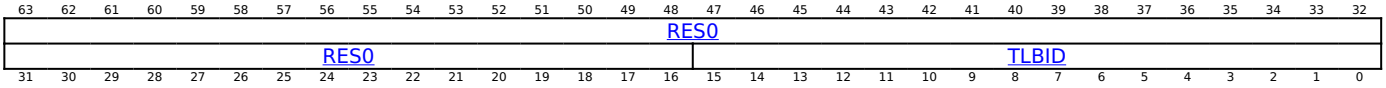
This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE2IS, TLBI ALLE2ISNXS are UNDEFINED.

Attributes

TLBI ALLE2IS, TLBI ALLE2ISNXS is a 64-bit System instruction.

Field descriptions

When FEAT_TLBID is implemented:



Bits [63:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBI ALLE2IS, TLBI ALLE2ISNXS

If FEAT_TLBID is not implemented, the Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_ALL() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ALLE2IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0011	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

            return;
        else
            AArch64_TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Broadcast_ISH, TLBI_ExcludeXS, X{64}(t));
        end;
    end;
end;
```

TLBI ALLE2OS, TLBI ALLE2OSNXS, TLB Invalidate All, EL2, Outer Shareable

The TLBI ALLE2OS, TLBI ALLE2OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any address using the Secure EL2&0 or EL2 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any address using the Non-secure EL2&0 or EL2 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any address using the Realm EL2&0 or EL2 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any address using the Secure EL2&0 or EL2 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any address using the Non-secure EL2&0 or EL2 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

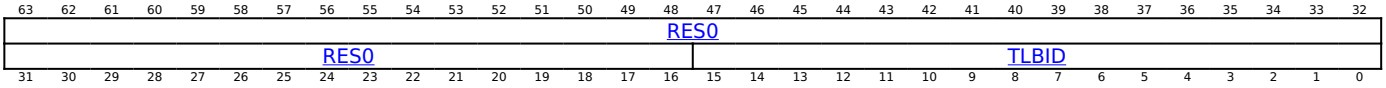
This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE2OS, TLBI ALLE2OSNXS are UNDEFINED.

Attributes

TLBI ALLE2OS, TLBI ALLE2OSNXS is a 64-bit System instruction.

Field descriptions

When FEAT_TLBID is implemented:



Bits [63:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBI ALLE2OS, TLBI ALLE2OSNXS

If FEAT_TLBID is not implemented, the Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_ALL() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ALLE2OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0001	0b000

```
if !(IsFeatureImplemented(FEAT_TLBIOS) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();

        end;
    end;
end;
```

TLBI ALLE3, TLBI ALLE3NXS, TLB Invalidate All, EL3

The TLBI ALLE3, TLBI ALLE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be required to translate an address using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ALLE3, TLBI ALLE3NXS are UNDEFINED.

Attributes

TLBI ALLE3, TLBI ALLE3NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI ALLE3, TLBI ALLE3NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ASIDE1, TLBI ASIDE1NXS, TLB Invalidate by ASID, EL1

The TLBI ASIDE1, TLBI ASIDE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

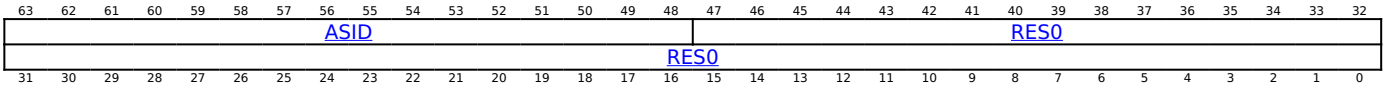
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ASIDE1, TLBI ASIDE1NXS are UNDEFINED.

Attributes

TLBI ASIDE1, TLBI ASIDE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:0]

Reserved, RES0.

Executing TLBI ASIDE1, TLBI ASIDE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_ASID() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ASIDE1IS, TLBI ASIDE1ISNXS, TLB Invalidate by ASID, EL1, Inner Shareable

The TLBI ASIDE1IS, TLBI ASIDE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

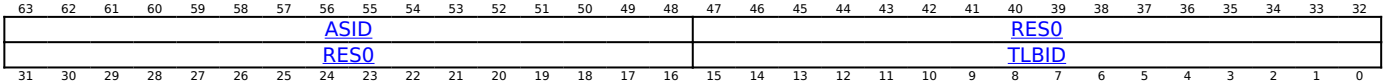
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ASIDE1IS, TLBI ASIDE1ISNXS are UNDEFINED.

Attributes

TLBI ASIDE1IS, TLBI ASIDE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBI ASIDE1IS, TLBI ASIDE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_ASID() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI ASIDE1IS{, <Xt>}

TLBI ASIDE1OS, TLBI ASIDE1OSNXS, TLB Invalidate by ASID, EL1, Outer Shareable

The TLBI ASIDE1OS, TLBI ASIDE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate an address using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate an address using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate an address using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

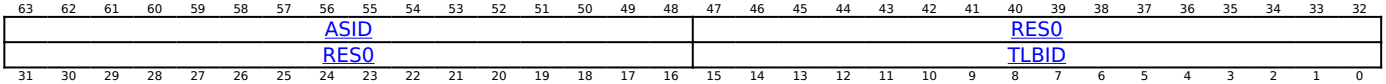
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI ASIDE1OS, TLBI ASIDE1OSNXS are UNDEFINED.

Attributes

TLBI ASIDE1OS, TLBI ASIDE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate TLB entries that match the ASID values will be affected by this System instruction.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Bits [47:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBI IPAS2E1, TLBI IPAS2E1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI IPAS2E1, TLBI IPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

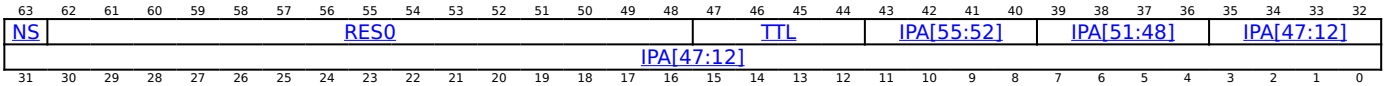
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2E1, TLBI IPAS2E1NXS are UNDEFINED.

Attributes

TLBI IPAS2E1, TLBI IPAS2E1NXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2E1, TLBI IPAS2E1NXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2E1{, <Xt>}

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

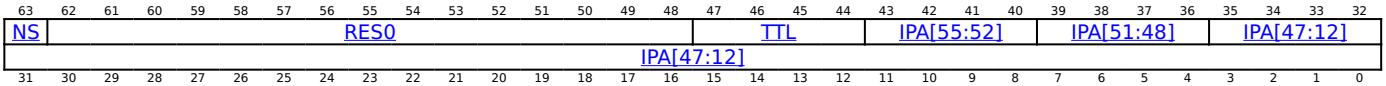
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2E1IS, TLBI IPAS2E1ISNXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2E1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0000	0b001

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

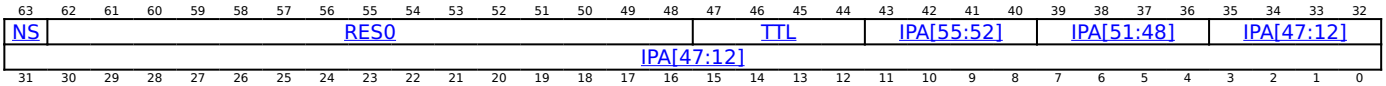
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2E1OS, TLBI IPAS2E1OSNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

TLBI IPAS2LE1, TLBI IPAS2LE1NXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI IPAS2LE1, TLBI IPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

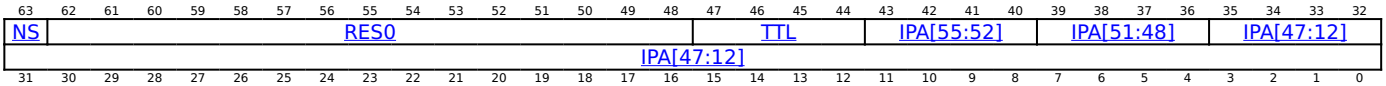
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

IPA[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[51:48], bits [39:36]
When FEAT_LPA is implemented:

Extension to IPA[47:12]. For more information, see IPA[47:12].

Otherwise:

Reserved, RES0.

IPA[47:12], bits [35:0]

Bits[47:12] of the intermediate physical address to match. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

If ID_AA64MMFR0_EL1.PARange is 0b0111, bits IPA[55:48] form the upper part of the address value.

If ID_AA64MMFR0_EL1.PARange is 0b0110, bits IPA[51:48] form the upper part of the address value and bits IPA[55:52] are RES0.

If ID_AA64MMFR0_EL1.PARange is not 0b0110 and not 0b0111, bits IPA[55:48] are RES0.

Executing TLBI IPAS2LE1IS, TLBI IPAS2LE1ISNXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI IPAS2LE1IS{, <Xt>}

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS, TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

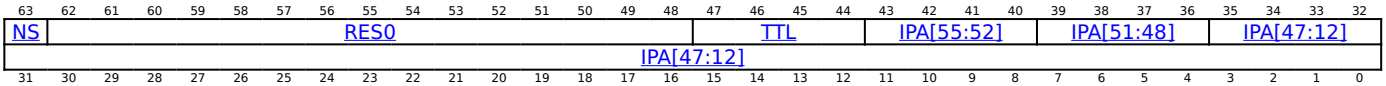
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI IPAS2LE1OS, TLBI IPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

TLBI PAALL, TLB Invalidate GPT Information by PA, All Entries, Local

The TLBI PAALL characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation applies to all TLB entries containing GPT information.
- The invalidation affects only the TLBs for the PE executing the operation.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: TLBI PAALL, TLBI PAALLOS, TLBI RPALOS, and TLBI RPAOS.

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI PAALL are UNDEFINED.

Attributes

TLBI PAALL is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI PAALL

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI PAALL{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0111	0b100

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    AArch64_TLBI_PAALL(Broadcast_NSH);
end;
```

TLBI PAALLOS, TLB Invalidate GPT Information by PA, All Entries, Outer Shareable

The TLBI PAALLOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation applies to all TLB entries containing GPT information.
- The invalidation affects all TLBs in the Outer Shareable domain.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: TLBI PAALL, TLBI PAALLOS, TLBI RPALOS, and TLBI RPAOS.

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI PAALLOS are UNDEFINED.

Attributes

TLBI PAALLOS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI PAALLOS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI PAALLOS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0001	0b100

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_AA64)) then

TLBI RIPAS2E1, TLBI RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBI RIPAS2E1, TLBI RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

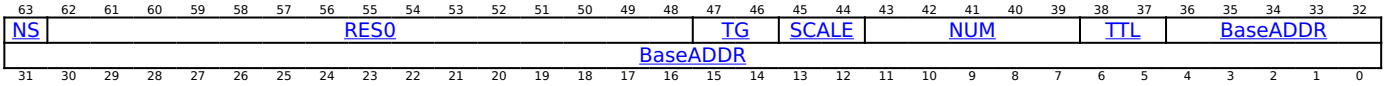
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2E1, TLBI RIPAS2E1NXS are UNDEFINED.

Attributes

TLBI RIPAS2E1, TLBI RIPAS2E1NXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and VTCR_EL2.DS == '1') or (FEAT_D128 is implemented and VTCR_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RIPAS2E1, TLBI RIPAS2E1NXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2E1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b010

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

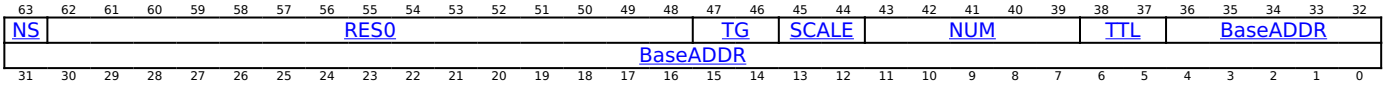
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1IS, TLBI RIPAS2E1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from any level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2E1OS, TLBI RIPAS2E1OSNXS is a 64-bit System instruction.

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

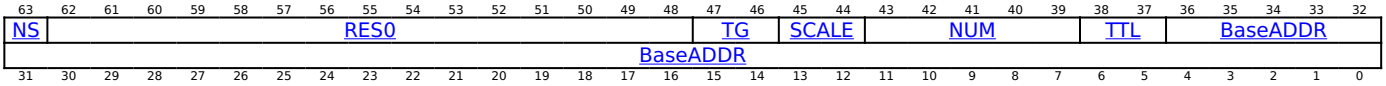
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and VTCR_EL2.DS == '1') or (FEAT_D128 is implemented and VTCR_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RIPAS2LE1, TLBI RIPAS2LE1NXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2LE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0100	0b110

```

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

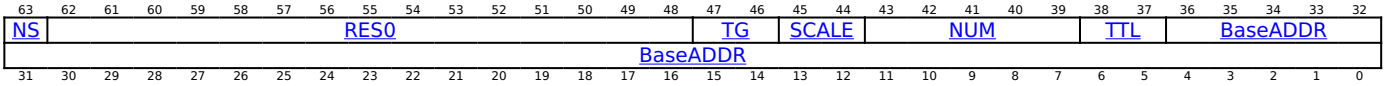
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1IS, TLBI RIPAS2LE1ISNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 2 only translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 2 only translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

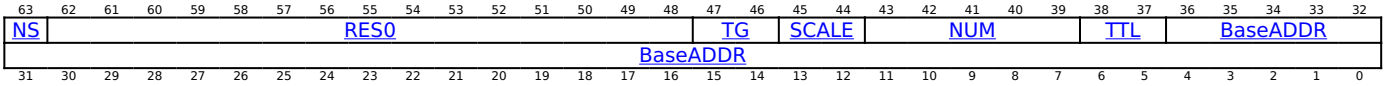
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS is a 64-bit System instruction.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and VTCR_EL2.DS == '1') or (FEAT_D128 is implemented and VTCR_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RIPAS2LE1OS, TLBI RIPAS2LE1OSNXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RIPAS2LE1OS{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI RPALOS, TLB Range Invalidate GPT Information by PA, Last level, Outer Shareable

The TLBI RPALOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation affects all TLBs in the Outer Shareable domain.
- Invalidates TLB entries containing GPT information from the final level of the GPT walk that relates to the supplied physical address.
- Invalidations are range-based, invalidating TLB entries starting from the address in BaseADDR, within the range as specified by SIZE.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: TLBI PAALL, TLBI PAALLOS, TLBI RPALOS, and TLBI RPAOS.

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

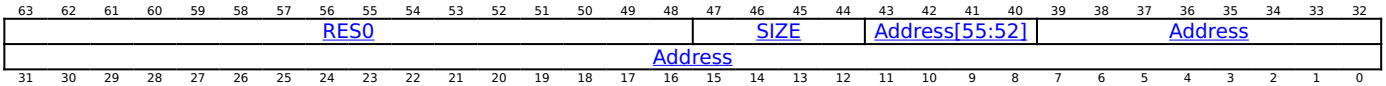
Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RPALOS are UNDEFINED.

Attributes

TLBI RPALOS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

SIZE, bits [47:44]

Size of the range for invalidation.

If SIZE is a reserved value, no TLB entries are required to be invalidated.

SIZE	Meaning
0b0000	4KB.
0b0001	16KB.
0b0010	64KB.
0b0011	2MB.
0b0100	32MB.
0b0101	512MB.
0b0110	1GB.
0b0111	16GB.
0b1000	64GB.
0b1001	512GB.

All other values are reserved.

If SIZE gives a range smaller than the configured physical granule size in GPCCR_EL3.PGS, then the Effective value of SIZE is taken to be the size configured by GPCCR_EL3.PGS.

If GPCCR_EL3.PGS is configured to a reserved value, no TLB entries are required to be invalidated.

If GPCCR_EL3.PGS is configured to different values at the broadcasting PE and receiving PE, no TLB entries are required to be invalidated at the receiving PE.

Address[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to Address. For more information, see Address.

Otherwise:

Reserved, RES0.

Address, bits [39:0]

The starting address for the range of the maintenance instruction.

This field is decoded with reference to the value of GPCCR_EL3.PGS to give BaseADDR as follows:

GPCCR_EL3.PGS	BaseADDR
0b00 (4KB)	BaseADDR[51:12] = Xt[39:0]
0b10 (16KB)	BaseADDR[51:14] = Xt[39:2]
0b01 (64KB)	BaseADDR[51:16] = Xt[39:4]

Other bits of BaseADDR are treated as zero, to give the Effective value of BaseADDR.

If the Effective value of BaseADDR is not aligned to the size of the Effective value of SIZE, no TLB entries are required to be invalidated.

If the Effective value of BaseADDR targets an address above the implemented PA range that ID_AA64MMFR0_EL1.PARange indicates, no TLB entries are required to be invalidated.

If ID_AA64MMFR0_EL1.PARange is 0b0111, Address[55:52] form the upper part of the BaseADDR value. Otherwise, Address[55:52] are RES0.

Executing TLBI RPALOS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RPALOS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0100	0b111

```
if !(IsFeatureImplemented(FEAT_RME) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    AArch64_TLBI_RPA(TLBILevel_Last, X{64}(t), Broadcast_OSH);
end;
```

TLBI RPAOS, TLB Range Invalidate GPT Information by PA, Outer Shareable

The TLBI RPAOS characteristics are:

Purpose

Invalidates cached copies of GPT entries from TLBs. Details:

- The invalidation applies to TLB entries containing GPT information that relates to a physical address.
- The invalidation affects all TLBs in the Outer Shareable domain.
- Invalidates TLB entries containing GPT information from all levels of the GPT walk that relates to the supplied physical address.
- Invalidations are range-based, invalidating TLB entries starting from the address in BaseADDR, within the range as specified by SIZE.

The full set of TLB maintenance instructions that invalidate cached GPT entries is: TLBI PAALL, TLBI PAALLOS, TLBI RPALOS, and TLBI RPAOS.

These instructions have the same ordering, observability, and completion behavior as all other TLBI instructions.

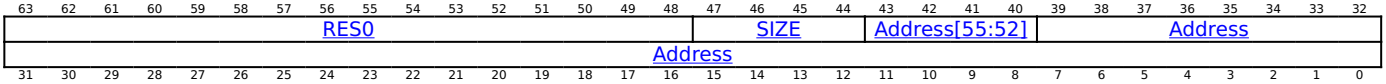
Configuration

This instruction is present only when FEAT_RME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RPAOS are UNDEFINED.

Attributes

TLBI RPAOS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

SIZE, bits [47:44]

Size of the range for invalidation.

If SIZE is a reserved value, no TLB entries are required to be invalidated.

SIZE	Meaning
0b0000	4KB.
0b0001	16KB.
0b0010	64KB.
0b0011	2MB.
0b0100	32MB.
0b0101	512MB.
0b0110	1GB.
0b0111	16GB.
0b1000	64GB.
0b1001	512GB.

All other values are reserved.

If SIZE gives a range smaller than the configured physical granule size in GPCCR_EL3.PGS, then the Effective value of SIZE is taken to be the size configured by GPCCR_EL3.PGS.

If GPCCR_EL3.PGS is configured to a reserved value, no TLB entries are required to be invalidated.

If GPCCR_EL3.PGS is configured to different values at the broadcasting PE and receiving PE, no TLB entries are required to be invalidated at the receiving PE.

Address[55:52], bits [43:40]
When FEAT_D128 is implemented:

Extension to Address. For more information, see Address.

Otherwise:

Reserved, RES0.

Address, bits [39:0]

The starting address for the range of the maintenance instruction.

This field is decoded with reference to the value of GPCCR_EL3.PGS to give BaseADDR as follows:

GPCCR_EL3.PGS	BaseADDR
0b00 (4KB)	BaseADDR[51:12] = Xt[39:0]
0b10 (16KB)	BaseADDR[51:14] = Xt[39:2]
0b01 (64KB)	BaseADDR[51:16] = Xt[39:4]

Other bits of BaseADDR are treated as zero, to give the Effective value of BaseADDR.

If the Effective value of BaseADDR is not aligned to the size of the Effective value of SIZE, no TLB entries are required to be invalidated.

If the Effective value of BaseADDR targets an address above the implemented PA range that ID_AA64MMFR0_EL1.PARange indicates, no TLB entries are required to be invalidated.

If ID_AA64MMFR0_EL1.PARange is 0b0111, Address[55:52] form the upper part of the BaseADDR value. Otherwise, Address[55:52] are RES0.

```

2025-12-10 16:11:30, 2025-12_rel

TLBI RVAAE1, TLBI RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBI RVAAE1, TLBI RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

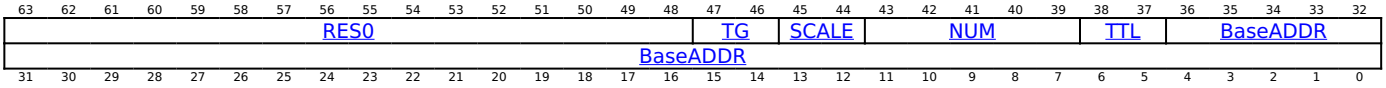
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAAE1, TLBI RVAAE1NXS are UNDEFINED.

Attributes

TLBI RVAAE1, TLBI RVAAE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAAE1, TLBI RVAAE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAAE1{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI RVAAE1IS, TLBI RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI RVAAE1IS, TLBI RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAAE1IS, TLBI RVAAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAAE1IS, TLBI RVAAE1ISNXS is a 64-bit System instruction.

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAAE1IS, TLBI RVAAE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAAE1OS, TLBI RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI RVAAE1OS, TLBI RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

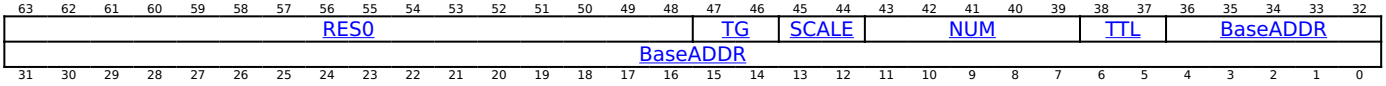
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAAE1OS, TLBI RVAAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAAE1OS, TLBI RVAAE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAALE1, TLBI RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBI RVAALE1, TLBI RVAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

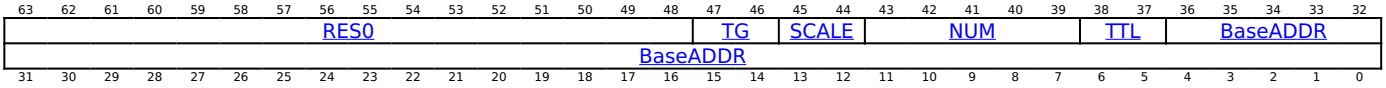
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAALE1, TLBI RVAALE1NXS are UNDEFINED.

Attributes

TLBI RVAALE1, TLBI RVAALE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVAALE1IS, TLBI RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI RVAALE1IS, TLBI RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

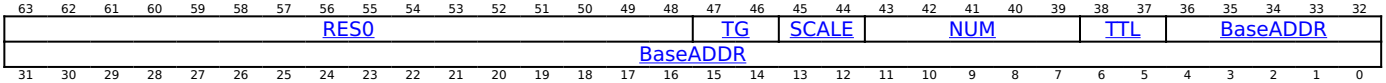
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAALE1IS, TLBI RVAALE1ISNXS are UNDEFINED.

Attributes

TLBI RVAALE1IS, TLBI RVAALE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAALE1IS, TLBI RVAALE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAALE1OS, TLBI RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI RVAALE1OS, TLBI RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the leaf level of the translation table walk, indicated by the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the leaf level of the translation table walk, if TTL is 0b00.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

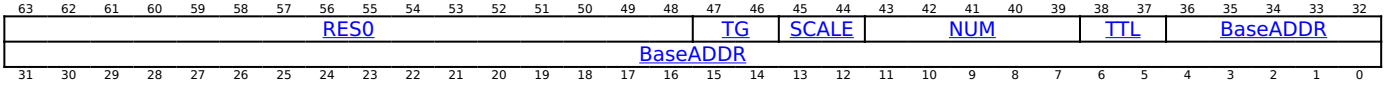
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAALE1OS, TLBI RVAALE1OSNXS are UNDEFINED.

Attributes

TLBI RVAALE1OS, TLBI RVAALE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAALE1OS, TLBI RVAALE1OSNXS

2025-12-10 16:11:30, 2025-12_rel

TLBI RVAE1, TLBI RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBI RVAE1, TLBI RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

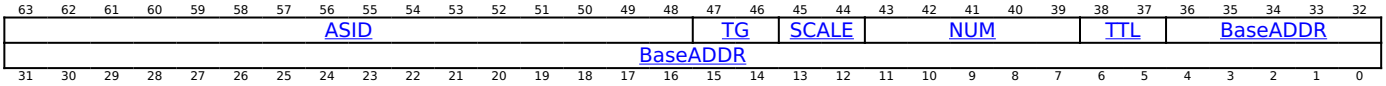
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE1, TLBI RVAE1NXS are UNDEFINED.

Attributes

TLBI RVAE1, TLBI RVAE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE1, TLBI RVAE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0110	0b001

```

TLBI RVAE1IS, TLBI RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBI RVAE1IS, TLBI RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

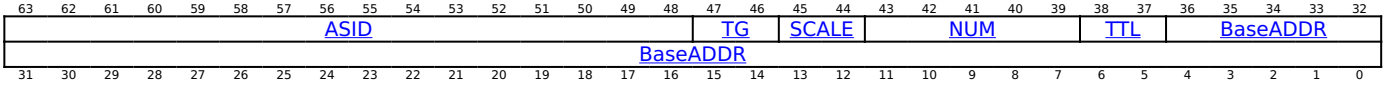
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE1IS, TLBI RVAE1ISNXS are UNDEFINED.

Attributes

TLBI RVAE1IS, TLBI RVAE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE1IS, TLBI RVAE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

2025-12-10 16:11:30, 2025-12_rel

TLBI RVAE1OS, TLBI RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBI RVAE1OS, TLBI RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

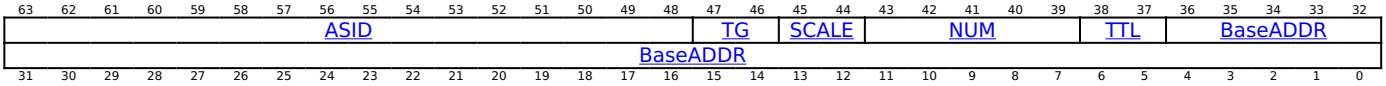
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE1OS, TLBI RVAE1OSNXS are UNDEFINED.

Attributes

TLBI RVAE1OS, TLBI RVAE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE1OS, TLBI RVAE1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE1OS{, <Xt>}

TLBI RVAE2, TLBI RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBI RVAE2, TLBI RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

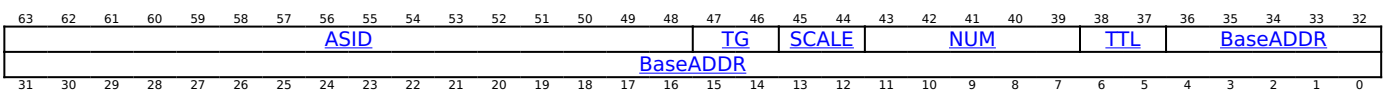
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE2, TLBI RVAE2NXS are UNDEFINED.

Attributes

TLBI RVAE2, TLBI RVAE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL2.DS == '1') or (FEAT_D128 is implemented and TCR2_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE2, TLBI RVAE2NXS

This system instruction is an alias of the SYS instruction.

TLBI RVAE2IS, TLBI RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBI RVAE2IS, TLBI RVAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

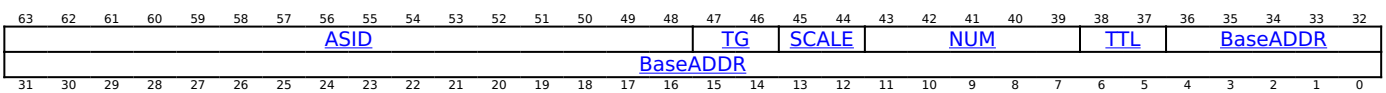
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE2IS, TLBI RVAE2ISNXS are UNDEFINED.

Attributes

TLBI RVAE2IS, TLBI RVAE2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TLBI RVAE2OS, TLBI RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBI RVAE2OS, TLBI RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

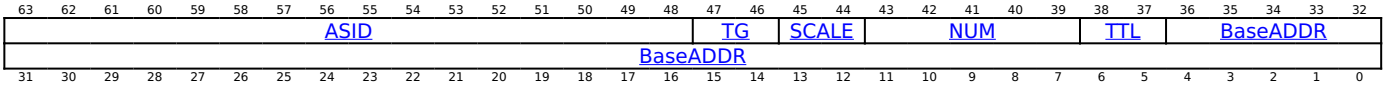
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE2OS, TLBI RVAE2OSNXS are UNDEFINED.

Attributes

TLBI RVAE2OS, TLBI RVAE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL2.DS == '1') or (FEAT_D128 is implemented and TCR2_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVAE2OS, TLBI RVAE2OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVAE2OS{, <Xt>}

TLBI RVAE3, TLBI RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBI RVAE3, TLBI RVAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

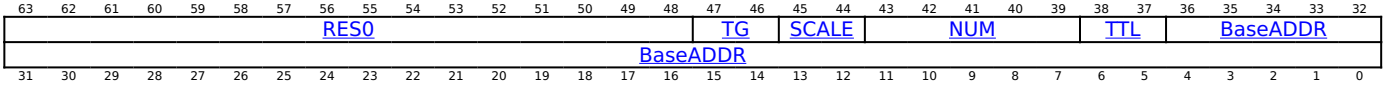
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVAE3, TLBI RVAE3NXS are UNDEFINED.

Attributes

TLBI RVAE3, TLBI RVAE3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

TLBI RVAE3OS, TLBI RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBI RVAE3OS, TLBI RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

TLBI RVALE1, TLBI RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBI RVALE1, TLBI RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

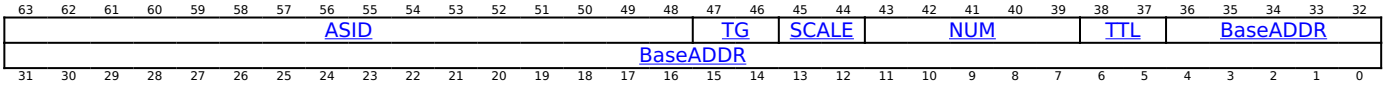
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE1, TLBI RVALE1NXS are UNDEFINED.

Attributes

TLBI RVALE1, TLBI RVALE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE1, TLBI RVALE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI RVALE1IS, TLBI RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI RVALE1IS, TLBI RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

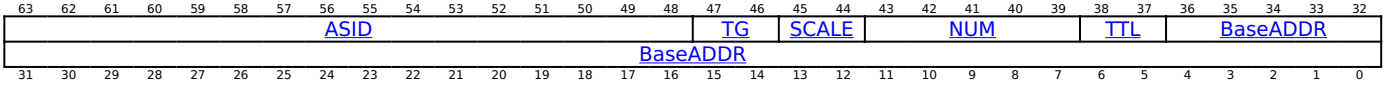
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE1IS, TLBI RVALE1ISNXS are UNDEFINED.

Attributes

TLBI RVALE1IS, TLBI RVALE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE1IS, TLBI RVALE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1IS{, <Xt>}

TLBI RVALE1OS, TLBI RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI RVALE1OS, TLBI RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

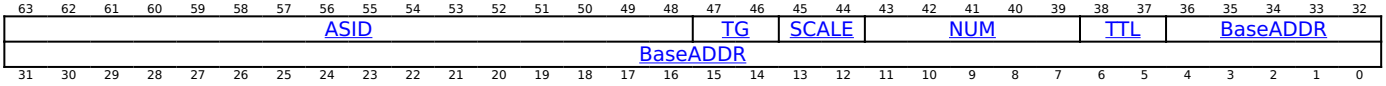
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE1OS, TLBI RVALE1OSNXS are UNDEFINED.

Attributes

TLBI RVALE1OS, TLBI RVALE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL1.DS == '1') or (FEAT_D128 is implemented and TCR2_EL1.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE1OS, TLBI RVALE1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE1OS{, <Xt>}

2025-12-10 16:11:30, 2025-12_rel

TLBI RVALE2, TLBI RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBI RVALE2, TLBI RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

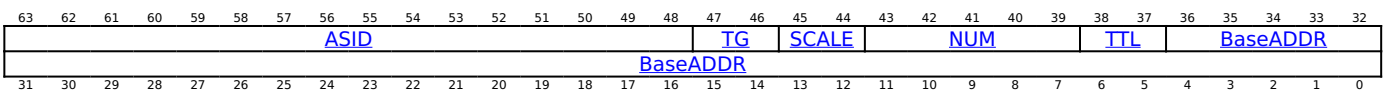
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE2, TLBI RVALE2NXS are UNDEFINED.

Attributes

TLBI RVALE2, TLBI RVALE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL2.DS == '1') or (FEAT_D128 is implemented and TCR2_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVALE2IS, TLBI RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI RVALE2IS, TLBI RVALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE\ +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

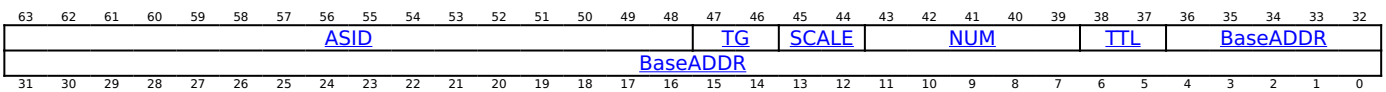
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE2IS, TLBI RVALE2ISNXS are UNDEFINED.

Attributes

TLBI RVALE2IS, TLBI RVALE2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL2.DS == '1') or (FEAT_D128 is implemented and TCR2_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

TLBI RVALE2OS, TLBI RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI RVALE2OS, TLBI RVALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE\ +1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

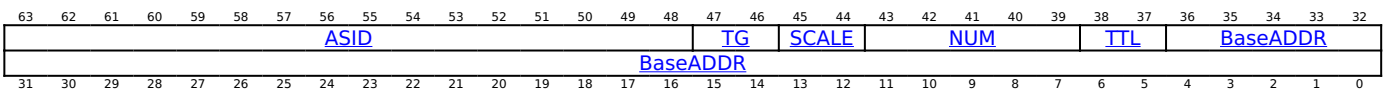
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE2OS, TLBI RVALE2OSNXS are UNDEFINED.

Attributes

TLBI RVALE2OS, TLBI RVALE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1. If FEAT_LPA2 is not implemented, when using a 16KB translation granule, this value is reserved and hardware should treat this field as 0b00.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

BaseADDR, bits [36:0]
When (FEAT_LPA2 is implemented and TCR_EL2.DS == '1') or (FEAT_D128 is implemented and TCR2_EL2.D128 == '1'):

The starting address for the range of the maintenance instructions. This field is BaseADDR[52:16] for all translation granules.

When using a 4KB translation granule, BaseADDR[15:12] is treated as 0b0000.

When using a 16KB translation granule, BaseADDR[15:14] is treated as 0b00.

Otherwise:

The starting address for the range of the maintenance instruction.

When using a 4KB translation granule, this field is BaseADDR[48:12].

When using a 16KB translation granule, this field is BaseADDR[50:14].

When using a 64KB translation granule, this field is BaseADDR[52:16].

Executing TLBI RVALE2OS, TLBI RVALE2OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI RVALE2OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0101	0b101

TLBI RVALE3, TLBI RVALE3NXS, TLB Range Invalidate by VA, Last level, EL3

The TLBI RVALE3, TLBI RVALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation applies to the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 000000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

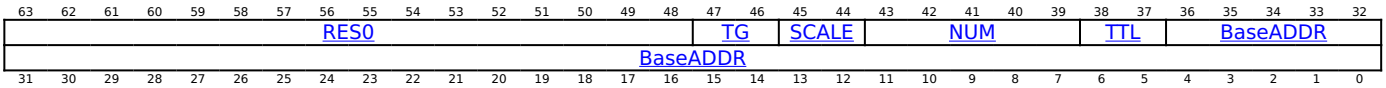
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE3, TLBI RVALE3NXS are UNDEFINED.

Attributes

TLBI RVALE3, TLBI RVALE3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

TLBI RVALE3OS, TLBI RVALE3OSNXS, TLB Range Invalidate by VA, Last level, EL3, Outer Shareable

The TLBI RVALE3OS, TLBI RVALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL is 0b00.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 64-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when:

- For the 4K translation granule:
  - If TTL==01 and BaseADDR[29:12] is not equal to 0000000000000000.
  - If TTL==10 and BaseADDR[20:12] is not equal to 000000000.
- For the 16K translation granule:
  - If TTL==10 and BaseADDR[24:14] is not equal to 00000000000.
- For the 64K translation granule:
  - If TTL==01 and BaseADDR[41:16] is not equal to 000000000000000000000000.
  - If TTL==10 and BaseADDR[28:16] is not equal to 0000000000000.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

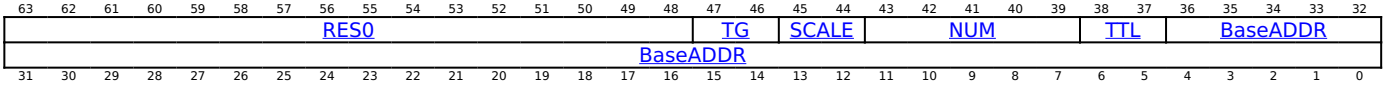
Configuration

This instruction is present only when FEAT_TLBIRANGE is implemented, FEAT_TLBIOS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI RVALE3OS, TLBI RVALE3OSNXS are UNDEFINED.

Attributes

TLBI RVALE3OS, TLBI RVALE3OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TLBI VAAE1, TLBI VAAE1NXS, TLB Invalidate by VA, All ASID, EL1

The TLBI VAAE1, TLBI VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL is 0b00.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

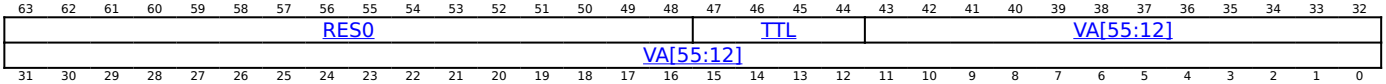
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAAE1, TLBI VAAE1NXS are UNDEFINED.

Attributes

TLBI VAAE1, TLBI VAAE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAAE1, TLBI VAAE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1{, <Xt>}

op0	op1	CRn	CRm	op2

0b01	0b000	0b1000	0b0111	0b011

```
if !IsFeatureImplemented(FEAT_AA64) then

TLBI VAAE1IS, TLBI VAAE1ISNXS, TLB Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBI VAAE1IS, TLBI VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

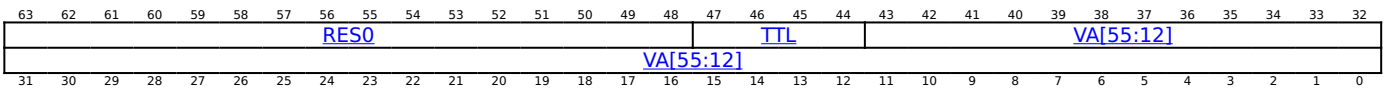
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAAE1IS, TLBI VAAE1ISNXS are UNDEFINED.

Attributes

TLBI VAAE1IS, TLBI VAAE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAAE1IS, TLBI VAAE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VAA() in the Shared Pseudocode.

```

TLBI VAAE1OS, TLBI VAAE1OSNXS, TLB Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBI VAAE1OS, TLBI VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from any level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

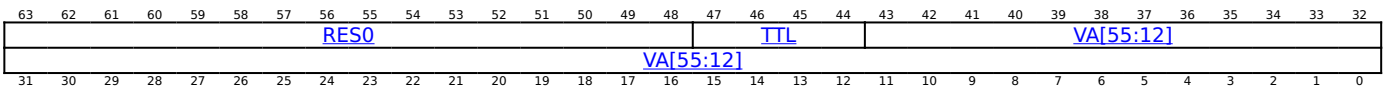
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAAE1OS, TLBI VAAE1OSNXS are UNDEFINED.

Attributes

TLBI VAAE1OS, TLBI VAAE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAAE1OS, TLBI VAAE1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAAE1OS{, <Xt>}

TLBI VAALE1, TLBI VAALE1NXS, TLB Invalidate by VA, All ASID, Last level, EL1

The TLBI VAALE1, TLBI VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

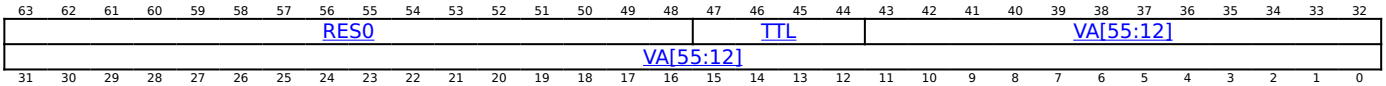
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAALE1, TLBI VAALE1NXS are UNDEFINED.

Attributes

TLBI VAALE1, TLBI VAALE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAALE1, TLBI VAALE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAALE1{, <Xt>}

TLBI VAALE1IS, TLBI VAALE1ISNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBI VAALE1IS, TLBI VAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

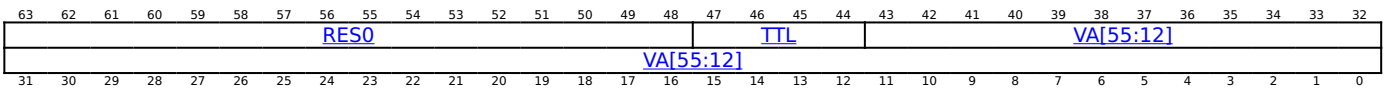
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAALE1IS, TLBI VAALE1ISNXS are UNDEFINED.

Attributes

TLBI VAALE1IS, TLBI VAALE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAALE1IS, TLBI VAALE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VAA() in the Shared Pseudocode.

TLBI VAALE1OS, TLBI VAALE1OSNXS, TLB Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBI VAALE1OS, TLBI VAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, from the final level of the translation table walk, if TTL[3:2] is 0b00.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

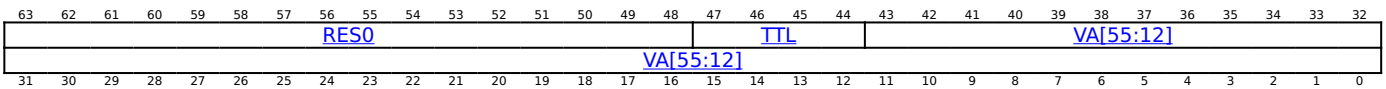
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAALE1OS, TLBI VAALE1OSNXS are UNDEFINED.

Attributes

TLBI VAALE1OS, TLBI VAALE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAALE1OS, TLBI VAALE1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAALE1OS{, <Xt>}

    end;
end;
```

TLBI VAE1, TLBI VAE1NXS, TLB Invalidate by VA, EL1

The TLBI VAE1, TLBI VAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

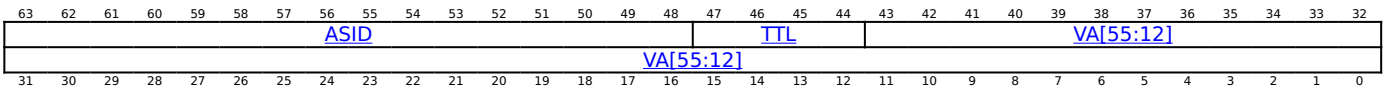
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE1, TLBI VAE1NXS are UNDEFINED.

Attributes

TLBI VAE1, TLBI VAE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE1, TLBI VAE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE1{, <Xt>}

op0	op1	CRn	CRm	op2

0b01	0b000	0b1000	0b0111	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then

    end;
end;
```

TLBI VAE1IS, TLBI VAE1ISNXS, TLB Invalidate by VA, EL1, Inner Shareable

The TLBI VAE1IS, TLBI VAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

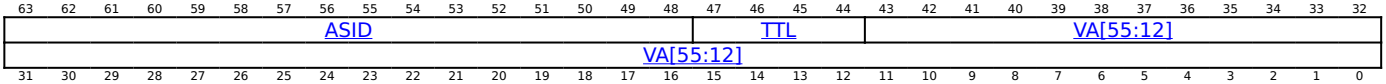
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE1IS, TLBI VAE1ISNXS are UNDEFINED.

Attributes

TLBI VAE1IS, TLBI VAE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE1IS, TLBI VAE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE1IS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0011	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then

TLBI VAE1OS, TLBI VAE1OSNXS, TLB Invalidate by VA, EL1, Outer Shareable

The TLBI VAE1OS, TLBI VAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

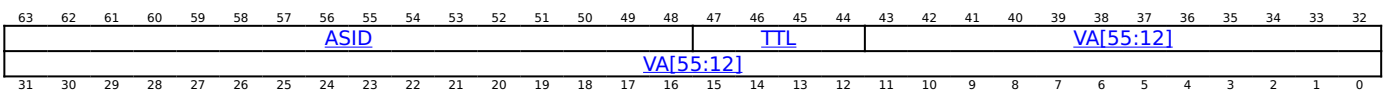
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE1OS, TLBI VAE1OSNXS are UNDEFINED.

Attributes

TLBI VAE1OS, TLBI VAE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE1OS, TLBI VAE1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE2, TLBI VAE2NXS, TLB Invalidate by VA, EL2

The TLBI VAE2, TLBI VAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

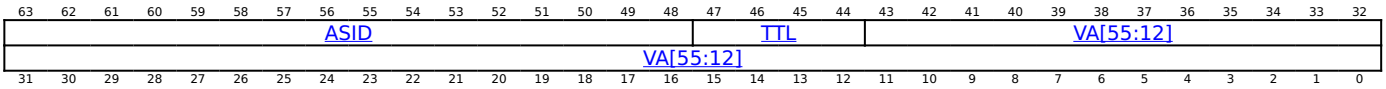
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE2, TLBI VAE2NXS are UNDEFINED.

Attributes

TLBI VAE2, TLBI VAE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE2, TLBI VAE2NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE2IS, TLBI VAE2ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE2IS{, <Xt>}

op0	op1	CRn	CRm	op2

0b01	0b100	0b1000	0b0011	0b001

```

TLBI VAE2OS, TLBI VAE2OSNXS, TLB Invalidate by VA, EL2, Outer Shareable

The TLBI VAE2OS, TLBI VAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

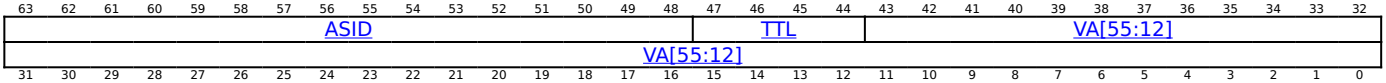
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE2OS, TLBI VAE2OSNXS are UNDEFINED.

Attributes

TLBI VAE2OS, TLBI VAE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE2OS, TLBI VAE2OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

TLBI VAE3, TLBI VAE3NXS, TLB Invalidate by VA, EL3

The TLBI VAE3, TLBI VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

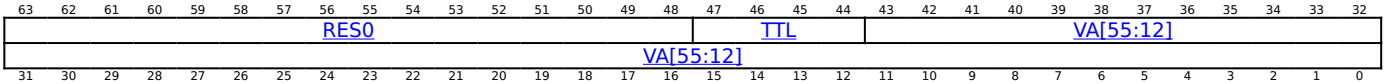
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE3, TLBI VAE3NXS are UNDEFINED.

Attributes

TLBI VAE3, TLBI VAE3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE3, TLBI VAE3NXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE3{, <Xt>}

TLBI VAE3IS, TLBI VAE3ISNXS, TLB Invalidate by VA, EL3, Inner Shareable

The TLBI VAE3IS, TLBI VAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

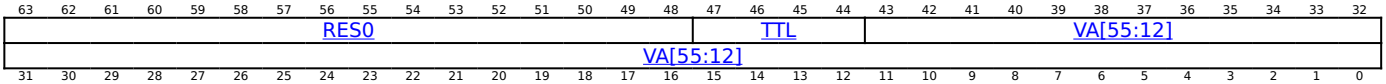
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE3IS, TLBI VAE3ISNXS are UNDEFINED.

Attributes

TLBI VAE3IS, TLBI VAE3ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

TLBI VAE3OS, TLBI VAE3OSNXS, TLB Invalidate by VA, EL3, Outer Shareable

The TLBI VAE3OS, TLBI VAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

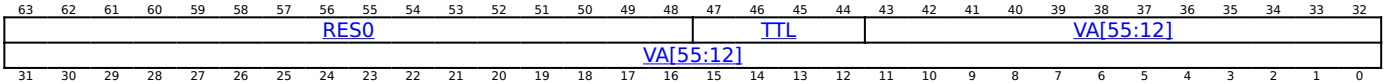
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VAE3OS, TLBI VAE3OSNXS are UNDEFINED.

Attributes

TLBI VAE3OS, TLBI VAE3OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VAE3OS, TLBI VAE3OSNXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VAE3OS{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b110	0b1000	0b0001	0b001

```
if !(IsFeatureImplemented(FEAT_TLBIOS) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();

TLBI VALE1, TLBI VALE1NXS, TLB Invalidate by VA, Last level, EL1

The TLBI VALE1, TLBI VALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

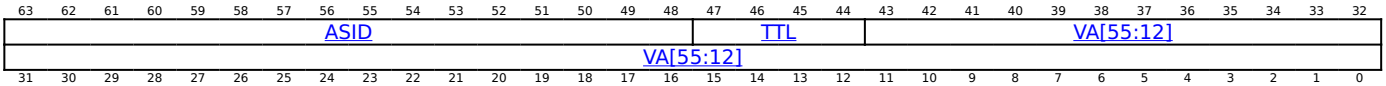
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE1, TLBI VALE1NXS are UNDEFINED.

Attributes

TLBI VALE1, TLBI VALE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE1, TLBI VALE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1{, <Xt>}

op0	op1	CRn	CRm	op2

0b01	0b000	0b1000	0b0111	0b101

TLBI VALE1IS, TLBI VALE1ISNXS, TLB Invalidate by VA, Last level, EL1, Inner Shareable

The TLBI VALE1IS, TLBI VALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

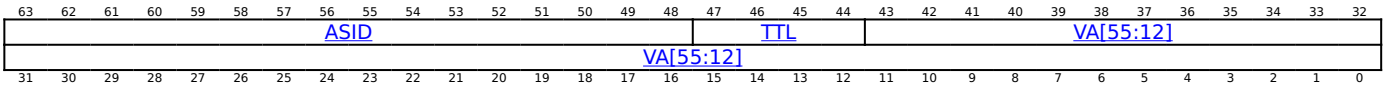
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE1IS, TLBI VALE1ISNXS are UNDEFINED.

Attributes

TLBI VALE1IS, TLBI VALE1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE1IS, TLBI VALE1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1OS, TLBI VALE1OSNXS, TLB Invalidate by VA, Last level, EL1, Outer Shareable

The TLBI VALE1OS, TLBI VALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

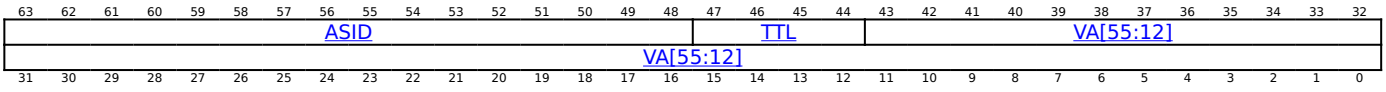
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE1OS, TLBI VALE1OSNXS are UNDEFINED.

Attributes

TLBI VALE1OS, TLBI VALE1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE1OS, TLBI VALE1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE1OS{, <Xt>}

TLBI VALE2, TLBI VALE2NXS, TLB Invalidate by VA, Last level, EL2

The TLBI VALE2, TLBI VALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

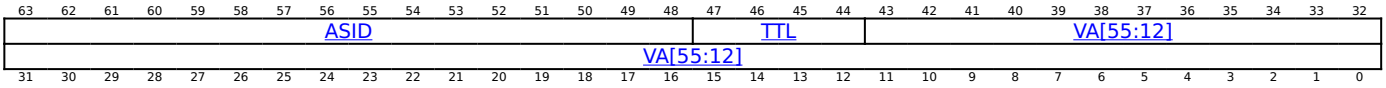
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE2, TLBI VALE2NXS are UNDEFINED.

Attributes

TLBI VALE2, TLBI VALE2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE2, TLBI VALE2NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE2{, <Xt>}

TLBI VALE2IS, TLBI VALE2ISNXS, TLB Invalidate by VA, Last level, EL2, Inner Shareable

The TLBI VALE2IS, TLBI VALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

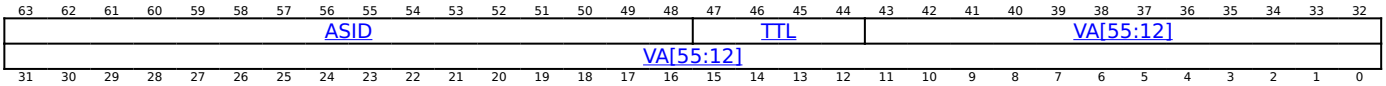
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE2IS, TLBI VALE2ISNXS are UNDEFINED.

Attributes

TLBI VALE2IS, TLBI VALE2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE2IS, TLBI VALE2ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

TLBI VALE2OS, TLBI VALE2OSNXS, TLB Invalidate by VA, Last level, EL2, Outer Shareable

The TLBI VALE2OS, TLBI VALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

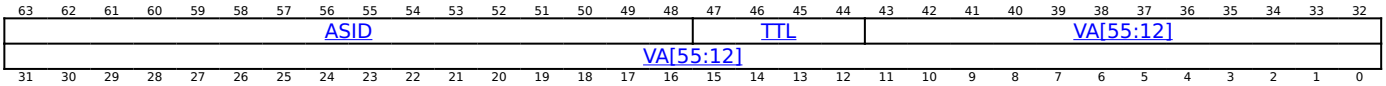
Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE2OS, TLBI VALE2OSNXS are UNDEFINED.

Attributes

TLBI VALE2OS, TLBI VALE2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE2OS, TLBI VALE2OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE2OS{, <Xt>}

TLBI VALE3, TLBI VALE3NXS, TLB Invalidate by VA, Last level, EL3

The TLBI VALE3, TLBI VALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk.
  - If FEAT_D128 is implemented, a 128-bit stage 1 translation table entry, if TTL[3:2] is 0b00.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

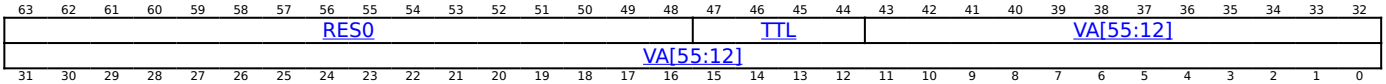
Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VALE3, TLBI VALE3NXS are UNDEFINED.

Attributes

TLBI VALE3, TLBI VALE3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : If FEAT_LPA2 is implemented, level 0. Otherwise, treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : If FEAT_LPA2 is implemented, level 1. Otherwise, treat as if TTL<3:2> is 0b00. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

VA[55:12], bits [43:0]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Executing TLBI VALE3, TLBI VALE3NXS

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VALE3{, <Xt>}

op0	op1	CRn	CRm	op2

TLBI VMALLE1, TLBI VMALLE1NXS, TLB Invalidate by VMID, All at stage 1, EL1

The TLBI VMALLE1, TLBI VMALLE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLE1, TLBI VMALLE1NXS are UNDEFINED.

Attributes

TLBI VMALLE1, TLBI VMALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI VMALLE1, TLBI VMALLE1NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VMALL() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0111	0b000

TLBI VMALLE1IS, TLBI VMALLE1ISNXS, TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable

The TLBI VMALLE1IS, TLBI VMALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

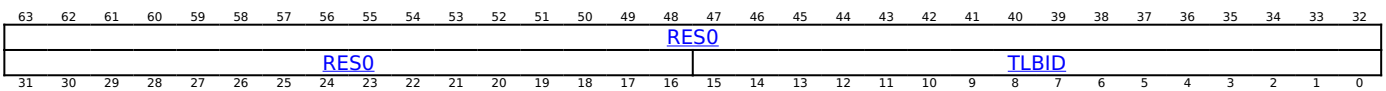
This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLE1IS, TLBI VMALLE1ISNXS are UNDEFINED.

Attributes

TLBI VMALLE1IS, TLBI VMALLE1ISNXS is a 64-bit System instruction.

Field descriptions

When FEAT_TLBID is implemented:



Bits [63:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBI VMALLE1IS, TLBI VMALLE1ISNXS

If FEAT_TLBID is not implemented, the Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBI_VMALL() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLE1IS{, <Xt>}

TLBI VMALLE1OS, TLBI VMALLE1OSNXS, TLB Invalidate by VMID, All at stage 1, EL1, Outer Shareable

The TLBI VMALLE1OS, TLBI VMALLE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_TLBIOS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLE1OS, TLBI VMALLE1OSNXS are UNDEFINED.

Attributes

TLBI VMALLE1OS, TLBI VMALLE1OSNXS is a 64-bit System instruction.

TLBI VMALLS12E1, TLBI VMALLS12E1NXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1

The TLBI VMALLS12E1, TLBI VMALLS12E1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - If SCR_EL3.{NSE, NS} is {0, 0}, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {0, 1}, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {1, 1}, then:
    - The entry would be required to translate an address using the Realm EL1&0 translation regime.
    - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
  - If SCR_EL3.NS is 0, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.NS is 1, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLS12E1, TLBI VMALLS12E1NXS are UNDEFINED.

Attributes

TLBI VMALLS12E1, TLBI VMALLS12E1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing TLBI VMALLS12E1, TLBI VMALLS12E1NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable

The TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - If SCR_EL3.{NSE, NS} is {0, 0}, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {0, 1}, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {1, 1}, then:
    - The entry would be required to translate an address using the Realm EL1&0 translation regime.
    - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
  - If SCR_EL3.NS is 0, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.NS is 1, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

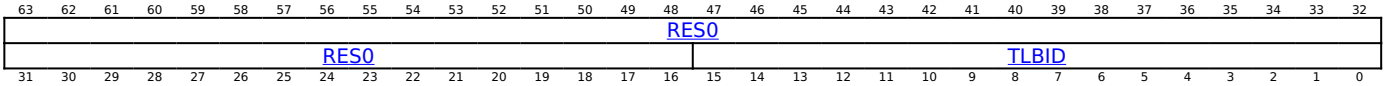
This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS are UNDEFINED.

Attributes

TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS is a 64-bit System instruction.

Field descriptions

When FEAT_TLBID is implemented:



Bits [63:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBI VMALLS12E1IS, TLBI VMALLS12E1ISNXS

If FEAT_TLBID is not implemented, the Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBI VMALLS12E1IS{, <Xt>}

TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS, TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Outer Shareable

The TLBI VMALLS12E1OS, TLBI VMALLS12E1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is a stage 1 or stage 2 translation table entry, from any level of the translation table walk.
- If FEAT_RME is implemented, one of the following applies:
  - If SCR_EL3.{NSE, NS} is {0, 0}, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {0, 1}, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {1, 1}, then:
    - The entry would be required to translate an address using the Realm EL1&0 translation regime.
    - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
  - If SCR_EL3.NS is 0, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.NS is 1, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

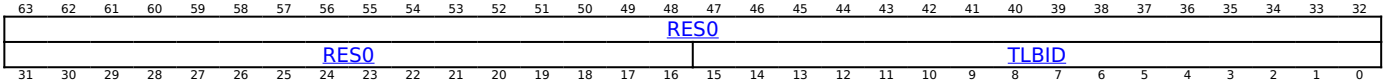
This instruction is present only when FEAT_TLBIW is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBI VMALLWS2E1IS, TLBI VMALLWS2E1ISNXS are UNDEFINED.

Attributes

TLBI VMALLWS2E1IS, TLBI VMALLWS2E1ISNXS is a 64-bit System instruction.

Field descriptions

When FEAT_TLBID is implemented:



Bits [63:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBI VMALLWS2E1IS, TLBI VMALLWS2E1ISNXS

If FEAT_TLBID is not implemented, the Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

TLBI VMALLWS2E1OS, TLBI VMALLWS2E1OSNXS, TLB Invalidate stage 2 write permission by VMID, EL1&0, Outer Shareable

The TLBI VMALLWS2E1OS, TLBI VMALLWS2E1OSNXS characteristics are:

Purpose

Invalidates stage 2 write permissions from cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry would be used for stage 2 translation. This applies if the TLB entry holds information from stage 2 translation only, or combined information from stage 1 and stage 2 translation.
- If FEAT_RME is implemented, one of the following applies:
  - If SCR_EL3.{NSE, NS} is {0, 0}, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {0, 1}, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.
  - If SCR_EL3.{NSE, NS} is {1, 1}, then:
    - The entry would be required to translate an address using the Realm EL1&0 translation regime.
    - The entry would be used with the current VMID.
- If FEAT_RME is not implemented, one of the following applies:
  - If SCR_EL3.NS is 0, then:
    - The entry would be required to translate an address using the Secure EL1&0 translation regime.
    - If FEAT_SEL2 is implemented and enabled, the entry would be used with the current VMID.
  - If SCR_EL3.NS is 1, then:
    - The entry would be required to translate an address using the Non-secure EL1&0 translation regime.
    - If Non-secure EL2 is implemented, the entry would be used with the current VMID.

Note

For the EL1&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

TLBIDIDR_EL1, TLBI Domains Identification Register (EL1)

The TLBIDIDR_EL1 characteristics are:

Purpose

Provides information on how many bits of the TLBID field are implemented for TLBI IS and TLBI OS instructions.

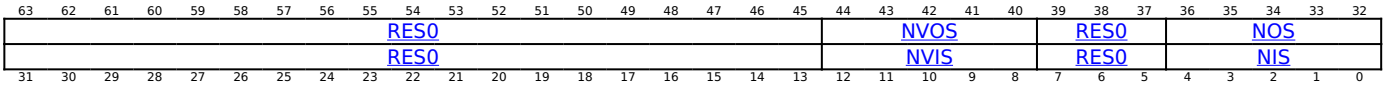
Configuration

This register is present only when FEAT_TLBID is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIDIDR_EL1 are UNDEFINED.

Attributes

TLBIDIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:45]

Reserved, RES0.

NVOS, bits [44:40]

Number of bits of Virtual TLBI Domain supported for Outer Shareable TLBI instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NVOS	Meaning
0b00000	There are no Virtual TLBI Domain Outer shareable bits.
0b00001..0b00101	The number of Virtual TLBI Domain Outer shareable bits.

The permitted values of this field depend on the value of NOS, as follows:

- If NOS is 0, NVOS is 0.
- If NOS is between 1 and 8, NVOS is between 1 and 5.
- If NOS is between 9 and 16, NVOS is between 1 and 4.

Access to this field is RO.

Bits [39:37]

Reserved, RES0.

NOS, bits [36:32]

Number of bits of TLBI Domain supported for Outer Shareable TLBI instructions.

Values greater than 16 are reserved.

The value of this field additionally determines the width of the VTLBIDOS<n>_EL2.TD<m> fields, as follows:

The value of this field is an IMPLEMENTATION DEFINED choice of:

NOS	Meaning
0b00000	The VTLBIDOS<n>_EL2 registers are not implemented.
0b00001..0b01000	Each TD<m> field is 8 bits wide. NVOS is between 0 and 5.
0b01001..0b10000	Each TD<m> field is 16 bits wide. NVOS must be between 0 and 4.

Access to this field is RO.

Bits [31:13]

Reserved, RES0.

NVIS, bits [12:8]

Number of bits of Virtual TLBI Domain supported for Inner Shareable TLBI instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NVIS	Meaning
0b00000	There are no Virtual TLBI Domain Inner shareable bits.
0b00001..0b00101	The number of Virtual TLBI Domain Inner shareable bits.

The permitted values of this field depend on the value of NIS, as follows:

- If NIS is 0, NVIS is 0.
- If NIS is between 1 and 8, NVIS is between 1 and 5.
- If NIS is between 9 and 16, NVIS is between 1 and 4.

Access to this field is RO.

Bits [7:5]

Reserved, RES0.

NIS, bits [4:0]

Number of bits of TLBI Domain supported for Inner Shareable TLBI instructions.

Values greater than 16 are reserved.

The value of this field additionally determines the width of the VTLBID<n>_EL2.TD<m> fields, as follows:

The value of this field is an IMPLEMENTATION DEFINED choice of:

NIS	Meaning
0b00000	The VTLBID<n>_EL2 registers are not implemented.
0b00001..0b01000	Each TD<m> field is 8 bits wide. NVIS is between 0 and 5.
0b01001..0b10000	Each TD<m> field is 16 bits wide. NVIS is between 0 and 4.

Access to this field is RO.

Accessing TLBIDIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TLBIDIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b110

```

TLBIP IPAS2E1, TLBIP IPAS2E1NXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1

The TLBIP IPAS2E1, TLBIP IPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

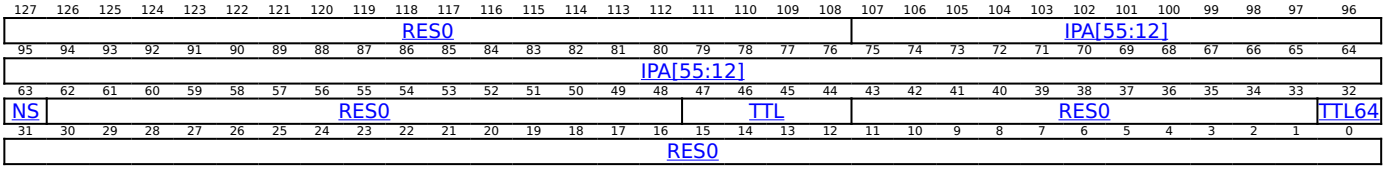
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1, TLBIP IPAS2E1NXS are UNDEFINED.

Attributes

TLBIP IPAS2E1, TLBIP IPAS2E1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[55:12], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

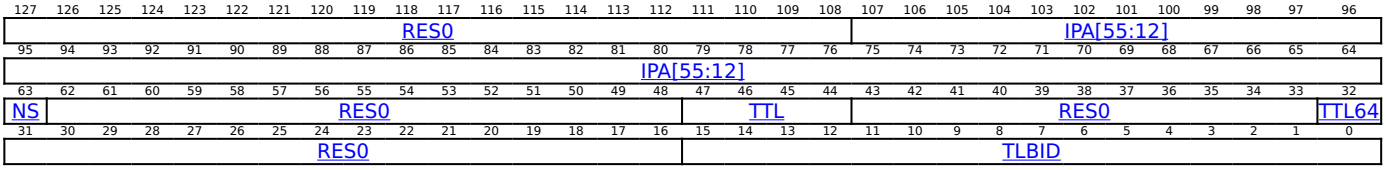
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS are UNDEFINED.

Attributes

TLBIP IPAS2E1IS, TLBIP IPAS2E1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[55:12], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2E1OS, TLBIP IPAS2E1OSNXS are UNDEFINED.

TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1

The TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS are UNDEFINED.

Attributes

TLBIP IPAS2LE1, TLBIP IPAS2LE1NXS is a 128-bit System instruction.

Field descriptions

TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

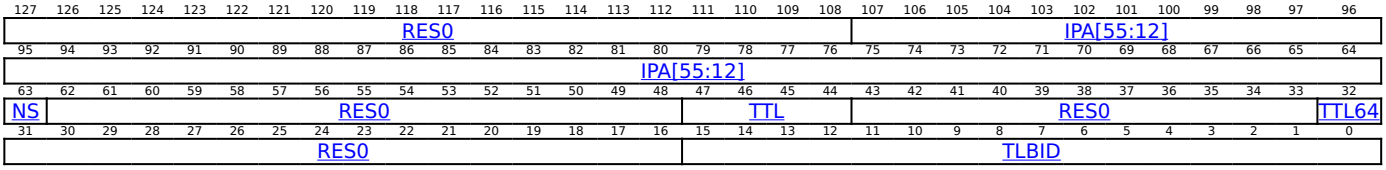
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBIP IPAS2LE1IS, TLBIP IPAS2LE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

IPA[55:12], bits [107:64]

Bits[55:12] of the intermediate physical address to match.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS, TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate the specified IPA using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate the specified IPA using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate the specified IPA using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBIP IPAS2LE1OS, TLBIP IPAS2LE1OSNXS is a 128-bit System instruction.

Field descriptions

TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1

The TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

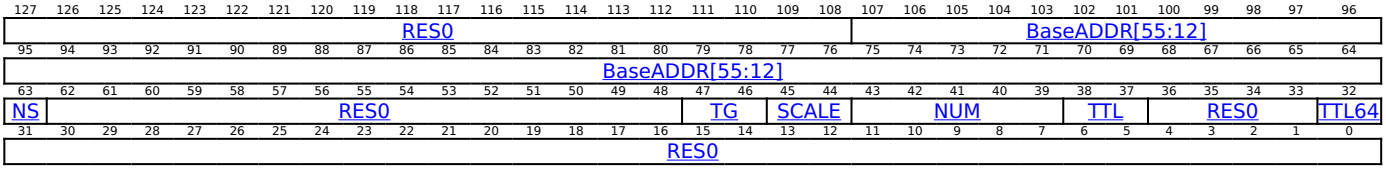
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS are UNDEFINED.

Attributes

TLBIP RIPAS2E1, TLBIP RIPAS2E1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.

TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable

The TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

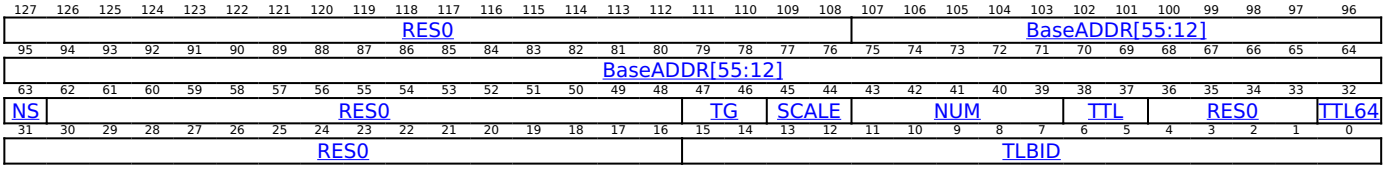
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS are UNDEFINED.

Attributes

TLBIP RIPAS2E1IS, TLBIP RIPAS2E1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable

The TLBIP RIPAS2E1OS, TLBIP RIPAS2E1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable

The TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

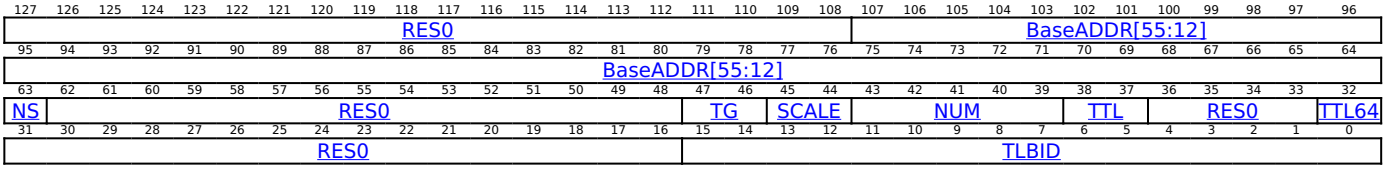
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1IS, TLBIP RIPAS2LE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS, TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable

The TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS characteristics are:

Purpose

If EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 2 only translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- If FEAT_RME is implemented, one of the following applies:
  - SCR_EL3.{NSE, NS} is {0, 0} and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {0, 1} and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
  - SCR_EL3.{NSE, NS} is {1, 1} and the entry would be required to translate any IPA in the specified address range using the Realm EL1&0 translation regime.
- If FEAT_RME is not implemented, one of the following applies:
  - SCR_EL3.NS is 0 and the entry would be required to translate any IPA in the specified address range using the Secure EL1&0 translation regime.
  - SCR_EL3.NS is 1 and the entry would be required to translate any IPA in the specified address range using the Non-secure EL1&0 translation regime.
- The entry would be used with the current VMID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

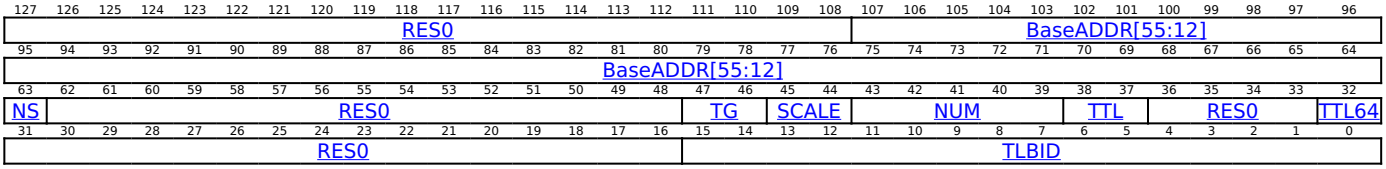
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS are UNDEFINED.

Attributes

TLBIP RIPAS2LE1OS, TLBIP RIPAS2LE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

NS, bit [63]
When FEAT_RME is implemented:

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 0}, NS selects the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {1, 1}, this field is RES0, and the instruction applies only to the Realm IPA space.

When the instruction is executed and SCR_EL3.{NSE, NS} == {0, 1}, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is implemented and FEAT_RME is not implemented:

Not Secure. Specifies the IPA space.

NS	Meaning
0b0	IPA is in the Secure IPA space.
0b1	IPA is in the Non-secure IPA space.

When the instruction is executed in Non-secure state, this field is RES0, and the instruction applies only to the Non-secure IPA space.

When FEAT_SEL2 is not implemented, or if EL2 is disabled in the current Security state, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP RVAAE1, TLBIP RVAAE1NXS, TLB Range Invalidate by VA, All ASID, EL1

The TLBIP RVAAE1, TLBIP RVAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

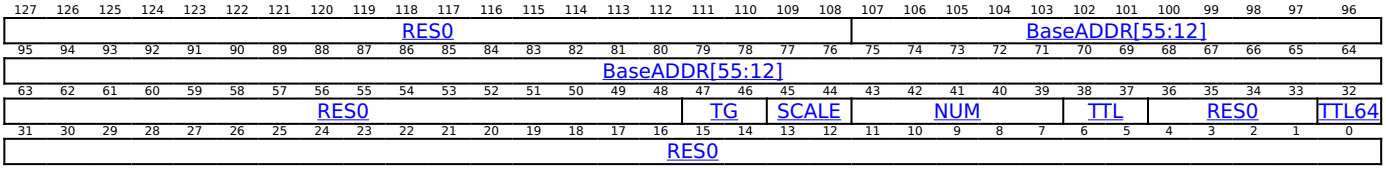
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAAE1, TLBIP RVAAE1NXS are UNDEFINED.

Attributes

TLBIP RVAAE1, TLBIP RVAAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS, TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable

The TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

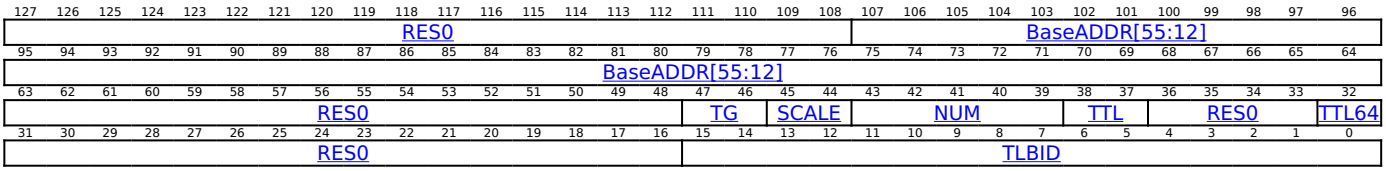
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAAE1IS, TLBIP RVAAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS, TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable

The TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

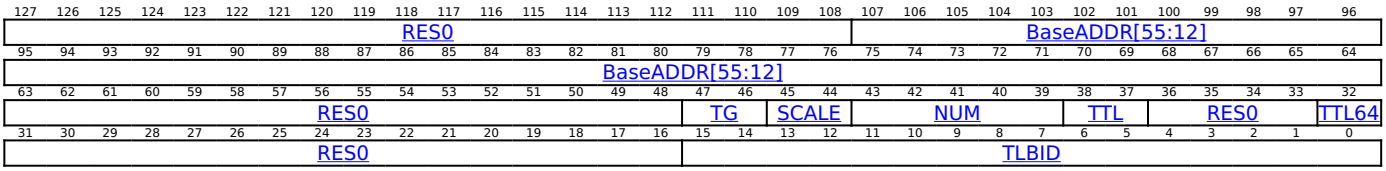
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP RVAAE1OS, TLBIP RVAAE1OSNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_RVAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RVAAE1OS{, <Xt>, <Xt2>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0101	0b011

TLBIP RVAALE1, TLBIP RVAALE1NXS, TLB Range Invalidate by VA, All ASID, Last level, EL1

The TLBIP RVAALE1, TLBIP RVAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

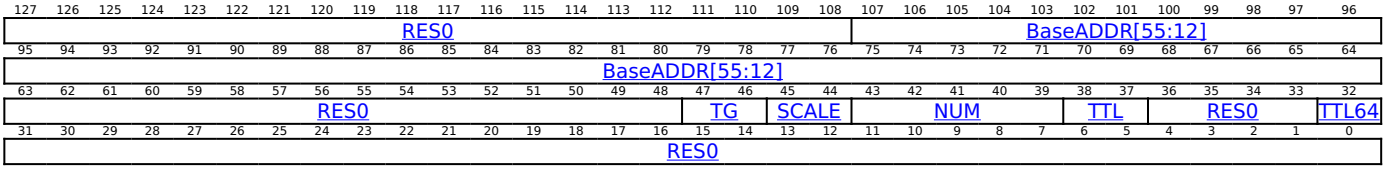
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAALE1, TLBIP RVAALE1NXS are UNDEFINED.

Attributes

TLBIP RVAALE1, TLBIP RVAALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Executing TLBIP RVAALE1, TLBIP RVAALE1NXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_RVAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RVAALE1{, <Xt>, <Xt2>}

TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

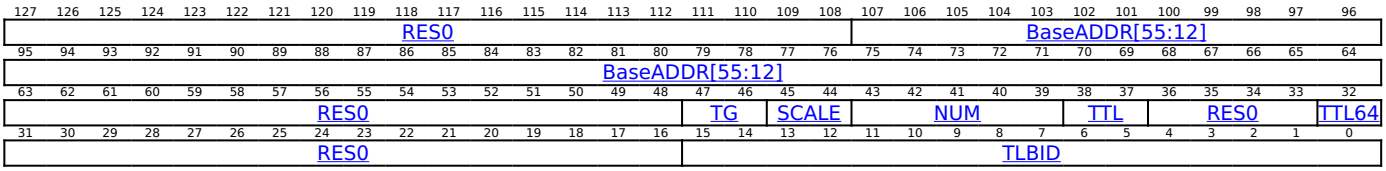
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAALE1IS, TLBIP RVAALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS, TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

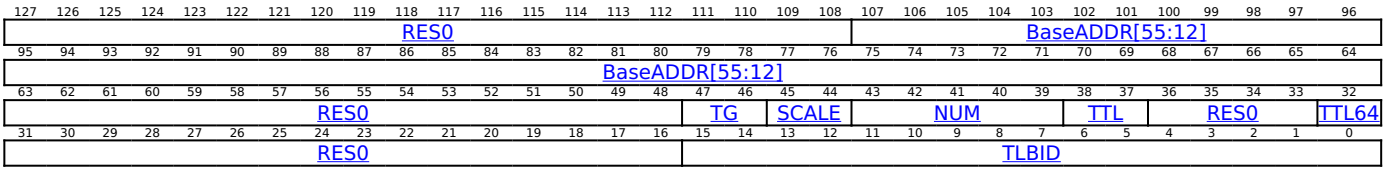
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP RVAALE1OS, TLBIP RVAALE1OSNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_RVAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RVAALE1OS{, <Xt>, <Xt2>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0101	0b111

TLBIP RVAE1, TLBIP RVAE1NXS, TLB Range Invalidate by VA, EL1

The TLBIP RVAE1, TLBIP RVAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

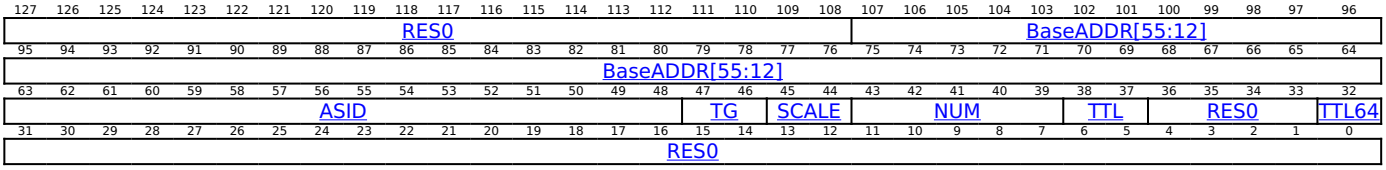
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE1, TLBIP RVAE1NXS are UNDEFINED.

Attributes

TLBIP RVAE1, TLBIP RVAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Executing TLBIP RVAE1, TLBIP RVAE1NXS

This system instruction is an alias of the SYSP instruction.

TLBIP RVAE1IS, TLBIP RVAE1ISNXS, TLB Range Invalidate by VA, EL1, Inner Shareable

The TLBIP RVAE1IS, TLBIP RVAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

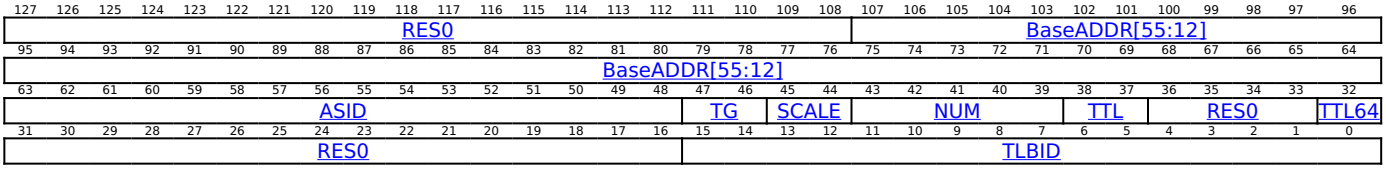
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE1IS, TLBIP RVAE1ISNXS are UNDEFINED.

Attributes

TLBIP RVAE1IS, TLBIP RVAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP RVAE1IS, TLBIP RVAE1ISNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RVAE1IS{, <Xt>, <Xt2>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b1000	0b0010	0b001

TLBIP RVAE1OS, TLBIP RVAE1OSNXS, TLB Range Invalidate by VA, EL1, Outer Shareable

The TLBIP RVAE1OS, TLBIP RVAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

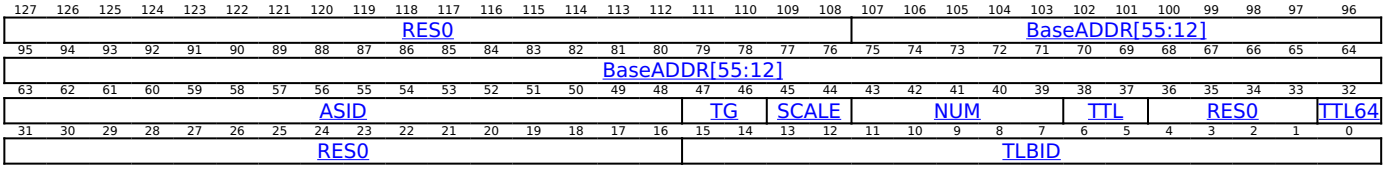
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE1OS, TLBIP RVAE1OSNXS are UNDEFINED.

Attributes

TLBIP RVAE1OS, TLBIP RVAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.

- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP RVAE2, TLBIP RVAE2NXS, TLB Range Invalidate by VA, EL2

The TLBIP RVAE2, TLBIP RVAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

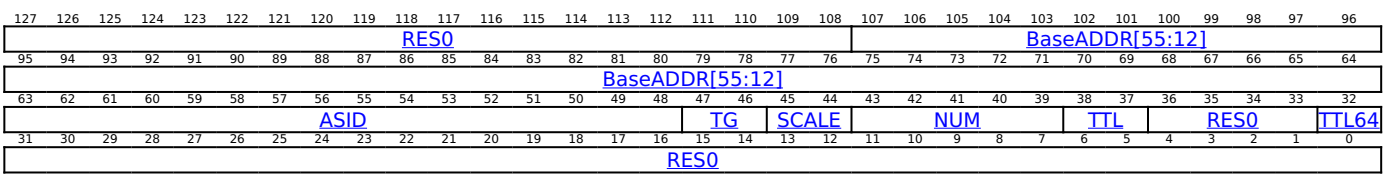
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE2, TLBIP RVAE2NXS are UNDEFINED.

Attributes

TLBIP RVAE2, TLBIP RVAE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP RVAE2IS, TLBIP RVAE2ISNXS, TLB Range Invalidate by VA, EL2, Inner Shareable

The TLBIP RVAE2IS, TLBIP RVAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

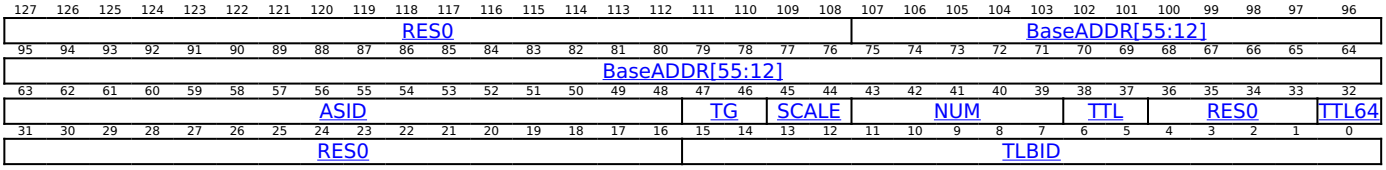
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE2IS, TLBIP RVAE2ISNXS are UNDEFINED.

Attributes

TLBIP RVAE2IS, TLBIP RVAE2ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP RVAE2IS, TLBIP RVAE2ISNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RVAE2IS{, <Xt>, <Xt2>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b1000	0b0010	0b001

TLBIP RVAE2OS, TLBIP RVAE2OSNXS, TLB Range Invalidate by VA, EL2, Outer Shareable

The TLBIP RVAE2OS, TLBIP RVAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

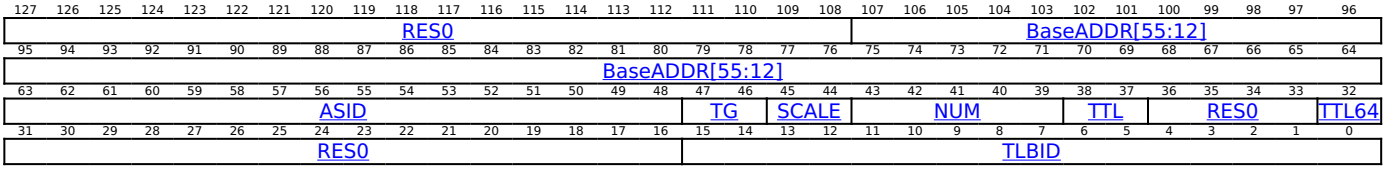
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE2OS, TLBIP RVAE2OSNXS are UNDEFINED.

Attributes

TLBIP RVAE2OS, TLBIP RVAE2OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP RVAE3, TLBIP RVAE3NXS, TLB Range Invalidate by VA, EL3

The TLBIP RVAE3, TLBIP RVAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE +1)}$ * Translation_Granule_Size)].

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

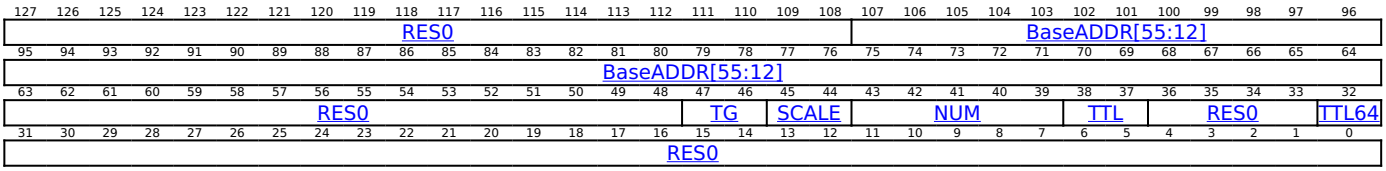
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE3, TLBIP RVAE3NXS are UNDEFINED.

Attributes

TLBIP RVAE3, TLBIP RVAE3NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

TLBIP RVAE3IS, TLBIP RVAE3ISNXS, TLB Range Invalidate by VA, EL3, Inner Shareable

The TLBIP RVAE3IS, TLBIP RVAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

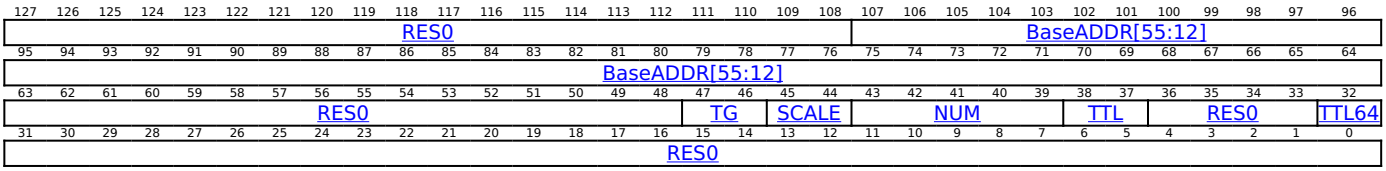
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE3IS, TLBIP RVAE3ISNXS are UNDEFINED.

Attributes

TLBIP RVAE3IS, TLBIP RVAE3ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

TLBIP RVAE3OS, TLBIP RVAE3OSNXS, TLB Range Invalidate by VA, EL3, Outer Shareable

The TLBIP RVAE3OS, TLBIP RVAE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

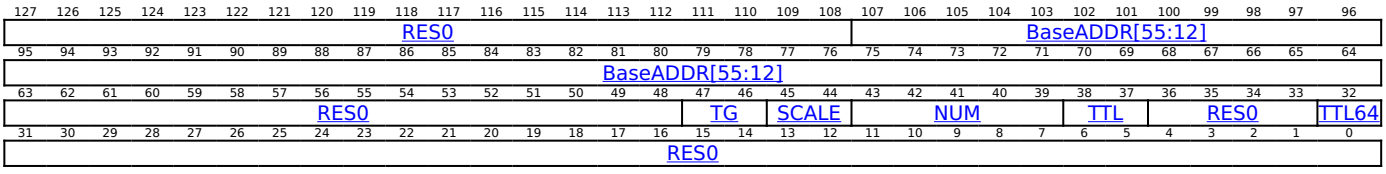
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVAE3OS, TLBIP RVAE3OSNXS are UNDEFINED.

Attributes

TLBIP RVAE3OS, TLBIP RVAE3OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

TLBIP RVALE1, TLBIP RVALE1NXS, TLB Range Invalidate by VA, Last level, EL1

The TLBIP RVALE1, TLBIP RVALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

For more information about the architectural requirements for this System instruction, see 'Invalidating TLB entries from stage 2 translations'.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

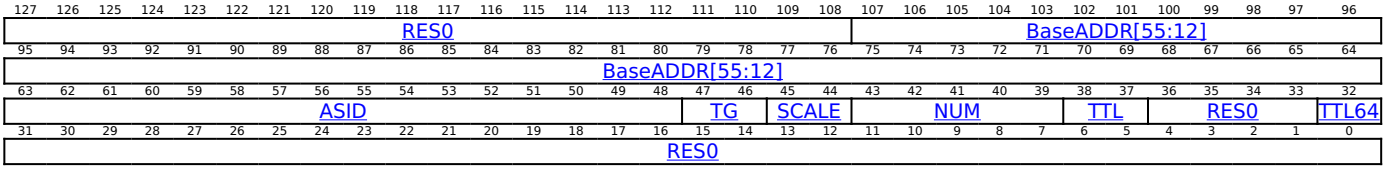
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE1, TLBIP RVALE1NXS are UNDEFINED.

Attributes

TLBIP RVALE1, TLBIP RVALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP RVALE1IS, TLBIP RVALE1ISNXS, TLB Range Invalidate by VA, Last level, EL1, Inner Shareable

The TLBIP RVALE1IS, TLBIP RVALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

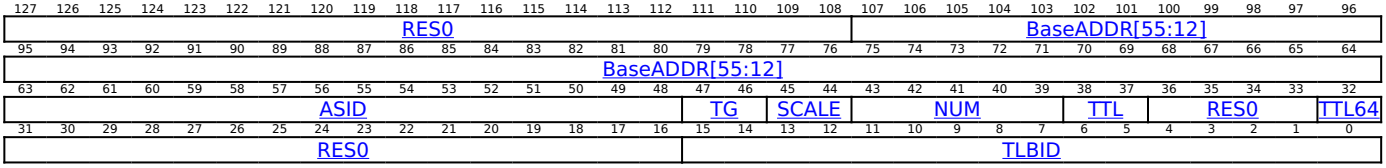
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE1IS, TLBIP RVALE1ISNXS are UNDEFINED.

Attributes

TLBIP RVALE1IS, TLBIP RVALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP RVALE1IS, TLBIP RVALE1ISNXS

TLBIP RVALE1OS, TLBIP RVALE1OSNXS, TLB Range Invalidate by VA, Last level, EL1, Outer Shareable

The TLBIP RVALE1OS, TLBIP RVALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate any of the VAs in the specified address range using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate any of the VAs in the specified address range using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

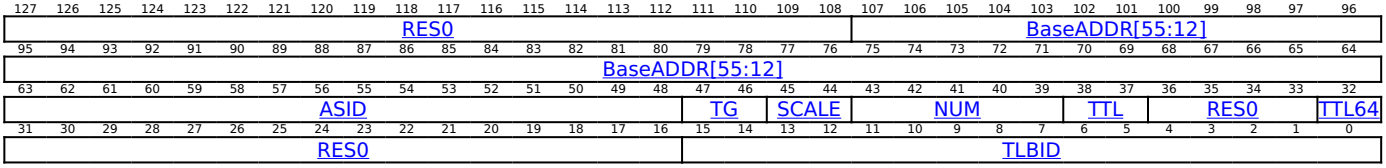
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE1OS, TLBIP RVALE1OSNXS are UNDEFINED.

Attributes

TLBIP RVALE1OS, TLBIP RVALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP RVALE1OS, TLBIP RVALE1OSNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RVALE2, TLBIP RVALE2NXS, TLB Range Invalidate by VA, Last level, EL2

The TLBIP RVALE2, TLBIP RVALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

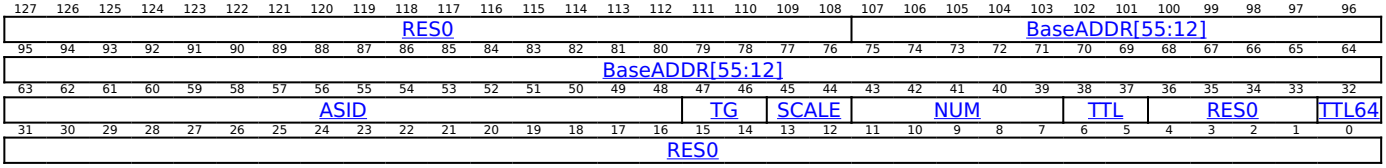
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE2, TLBIP RVALE2NXS are UNDEFINED.

Attributes

TLBIP RVALE2, TLBIP RVALE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

TLBIP RVALE2IS, TLBIP RVALE2ISNXS, TLB Range Invalidate by VA, Last level, EL2, Inner Shareable

The TLBIP RVALE2IS, TLBIP RVALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

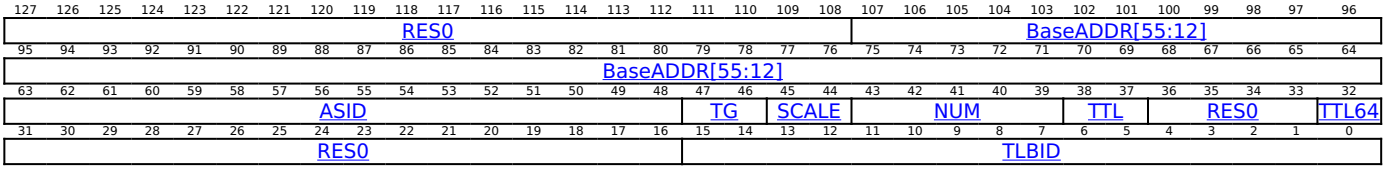
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE2IS, TLBIP RVALE2ISNXS are UNDEFINED.

Attributes

TLBIP RVALE2IS, TLBIP RVALE2ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP RVALE2IS, TLBIP RVALE2ISNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_RVA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP RVALE2IS{, <Xt>, <Xt2>}

TLBIP RVALE2OS, TLBIP RVALE2OSNXS, TLB Range Invalidate by VA, Last level, EL2, Outer Shareable

The TLBIP RVALE2OS, TLBIP RVALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any VA in the range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)] using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE2OS, TLBIP RVALE2OSNXS are UNDEFINED.

Attributes

TLBIP RVALE2OS, TLBIP RVALE2OSNXS is a 128-bit System instruction.

TLBIP RVALE3IS, TLBIP RVALE3ISNXS, TLB Range Invalidate by VA, Last level, EL3, Inner Shareable

The TLBIP RVALE3IS, TLBIP RVALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

Configuration

TLBIP RVALE3OS, TLBIP RVALE3OSNXS, TLB Range Invalidate by VA, Last level, EL3, Outer Shareable

The TLBIP RVALE3OS, TLBIP RVALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk up to the level indicated in the TTL hint, and one of the following applies:
    - TTL64 is 0 and TTL is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate any of the VAs in the specified address range using the EL3 translation regime.
- The entry is within the address range determined by the formula [BaseADDR <= VA < BaseADDR + ((NUM +1)*$2^{(5*SCALE+1)}$ * Translation_Granule_Size)].

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

For 128-bit translation table entry, the range of addresses invalidated is UNPREDICTABLE when Block or Page size corresponding to TTL and TG, for the translation system is not aligned.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

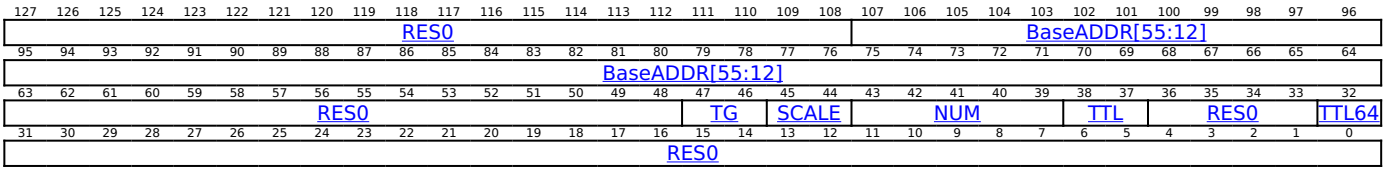
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP RVALE3OS, TLBIP RVALE3OSNXS are UNDEFINED.

Attributes

TLBIP RVALE3OS, TLBIP RVALE3OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

BaseADDR[55:12], bits [107:64]

The starting address for the range of the maintenance instructions. This field is BaseADDR[55:12] for all translation granules.

Bits [63:48]

Reserved, RES0.

TG, bits [47:46]

Translation granule size.

TG	Meaning
0b00	Reserved.
0b01	4K translation granule.
0b10	16K translation granule.
0b11	64K translation granule.

The instruction takes a translation granule size for the translations that are being invalidated. If the translations used a different translation granule size than the one being specified, then the architecture does not require that the instruction invalidates any entries.

SCALE, bits [45:44]

The exponent element of the calculation that is used to produce the upper range.

NUM, bits [43:39]

The base element of the calculation that is used to produce the upper range.

TTL, bits [38:37]

TTL Level hint. The TTL hint is only guaranteed to invalidate:

- Non-leaf-level entries in the range up to but not including the level described by the TTL hint.
- Leaf-level entries in the range that match the level described by the TTL hint.

TTL	Meaning
0b00	The entries in the range can be using any level for the translation table entries.
0b01	The TTL hint indicates level 1.
0b10	The TTL hint indicates level 2.
0b11	The TTL hint indicates level 3.

Bits [36:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Executing TLBIP RVALE3OS, TLBIP RVALE3OSNXS

This system instruction is an alias of the SYSP instruction.

TLBIP VAAE1, TLBIP VAAE1NXS, TLB Invalidate Pair by VA, All ASID, EL1

The TLBIP VAAE1, TLBIP VAAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

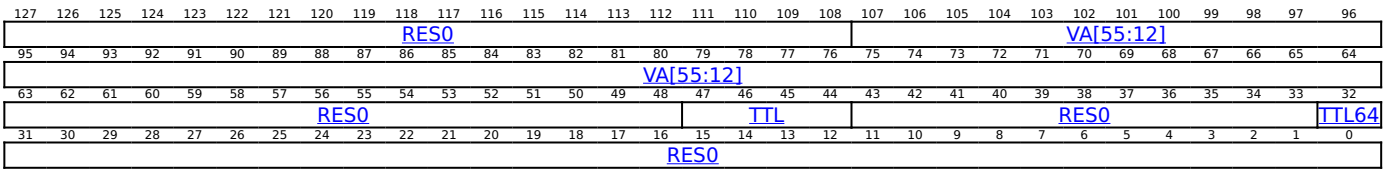
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAAE1, TLBIP VAAE1NXS are UNDEFINED.

Attributes

TLBIP VAAE1, TLBIP VAAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Executing TLBIP VAAE1, TLBIP VAAE1NXS

This system instruction is an alias of the SYSP instruction.

TLBIP VAAE1IS, TLBIP VAAE1ISNXS, TLB Invalidate Pair by VA, All ASID, EL1, Inner Shareable

The TLBIP VAAE1IS, TLBIP VAAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

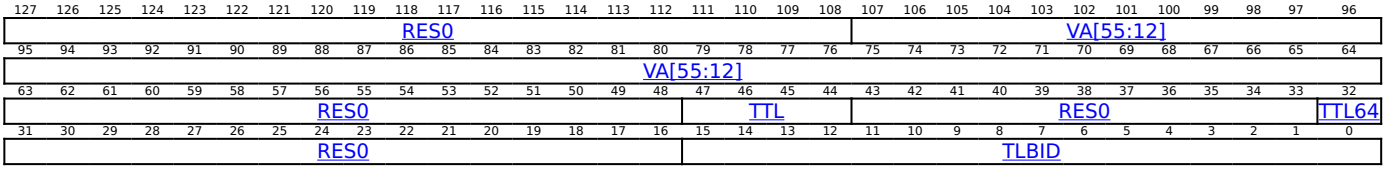
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAAE1IS, TLBIP VAAE1ISNXS are UNDEFINED.

Attributes

TLBIP VAAE1IS, TLBIP VAAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP VAAE1OS, TLBIP VAAE1OSNXS, TLB Invalidate Pair by VA, All ASID, EL1, Outer Shareable

The TLBIP VAAE1OS, TLBIP VAAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

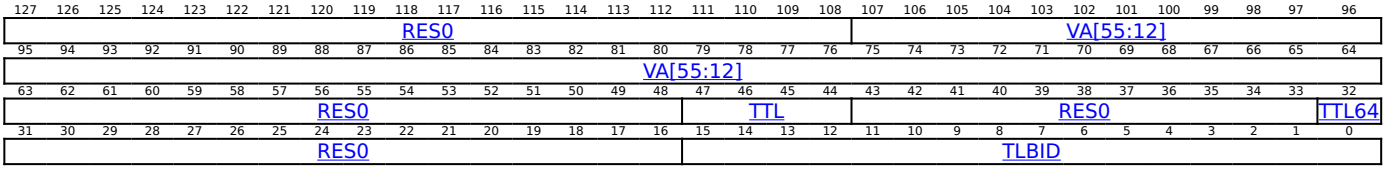
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAAE1OS, TLBIP VAAE1OSNXS are UNDEFINED.

Attributes

TLBIP VAAE1OS, TLBIP VAAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP VAAE1OS, TLBIP VAAE1OSNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_VAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VAALE1, TLBIP VAALE1NXS, TLB Invalidate Pair by VA, All ASID, Last level, EL1

The TLBIP VAALE1, TLBIP VAALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

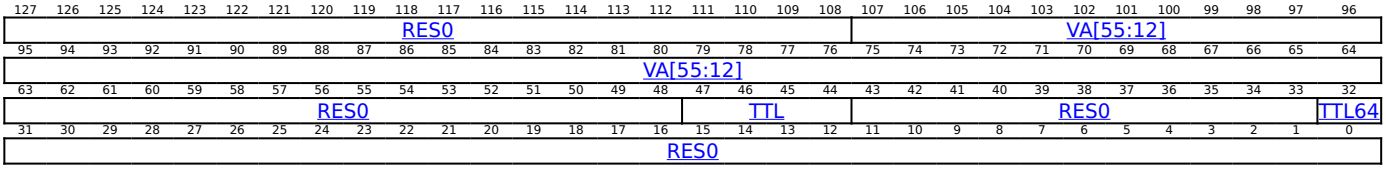
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAALE1, TLBIP VAALE1NXS are UNDEFINED.

Attributes

TLBIP VAALE1, TLBIP VAALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP VAALE1IS, TLBIP VAALE1ISNXS, TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Inner Shareable

The TLBIP VAALE1IS, TLBIP VAALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

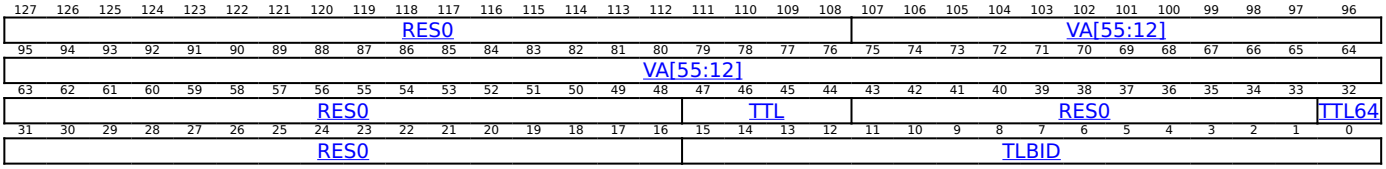
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAALE1IS, TLBIP VAALE1ISNXS are UNDEFINED.

Attributes

TLBIP VAALE1IS, TLBIP VAALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP VAALE1IS, TLBIP VAALE1ISNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_VAA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VAALE1OS, TLBIP VAALE1OSNXS, TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Outer Shareable

The TLBIP VAALE1OS, TLBIP VAALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

Note

For the EL1&0 and EL2&0 translation regimes, the invalidation applies to both global entries and non-global entries with any ASID.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

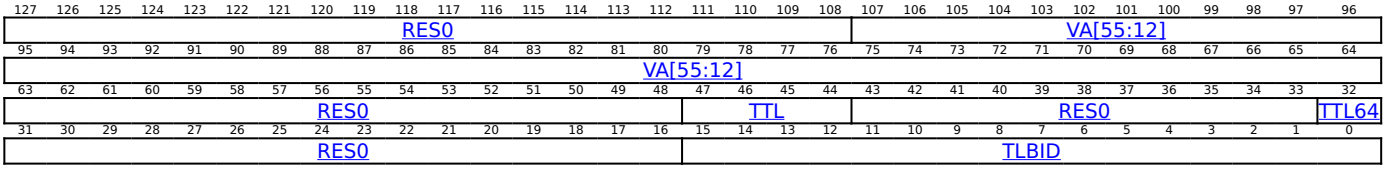
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAALE1OS, TLBIP VAALE1OSNXS are UNDEFINED.

Attributes

TLBIP VAALE1OS, TLBIP VAALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

If the TLB maintenance instructions are targeting a translation regime that is using AArch32, and so has a VA of only 32 bits, then the software must treat bits[55:32] as RES0.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP VAE1, TLBIP VAE1NXS, TLB Invalidate Pair by VA, EL1

The TLBIP VAE1, TLBIP VAE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

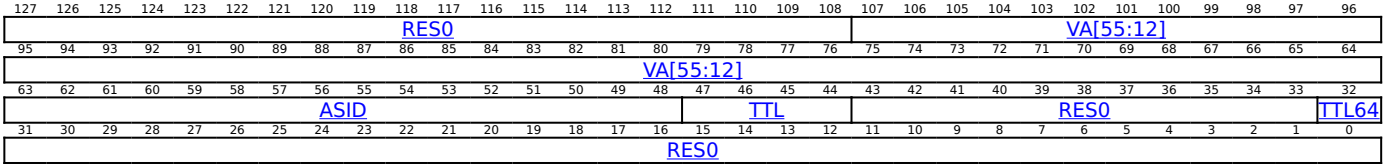
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE1, TLBIP VAE1NXS are UNDEFINED.

Attributes

TLBIP VAE1, TLBIP VAE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP VAE1IS, TLBIP VAE1ISNXS, TLB Invalidate Pair by VA, EL1, Inner Shareable

The TLBIP VAE1IS, TLBIP VAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

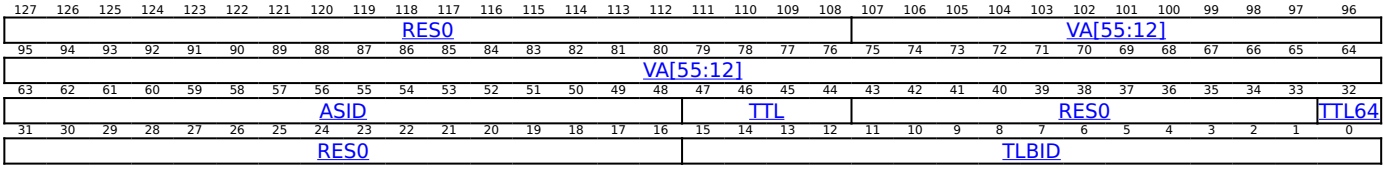
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE1IS, TLBIP VAE1ISNXS are UNDEFINED.

Attributes

TLBIP VAE1IS, TLBIP VAE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP VAE1OS, TLBIP VAE1OSNXS, TLB Invalidate Pair by VA, EL1, Outer Shareable

The TLBIP VAE1OS, TLBIP VAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

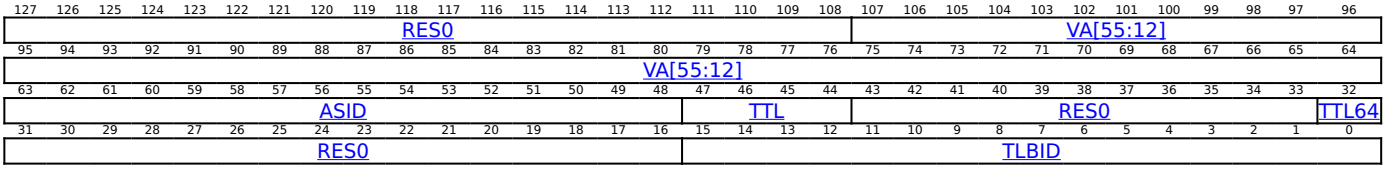
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE1OS, TLBIP VAE1OSNXS are UNDEFINED.

Attributes

TLBIP VAE1OS, TLBIP VAE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP VAE2, TLBIP VAE2NXS, TLB Invalidate Pair by VA, EL2

The TLBIP VAE2, TLBIP VAE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

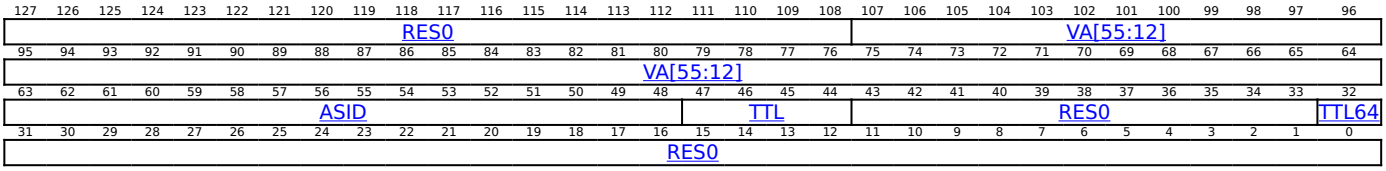
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE2, TLBIP VAE2NXS are UNDEFINED.

Attributes

TLBIP VAE2, TLBIP VAE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Executing TLBIP VAE2, TLBIP VAE2NXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VAE2IS, TLBIP VAE2ISNXS, TLB Invalidate Pair by VA, EL2, Inner Shareable

The TLBIP VAE2IS, TLBIP VAE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

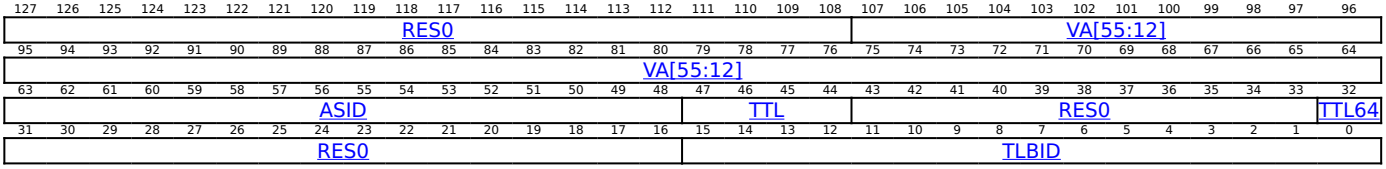
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE2IS, TLBIP VAE2ISNXS are UNDEFINED.

Attributes

TLBIP VAE2IS, TLBIP VAE2ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TLBIP VAE2OS, TLBIP VAE2OSNXS, TLB Invalidate Pair by VA, EL2, Outer Shareable

The TLBIP VAE2OS, TLBIP VAE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be required to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from any level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is from a level of the translation table walk above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

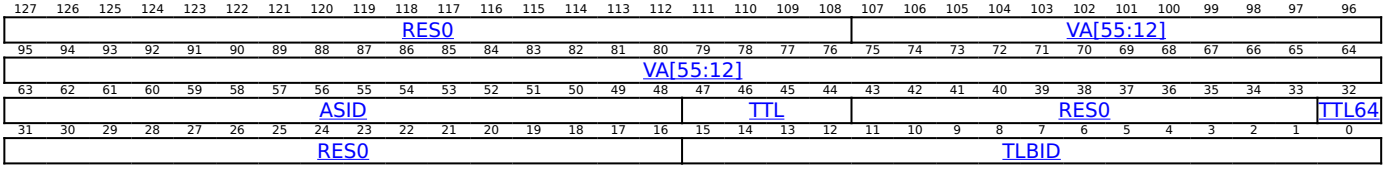
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE2OS, TLBIP VAE2OSNXS are UNDEFINED.

Attributes

TLBIP VAE2OS, TLBIP VAE2OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

end;
```

TLBIP VAE3, TLBIP VAE3NXS, TLB Invalidate Pair by VA, EL3

The TLBIP VAE3, TLBIP VAE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

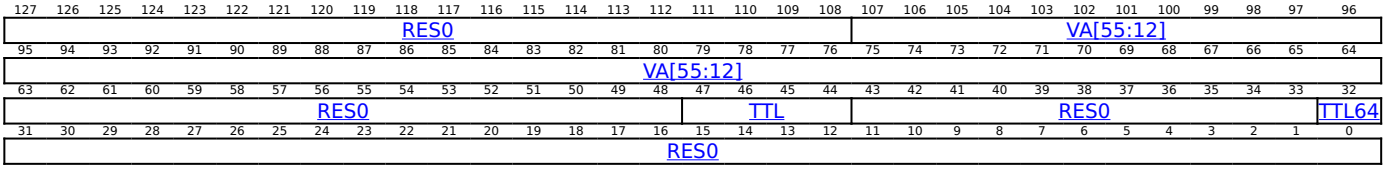
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VAE3, TLBIP VAE3NXS are UNDEFINED.

Attributes

TLBIP VAE3, TLBIP VAE3NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

TLBIP VAE3IS, TLBIP VAE3ISNXS, TLB Invalidate Pair by VA, EL3, Inner Shareable

The TLBIP VAE3IS, TLBIP VAE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from any level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

TLBIP VALE1, TLBIP VALE1NXS, TLB Invalidate Pair by VA, Last level, EL1

The TLBIP VALE1, TLBIP VALE1NXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

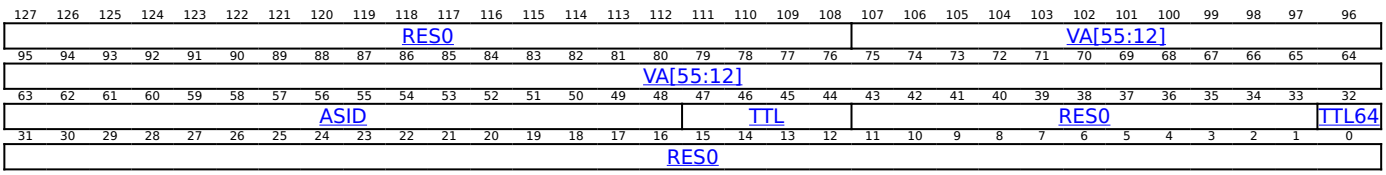
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE1, TLBIP VALE1NXS are UNDEFINED.

Attributes

TLBIP VALE1, TLBIP VALE1NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Executing TLBIP VALE1, TLBIP VALE1NXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VALE1IS, TLBIP VALE1ISNXS, TLB Invalidate Pair by VA, Last level, EL1, Inner Shareable

The TLBIP VALE1IS, TLBIP VALE1ISNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

From Armv8.4, when a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

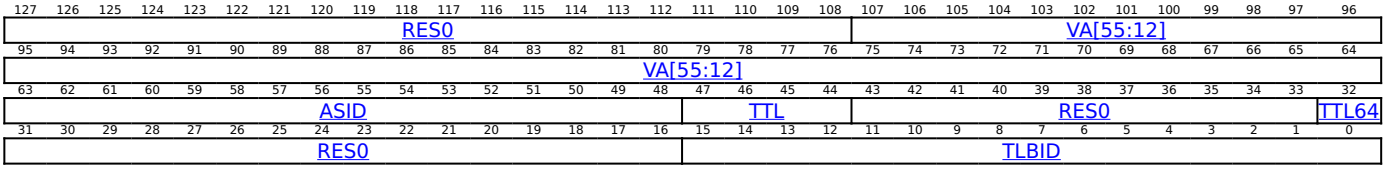
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE1IS, TLBIP VALE1ISNXS are UNDEFINED.

Attributes

TLBIP VALE1IS, TLBIP VALE1ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP VALE1OS, TLBIP VALE1OSNXS, TLB Invalidate Pair by VA, Last level, EL1, Outer Shareable

The TLBIP VALE1OS, TLBIP VALE1OSNXS characteristics are:

Purpose

Invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- When EL2 is implemented and enabled in the current Security state:
  - If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the entry would be used with the current VMID and would be required to translate the specified VA using the EL1&0 translation regime for the Security state.
  - If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the entry would be required to translate the specified VA using the EL2&0 translation regime for the Security state.
- When EL2 is not implemented or is disabled in the current Security state, the entry would be required to translate the specified VA using the EL1&0 translation regime for the Security state.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

Note

When a TLB maintenance instruction is generated to the Secure EL1&0 translation regime and is defined to pass a VMID argument, or would be defined to pass a VMID argument if SCR_EL3.EEL2==1, then:

- A PE with SCR_EL3.EEL2==1 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==0.
- A PE with SCR_EL3.EEL2==0 is not architecturally required to invalidate any entries in the Secure EL1&0 translation of a PE in the same required shareability domain with SCR_EL3.EEL2==1.
- A PE is architecturally required to invalidate all relevant entries in the Secure EL1&0 translation of a System MMU in the same required shareability domain with a VMID of 0.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

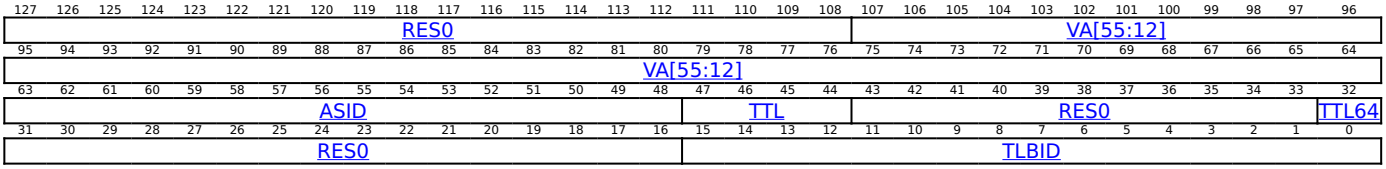
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE1OS, TLBIP VALE1OSNXS are UNDEFINED.

Attributes

TLBIP VALE1OS, TLBIP VALE1OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

TLBIP VALE2, TLBIP VALE2NXS, TLB Invalidate Pair by VA, Last level, EL2

The TLBIP VALE2, TLBIP VALE2NXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

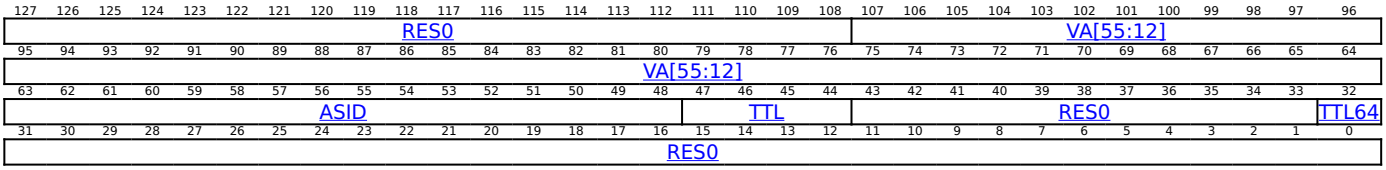
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE2, TLBIP VALE2NXS are UNDEFINED.

Attributes

TLBIP VALE2, TLBIP VALE2NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

TLBIP VALE2IS, TLBIP VALE2ISNXS, TLB Invalidate Pair by VA, Last level, EL2, Inner Shareable

The TLBIP VALE2IS, TLBIP VALE2ISNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

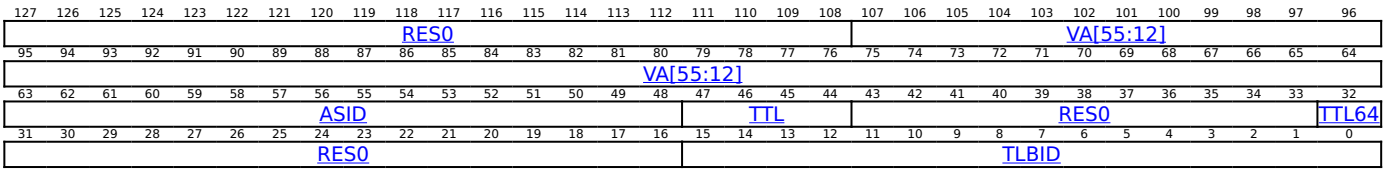
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE2IS, TLBIP VALE2ISNXS are UNDEFINED.

Attributes

TLBIP VALE2IS, TLBIP VALE2ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

TLBIP VALE2OS, TLBIP VALE2OSNXS, TLB Invalidate Pair by VA, Last level, EL2, Outer Shareable

The TLBIP VALE2OS, TLBIP VALE2OSNXS characteristics are:

Purpose

When EL2 is implemented and enabled in the current Security state, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL2 or EL2&0 translation regime, as determined by the Effective value of HCR_EL2.E2H, for the Security state.
- If the Effective value of HCR_EL2.E2H is not 1, the entry is from the final level of the translation table walk.
- If the Effective value of HCR_EL2.E2H is 1, one of the following applies:
  - The entry is a global entry from the final level of the translation table walk.
  - The entry is a non-global entry from the final level of the translation table walk that matches the specified ASID.

The Security state is indicated by the value of SCR_EL3.NS if FEAT_RME is not implemented, or SCR_EL3.{NSE, NS} if FEAT_RME is implemented.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_TLBID is implemented, the set of PEs is reduced to be PEs that are also within the TLBI Domain specified in the TLBID field and system register configuration.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

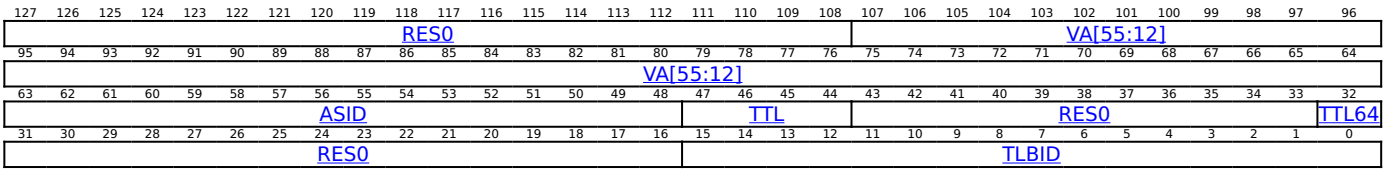
Configuration

This instruction is present only when (FEAT_D128 is implemented or FEAT_TLBID is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE2OS, TLBIP VALE2OSNXS are UNDEFINED.

Attributes

TLBIP VALE2OS, TLBIP VALE2OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

ASID, bits [63:48]
When ELIsInHost(EL2):

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

If the implementation supports 16 bits of ASID, then the upper 8 bits of the ASID must be written to 0 by software when the context being invalidated only uses 8 bits.

Otherwise:

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

Bits [43:33]

Reserved, RES0.

TTL64, bit [32]
When FEAT_TLBID is implemented:

Specifies that the TTL hint applies to VMSAv8-64 TLB entries.

TTL64	Meaning
0b0	The TTL field applies to cached copies of VMSAv9-128 translation table entries.
0b1	The TTL field applies to cached copies of VMSAv8-64 translation table entries.

Otherwise:

Reserved, RES0.

Bits [31:16]

Reserved, RES0.

TLBID, bits [15:0]
When FEAT_TLBID is implemented:

TLBI Domain.

Otherwise:

Reserved, RES0.

Executing TLBIP VALE2OS, TLBIP VALE2OSNXS

This system instruction is an alias of the SYSP instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_TLBIP_VA() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIP VALE3, TLBIP VALE3NXS, TLB Invalidate Pair by VA, Last level, EL3

The TLBIP VALE3, TLBIP VALE3NXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

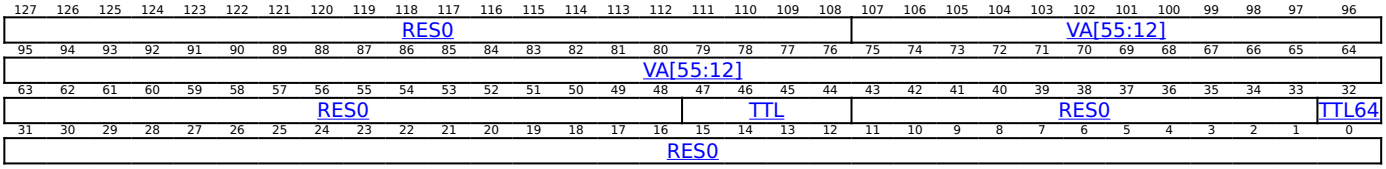
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE3, TLBIP VALE3NXS are UNDEFINED.

Attributes

TLBIP VALE3, TLBIP VALE3NXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

TLBIP VALE3IS, TLBIP VALE3ISNXS, TLB Invalidate Pair by VA, Last level, EL3, Inner Shareable

The TLBIP VALE3IS, TLBIP VALE3ISNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

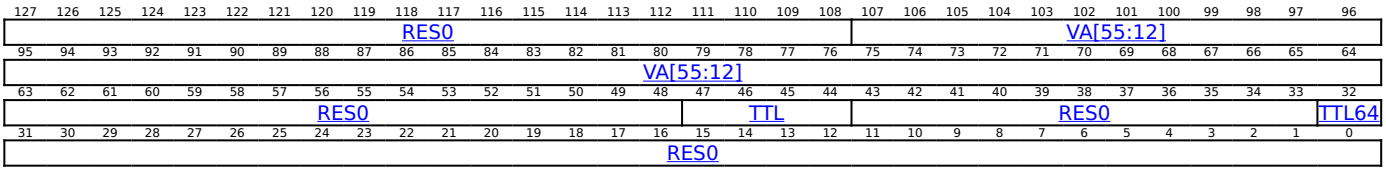
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE3IS, TLBIP VALE3ISNXS are UNDEFINED.

Attributes

TLBIP VALE3IS, TLBIP VALE3ISNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.

TLBIP VALE3OS, TLBIP VALE3OSNXS, TLB Invalidate Pair by VA, Last level, EL3, Outer Shareable

The TLBIP VALE3OS, TLBIP VALE3OSNXS characteristics are:

Purpose

If EL3 is implemented, invalidates cached copies of translation table entries from TLBs that meet all the following requirements:

- The entry is one of the following:
  - A 128-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0.
    - TTL64 is 1 and TTL[3:2] is 0b00 or treated as 0b00.
  - A 64-bit stage 1 translation table entry, from the final level of the translation table walk, and one of the following applies:
    - TTL64 is 0 and TTL[3:2] is 0b00 or treated as 0b00.
    - TTL64 is 1.
- The entry would be used to translate the specified VA using the EL3 translation regime.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

If FEAT_XS is implemented, the nXS variant of this System instruction is defined.

It is IMPLEMENTATION SPECIFIC whether the TLBI System instruction with the nXS qualifier invalidates TLB entries with the XS attribute set to 1.

The TLBI System instruction without the nXS qualifier waits for all memory accesses using in-scope old translation information to complete before it is considered complete.

The TLBI System instruction with the nXS qualifier is considered complete when the subset of these memory accesses with XS attribute set to 0 are complete.

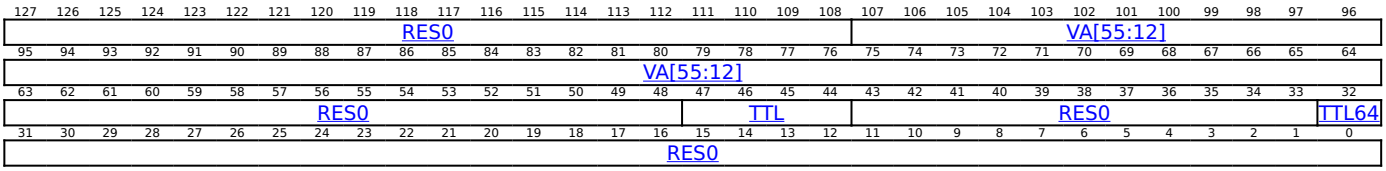
Configuration

This instruction is present only when FEAT_D128 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TLBIP VALE3OS, TLBIP VALE3OSNXS are UNDEFINED.

Attributes

TLBIP VALE3OS, TLBIP VALE3OSNXS is a 128-bit System instruction.

Field descriptions



Bits [127:108]

Reserved, RES0.

VA[55:12], bits [107:64]

Bits[55:12] of the virtual address to match. Any appropriate TLB entries that match the ASID value (if appropriate) and VA will be affected by this System instruction.

The treatment of the low-order bits of this field depends on the translation granule size, as follows:

- Where a 4KB translation granule is being used, all bits are valid and used for the invalidation.
- Where a 16KB translation granule is being used, bits [1:0] of this field are RES0 and ignored when the instruction is executed, because VA[13:12] have no effect on the operation of the instruction.
- Where a 64KB translation granule is being used, bits [3:0] of this field are RES0 and ignored when the instruction is executed, because VA[15:12] have no effect on the operation of the instruction.

Bits [63:48]

Reserved, RES0.

TTL, bits [47:44]
When FEAT_TTL is implemented:

Translation Table Level. Indicates the level of the translation table walk that holds the leaf entry for the address being invalidated.

TTL	Meaning
0b00xx	No information supplied as to the translation table level. Hardware must assume that the entry can be from any level. In this case, TTL<1:0> is RES0.
0b01xx	The entry comes from a 4KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Level 0. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b10xx	The entry comes from a 16KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.
0b11xx	The entry comes from a 64KB translation granule. The level of walk for the leaf level 0bxx is encoded as: 0b00 : Reserved. Treat as if TTL<3:2> is 0b00. 0b01 : Level 1. 0b10 : Level 2. 0b11 : Level 3.

If an incorrect value of the TTL field is specified for the entry being invalidated by the instruction, then no entries are required by the architecture to be invalidated from the TLB.

Otherwise:

Reserved, RES0.

TPIDR2_EL0, EL0 Read/Write Software Thread ID Register 2

The TPIDR2_EL0 characteristics are:

Purpose

Provides a location where SME-aware software executing at EL0 can store thread identifying information, for context management purposes.

The PE makes no use of this register.

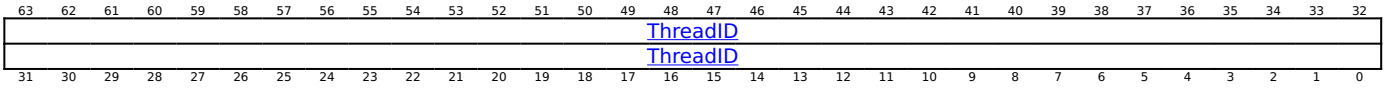
Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPIDR2_EL0 are UNDEFINED.

Attributes

TPIDR2_EL0 is a 64-bit register.

Field descriptions



ThreadID, bits [63:0]

Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDR2_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TPIDR2_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0000	0b101

TPIDR3_EL2, EL2 Software Thread ID Register 3

The TPIDR3_EL2 characteristics are:

Purpose

Provides a location where software executing at EL2 can store thread identifying information.

The PE makes no use of this register.

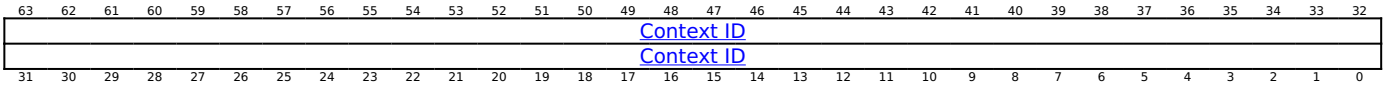
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPIDR3_EL2 are UNDEFINED.

Attributes

TPIDR3_EL2 is a 64-bit register.

Field descriptions



Bits [63:0]

Reserved for software use.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDR3_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TPIDR3_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1101	0b0000	0b000

TPMAX0_EL0, Thread-Private State Upper Limit 0 (EL0)

The TPMAX0_EL0 characteristics are:

Purpose

Configures upper thread-private limit 0 for execution at EL0.

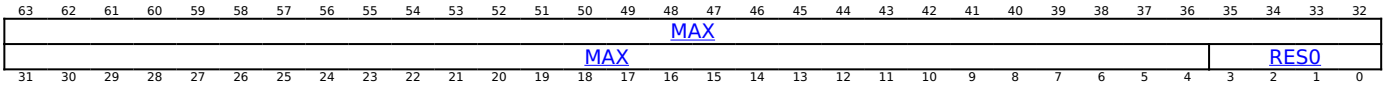
Configuration

This register is present only when FEAT_TPS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMAX0_EL0 are UNDEFINED.

Attributes

TPMAX0_EL0 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MAX, bits [63:4]

This field configures bits [63:4] of the highest accessible address of the thread-private region defined by TPMIN0_EL0 and TPMAX0_EL0.

VA bits [3:0] are 0b1111.

The most-significant bits are RESS, according to the relevant TCR_ELx.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_ELx.TBI and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_ELx.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing TPMAX0_EL0

Accesses to this register use the following encodings in the System register encoding space:

TPMAX0_EL1, Thread-Private State Upper Limit 0 (EL1)

The TPMAX0_EL1 characteristics are:

Purpose

Configures upper thread-private limit 0 for execution at EL1.

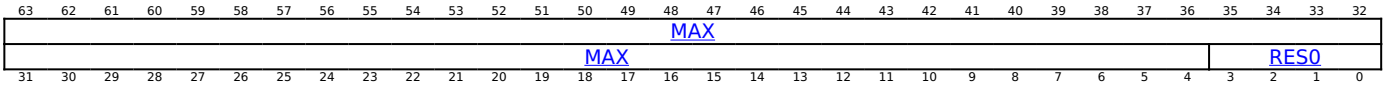
Configuration

This register is present only when FEAT_TPSP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMAX0_EL1 are UNDEFINED.

Attributes

TPMAX0_EL1 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MAX, bits [63:4]

This field configures bits [63:4] of the highest accessible address of the thread-private region defined by TPMIN0_EL1 and TPMAX0_EL1.

VA bits [3:0] are 0b1111.

The most-significant bits are RESS, according to the relevant TCR_EL1.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_EL1.TBI and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_EL1.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

TPMAX1_EL0, Thread-Private State Upper Limit 1 (EL0)

The TPMAX1_EL0 characteristics are:

Purpose

Configures upper thread-private limit 1 for execution at EL0.

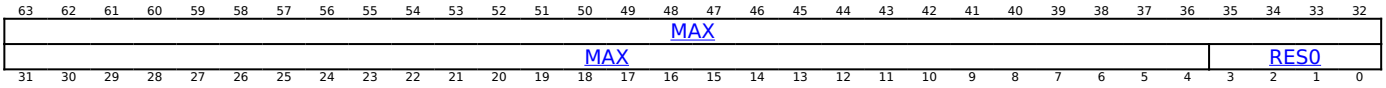
Configuration

This register is present only when FEAT_TPS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMAX1_EL0 are UNDEFINED.

Attributes

TPMAX1_EL0 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MAX, bits [63:4]

This field configures bits [63:4] of the highest accessible address of the thread-private region defined by TPMIN1_EL0 and TPMAX1_EL0.

VA bits [3:0] are 0b1111.

The most-significant bits are RESS, according to the relevant TCR_ELx.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_ELx.TBI and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_ELx.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing TPMAX1_EL0

TPMIN0_EL0, Thread-Private State Lower Limit 0 (EL0)

The TPMIN0_EL0 characteristics are:

Purpose

Configures lower thread-private limit 0 for execution at EL0.

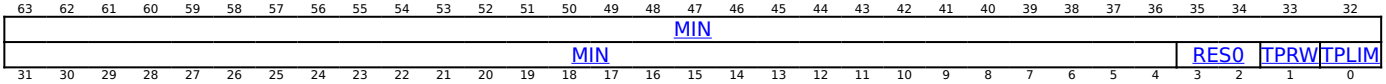
Configuration

This register is present only when FEAT_TPS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMIN0_EL0 are UNDEFINED.

Attributes

TPMIN0_EL0 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MIN, bits [63:4]

This field configures bits [63:4] of the lowest accessible address of the thread-private region defined by TPMIN0_EL0 and TPMAX0_EL0.

VA bits [3:0] are zero.

The most-significant bits are RESS, according to the relevant TCR_EL1.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_EL1.TBI, or if HCR_EL2.{E2H, TGE} is {1, 1}, TCR_EL2.TBI, and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_EL1.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

TPRW, bit [1]

This field configures whether TPLIM applies to read accesses.

TPRW	Meaning
0b0	Checks against TPMIN<n>_EL0 and TPMAX<n>_EL0 apply to write accesses only.
0b1	Checks against TPMIN<n>_EL0 and TPMAX<n>_EL0 apply to read and write accesses.

This bit exists only in the TPMIN0_ELx registers, and is RES0 in TPMIN1_ELx registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPLIM, bit [0]

Enable checking of accesses to thread-private memory.

This control applies to unprivileged data accesses and cache maintenance operations, of the type configured in TPMIN0_EL0.TPRW, made to thread-private pages.

TPLIM	Meaning
0b0	No accesses of the specified type are permitted by TPMIN0_EL0 and TPMAX0_EL0.
0b1	An access of the specified type does not generate a TPLIM Permission fault if the VA is in the range programmed in TPMIN0_EL0 and TPMAX0_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPMIN0_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TPMIN0_EL0

TPMIN0_EL1, Thread-Private State Lower Limit 0 (EL1)

The TPMIN0_EL1 characteristics are:

Purpose

Configures lower thread-private limit 0 for execution at EL1.

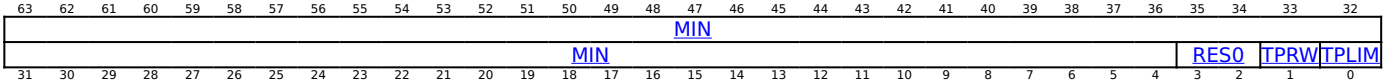
Configuration

This register is present only when FEAT_TPSP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMIN0_EL1 are UNDEFINED.

Attributes

TPMIN0_EL1 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MIN, bits [63:4]

This field configures bits [63:4] of the lowest accessible address of the thread-private region defined by TPMIN0_EL1 and TPMAX0_EL1. VA bits [3:0] are zero.

The most-significant bits are RESS, according to the relevant TCR_EL1.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_EL1.TBI and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_EL1.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

TPRW, bit [1]

This field configures whether TPLIM applies to read accesses.

TPRW	Meaning
0b0	Checks against TPMIN<n>_EL1 and TPMAX<n>_EL1 apply to write accesses only.
0b1	Checks against TPMIN<n>_EL1 and TPMAX<n>_EL1 apply to read and write accesses.

This bit exists only in the TPMIN0_ELx registers, and is RES0 in TPMIN1_ELx registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPLIM, bit [0]

Enable checking of accesses to thread-private memory.

This control applies to data accesses, other than unprivileged accesses, and cache maintenance operations, of the type configured in TPMIN0_EL1.TPRW, made to thread-private pages.

TPLIM	Meaning
0b0	No accesses of the specified type are permitted by TPMIN0_EL1 and TPMAX0_EL1.
0b1	An access of the specified type does not generate a TPLIM Permission fault if the VA is in the range programmed in TPMIN0_EL1 and TPMAX0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPMIN0_EL2, Thread-Private State Lower Limit 0 (EL2)

The TPMIN0_EL2 characteristics are:

Purpose

Configures lower thread-private limit 0 for execution at EL2.

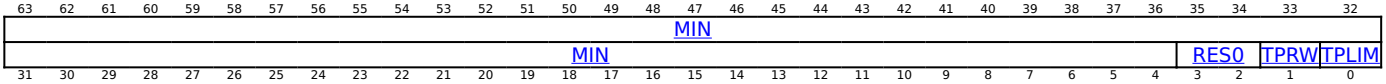
Configuration

This register is present only when FEAT_TPSP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMIN0_EL2 are UNDEFINED.

Attributes

TPMIN0_EL2 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MIN, bits [63:4]

This field configures bits [63:4] of the lowest accessible address of the thread-private region defined by TPMIN0_EL2 and TPMAX0_EL2. VA bits [3:0] are zero.

The most-significant bits are RESS, according to the relevant TCR_EL2.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_EL2.TBI and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_EL2.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

TPRW, bit [1]

This field configures whether TPLIM applies to read accesses.

TPRW	Meaning
0b0	Checks against TPMIN<n>_EL2 and TPMAX<n>_EL2 apply to write accesses only.
0b1	Checks against TPMIN<n>_EL2 and TPMAX<n>_EL2 apply to read and write accesses.

This bit exists only in the TPMIN0_ELx registers, and is RES0 in TPMIN1_ELx registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPLIM, bit [0]

Enable checking of accesses to thread-private memory.

This control applies to data accesses, other than unprivileged accesses, and cache maintenance operations, of the type configured in TPMIN0_EL2.TPRW, made to thread-private pages.

TPLIM	Meaning
0b0	No accesses of the specified type are permitted by TPMIN0_EL2 and TPMAX0_EL2.
0b1	An access of the specified type does not generate a TPLIM Permission fault if the VA is in the range programmed in TPMIN0_EL2 and TPMAX0_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPMIN0_EL2

Accesses to this register use the following encodings in the System register encoding space:

TPMIN1_EL0, Thread-Private State Lower Limit 1 (EL0)

The TPMIN1_EL0 characteristics are:

Purpose

Configures lower thread-private limit 1 for execution at EL0.

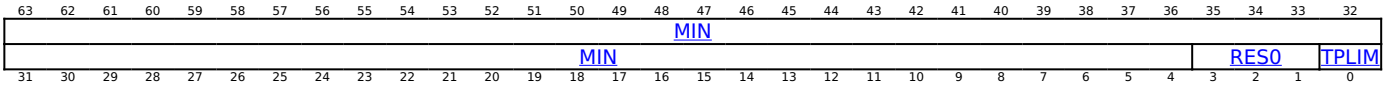
Configuration

This register is present only when FEAT_TPS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMIN1_EL0 are UNDEFINED.

Attributes

TPMIN1_EL0 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MIN, bits [63:4]

This field configures bits [63:4] of the lowest accessible address of the thread-private region defined by TPMIN1_EL0 and TPMAX1_EL0. VA bits [3:0] are zero.

The most-significant bits are RESS, according to the relevant TCR_EL1.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_EL1.TBI, or if HCR_EL2.{E2H, TGE} is {1, 1}, TCR_EL2.TBI, and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_EL1.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

TPLIM, bit [0]

Enable checking of accesses to thread-private memory.

This control applies to unprivileged data accesses and cache maintenance operations, of the type configured in TPMIN0_EL0.TPRW, made to thread-private pages.

TPLIM	Meaning
0b0	No accesses of the specified type are permitted by TPMIN1_EL0 and TPMAX1_EL0.
0b1	An access of the specified type does not generate a TPLIM Permission fault if the VA is in the range programmed in TPMIN1_EL0 and TPMAX1_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPMIN1_EL0

TPMIN1_EL2, Thread-Private State Lower Limit 1 (EL2)

The TPMIN1_EL2 characteristics are:

Purpose

Configures lower thread-private limit 1 for execution at EL2.

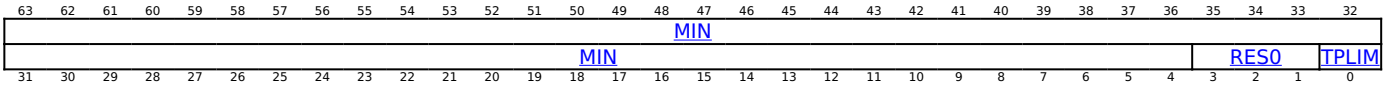
Configuration

This register is present only when FEAT_TPSP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TPMIN1_EL2 are UNDEFINED.

Attributes

TPMIN1_EL2 is a 64-bit register.

Field descriptions



The values in this register are not permitted to be cached in a TLB.

MIN, bits [63:4]

This field configures bits [63:4] of the lowest accessible address of the thread-private region defined by TPMIN1_EL2 and TPMAX1_EL2. VA bits [3:0] are zero.

The most-significant bits are RESS, according to the relevant TCR_EL2.TnSZ configuration, in the same manner as the most-significant bits in the VNCR_EL2 register.

The effects of TCR_EL2.TBI and any other bit that affects the interpretation of the most-significant bits of a VA is IGNORED and this field should be programmed to a sign-extended VA according to the value of TCR_EL2.TnSZ.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

TPLIM, bit [0]

Enable checking of accesses to thread-private memory.

This control applies to data accesses, other than unprivileged accesses, and cache maintenance operations, of the type configured in TPMIN0_EL2.TPRW, made to thread-private pages.

TPLIM	Meaning
0b0	No accesses of the specified type are permitted by TPMIN1_EL2 and TPMAX1_EL2.
0b1	An access of the specified type does not generate a TPLIM Permission fault if the VA is in the range programmed in TPMIN1_EL2 and TPMAX1_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPMIN1_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TPMIN1_EL2

TRBBASER_EL1, Trace Buffer Base Address Register

The TRBBASER_EL1 characteristics are:

Purpose

Defines the base address for the trace buffer.

Configuration

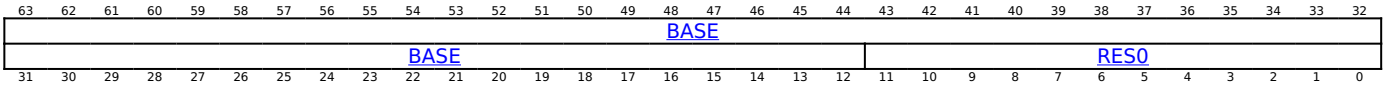
AArch64 System register TRBBASER_EL1 bits [63:0] are architecturally mapped to External register TRBBASER_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBBASER_EL1 are UNDEFINED.

Attributes

TRBBASER_EL1 is a 64-bit register.

Field descriptions



BASE, bits [63:12]

Trace Buffer Base pointer address. (TRBBASER_EL1.BASE << 12) is the address of the first byte in the trace buffer. Bits [11:0] of the Base pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBBASER_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing TRBBASER_EL1

The PE might ignore a write to TRBBASER_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBBASER_EL1

TRBIDR_EL1, Trace Buffer ID Register

The TRBIDR_EL1 characteristics are:

Purpose

Describes constraints on using the Trace Buffer Unit to software, including whether the Trace Buffer Unit can be programmed at the current Exception level.

Configuration

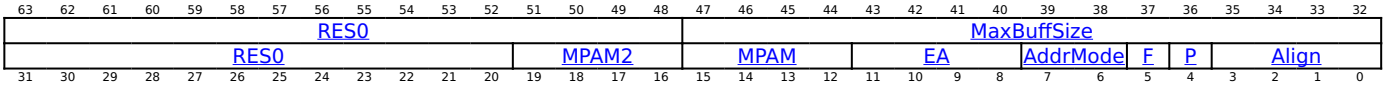
AArch64 System register TRBIDR_EL1 bits [63:0] are architecturally mapped to External register TRBIDR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBIDR_EL1 are UNDEFINED.

Attributes

TRBIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

MaxBuffSize, bits [47:32]

Maximum supported trace buffer size. Reserved for software use.

The only permitted value is 0x0000, indicating there is no limit to the maximum buffer size.

Note

Permitted values relate to the values an implementation is permitted to set this field to. A hypervisor might trap accesses to this register and use other values to describe limitations of its virtualization support to a guest operating system, as follows:

- MaxBuffSize bits[8:0] encodes a mantissa value, M.
- MaxBuffSize bits[13:9] encodes an exponent value, E.
- MaxBuffSize bits[15:14] are reserved.

The maximum buffer size, in bytes, is expressed using the following function:

if IsZero(E), then UInt(M:Zeros(12)) else UInt('1':M:Zeros(UInt(E)+11))

For example:

- A value of 0x0001 means a maximum buffer size of 4KB.
- A value of 0x3FFF means a maximum buffer size of 4092TB.

Reads as 0x0000.

Access to this field is RO.

Bits [31:20]

Reserved, RES0.

MPAM2, bits [19:16]
When FEAT_TRBE_EXT is implemented:

FEAT_MPAMv2 extensions. Indicates Memory Partitioning and Monitoring (MPAM) support using FEAT_MPAMv2 in the Trace Buffer Unit when using External mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM2	Meaning
0b0000	Trace Buffer External Mode is not implemented or the version of MPAM supported by this field is not implemented by the PE.
0b0001	FEAT_MPAMv2 is implemented by the Trace Buffer Unit, using default PARTID and PMG values in External mode.
0b0010	Trace Buffer MPAM extensions implemented, using FEAT_MPAMv2.

When FEAT_MPAMv2 is not implemented by the PE or FEAT_TRBE_EXT is not implemented by the PE, the only permitted value is 0b0000.

When FEAT_MPAMv2 and FEAT_TRBE_EXT are both implemented by the PE, the value 0b0000 is not permitted.

FEAT_TRBE_MPAM implements the functionality identified by the value 0b0010.

Access to this field is RO.

Otherwise:

Reserved, RES0.

MPAM, bits [15:12]
When FEAT_TRBE_EXT is implemented:

FEAT_MPAMv0p1 or FEAT_MPAMv1p0 extensions. Indicates Memory Partitioning and Monitoring (MPAM) support using FEAT_MPAMv0p1 or FEAT_MPAMv1p0 in the Trace Buffer Unit when using External mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM	Meaning
0b0000	Trace Buffer External Mode is not implemented or the version of MPAM supported by this field is not implemented by the PE.
0b0001	FEAT_MPAMv0p1 or FEAT_MPAMv1p0 is implemented by the Trace Buffer Unit, using default PARTID and PMG values in External mode.
0b0010	Trace Buffer MPAM extensions implemented, using FEAT_MPAMv0p1 or FEAT_MPAMv1p0.

When FEAT_TRBE_EXT is not implemented by the PE, or if FEAT_MPAMv0p1 and FEAT_MPAMv1p0 are not implemented by the PE, the only permitted value is 0b0000.

When FEAT_TRBE_EXT is implemented by the PE, and at least one of FEAT_MPAMv0p1 and FEAT_MPAMv1p0 are implemented by the PE, the value 0b0000 is not permitted.

FEAT_TRBE_MPAM implements the functionality identified by the value 0b0010.

Access to this field is RO.

Otherwise:

Reserved, RES0.

EA, bits [11:8]

External Abort handling. Describes how the PE manages External aborts on writes made by the Trace Buffer Unit to the trace buffer.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EA	Meaning
0b0000	Not described.
0b0001	The PE ignores External aborts on writes made by the Trace Buffer Unit.
0b0010	An External abort on a write made by the Trace Buffer Unit generates an asynchronous SError exception at the PE.

All other values are reserved.

From Armv9.3, the value 0b0000 is not permitted.

The behavior described by this field does not apply for External aborts on a translation table walk, translation table update, or GPT walk made by the Trace Buffer Unit that are reported as MMU faults using TRBSR_ELx. For more information, see 'External aborts'.

Access to this field is RO.

AddrMode, bits [7:6]

Address Modes. Describes the addressing modes available for the trace buffer.

AddrMode	Meaning
0b00	Virtual and physical address modes are supported.
0b01	Only virtual address mode is supported.
0b10	Reserved for software use under virtualization, to show that only physical address mode is supported.

Other values are reserved.

If the Effective value of TRFCR_EL2.DnVM is 1 and the value returned for TRBIDR_EL1.P is 0, then this field reads as 0b01. Otherwise, this field reads as 0b00.

Note

A hypervisor might trap accesses to this register to describe limitations of its virtualization support to a guest operating system.

F, bit [5]

Flag updates. Describes how address translations performed by the Trace Buffer Unit manage the Access flag and dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F	Meaning
0b0	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is always disabled for all translation stages.
0b1	Hardware management of the Access flag and dirty state for accesses made by the Trace Buffer Unit is controlled in the same way as explicit memory accesses in the trace buffer owning translation regime.

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv9.3, the value 0 is not permitted.

Access to this field is RO.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the trace buffer owning Exception level is a higher Exception level or the trace buffer owning Security state is not the current Security state.

P	Meaning
0b0	Programming is allowed.
0b1	Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of MDCR_EL3.NSTB, MDCR_EL3.NSTBE, and MDCR_EL2.E2TB:

- If EL3 is implemented, MDCR_EL3.NSTB is 0b0x, and either FEAT_RME is not implemented, or Secure state is implemented and MDCR_EL3.NSTBE is 0, then this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.

    - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
    - If Secure EL2 is implemented and enabled, and MDCR_EL2.E2TB is 0b00, Secure EL1.
- If EL3 is implemented, MDCR_EL3.NSTB is 0b1x and either FEAT_RME is not implemented or MDCR_EL3.NSTBE is 0, then this field reads as one from:
    - If Secure state is implemented, Secure EL1.
    - If Secure EL2 is implemented, Secure EL2.
    - If EL2 is implemented and MDCR_EL2.E2TB is 0b00, Non-secure EL1.
    - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and MDCR_EL3.{NSTB, NSTBE} is {0b1x, 1}, then this field reads as one from:
    - Non-secure EL1 and Non-secure EL2.
    - If Secure state is implemented, Secure EL1 and Secure EL2.
    - If MDCR_EL2.E2TB is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2TB is 0b00, then this field reads as one from EL1.

Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to TRBPTR_EL1 and TRBTRG_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

Access to this field is RO.

Accessing TRBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b111

```
if !IsFeatureImplemented(FEAT_TRBE) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_FGT) && (!HaveEL(EL3) || SCR_EL3().FGTEn == '1') &&
HDFGRTR_EL2().TRBIDR_EL1 == '1' then
        AArch64_SystemAccessTrap(EL2, 0x18);
    elsif IsFeatureImplemented(FEAT_TRBE_EXT) && OSLSR_EL1().OSLK == '0' && HaltingAllowed() && EDSCR2().TTA == '1'
then
        Halt(DebugHalt_SoftwareAccess);
    else
        X{64}(t) = TRBIDR_EL1();
    end;
elsif PSTATE.EL == EL2 then

TRBLIMITR_EL1, Trace Buffer Limit Address Register

The TRBLIMITR_EL1 characteristics are:

Purpose

Defines the top address for the trace buffer, and controls the trace buffer modes and enable.

Configuration

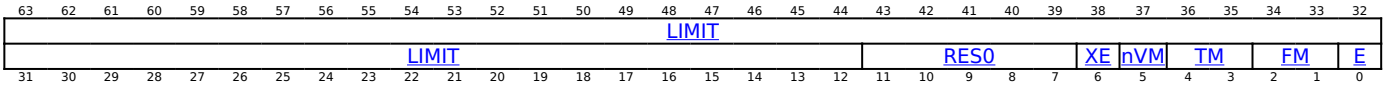
AArch64 System register TRBLIMITR_EL1 bits [63:0] are architecturally mapped to External register TRBLIMITR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBLIMITR_EL1 are UNDEFINED.

Attributes

TRBLIMITR_EL1 is a 64-bit register.

Field descriptions



LIMIT, bits [63:12]

Trace Buffer Limit pointer address. (TRBLIMITR_EL1.LIMIT << 12) is the address of the last byte in the trace buffer plus one. Bits [11:0] of the Limit pointer address are always zero. If the smallest implemented translation granule is not 4KB, then TRBLIMITR_EL1[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

XE, bit [6]
When FEAT_TRBE_EXT is implemented:

Trace Buffer Unit External mode enable. Used for save/restore of TRBLIMITR_EL1.XE.

XE	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is FALSE, the Trace Buffer Unit is enabled.

Software must treat this field as UNK/SBZP when the OS Lock is unlocked.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When !OSLockStatus(), access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

nVM, bit [5]

Address mode.

nVM	Meaning
0b0	The trace buffer pointers are virtual addresses.
0b1	The trace buffer pointers are: • Physical address in the owning security state if the owning translation regime has no stage 2 translation. • Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

If FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, then the PE ignores the value of this field and the trace buffer pointers are always physical addresses.

If FEAT_TRBEv1p1 is implemented, SelfHostedTraceEnabled() == TRUE, and the Effective value of TRFCR_EL2.DnVM is 1, then the PE ignores the value of this field, and the trace buffer pointers are always virtual addresses.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RES1 if all the following are true:
  - FEAT_TRBE_EXT is implemented.
  - !SelfHostedTraceEnabled().
- Access to this field is RO if all the following are true:
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.
- Otherwise, access to this field is RW.

TM, bits [4:3]

Trigger mode.

TM	Meaning
0b00	Stop on trigger. Flush then stop collection and raise maintenance interrupt on Trigger Event.
0b01	IRQ on trigger. Continue collection and raise maintenance interrupt on Trigger Event.
0b11	Ignore trigger. Continue collection and do not raise maintenance interrupt on Trigger Event.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

FM, bits [2:1]

Trace buffer mode.

FM	Meaning
0b00	Fill mode. Stop collection and raise maintenance interrupt on current write pointer wrap.
0b01	Wrap mode. Continue collection and raise maintenance interrupt on current write pointer wrap.
0b11	Circular Buffer mode. Continue collection and do not raise maintenance interrupt on current write pointer wrap.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Trace Buffer Unit enable. Controls whether the Trace Buffer Unit is enabled when SelfHostedTraceEnabled() == TRUE.

E	Meaning
0b0	Trace Buffer Unit is not enabled by this control.
0b1	If SelfHostedTraceEnabled() is TRUE, the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is implemented and SelfHostedTraceEnabled() == FALSE, then TRBLIMITR_EL1.XE controls whether the Trace Buffer Unit is enabled.

If FEAT_TRBE_EXT is not implemented, then the Trace Buffer Unit is disabled when SelfHostedTraceEnabled() == FALSE.

All output is discarded by the Trace Buffer Unit when the Trace Buffer Unit is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRBLIMITR_EL1

The PE might ignore a write to TRBLIMITR_EL1 if all the following are true:

- TRBLIMITR_EL1.E == 0b1.
- Either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- The write does not set TRBLIMITR_EL1.E to 0.

If FEAT_TRBE_EXT is implemented, the PE might ignore a write to TRBLIMITR_EL1 if all the following are true:

- TRBLIMITR_EL1.XE == 0b1.
- The Trace Buffer Unit is using External mode.
- The write does not set TRBLIMITR_EL1.XE to 0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBLIMITR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b000

TRBMAR_EL1, Trace Buffer Memory Attribute Register

The TRBMAR_EL1 characteristics are:

Purpose

Controls Trace Buffer Unit accesses to memory.

If the trace buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

Configuration

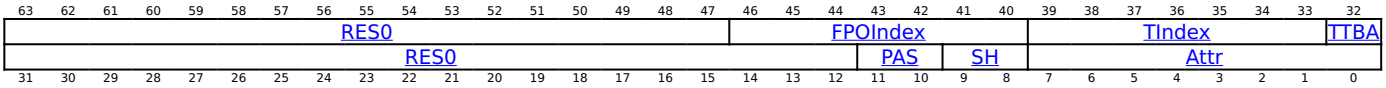
AArch64 System register TRBMAR_EL1 bits [63:0] are architecturally mapped to External register TRBMAR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBMAR_EL1 are UNDEFINED.

Attributes

TRBMAR_EL1 is a 64-bit register.

Field descriptions



Bits [63:47]

Reserved, RES0.

FPOIndex, bits [46:40]
When FEAT_S1POE2 is implemented:

FPOIndex to use for the Trace buffer.

Bits of this field above the configured POIndex size in TCR2_ELx.POIW for the Owning Exception level are RES0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TIndex, bits [39:33]
When FEAT_S1POE2 is implemented:

Privileged TIndex to use for the Trace buffer.

Bits of this field above the configured TIndex size in IRTBRP_ELx.TIW for the Owning Exception level are RES0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTBA, bit [32]
When FEAT_S1POE2 is implemented:

Selects which ASID for the Owning Exception level to use for IRT PLB lookups for the Trace buffer, if TCR2_ELx.A2 is 1.

TTBA	Meaning
0b0	TTBR0_ELx.ASID is used.
0b1	TTBR1_ELx.ASID is used.

If TCR2_ELx.A2 is 0, this field is RES0 and has no effect on the selection of ASID.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:12]

Reserved, RES0.

PAS, bits [11:10]
When FEAT_TRBE_EXT is implemented:

Physical address specifier. Defines the PAS attribute for memory addressed by the buffer in External mode.

PAS	Meaning	Applies when
0b00	Secure.	When FEAT_Secure is implemented
0b01	Non-secure.	
0b10	Root.	When FEAT_RME is implemented
0b11	Realm.	When FEAT_RME is implemented

All other values are reserved.

If the Trace Buffer Unit is using external mode and either TRBMAR_EL1.PAS is set to a reserved value, or the IMPLEMENTATION DEFINED authentication interface prohibits invasive debug of the Security state corresponding to the physical address space selected by TRBMAR_EL1.PAS, then when the Trace Buffer Unit receives trace data from the trace unit, it does not write the trace data to memory and generates a trace buffer management event. That is, if any of the following apply:

- ExternalInvasiveDebugEnabled() == FALSE.
- TRBMAR_EL1.PAS is 0b00, and either ExternalSecureInvasiveDebugEnabled() == FALSE or Secure state is not implemented.
- TRBMAR_EL1.PAS is 0b10, and either ExternalRootInvasiveDebugEnabled() == FALSE or FEAT_RME is not implemented.
- TRBMAR_EL1.PAS is 0b11, and either ExternalRealmInvasiveDebugEnabled() == FALSE or FEAT_RME is not implemented.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bits [9:8]

Trace buffer shareability domain. Defines the shareability domain for Normal memory used by the trace buffer.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when TRBMAR_EL1.Attr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Attr, bits [7:0]

Trace buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the trace buffer.

The encoding of this field is the same as that of a MAIR_ELx.Attr<n> field, as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_TRBE_EXT is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_TRBE_EXT is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing TRBMAR_EL1

The PE might ignore a write to TRBMAR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBMAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b100

TRBMPAM_EL1, Trace Buffer MPAM Configuration Register

The TRBMPAM_EL1 characteristics are:

Purpose

Defines the PARTID, PMG, and MPAM_SP values used by the trace buffer unit in external mode.

Configuration

AArch64 System register TRBMPAM_EL1 bits [63:0] are architecturally mapped to External register TRBMPAM_EL1[63:0].

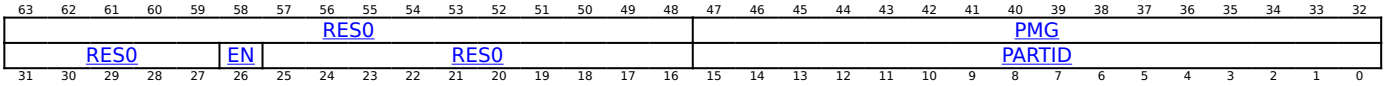
This register is present only when FEAT_TRBE_MPAM is implemented. Otherwise, direct accesses to TRBMPAM_EL1 are UNDEFINED.

Attributes

TRBMPAM_EL1 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:



Bits [63:48]

Reserved, RES0.

PMG, bits [47:32]

Performance Monitoring Group. Selects the PMG.

Only sufficient low-order bits are required to represent the TRBDEVID1.PMG_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:27]

Reserved, RES0.

EN, bit [26]

Enable. Enables use of non-default MPAM values.

EN	Meaning
0b0	Use default MPAM values.
0b1	Use TRBMPAM_EL1.{PARTID, PMG}.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Bits [25:16]

Reserved, RES0.

PARTID, bits [15:0]

Partition Identifier. Selects the PARTID.

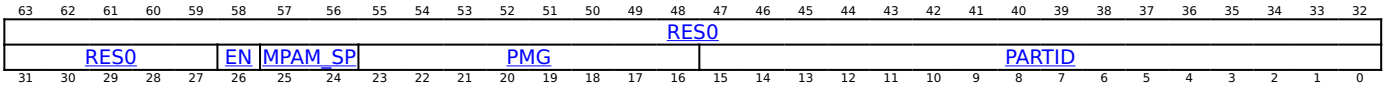
Only sufficient low-order bits are required to represent the TRBDEVID1.PARTID_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_MPAM is implemented:



Bits [63:27]

Reserved, RES0.

EN, bit [26]

Enable. Enables use of non-default MPAM values.

EN	Meaning
0b0	Use default MPAM values.
0b1	Use TRBMPAM_EL1.{PARTID, PMG, MPAM_SP}.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

MPAM_SP, bits [25:24]

Partition Identifier space. Selects the PARTID space.

MPAM_SP	Meaning	Applies when
0b00	PARTID is in the Secure PARTID space.	When FEAT_Secure is implemented
0b01	PARTID is in the Non-secure PARTID space.	
0b10	PARTID is in the Root PARTID space.	When FEAT_RME is implemented
0b11	PARTID is in the Realm PARTID space.	When FEAT_RME is implemented

If the Trace Buffer Unit is using external mode and either TRBMPAM_EL1.MPAM_SP is set to reserved value, or the IMPLEMENTATION DEFINED authentication interface prohibits invasive debug of the Security state corresponding to the Partition Identifier space selected by TRBMPAM_EL1.MPAM_SP, then when the Trace Buffer Unit receives trace data from the trace unit, it does not write the trace data to memory and generates a trace buffer management event.

The interface prohibits invasive debug of the Security state if any of the following apply:

- ExternalInvasiveDebugEnabled() == FALSE.
- Secure state is implemented, ExternalSecureInvasiveDebugEnabled() == FALSE and TRBMPAM_EL1.MPAM_SP is 0b00.
- FEAT_RME is implemented, ExternalRootInvasiveDebugEnabled() == FALSE, and TRBMPAM_EL1.MPAM_SP is 0b10.
- FEAT_RME is implemented, ExternalRealmInvasiveDebugEnabled() == FALSE, and TRBMPAM_EL1.MPAM_SP is 0b11.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PMG, bits [23:16]

Performance Monitoring Group. Selects the PMG.

Only sufficient low-order bits are required to represent the TRBDEVID1.PMG_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [15:0]

Partition Identifier. Selects the PARTID.

Only sufficient low-order bits are required to represent the TRBDEVID1.PARTID_MAX. Higher-order bits are RES0.

This field is ignored by the PE when SelfHostedTraceEnabled() == TRUE.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBMPAM_EL1

The PE might ignore a write to TRBMPAM_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBMPAM_EL1

TRBPTR_EL1, Trace Buffer Write Pointer Register

The TRBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the trace buffer.

Configuration

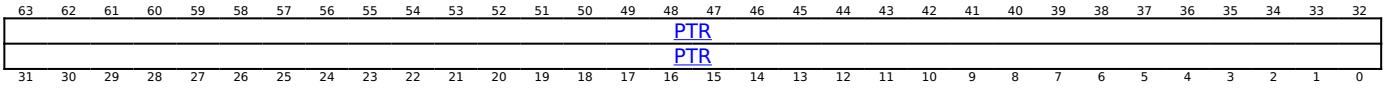
AArch64 System register TRBPTR_EL1 bits [63:0] are architecturally mapped to External register TRBPTR_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBPTR_EL1 are UNDEFINED.

Attributes

TRBPTR_EL1 is a 64-bit register.

Field descriptions



PTR, bits [63:0]

Trace Buffer current write pointer address.

Defines the virtual address of the next entry to be written to the trace buffer.

If TRBIDR_EL1.Align is not zero, then it is IMPLEMENTATION DEFINED whether bits [M-1:0] are RES0 or read/write, where M is an integer between 1 and TRBIDR_EL1.Align inclusive.

The architecture places restrictions on the values that software can write to the pointer. For more information, see 'Restrictions on Programming the Trace Buffer Unit'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBPTR_EL1

The PE might ignore a write to TRBPTR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBPTR_EL1

op0	op1	CRn	CRm	op2

TRBSR_EL1, Trace Buffer Status/syndrome Register (EL1)

The TRBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

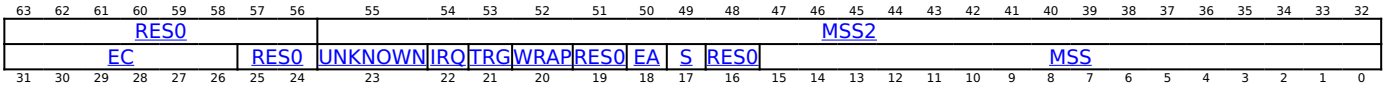
AArch64 System register TRBSR_EL1 bits [63:0] are architecturally mapped to External register TRBSR_EL1[63:0].

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBSR_EL1 are UNDEFINED.

Attributes

TRBSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

MSS2 encoding for other trace buffer management events

Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

DPOIndex, bits [23:17]
When FEAT_S1POE2 is implemented:

DPOIndex for the fault.

For a stage 1 Permission fault, if FEAT_S1POE2 is implemented and MSS2.Overlay is 1, this field reports the POIndex from the translation for the access that generated the fault.

Otherwise:

Reserved, RES0.

OverlayFetch, bit [16]
When FEAT_S1POE2 is implemented:

Fetch of POE2 table.

OverlayFetch	Meaning
0b0	Fault was not generated on a fetch of IRT or DPOT information.
0b1	Fault was generated on a fetch of IRT or DPOT information.

Otherwise:

Reserved, RES0.

Bits [15:9]

Reserved, RES0.

TopLevel, bit [8]
When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented, TRBSR_EL1.EC == '100101', and GetTRBSR_EL1_FSC() IN {'0011xx'}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL1_FSC() IN {'0011xx'}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL1_FSC() IN {'0011xx'}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

MSS2 encoding for Granule Protection Check faults on write to trace buffer

Bits [23:0]

Reserved, RES0.

MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for other trace buffer management events	MSS2 encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to trace buffer	MSS2 encoding for Granule Protection Check faults on write to trace buffer	When FEAT_RME is implemented
0b011111	Trace buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:24]

Reserved, RES0.

Bit [23]
When FEAT_TRBE_EXT is implemented:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

IRQ, bit [22]

Maintenance status. Indicates that a trace buffer management event has been recorded.

IRQ	Meaning
0b0	No trace buffer management event for EL1 has been recorded.
0b1	A trace buffer management event for EL1 has been recorded.

When FEAT_TRBE_EXC is implemented, this field indicates a management event for EL1.

If FEAT_TRBE_EXC is implemented and the TRBE Profiling exception for EL1 is enabled, then when this field is 1, a TRBE Profiling exception for EL1 is pending

If FEAT_TRBE_EXC is not implemented or the TRBE Profiling exception for EL1 is disabled, then this field drives the TRBIRQ trace buffer interrupt request signal.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]
When the PE sets this bit as the result of an External abort:

External Abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Trace Buffer Unit.

It is IMPLEMENTATION DEFINED whether this field is set to 1 or is unchanged by the PE when a write by the Trace Buffer Unit generates an External abort on a translation table walk, translation table update, or GPT walk that is reported as an MMU fault. From Armv9.3, this field is not set to 1 by the PE for any other trace buffer management event.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the trace buffer management event.

The syndrome contents for each trace buffer management event are described in the following sections.

MSS encoding for other trace buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Trace buffer status code

BSC	Meaning	Applies when
0b000000	Collection not stopped, or access not allowed.	
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.	
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.	
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.	When FEAT_TRBE_EXT is implemented
0b000100	Buffer size. The requested trace buffer size was too large.	

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	

0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110010	PLB conflict abort.	When FEAT_S1POE2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to trace buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing TRBSR_EL1

The PE might ignore a write to TRBSR_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TRBSR_EL1 or TRBSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBSR_EL1

TRBSR_EL2, Trace Buffer Syndrome Register (EL2)

The TRBSR_EL2 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

Configuration

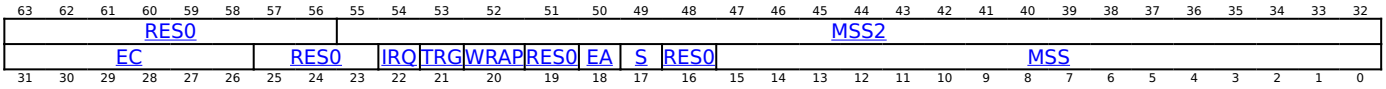
This register is present only when FEAT_TRBE_EXC is implemented. Otherwise, direct accesses to TRBSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TRBSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

MSS2 encoding for other trace buffer management events

Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

DPOIndex, bits [23:17]
When FEAT_S1POE2 is implemented:

DPOIndex for the fault.

For a stage 1 Permission fault, if FEAT_S1POE2 is implemented and MSS2.Overlay is 1, this field reports the POIndex from the translation for the access that generated the fault.

Otherwise:

Reserved, RES0.

OverlayFetch, bit [16]
When FEAT_S1POE2 is implemented:

Fetch of POE2 table.

OverlayFetch	Meaning
0b0	Fault was not generated on a fetch of IRT or DPOT information.
0b1	Fault was generated on a fetch of IRT or DPOT information.

Otherwise:

Reserved, RES0.

Bits [15:9]

Reserved, RES0.

TopLevel, bit [8]
When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented, TRBSR_EL2.EC == '100101', and GetTRBSR_EL2_FSC() IN {'0011xx'}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL2_FSC() IN {'0011xx'}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL2_FSC() IN {'0011xx'}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

MSS2 encoding for Granule Protection Check faults on write to trace buffer

Bits [23:0]

Reserved, RES0.

MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for other trace buffer management events	MSS2 encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to trace buffer	MSS2 encoding for Granule Protection Check faults on write to trace buffer	When FEAT_RME is implemented
0b011111	Trace buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:23]

Reserved, RES0.

IRQ, bit [22]

Maintenance status. Indicates that a trace buffer management event has been recorded.

IRQ	Meaning
0b0	No trace buffer management event for EL2 has been recorded.
0b1	A trace buffer management event for EL2 has been recorded.

When FEAT_TRBE_EXC is implemented, this field indicates a management event for EL2.

If the TRBE Profiling exception for EL2 is enabled, then when this field is 1, a TRBE Profiling exception for EL2 is pending

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]
When the PE sets this bit as the result of an External abort:

External Abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Trace Buffer Unit.

It is IMPLEMENTATION DEFINED whether this field is set to 1 or is unchanged by the PE when a write by the Trace Buffer Unit generates an External abort on a translation table walk, translation table update, or GPT walk that is reported as an MMU fault. From Armv9.3, this field is not set to 1 by the PE for any other trace buffer management event.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the trace buffer management event.

The syndrome contents for each trace buffer management event are described in the following sections.

MSS encoding for other trace buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Trace buffer status code

BSC	Meaning	Applies when
0b000000	Collection not stopped, or access not allowed.	
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.	
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.	
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.	When FEAT_TRBE_EXT is implemented
0b000100	Buffer size. The requested trace buffer size was too large.	

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	

0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110010	PLB conflict abort.	When FEAT_S1POE2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to trace buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing TRBSR_EL2

The PE might ignore a write to TRBSR_EL2 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TRBSR_EL2 or TRBSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBSR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1001	0b1011	0b011

TRBSR_EL3, Trace Buffer Syndrome Register (EL3)

The TRBSR_EL3 characteristics are:

Purpose

Provides syndrome information to software for a trace buffer management event.

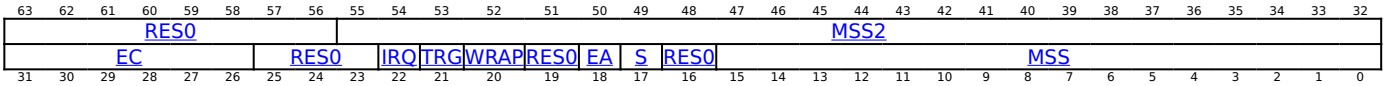
Configuration

This register is present only when FEAT_TRBE_EXC is implemented and EL3 is implemented. Otherwise, direct accesses to TRBSR_EL3 are UNDEFINED.

Attributes

TRBSR_EL3 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

MSS2 encoding for other trace buffer management events

Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

DPOIndex, bits [23:17]
When FEAT_S1POE2 is implemented:

DPOIndex for the fault.

For a stage 1 Permission fault, if FEAT_S1POE2 is implemented and MSS2.Overlay is 1, this field reports the POIndex from the translation for the access that generated the fault.

Otherwise:

Reserved, RES0.

OverlayFetch, bit [16]
When FEAT_S1POE2 is implemented:

Fetch of POE2 table.

OverlayFetch	Meaning
0b0	Fault was not generated on a fetch of IRT or DPOT information.
0b1	Fault was generated on a fetch of IRT or DPOT information.

Otherwise:

Reserved, RES0.

Bits [15:9]

Reserved, RES0.

TopLevel, bit [8]
When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented, TRBSR_EL3.EC == '100101', and GetTRBSR_EL3_FSC() IN {'0011xx'}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetTRBSR_EL3_FSC() IN {'0011xx'}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetTRBSR_EL3_FSC() IN {'0011xx'}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

MSS2 encoding for Granule Protection Check faults on write to trace buffer

Bits [23:0]

Reserved, RES0.

MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the trace buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other trace buffer management event. All trace buffer management events other than those described by the other defined Event class codes.	MSS encoding for other trace buffer management events	MSS2 encoding for other trace buffer management events	
0b011110	Granule Protection Check fault on write to trace buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to trace buffer	MSS2 encoding for Granule Protection Check faults on write to trace buffer	When FEAT_RME is implemented
0b011111	Trace buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	
0b100101	Stage 2 Data Abort on write to trace buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to trace buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [25:23]

Reserved, RES0.

IRQ, bit [22]

Maintenance status. Indicates that a trace buffer management event has been recorded.

IRQ	Meaning
0b0	No trace buffer management event for EL3 has been recorded.
0b1	A trace buffer management event for EL3 has been recorded.

When FEAT_TRBE_EXC is implemented, this field indicates a management event for EL3.

If the TRBE Profiling exception for EL3 is enabled, then when this field is 1, a TRBE Profiling exception for EL3 is pending

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

TRG, bit [21]

Triggered.

TRG	Meaning
0b0	No Detected Trigger has been observed since this field was last cleared to zero.
0b1	A Detected Trigger has been observed since this field was last cleared to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

WRAP, bit [20]

Wrapped.

WRAP	Meaning
0b0	The current write pointer has not wrapped since this field was last cleared to zero.
0b1	The current write pointer has wrapped since this field was last cleared to zero.

For each byte of trace the Trace Buffer Unit Accepts and writes to the trace buffer at the address in the current write pointer, if the current write pointer is equal to the Limit pointer minus one, the current write pointer is wrapped by setting it to the Base pointer, and this field is set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

EA, bit [18]
When the PE sets this bit as the result of an External abort:

External Abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Trace Buffer Unit.

It is IMPLEMENTATION DEFINED whether this field is set to 1 or is unchanged by the PE when a write by the Trace Buffer Unit generates an External abort on a translation table walk, translation table update, or GPT walk that is reported as an MMU fault. From Armv9.3, this field is not set to 1 by the PE for any other trace buffer management event.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Stopped.

S	Meaning
0b0	Collection has not been stopped.
0b1	Collection is stopped.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [16]

Reserved, RES0.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the trace buffer management event.

The syndrome contents for each trace buffer management event are described in the following sections.

MSS encoding for other trace buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Trace buffer status code

BSC	Meaning	Applies when
0b000000	Collection not stopped, or access not allowed.	
0b000001	Trace buffer filled. Collection stopped because the current write pointer wrapped to the base pointer and the trace buffer mode is Fill mode.	
0b000010	Trigger Event. Collection stopped because of a Trigger Event. See TRBTRG_EL1 for more information.	
0b000011	Manual Stop. Collection stopped because of a Manual Stop event. See TRBCR.ManStop for more information.	When FEAT_TRBE_EXT is implemented
0b000100	Buffer size. The requested trace buffer size was too large.	

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to trace buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	

0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110010	PLB conflict abort.	When FEAT_S1POE2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to trace buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for trace buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing TRBSR_EL3

The PE might ignore a write to TRBSR_EL3 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBSR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1001	0b1011	0b011

```
if !(IsFeatureImplemented(FEAT_TRBE_EXC) && HaveEL(EL3)) then

TRBTRG_EL1, Trace Buffer Trigger Counter Register

The TRBTRG_EL1 characteristics are:

Purpose

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

Configuration

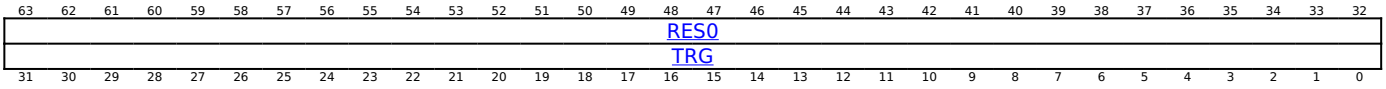
AArch64 System register TRBTRG_EL1 bits [63:0] are architecturally mapped to External register TRBTRG_EL1[63:0] when FEAT_TRBE_EXT is implemented.

This register is present only when FEAT_TRBE is implemented. Otherwise, direct accesses to TRBTRG_EL1 are UNDEFINED.

Attributes

TRBTRG_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

TRG, bits [31:0]

Trigger count.

Specifies the number of bytes of trace to capture following a Detected Trigger before a Trigger Event.

TRBTRG_EL1 decrements by 1 for every byte of trace written to the trace buffer when all of the following are true:

- TRBTRG_EL1 is nonzero.
- TRBSR_EL1.TRG is 1.

The architecture places restrictions on the values that software can write to the counter.

Note

As a result of the restrictions an implementation might treat some of TRG[M:0] as RES0, where M is defined by TRBIDR_EL1.Align.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing TRBTRG_EL1

The PE might ignore a write to TRBTRG_EL1 if any of the following apply:

- TRBLIMITR_EL1.E == 0b1, and either FEAT_TRBE_EXT is not implemented or the Trace Buffer Unit is using Self-hosted mode.
- TRBLIMITR_EL1.XE == 0b1, FEAT_TRBE_EXT is implemented, and the Trace Buffer Unit is using External mode.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRBTRG_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1011	0b110

2025-12-10 16:11:30, 2025-12_rel

TRCACATR<n>, Trace Address Comparator Access Type Register <n>, n = 0 - 15

The TRCACATR<n> characteristics are:

Purpose

Defines the type of access for the corresponding TRCACVR<n> Register. This register configures the context type, Exception levels, alignment, masking that is applied by the Address Comparator, and how the Address Comparator behaves when it is one half of an Address Range Comparator.

Configuration

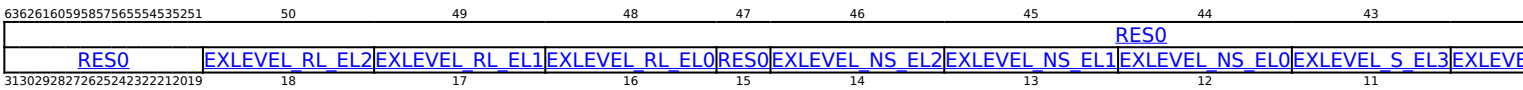
AArch64 System register TRCACATR<n> bits [63:0] are architecturally mapped to External register TRCACATR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACATR<n> are UNDEFINED.

Attributes

TRCACATR<n> is a 64-bit register.

Field descriptions



Bits [63:19]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [18]
When FEAT_RME is implemented:

Realm EL2 address comparison control. Controls whether a comparison can occur at EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator performs comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator does not perform comparisons in Realm EL2.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL2 is 0 the Address Comparator does not perform comparisons in Realm EL2. When TRCACATR<n>.EXLEVEL_NS_EL2 is 1 the Address Comparator performs comparisons in Realm EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [17]
When FEAT_RME is implemented:

Realm EL1 address comparison control. Controls whether a comparison can occur at EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator performs comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator does not perform comparisons in Realm EL1.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL1 is 0 the Address Comparator does not perform comparisons in Realm EL1. When TRCACATR<n>.EXLEVEL_NS_EL1 is 1 the Address Comparator performs comparisons in Realm EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [16]
When FEAT_RME is implemented:

Realm EL0 address comparison control. Controls whether a comparison can occur at EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator performs comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator does not perform comparisons in Realm EL0.
0b1	When TRCACATR<n>.EXLEVEL_NS_EL0 is 0 the Address Comparator does not perform comparisons in Realm EL0. When TRCACATR<n>.EXLEVEL_NS_EL0 is 1 the Address Comparator performs comparisons in Realm EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [14]
When Non-secure EL2 is implemented:

Non-secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL2.
0b1	The Address Comparator does not perform comparisons in Non-secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [13]
When Non-secure EL1 is implemented:

Non-secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL1.
0b1	The Address Comparator does not perform comparisons in Non-secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [12]
When Non-secure EL0 is implemented:

Non-secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The Address Comparator performs comparisons in Non-secure EL0.
0b1	The Address Comparator does not perform comparisons in Non-secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [11]
When EL3 is implemented:

EL3 address comparison control. Controls whether a comparison can occur at EL3.

EXLEVEL_S_EL3	Meaning
0b0	The Address Comparator performs comparisons at EL3.
0b1	The Address Comparator does not perform comparisons at EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [10]
When Secure EL2 is implemented:

Secure EL2 address comparison control. Controls whether a comparison can occur at EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The Address Comparator performs comparisons in Secure EL2.
0b1	The Address Comparator does not perform comparisons in Secure EL2.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [9]
When Secure EL1 is implemented:

Secure EL1 address comparison control. Controls whether a comparison can occur at EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The Address Comparator performs comparisons in Secure EL1.
0b1	The Address Comparator does not perform comparisons in Secure EL1.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [8]
When Secure EL0 is implemented:

Secure EL0 address comparison control. Controls whether a comparison can occur at EL0 in Secure state.

EXLEVEL_S_EL0	Meaning
0b0	The Address Comparator performs comparisons in Secure EL0.
0b1	The Address Comparator does not perform comparisons in Secure EL0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

CONTEXT, bits [6:4]
When TRCIDR4.NUMCIDC != '0000' or TRCIDR4.NUMVMIDC != '0000':

Selects a Context Identifier Comparator or Virtual Context Identifier Comparator:

CONTEXT	Meaning	Applies when
0b000	Comparator 0.	
0b001	Comparator 1.	When UInt(TRCIDR4.NUMCIDC) > 1 or UInt(TRCIDR4.NUMVMIDC) > 1
0b010	Comparator 2.	When UInt(TRCIDR4.NUMCIDC) > 2 or UInt(TRCIDR4.NUMVMIDC) > 2
0b011	Comparator 3.	When UInt(TRCIDR4.NUMCIDC) > 3 or UInt(TRCIDR4.NUMVMIDC) > 3
0b100	Comparator 4.	When UInt(TRCIDR4.NUMCIDC) > 4 or UInt(TRCIDR4.NUMVMIDC) > 4
0b101	Comparator 5.	When UInt(TRCIDR4.NUMCIDC) > 5 or UInt(TRCIDR4.NUMVMIDC) > 5
0b110	Comparator 6.	When UInt(TRCIDR4.NUMCIDC) > 6 or UInt(TRCIDR4.NUMVMIDC) > 6
0b111	Comparator 7.	When UInt(TRCIDR4.NUMCIDC) > 7 or UInt(TRCIDR4.NUMVMIDC) > 7

The width of this field is dependent on the maximum number of Context Identifier Comparators or Virtual Context Identifier Comparators implemented. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CONTEXTTYPE, bits [3:2]
When TRCIDR4.NUMCIDC != '0000' or TRCIDR4.NUMVMIDC != '0000':

Controls whether the Address Comparator is dependent on a Context Identifier Comparator, a Virtual Context Identifier Comparator, or both comparisons.

CONTEXTTYPE	Meaning	Applies when
0b00	The Address Comparator is not dependent on the Context Identifier Comparators or Virtual Context Identifier Comparators.	
0b01	The Address Comparator is dependent on the Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMCIDC != '0000'
0b10	The Address Comparator is dependent on the Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if both the Virtual Context Identifier Comparator and the address comparison match.	When TRCIDR4.NUMVMIDC != '0000'
0b11	The Address Comparator is dependent on the Context Identifier Comparator and Virtual Context Identifier Comparator that TRCACATR<n>.CONTEXT specifies. The Address Comparator signals a match only if the Context Identifier Comparator, the Virtual Context Identifier Comparator, and address comparison all match.	When TRCIDR4.NUMCIDC != '0000' and TRCIDR4.NUMVMIDC != '0000'

If TRCIDR4.NUMCIDC == 0b0000, then bit [2] is RES0.

If TRCIDR4.NUMVMIDC == 0b0000, then bit [3] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing TRCACATR<n>

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 1.
- TRCVIIECTLR.EXCLUDE[n/2] == 1.
- TRCVIIECTLR.INCLUDE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
- TRCVISSCTLR.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- TRCQCTLR.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCACATR<m> ; Where m = 0-15

op0	op1	CRn	CRm	op2
0b10	0b001	0b0010	m[2:0]:0b0	0b01:m[3]

TRCACVR<n>, Trace Address Comparator Value Register <n>, n = 0 - 15

The TRCACVR<n> characteristics are:

Purpose

Contains the address value.

Configuration

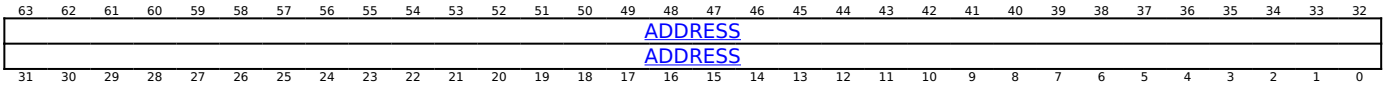
AArch64 System register TRCACVR<n> bits [63:0] are architecturally mapped to External register TRCACVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) * 2 > n. Otherwise, direct accesses to TRCACVR<n> are UNDEFINED.

Attributes

TRCACVR<n> is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Address Value.

The Address Comparators can support implementations that use multiple address widths. When the trace unit compares the ADDRESS field with an address that has a width less than this field, then the address must be zero-extended to the ADDRESS field width. The trace unit then compares all implemented bits. For example, in a system that supports both 32-bit and 64-bit addresses, when the PE is in AArch32 state the comparator must zero-extend the 32-bit address and compare against the full 64 bits that are stored in TRCACVR<n>.ADDRESS. This requires that the trace analyzer always programs all implemented bits of TRCACVR<n>.ADDRESS.

The result of writing a value other than all zeros or all ones to ADDRESS at bits[63:P] is an UNKNOWN value, where P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

The result of writing a value of all zeros or all ones to ADDRESS at bits[63:P] is the written value, and a read of the register returns the written value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCACVR<n>

Must be programmed if any of the following are true:

- TRCBBCTLR.RANGE[n/2] == 1.
- TRCRSCTLR<a>.GROUP == 0b0100 and TRCRSCTLR<a>.SAC[n] == 1.
- TRCRSCTLR<a>.GROUP == 0b0101 and TRCRSCTLR<a>.ARC[n/2] == 1.
- TRCVIIECTLR.EXCLUDE[n/2] == 1.
- TRCVIIECTLR.INCLUDE[n/2] == 1.
- TRCVISSCTLR.START[n] == 1.
- TRCVISSCTLR.STOP[n] == 1.
- TRCSSCCR<>.ARC[n/2] == 1.
- TRCSSCCR<>.SAC[n] == 1.
- TRCQCTLR.RANGE[n/2] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCACVR<m> ; Where m = 0-15

TRCAUTHSTATUS, Trace Authentication Status Register

The TRCAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

For additional information, see the CoreSight Architecture Specification.

Configuration

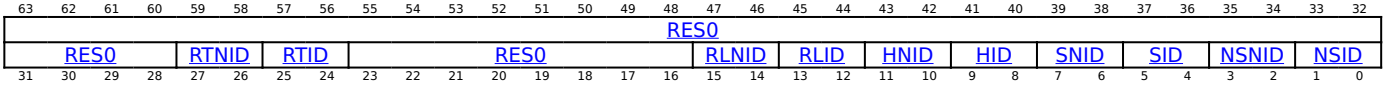
AArch64 System register TRCAUTHSTATUS bits [31:0] are architecturally mapped to External register TRCAUTHSTATUS[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCAUTHSTATUS are UNDEFINED.

Attributes

TRCAUTHSTATUS is a 64-bit register.

Field descriptions



Bits [63:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTNID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLNID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.

HNID, bits [11:10]

Hyp Non-invasive Debug. Indicates whether a separate enable control for EL2 non-invasive debug features is implemented and enabled.

HNID	Meaning
0b00	Separate Hyp non-invasive debug enable not implemented, or EL2 non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

HID, bits [9:8]

Hyp Invasive Debug. Indicates whether a separate enable control for EL2 invasive debug features is implemented and enabled.

HID	Meaning
0b00	Separate Hyp invasive debug enable not implemented, or EL2 invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

SNID, bits [7:6]

Secure Non-invasive Debug. Indicates whether Secure non-invasive debug features are implemented and enabled.

SNID	Meaning
0b00	Secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When Secure state is implemented, this field reads as 0b10 or 0b11 depending whether Secure non-invasive debug is enabled.

When Secure state is not implemented, this field reads as 0b00.

SID, bits [5:4]

Secure Invasive Debug. Indicates whether Secure invasive debug features are implemented and enabled.

SID	Meaning
0b00	Secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

NSNID, bits [3:2]

Non-secure Non-invasive Debug. Indicates whether Non-secure non-invasive debug features are implemented and enabled.

NSNID	Meaning
0b00	Non-secure non-invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

When Non-secure state is implemented, this field reads as 0b11.

When Non-secure state is not implemented, this field reads as 0b00.

NSID, bits [1:0]

Non-secure Invasive Debug. Indicates whether Non-secure invasive debug features are implemented and enabled.

NSID	Meaning
0b00	Non-secure invasive debug features not implemented.
0b10	Implemented and disabled.
0b11	Implemented and enabled.

All other values are reserved.

This field reads as 0b00.

Accessing TRCAUTHSTATUS

For implementations that support multiple access mechanisms, different access mechanisms can return different values for reads of TRCAUTHSTATUS if the authentication signals have changed and that change has not yet been synchronized by a Context synchronization event. This scenario can happen if, for example, the external debugger view is implemented separately from the system instruction view to allow for separate power domains, and so observes changes on the signals differently.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCAUTHSTATUS

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1110	0b110

TRCAUXCTLR, Trace Auxiliary Control Register

The TRCAUXCTLR characteristics are:

Purpose

The function of this register is IMPLEMENTATION DEFINED.

Configuration

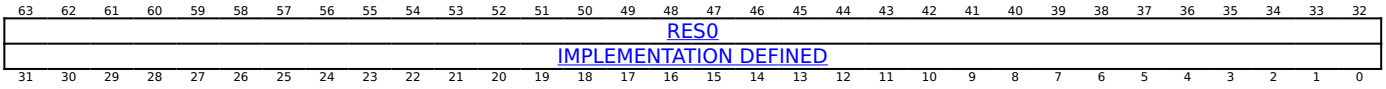
AArch64 System register TRCAUXCTLR bits [31:0] are architecturally mapped to External register TRCAUXCTLR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCAUXCTLR are UNDEFINED.

Attributes

TRCAUXCTLR is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to the expression `0x00000000`.

Accessing TRCAUXCTLR

If this register is nonzero then it might cause the behavior of a trace unit to contradict this architecture specification. See the documentation of the specific implementation for information about the IMPLEMENTATION DEFINED support for this register.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCAUXCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0110	0b000

```

TRCBBCTLR, Trace Branch Broadcast Control Register

The TRCBBCTLR characteristics are:

Purpose

Controls the regions in the memory map where branch broadcasting is active.

Configuration

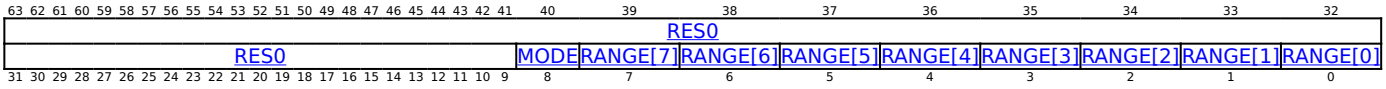
AArch64 System register TRCBBCTLR bits [31:0] are architecturally mapped to External register TRCBBCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, TRCIDR0.TRCBB == '1', and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCBBCTLR are UNDEFINED.

Attributes

TRCBBCTLR is a 64-bit register.

Field descriptions



Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Mode.

MODE	Meaning
0b0	Exclude Mode. Branch broadcasting is not active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then branch broadcasting is active for all instructions.
0b1	Include Mode. Branch broadcasting is active for instructions in the address ranges defined by TRCBBCTLR.RANGE. If TRCBBCTLR.RANGE == 0x00 then the behavior of the trace unit is CONSTRAINED UNPREDICTABLE. That is, the trace unit might or might not consider any instructions to be in a branch broadcasting region.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Selects whether Address Range Comparator <m> is used with branch broadcasting.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected.
0b1	The address range that Address Range Comparator <m> defines, is selected.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCBBCTLR

Must be programmed if TRCCONFIGR.BB == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCBBCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1111	0b000

TRCCCCTLR, Trace Cycle Count Control Register

The TRCCCCTLR characteristics are:

Purpose

Set the threshold value for cycle counting.

Configuration

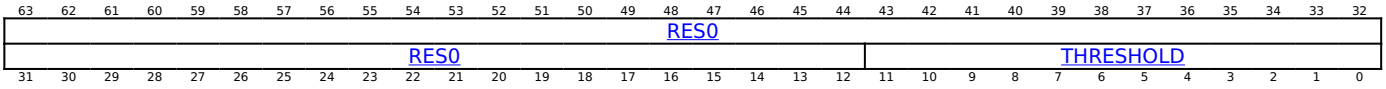
AArch64 System register TRCCCCTLR bits [31:0] are architecturally mapped to External register TRCCCCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR0.TRCCCI == '1'. Otherwise, direct accesses to TRCCCCTLR are UNDEFINED.

Attributes

TRCCCCTLR is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

THRESHOLD, bits [11:0]

Sets the threshold value for instruction trace cycle counting.

The minimum threshold value that can be programmed into THRESHOLD is given in TRCIDR3.CCITMIN. If the THRESHOLD value is smaller than the value in TRCIDR3.CCITMIN then the behavior is CONSTRAINED UNPREDICTABLE. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

Writing a value of zero when TRCCONFIGR.CCI enables instruction trace cycle counting results in CONSTRAINED UNPREDICTABLE behavior. That is, cycle counts might or might not be included in the trace and the cycle count threshold is not known.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCCCTLR

Must be programmed if TRCCONFIGR.CCI == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCCCTLR

TRCCIDCCTLR0, Trace Context Identifier Comparator Control Register 0

The TRCCIDCCTLR0 characteristics are:

Purpose

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 0 to 3.

Configuration

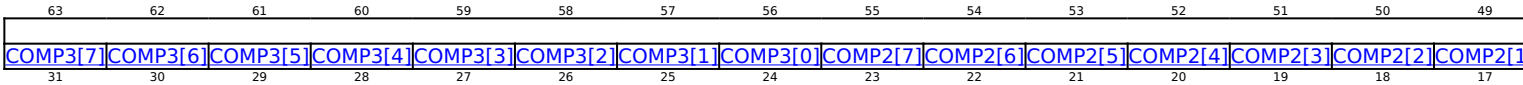
AArch64 System register TRCCIDCCTLR0 bits [31:0] are architecturally mapped to External register TRCCIDCCTLR0[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMCIDC) > 0x0, and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTLR0 are UNDEFINED.

Attributes

TRCCIDCCTLR0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP3[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 3:

TRCCIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR3. Each bit in this field corresponds to a byte in TRCCIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR3[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 2:

TRCCIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR2. Each bit in this field corresponds to a byte in TRCCIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR2[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 1:

TRCCIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR1. Each bit in this field corresponds to a byte in TRCCIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR1[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 0:

TRCCIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR0. Each bit in this field corresponds to a byte in TRCCIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR0[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR0

If software uses the TRCCIDCVR<n> registers, for n = 0 to 3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCCTLR0

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0000	0b010

TRCCIDCCTLR1, Trace Context Identifier Comparator Control Register 1

The TRCCIDCCTLR1 characteristics are:

Purpose

Contains Context identifier mask values for the TRCCIDCVR<n> registers, for n = 4 to 7.

Configuration

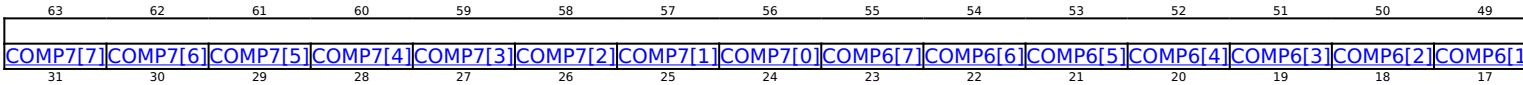
AArch64 System register TRCCIDCCTLR1 bits [31:0] are architecturally mapped to External register TRCCIDCCTLR1[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMCIDC) > 0x4, and UInt(TRCIDR2.CIDSIZE) > 0. Otherwise, direct accesses to TRCCIDCCTLR1 are UNDEFINED.

Attributes

TRCCIDCCTLR1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP7[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 7:

TRCCIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR7. Each bit in this field corresponds to a byte in TRCCIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR7[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 6:

TRCCIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR6. Each bit in this field corresponds to a byte in TRCCIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR6[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 5:

TRCCIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR5. Each bit in this field corresponds to a byte in TRCCIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR5[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMCIDC) > 4:

TRCCIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCCIDCVR4. Each bit in this field corresponds to a byte in TRCCIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.
0b1	The trace unit ignores TRCCIDCVR4[(m×8+7):(m×8)] when it performs the Context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.CIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCCIDCCTLR1

If software uses the TRCCIDCVR<n> registers, for n = 4 to 7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCCIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCCIDCVR<n> is not 0x00, the behavior of the Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCCTLR1

TRCCIDCVR<n>, Trace Context Identifier Comparator Value Registers <n>, n = 0 - 7

The TRCCIDCVR<n> characteristics are:

Purpose

Contains a Context identifier value.

Configuration

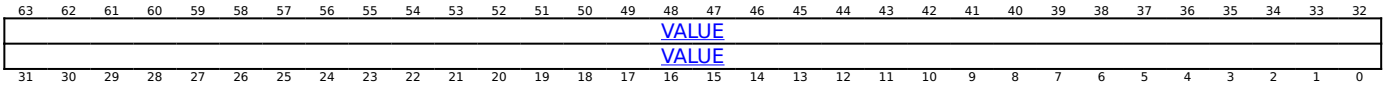
AArch64 System register TRCCIDCVR<n> bits [63:0] are architecturally mapped to External register TRCCIDCVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMCIDC) > n. Otherwise, direct accesses to TRCCIDCVR<n> are UNDEFINED.

Attributes

TRCCIDCVR<n> is a 64-bit register.

Field descriptions



VALUE, bits [63:0]

Context identifier value. The width of this field is indicated by TRCIDR2.CIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Context identifier is zero until the PE updates the Context identifier.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCIDCVR<n>

Must be programmed if any of the following are true:

- TRCRSCTLR<a>.GROUP == 0b0110 and TRCRSCTLR<a>.CID[n] == 1.
- TRCACATR<a>.CONTEXTTYPE == 0b01 or 0b11 and TRCACATR<a>.CONTEXT == n.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCIDCVR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	m[2:0]:0b0	0b000

```

TRCCLAIMCLR, Trace Claim Tag Clear Register

The TRCCLAIMCLR characteristics are:

Purpose

In conjunction with TRCCLAIMSET, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMCLR bits [63:0] are architecturally mapped to AArch64 System register TRCCLAIMSET[63:0].

AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

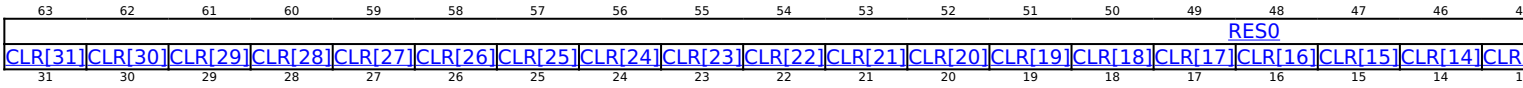
AArch64 System register TRCCLAIMCLR bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCCLAIMCLR are UNDEFINED.

Attributes

TRCCLAIMCLR is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

CLR[<m>], bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLR[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in TRCCLAIMSET.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Accessing this field has the following behavior:

- When m >= NUM_TRC_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing TRCCLAIMCLR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCLAIMCLR

op0	op1	CRn	CRm	op2

TRCCLAIMSET, Trace Claim Tag Set Register

The TRCCLAIMSET characteristics are:

Purpose

In conjunction with TRCCLAIMCLR, provides Claim Tag bits that can be separately set and cleared to indicate whether functionality is in use by a debug agent.

For additional information, see the CoreSight Architecture Specification.

Configuration

AArch64 System register TRCCLAIMSET bits [63:0] are architecturally mapped to AArch64 System register TRCCLAIMCLR[63:0].

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMSET[31:0].

AArch64 System register TRCCLAIMSET bits [31:0] are architecturally mapped to External register TRCCLAIMCLR[31:0].

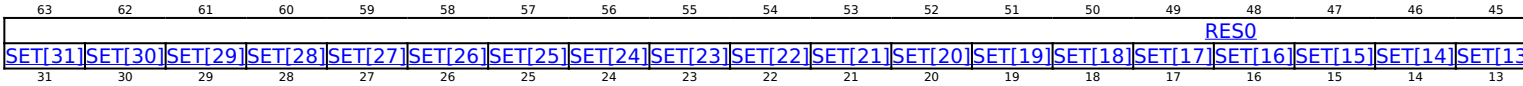
This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCCLAIMSET are UNDEFINED.

The number of claim tag bits implemented is IMPLEMENTATION DEFINED. Arm recommends that implementations support a minimum of four claim tag bits, that is, SET[3:0] reads as 0b1111.

Attributes

TRCCLAIMSET is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

SET[<m>], bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

SET[<m>]	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

Accessing this field has the following behavior:

- When m >= NUM_TRC_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is RAO/W1S.

Configuration

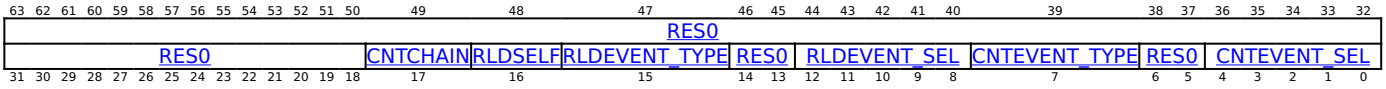
AArch64 System register TRCCNTCTLR<n> bits [31:0] are architecturally mapped to External register TRCCNTCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTCTLR<n> are UNDEFINED.

Attributes

TRCCNTCTLR<n> is a 64-bit register.

Field descriptions



Bits [63:18]

Reserved, RES0.

CNTCHAIN, bit [17]
When n is odd:

For TRCCNTCTLR3 and TRCCNTCTLR1, this field controls whether the Counter decrements when a reload event occurs for Counter <n-1>.

CNTCHAIN	Meaning
0b0	The Counter does not decrement when a reload event for Counter <n-1> occurs.
0b1	Counter <n> decrements when a reload event for Counter <n-1> occurs. This concatenates Counter <n> and Counter <n-1>, to provide a larger count value.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLDSELF, bit [16]

Controls whether a reload event occurs for the Counter, when the Counter reaches zero.

RLDSELF	Meaning
0b0	Normal mode. The Counter is in Normal mode.
0b1	Self-reload mode. The Counter is in Self-reload mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RLDEVENT_TYPE, bit [15]

Selects an event, that when it occurs causes a reload event for Counter <n>

Chooses the type of Resource Selector.

RLDEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.RLDEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.RLDEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

RLDEVENT_SEL, bits [12:8]

Selects an event, that when it occurs causes a reload event for Counter <n>

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.RLDEVENT.TYPE controls whether TRCCNTCTLR<n>.RLDEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

CNTEVENT_TYPE, bit [7]

Selects an event, that when it occurs causes Counter <n> to decrement.

Chooses the type of Resource Selector.

CNTEVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCCNTCTLR<n>.CNTEVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCCNTCTLR<n>.CNTEVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

CNTEVENT_SEL, bits [4:0]

Selects an event, that when it occurs causes Counter <n> to decrement.

Defines the selected Resource Selector or pair of Resource Selectors. TRCCNTCTLR<n>.CNTEVENT.TYPE controls whether TRCCNTCTLR<n>.CNTEVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTCTLR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCNTCTLR<m> ; Where m = 0-3

TRCCNTRLDVR<n>, Trace Counter Reload Value Register <n>, n = 0 - 3

The TRCCNTRLDVR<n> characteristics are:

Purpose

This sets or returns the reload count value for Counter <n>.

Configuration

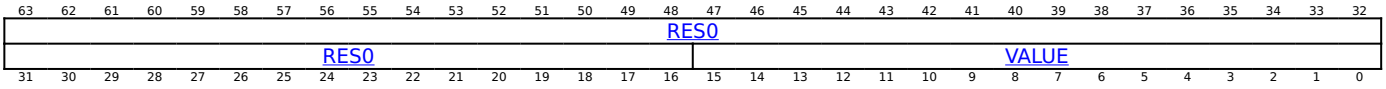
AArch64 System register TRCCNTRLDVR<n> bits [31:0] are architecturally mapped to External register TRCCNTRLDVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR5.NUMCNTR) > n. Otherwise, direct accesses to TRCCNTRLDVR<n> are UNDEFINED.

Attributes

TRCCNTRLDVR<n> is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

VALUE, bits [15:0]

Contains the reload value for Counter <n>. When a reload event occurs for Counter <n> then the trace unit copies the VALUE<n> field into Counter <n>.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCCNTRLDVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.COUNTERS[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCNTRLDVR<m> ; Where m = 0-3

TRCCONFIGR, Trace Configuration Register

The TRCCONFIGR characteristics are:

Purpose

Controls the tracing options.

Configuration

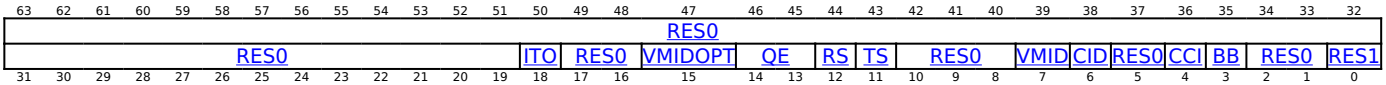
AArch64 System register TRCCONFIGR bits [31:0] are architecturally mapped to External register TRCCONFIGR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCCONFIGR are UNDEFINED.

Attributes

TRCCONFIGR is a 64-bit register.

Field descriptions



Bits [63:19]

Reserved, RES0.

ITO, bit [18]
When TRCIDR0.ITE == '1':

Instrumentation Trace Override.

ITO	Meaning
0b0	Instrumentation Trace Override disabled.
0b1	Instrumentation Trace Override enabled.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [17:16]

Reserved, RES0.

VMIDOPT, bit [15]
When TRCIDR2.VMIDOPT == '01':

Virtual context identifier selection control.

VMIDOPT	Meaning
0b0	VTTBR_EL2.VMID is used as the Virtual context identifier.
0b1	CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == '00':

Reserved, RES0.

Virtual context identifier selection control.

VTTBR_EL2.VMID is used as the Virtual context identifier.

When TRCIDR2.VMIDOPT == '10':

Reserved, RES1.

Virtual context identifier selection control.

CONTEXTIDR_EL2.PROCID is used as the Virtual context identifier.

Otherwise:

Reserved, RES0.

QE, bits [14:13]
When TRCIDR0.QSUPP == '01':

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled. Q elements without instruction counts are disabled.

All other values are reserved.

When TRCIDR0.QSUPP == '10':

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b11	Q elements with instruction counts are enabled. Q elements without instruction counts are enabled.

All other values are reserved.

When TRCIDR0.QSUPP == '11':

Q element generation control.

QE	Meaning
0b00	Q elements are disabled.
0b01	Q elements with instruction counts are enabled. Q elements without instruction counts are disabled.
0b11	Q elements with instruction counts are enabled. Q elements without instruction counts are enabled.

All other values are reserved.

Otherwise:

Reserved, RES0.

RS, bit [12]
When TRCIDR0.RETSTACK == '1':

Return stack control.

RS	Meaning
0b0	Return stack is disabled.
0b1	Return stack is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TS, bit [11]
When TRCIDR0.TSSIZE != '00000':

Global timestamp tracing control.

TS	Meaning
0b0	Global timestamp tracing is disabled.
0b1	Global timestamp tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [10:8]

Reserved, RES0.

VMID, bit [7]
When TRCIDR2.VMIDSIZE != '00000':

Virtual context identifier tracing control.

VMID	Meaning
0b0	Virtual context identifier tracing is disabled.
0b1	Virtual context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CID, bit [6]
When TRCIDR2.CIDSIZE != '00000':

Context identifier tracing control.

CID	Meaning
0b0	Context identifier tracing is disabled.
0b1	Context identifier tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

CCI, bit [4]
When TRCIDR0.TRCCCI == '1':

Cycle counting instruction tracing control.

CCI	Meaning
0b0	Cycle counting instruction tracing is disabled.
0b1	Cycle counting instruction tracing is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BB, bit [3]
When TRCIDR0.TRCBB == '1':

Branch broadcasting control.

BB	Meaning
0b0	Branch broadcasting is disabled.
0b1	Branch broadcasting is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [2:1]

Reserved, RES0.

Bit [0]

Reserved, RES1.

Accessing TRCCONFIGR

Must always be programmed.

TRCCONFIGR.QE must be set to 0b00 if TRCCONFIGR.BB is not 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCCONFIGR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0100	0b000

TRCDEVARCH, Trace Device Architecture Register

The TRCDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

For additional information, see the CoreSight Architecture Specification.

Configuration

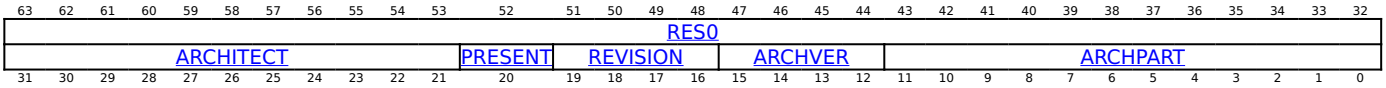
AArch64 System register TRCDEVARCH bits [31:0] are architecturally mapped to External register TRCDEVARCH[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCDEVARCH are UNDEFINED.

Attributes

TRCDEVARCH is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Defines the architect of the component. For Trace, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the TRCDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
0b0000	ETEv1.0, FEAT_ETE.
0b0001	ETEv1.1, FEAT_ETEv1p1.
0b0010	ETEv1.2, FEAT_ETEv1p2.
0b0011	ETEv1.3, FEAT_ETEv1p3.

All other values are reserved.

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0101	ETEv1.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHVER is ARCHID[15:12].

This field reads as 0x5.

Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA13	Arm PE trace architecture.

ARCHVER and ARCHPART are also defined as a single field, ARCHID, so that ARCHPART is ARCHID[11:0].

This field reads as 0xA13.

Access to this field is RO.

Accessing TRCDEVARCH

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCDEVARCH

op0	op1	CRn	CRm	op2
0b10	0b001	0b0111	0b1111	0b110

TRCEVENTCTL0R, Trace Event Control 0 Register

The TRCEVENTCTL0R characteristics are:

Purpose

Controls the generation of ETEEvents.

Configuration

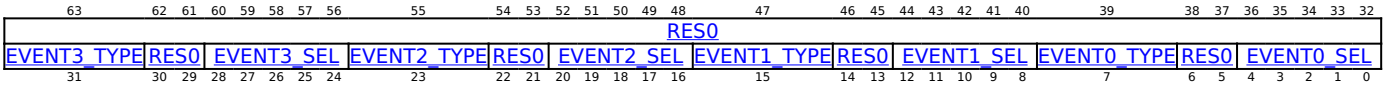
AArch64 System register TRCEVENTCTL0R bits [31:0] are architecturally mapped to External register TRCEVENTCTL0R[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR4.NUMRSPAIR != '0000'. Otherwise, direct accesses to TRCEVENTCTL0R are UNDEFINED.

Attributes

TRCEVENTCTL0R is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

EVENT3_TYPE, bit [31]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 3:

Chooses the type of Resource Selector.

EVENT3_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT3.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT3.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:29]

Reserved, RES0.

EVENT3_SEL, bits [28:24]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 3:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[3] == 1, then Event element 3 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT3.TYPE controls whether TRCEVENTCTL0R.EVENT3.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT2_TYPE, bit [23]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 2:

Chooses the type of Resource Selector.

EVENT2_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT2.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT2.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [22:21]

Reserved, RES0.

EVENT2_SEL, bits [20:16]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 2:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[2] == 1, then Event element 2 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT2.TYPE controls whether TRCEVENTCTL0R.EVENT2.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT1_TYPE, bit [15]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 1:

Chooses the type of Resource Selector.

EVENT1_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT1.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT1.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [14:13]

Reserved, RES0.

EVENT1_SEL, bits [12:8]
When TRCIDR4.NUMRSPAIR != '0000' and UInt(TRCIDR0.NUMEVENT) >= 1:

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[1] == 1, then Event element 1 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT1.TYPE controls whether TRCEVENTCTL0R.EVENT1.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EVENT0_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != '0000':

Chooses the type of Resource Selector.

EVENT0_TYPE	Meaning
0b0	A single Resource Selector. TRCEVENTCTL0R.EVENT0.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCEVENTCTL0R.EVENT0.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT0_SEL, bits [4:0]
When TRCIDR4.NUMRSPAIR != '0000':

When any of the selected resource events occurs and TRCEVENTCTL1R.INSTEN[0] == 1, then Event element 0 is generated in the instruction trace element stream.

Defines the selected Resource Selector or pair of Resource Selectors. TRCEVENTCTL0R.EVENT0.TYPE controls whether TRCEVENTCTL0R.EVENT0.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCEVENTCTL0R

TRCEVENTCTL1R, Trace Event Control 1 Register

The TRCEVENTCTL1R characteristics are:

Purpose

Controls the behavior of the ETEEvents that TRCEVENTCTL0R selects.

Configuration

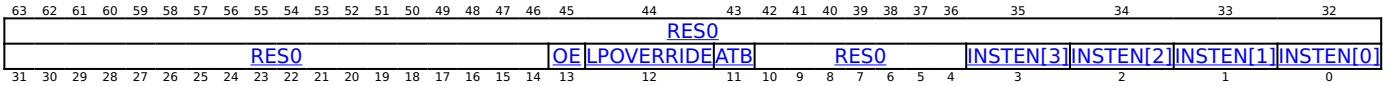
AArch64 System register TRCEVENTCTL1R bits [31:0] are architecturally mapped to External register TRCEVENTCTL1R[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCEVENTCTL1R are UNDEFINED.

Attributes

TRCEVENTCTL1R is a 64-bit register.

Field descriptions



Bits [63:14]

Reserved, RES0.

OE, bit [13]
When TRCIDR5.OE == '1':

ETE Trace Output Enable control.

OE	Meaning
0b0	Trace output to any IMPLEMENTATION DEFINED trace output interface is disabled.
0b1	Trace output to any IMPLEMENTATION DEFINED trace output interface is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

LPOVERRIDE, bit [12]
When TRCIDR5.LPOVERRIDE == '1':

Low-power Override Mode select.

LPOVERRIDE	Meaning
0b0	Trace unit Low-power Override Mode is not enabled. That is, the trace unit is permitted to enter low-power state.
0b1	Trace unit Low-power Override Mode is enabled. That is, entry to a low-power state does not affect the trace unit resources or trace generation.

Otherwise:

Reserved, RES0.

ATB, bit [11]
When TRCIDR5.ATBTRIG == '1':

AMBA Trace Bus (ATB) trigger enable.

If a CoreSight ATB interface is implemented then when ETEEvent 0 occurs the trace unit sets:

- ATID == 0x7D.
- ATDATA to the value of TRCTRACEIDR.

If the width of ATDATA is greater than the width of TRCTRACEIDR.TRACEID then the trace unit zeros the upper ATDATA bits.

If ETEEvent 0 is programmed to occur based on program execution, such as an Address Comparator, the ATB trigger might not be inserted into the ATB stream at the same time as any trace generated by that program execution is output by the trace unit. Typically, the generated trace might be buffered in a trace unit which means that the ATB trigger would be output before the associated trace is output.

If ETEEvent 0 is asserted multiple times in close succession, the trace unit is required to generate an ATB trigger for the first assertion, but might ignore one or more of the subsequent assertions. Arm recommends that the window in which ETEEvent 0 is ignored is limited only by the time taken to output an ATB trigger.

ATB	Meaning
0b0	ATB trigger is disabled.
0b1	ATB trigger is enabled.

Otherwise:

Reserved, RES0.

Bits [10:4]

Reserved, RES0.

INSTEN[<m>], bit [m], for m = 3 to 0

Event element control.

INSTEN[<m>]	Meaning
0b0	The trace unit does not generate an Event element <m>.
0b1	The trace unit generates an Event element <m> when ETEEvent <m> occurs.

Accessing this field has the following behavior:

- When TRCIDR4.NUMRSPAIR == '0000', access to this field is RES0 .
- Access to this field is RES0 if all the following are true:
  - TRCIDR4.NUMRSPAIR != '0000'.
  - m > UInt(TRCIDR0.NUMEVENT).
- Otherwise, access to this field is RW.

Accessing TRCEVENTCTL1R

Must be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCEVENTCTL1R

op0	op1	CRn	CRm	op2

2025-12-10 16:11:30, 2025-12_rel

TRCEXTINSELR<n>, Trace External Input Select Register <n>, n = 0 - 3

The TRCEXTINSELR<n> characteristics are:

Purpose

Use this to set, or read, which External Inputs are resources to the trace unit.

The name TRCEXTINSELR is an alias of TRCEXTINSELR0.

Configuration

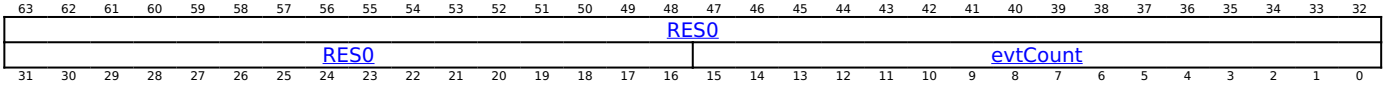
AArch64 System register TRCEXTINSELR<n> bits [31:0] are architecturally mapped to External register TRCEXTINSELR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR5.NUMEXTINSEL) > n. Otherwise, direct accesses to TRCEXTINSELR<n> are UNDEFINED.

Attributes

TRCEXTINSELR<n> is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

evtCount, bits [15:0]

PMU event to select.

The event number as defined by the Arm ARM.

Software must program this field with a PMU event that is supported by the PE being programmed.

There are three ranges of PMU event numbers:

- PMU event numbers in the range 0x0000 to 0x003F are common architectural and microarchitectural events.
- PMU event numbers in the range 0x0040 to 0x00BF are Arm recommended common architectural and microarchitectural PMU events.
- PMU event numbers in the range 0x00C0 to 0x03FF are IMPLEMENTATION DEFINED PMU events.

If evtCount is programmed to a PMU event that is reserved or not supported by the PE, the behavior depends on the PMU event type:

- For the range 0x0000 to 0x003F, then the PMU event is not active, and the value returned by a direct or external read of the evtCount field is the value written to the field.
- For IMPLEMENTATION DEFINED PMU events, it is UNPREDICTABLE what PMU event, if any, is counted, and the value returned by a direct or external read of the evtCount field is UNKNOWN.

UNPREDICTABLE means the PMU event must not expose privileged information.

Arm recommends that the behavior across a family of implementations is defined such that if a given implementation does not include a PMU event from a set of common IMPLEMENTATION DEFINED PMU events, then no PMU event is counted and the value read back on evtCount is the value written.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCEXTINSELR<n>

Must be programmed if any of the following is true: TRCRSCTLR<a>.GROUP == 0b0000 and TRCRSCTLR<a>.EXTIN[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCEXTINSELR<m> ; Where m = 0-3

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b10:m[1:0]	0b100

```
let m:integer = UInt(CRm[1:0]);

TRCIDR0, Trace ID Register 0

The TRCIDR0 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

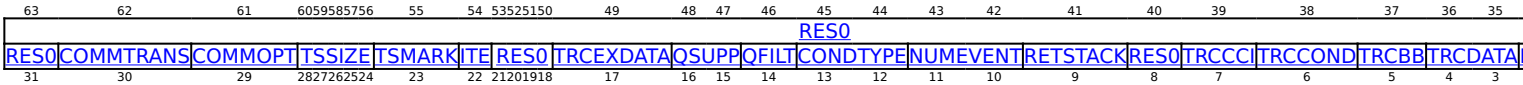
AArch64 System register TRCIDR0 bits [31:0] are architecturally mapped to External register TRCIDR0[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR0 are UNDEFINED.

Attributes

TRCIDR0 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

COMMTRANS, bit [30]

Transaction Start element behavior.

The value of this field is an IMPLEMENTATION DEFINED choice of:

COMMTRANS	Meaning
0b0	Transaction Start elements are P0 elements.
0b1	Transaction Start elements are not P0 elements.

Access to this field is RO.

COMMOPT, bit [29]

Indicates the contents and encodings of Cycle count packets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

COMMOPT	Meaning
0b0	Commit mode 0.
0b1	Commit mode 1.

The Commit mode defines the contents and encodings of Cycle Count packets, in particular how Commit elements are indicated by these packets. See the descriptions of these packets for more details.

Accessing this field has the following behavior:

- Access to this field is RAO/WI if all the following are true:
  - TRCIDR0.TRCCCI == '1'.
  - UInt(TRCIDR8.MAXSPEC) == 0x0.
- When TRCIDR0.TRCCCI == '0', access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

TSSIZE, bits [28:24]

Indicates that the trace unit implements Global timestamping and the size of the timestamp value.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TSSIZE	Meaning
0b00000	Global timestamping not implemented.
0b01000	Global timestamping implemented with a 64-bit timestamp value.

All other values are reserved.

This field reads as 0b01000.

Access to this field is RO.

TSMARK, bit [23]

Indicates whether Timestamp Marker elements are generated.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TSMARK	Meaning
0b0	Timestamp Marker elements are not generated.
0b1	Timestamp Marker elements are generated.

Access to this field is RO.

ITE, bit [22]

Indicates whether Instrumentation Trace is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ITE	Meaning
0b0	Instrumentation Trace not implemented.
0b1	Instrumentation Trace implemented.

This field has the value 1 if FEAT_ITE is implemented.

Access to this field is RO.

Bits [21:18]

Reserved, RES0.

TRCEXDATA, bit [17]
When TRCIDR0.TRCDATA != '00':

Indicates if the trace unit implements tracing of data transfers for exceptions and exception returns. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCEXDATA	Meaning
0b0	Tracing of data transfers for exceptions and exception returns not implemented.
0b1	Tracing of data transfers for exceptions and exception returns implemented.

Access to this field is RO.

Otherwise:

Reserved, RES0.

QSUPP, bits [16:15]

Indicates that the trace unit implements Q element support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

QSUPP	Meaning
0b00	Q element support is not implemented.
0b01	Q element support is implemented, and only supports Q elements with instruction counts.
0b10	Q element support is implemented, and only supports Q elements without instruction counts.
0b11	Q element support is implemented, and supports: • Q elements with instruction counts. • Q elements without instruction counts.

Access to this field is RO.

QFILT, bit [14]

Indicates if the trace unit implements Q element filtering.

The value of this field is an IMPLEMENTATION DEFINED choice of:

QFILT	Meaning
0b0	Q element filtering is not implemented.
0b1	Q element filtering is implemented.

If TRCIDR0.QSUPP == 0b00 then this field is 0.

Access to this field is RO.

CONDTYPE, bits [13:12]
When TRCIDR0.TRCCOND == '1':

Indicates how conditional instructions are traced. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CONDTYPE	Meaning
0b00	Conditional instructions are traced with an indication of whether they pass or fail their condition code check.
0b01	Conditional instructions are traced with an indication of the APSR condition flags.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NUMEVENT, bits [11:10]
When TRCIDR4.NUMRSPAIR == '0000':

Indicates the number of ETEEvents implemented.

NUMEVENT	Meaning
0b00	The trace unit supports 0 ETEEvents.

All other values are reserved.

Access to this field is RO.

When TRCIDR4.NUMRSPAIR != '0000':

Indicates the number of ETEEvents implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMEVENT	Meaning
0b00	The trace unit supports 1 ETEEvent.
0b01	The trace unit supports 2 ETEEvents.
0b10	The trace unit supports 3 ETEEvents.
0b11	The trace unit supports 4 ETEEvents.

Access to this field is RO.

Otherwise:

Reserved, RES0.

RETSTACK, bit [9]

Indicates if the trace unit supports the return stack.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RETSTACK	Meaning
0b0	Return stack not implemented.
0b1	Return stack implemented.

Access to this field is RO.

Bit [8]

Reserved, RES0.

TRCCCI, bit [7]

Indicates if the trace unit implements cycle counting.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCCCI	Meaning
0b0	Cycle counting not implemented.
0b1	Cycle counting implemented.

This field reads as 1.

Access to this field is RO.

TRCCOND, bit [6]

Indicates if the trace unit implements conditional instruction tracing. Conditional instruction tracing is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCCOND	Meaning
0b0	Conditional instruction tracing not implemented.
0b1	Conditional instruction tracing implemented.

This field reads as 0.

Access to this field is RO.

TRCBB, bit [5]

Indicates if the trace unit implements branch broadcasting.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCBB	Meaning
0b0	Branch broadcasting not implemented.
0b1	Branch broadcasting implemented.

This field reads as 1.

Access to this field is RO.

TRCDATA, bits [4:3]

Indicates if the trace unit implements data tracing. Data tracing is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCDATA	Meaning
0b00	Data tracing not implemented.
0b11	Data tracing implemented.

All other values are reserved.

This field reads as 0b00.

Access to this field is RO.

INSTP0, bits [2:1]

Indicates if load and store instructions are P0 instructions. Load and store instructions as P0 instructions is not implemented in ETE and this field is reserved for other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INSTP0	Meaning
0b00	Load and store instructions are not P0 instructions.
0b11	Load and store instructions are P0 instructions.

All other values are reserved.

When FEAT_ETE is implemented, the only permitted value is 0b00.

Access to this field is RO.

Bit [0]

Reserved, RES1.

Accessing TRCIDR0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR0

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1000	0b111

TRCIDR1, Trace ID Register 1

The TRCIDR1 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

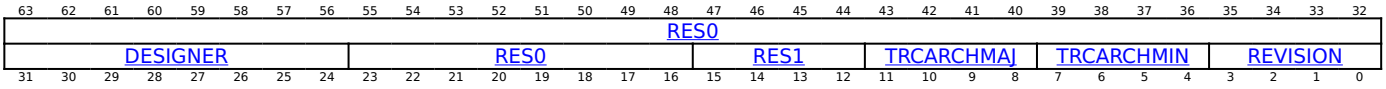
AArch64 System register TRCIDR1 bits [31:0] are architecturally mapped to External register TRCIDR1[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR1 are UNDEFINED.

Attributes

TRCIDR1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

DESIGNER, bits [31:24]

Indicates which company designed the trace unit. The permitted values of this field are the same as MIDR_EL1.Implementer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RES1.

TRCARCHMAJ, bits [11:8]

Major architecture version.

TRCARCHMAJ	Meaning
0b1111	If both TRCIDR1.TRCARCHMAJ and TRCIDR1.TRCARCHMIN == 0xF then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

Access to this field is RO.

TRCARCHMIN, bits [7:4]

Minor architecture version.

TRCARCHMIN	Meaning
0b1111	If both TRCIDR1.TRCARCHMAJ and TRCIDR1.TRCARCHMIN == 0xF then refer to TRCDEVARCH.

All other values are reserved.

This field reads as 0b1111.

Access to this field is RO.

REVISION, bits [3:0]

Implementation revision.

Returns an IMPLEMENTATION DEFINED value that identifies the revision of the trace unit.

Arm deprecates any use of this field and recommends that implementations set this field to zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCIDR1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR1

op0	op1	CRn	CRm	op2

TRCIDR2, Trace ID Register 2

The TRCIDR2 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

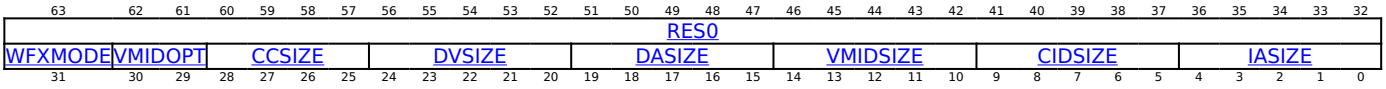
AArch64 System register TRCIDR2 bits [31:0] are architecturally mapped to External register TRCIDR2[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR2 are UNDEFINED.

Attributes

TRCIDR2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

WFXMODE, bit [31]

Indicates whether WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions:

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFXMODE	Meaning
0b0	WFI, WFIT, WFE, and WFET instructions are not classified as P0 instructions.
0b1	WFI, WFIT, WFE, and WFET instructions are classified as P0 instructions.

Access to this field is RO.

VMIDOPT, bits [30:29]

Indicates the options for Virtual context identifier selection.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDOPT	Meaning
0b00	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES0.
0b01	Virtual context identifier selection supported. TRCCONFIGR.VMIDOPT is implemented.
0b10	Virtual context identifier selection not supported. TRCCONFIGR.VMIDOPT is RES1.

All other values are reserved.

If TRCIDR2.VMIDSIZE == 0b00000 then this field is 0b00.

If TRCIDR2.VMIDSIZE != 0b00000 then this field is 0b10.

Access to this field is RO.

CCSIZE, bits [28:25]
When TRCIDR0.TRCCCI == '1':

Indicates the size of the cycle counter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCSIZE	Meaning
0b0000	The cycle counter is 12 bits in length.
0b0001	The cycle counter is 13 bits in length.
0b0010	The cycle counter is 14 bits in length.
0b0011	The cycle counter is 15 bits in length.
0b0100	The cycle counter is 16 bits in length.
0b0101	The cycle counter is 17 bits in length.
0b0110	The cycle counter is 18 bits in length.
0b0111	The cycle counter is 19 bits in length.
0b1000	The cycle counter is 20 bits in length.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DVSIZE, bits [24:20]
When TRCIDR0.TRCDATA != '00':

Indicates the data value size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DVSIZE	Meaning
0b00000	Data value tracing not implemented.
0b00100	Data value tracing has a maximum of 32-bit data values.
0b01000	Data value tracing has a maximum of 64-bit data values.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DASIZE, bits [19:15]
When TRCIDR0.TRCDATA != '00':

Indicates the data address size in bytes. Data tracing is not implemented in ETE and this field is reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DASIZE	Meaning
0b00000	Data address tracing not implemented.
0b00100	Data address tracing has a maximum of 32-bit data addresses.
0b01000	Data address tracing has a maximum of 64-bit data addresses.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

VMIDSIZE, bits [14:10]

Indicates the trace unit Virtual context identifier size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDSIZE	Meaning
0b00000	Virtual context identifier tracing is not supported.
0b00001	8-bit Virtual context identifier size.
0b00010	16-bit Virtual context identifier size.
0b00100	32-bit Virtual context identifier size.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b00000.

If the PE implements EL2 then this field is 0b00100.

Access to this field is RO.

CIDSIZE, bits [9:5]

Indicates the Context identifier size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CIDSIZE	Meaning
0b00000	Context identifier tracing is not supported.
0b00100	32-bit Context identifier size.

All other values are reserved.

This field reads as 0b00100.

Access to this field is RO.

IASIZE, bits [4:0]

Virtual instruction address size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IASIZE	Meaning
0b00100	Maximum of 32-bit instruction address size.
0b01000	Maximum of 64-bit instruction address size.

All other values are reserved.

This field reads as 0b01000.

Access to this field is RO.

Accessing TRCIDR2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR2

TRCIDR3, Trace ID Register 3

The TRCIDR3 characteristics are:

Purpose

Returns the base architecture of the trace unit.

Configuration

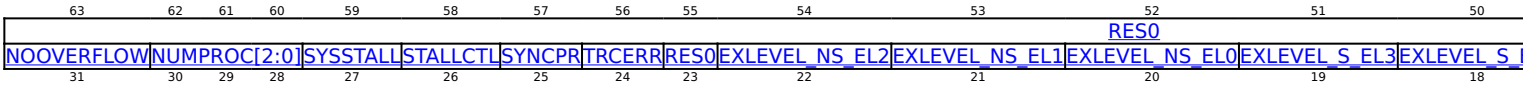
AArch64 System register TRCIDR3 bits [31:0] are architecturally mapped to External register TRCIDR3[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR3 are UNDEFINED.

Attributes

TRCIDR3 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NOOVERFLOW, bit [31]

Indicates if overflow prevention is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NOOVERFLOW	Meaning
0b0	Overflow prevention is not implemented.
0b1	Overflow prevention is implemented.

If TRCIDR3.STALLCTL == 0 then this field is 0.

Access to this field is RO.

NUMPROC, bits [13:12, 30:28]

Indicates the number of PEs available for tracing.

NUMPROC	Meaning
0b00000	The trace unit can trace one PE.

This field reads as 0b00000.

The NUMPROC field is split as follows:

- NUMPROC[2:0] is TRCIDR3[30:28].
- NUMPROC[4:3] is TRCIDR3[13:12].

Access to this field is RO.

SYSSTALL, bit [27]

Indicates if stalling of the PE is permitted.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSSTALL	Meaning
0b0	Stalling of the PE is not permitted.
0b1	Stalling of the PE is permitted.

The value of this field might be dynamic and change based on system conditions.

If TRCIDR3.STALLCTL == 0 then this field is 0.

Access to this field is RO.

STALLCTL, bit [26]

Indicates if trace unit implements stalling of the PE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

STALLCTL	Meaning
0b0	Stalling of the PE is not implemented.
0b1	Stalling of the PE is implemented.

Access to this field is RO.

SYNCPR, bit [25]

Indicates if an implementation has a fixed synchronization period.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYNCPR	Meaning
0b0	TRCSYNCPR is read/write so software can change the synchronization period.
0b1	TRCSYNCPR is read-only so the synchronization period is fixed.

This field reads as 0.

Access to this field is RO.

TRCERR, bit [24]

Indicates forced tracing of System Error exceptions is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is not implemented.
0b1	Forced tracing of System Error exceptions is implemented.

This field reads as 1.

Access to this field is RO.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]

Indicates if Non-secure EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL2	Meaning
0b0	Non-secure EL2 is not implemented.
0b1	Non-secure EL2 is implemented.

Access to this field is RO.

EXLEVEL_NS_EL1, bit [21]

Indicates if Non-secure EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL1	Meaning
0b0	Non-secure EL1 is not implemented.
0b1	Non-secure EL1 is implemented.

Access to this field is RO.

EXLEVEL_NS_EL0, bit [20]

Indicates if Non-secure EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_NS_EL0	Meaning
0b0	Non-secure EL0 is not implemented.
0b1	Non-secure EL0 is implemented.

Access to this field is RO.

EXLEVEL_S_EL3, bit [19]

Indicates if EL3 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL3	Meaning
0b0	EL3 is not implemented.
0b1	EL3 is implemented.

Access to this field is RO.

EXLEVEL_S_EL2, bit [18]

Indicates if Secure EL2 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL2	Meaning
0b0	Secure EL2 is not implemented.
0b1	Secure EL2 is implemented.

Access to this field is RO.

EXLEVEL_S_EL1, bit [17]

Indicates if Secure EL1 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL1	Meaning
0b0	Secure EL1 is not implemented.
0b1	Secure EL1 is implemented.

Access to this field is RO.

EXLEVEL_S_EL0, bit [16]

Indicates if Secure EL0 is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EXLEVEL_S_EL0	Meaning
0b0	Secure EL0 is not implemented.
0b1	Secure EL0 is implemented.

Access to this field is RO.

Bits [15:14]

Reserved, RES0.

CCITMIN, bits [11:0]
When TRCIDR0.TRCCCI == '0':

Indicates the minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

Reads as 0x000.

Access to this field is RO.

When TRCIDR0.TRCCCI == '1':

Indicates the minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCITMIN	Meaning
0x001..0xFFF	The minimum value that can be programmed in TRCCCCTLR.THRESHOLD.

The minimum value of this field is 0x001.

Access to this field is RO.

Otherwise:

Reserved, RES0.

TRCIDR4, Trace ID Register 4

The TRCIDR4 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

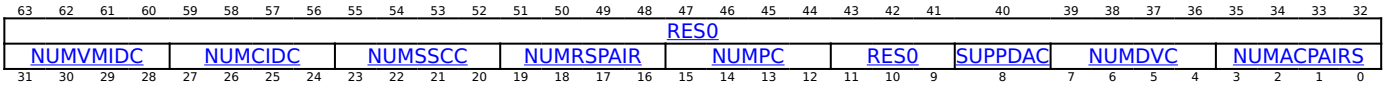
AArch64 System register TRCIDR4 bits [31:0] are architecturally mapped to External register TRCIDR4[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR4 are UNDEFINED.

Attributes

TRCIDR4 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NUMVMIDC, bits [31:28]

Indicates the number of Virtual Context Identifier Comparators that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMVMIDC	Meaning
0b0000..0b1000	The number of Virtual Context Identifier Comparators in this implementation.

All other values are reserved.

If the PE does not implement EL2 then this field is 0b0000.

Access to this field is RO.

NUMCIDC, bits [27:24]

Indicates the number of Context Identifier Comparators that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMCIDC	Meaning
0b0000..0b1000	The number of Context Identifier Comparators in this implementation.

All other values are reserved.

Access to this field is RO.

NUMSSCC, bits [23:20]

Indicates the number of Single-shot Comparator Controls that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMSSCC	Meaning
0b0000..0b1000	The number of Single-shot Comparator Controls in this implementation.

All other values are reserved.

Access to this field is RO.

NUMRSPAIR, bits [19:16]

Indicates the number of resource selector pairs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMRSPAIR	Meaning
0b0000	This implementation has zero resource selector pairs.
0b0001..0b1111	The number of resource selector pairs in this implementation, minus one.

All other values are reserved.

Access to this field is RO.

NUMPC, bits [15:12]

Indicates the number of PE Comparator Inputs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMPC	Meaning
0b0000..0b1000	The number of PE Comparator Inputs in this implementation.

All other values are reserved.

Access to this field is RO.

Bits [11:9]

Reserved, RES0.

SUPPDAC, bit [8]
When TRCIDR4.NUMACPAIRS != '0000':

Indicates whether data address comparisons are implemented. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SUPPDAC	Meaning
0b0	Data address comparisons not implemented.
0b1	Data address comparisons implemented.

This field reads as 0b0.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NUMDVC, bits [7:4]

Indicates the number of data value comparators. Data value comparators are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMDVC	Meaning
0b0000..0b1000	The number of data value comparators in this implementation.

All other values are reserved.

This field reads as 0b0000.

Access to this field is RO.

NUMACPAIRS, bits [3:0]

Indicates the number of Address Comparator pairs that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMACPAIRS	Meaning
0b0000..0b1000	The number of Address Comparator pairs in this implementation.

All other values are reserved.

Access to this field is RO.

Accessing TRCIDR4

Accesses to this register use the following encodings in the System register encoding space:

TRCIDR5, Trace ID Register 5

The TRCIDR5 characteristics are:

Purpose

Returns the tracing capabilities of the trace unit.

Configuration

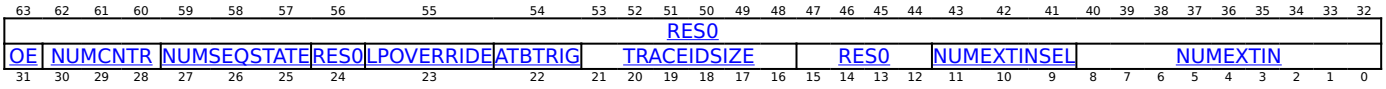
AArch64 System register TRCIDR5 bits [31:0] are architecturally mapped to External register TRCIDR5[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR5 are UNDEFINED.

Attributes

TRCIDR5 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

OE, bit [31]

Indicates support for the ETE Trace Output Enable.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OE	Meaning
0b0	ETE Trace Output Enable is not implemented.
0b1	ETE Trace Output Enable is implemented.

When FEAT_ETEv1p3 is implemented and when any IMPLEMENTATION DEFINED trace output interface is implemented, this field is 1.

Access to this field is RO.

NUMCNTR, bits [30:28]

Indicates the number of Counters that are available for tracing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMCNTR	Meaning
0b000..0b100	The number of Counters implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

Access to this field is RO.

NUMSEQSTATE, bits [27:25]

Indicates if the Sequencer is implemented and the number of Sequencer states that are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMSEQSTATE	Meaning
0b000	The Sequencer is not implemented.
0b100	Four Sequencer states are implemented.

All other values are reserved.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0b000.

Access to this field is RO.

Bit [24]

Reserved, RES0.

LPOVERRIDE, bit [23]

Indicates support for Low-power Override Mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LPOVERRIDE	Meaning
0b0	The trace unit does not support Low-power Override Mode.
0b1	The trace unit supports Low-power Override Mode.

Access to this field is RO.

ATBTRIG, bit [22]

Indicates if the implementation can support ATB triggers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ATBTRIG	Meaning
0b0	The implementation does not support ATB triggers.
0b1	The implementation supports ATB triggers.

If TRCIDR4.NUMRSPAIR == 0b0000 then this field is 0.

Access to this field is RO.

TRACEIDSIZE, bits [21:16]

Indicates the trace ID width.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRACEIDSIZE	Meaning
0b000000	The external trace interface is not implemented.
0b000111	The implementation supports a 7-bit trace ID.

All other values are reserved.

Note

AMBA ATB requires a 7-bit trace ID width.

Access to this field is RO.

Bits [15:12]

Reserved, RES0.

NUMEXTINSEL, bits [11:9]

Indicates how many External Input Selector resources are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NUMEXTINSEL	Meaning
0b000..0b100	The number of External Input Selector resources implemented.

All other values are reserved.

Access to this field is RO.

NUMEXTIN, bits [8:0]

Indicates how many External Inputs are implemented.

NUMEXTIN	Meaning
0b111111111	Unified PMU event selection.

All other values are reserved.

Access to this field is RO.

Accessing TRCIDR5

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR5

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1101	0b111

TRCIDR8, Trace ID Register 8

The TRCIDR8 characteristics are:

Purpose

Returns the maximum speculation depth of the instruction trace element stream.

Configuration

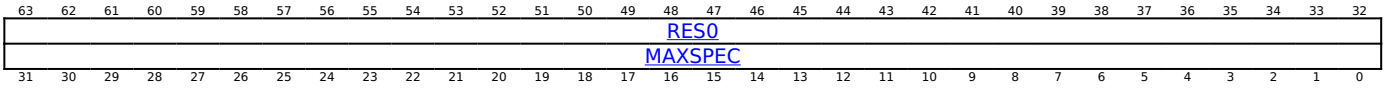
AArch64 System register TRCIDR8 bits [31:0] are architecturally mapped to External register TRCIDR8[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIDR8 are UNDEFINED.

Attributes

TRCIDR8 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

MAXSPEC, bits [31:0]

Indicates the maximum speculation depth of the instruction trace element stream. This is the maximum number of P0 elements in the trace element stream that can be speculative at any time.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing TRCIDR8

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCIDR8

op0	op1	CRn	CRm	op2

TRCIMSPEC0, Trace IMP DEF Register 0

The TRCIMSPEC0 characteristics are:

Purpose

TRCIMSPEC0 shows the presence of any IMPLEMENTATION DEFINED features, and provides an interface to enable the features that are provided.

Configuration

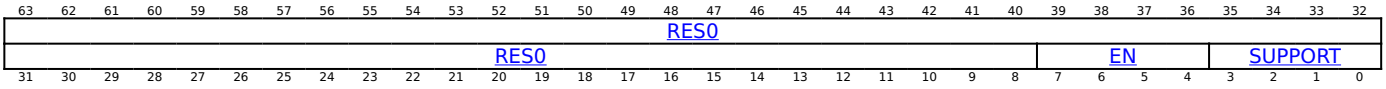
AArch64 System register TRCIMSPEC0 bits [31:0] are architecturally mapped to External register TRCIMSPEC0[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIMSPEC0 are UNDEFINED.

Attributes

TRCIMSPEC0 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

EN, bits [7:4]
When TRCIMSPEC0.SUPPORT != '0000':

Enable. Controls whether the IMPLEMENTATION DEFINED features are enabled.

EN	Meaning
0b0000	The IMPLEMENTATION DEFINED features are not enabled. The trace unit must behave as if the IMPLEMENTATION DEFINED features are not supported.
0b0001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b0111	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1000	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1001	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1010	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1011	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1100	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1101	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1110	The trace unit behavior is IMPLEMENTATION DEFINED.
0b1111	The trace unit behavior is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0000'.

Otherwise:

Reserved, RES0.

SUPPORT, bits [3:0]

Indicates whether the implementation supports IMPLEMENTATION DEFINED features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SUPPORT	Meaning
0b0000	No IMPLEMENTATION DEFINED features are supported.
0b0001	IMPLEMENTATION DEFINED features are supported.
0b0010	IMPLEMENTATION DEFINED features are supported.
0b0011	IMPLEMENTATION DEFINED features are supported.
0b0100	IMPLEMENTATION DEFINED features are supported.
0b0101	IMPLEMENTATION DEFINED features are supported.
0b0110	IMPLEMENTATION DEFINED features are supported.
0b0111	IMPLEMENTATION DEFINED features are supported.
0b1000	IMPLEMENTATION DEFINED features are supported.
0b1001	IMPLEMENTATION DEFINED features are supported.
0b1010	IMPLEMENTATION DEFINED features are supported.
0b1011	IMPLEMENTATION DEFINED features are supported.
0b1100	IMPLEMENTATION DEFINED features are supported.
0b1101	IMPLEMENTATION DEFINED features are supported.
0b1110	IMPLEMENTATION DEFINED features are supported.
0b1111	IMPLEMENTATION DEFINED features are supported.

Use of nonzero values requires written permission from Arm.

Access to this field is RO.

TRCIMSPEC<n>, Trace IMP DEF Register <n>, n = 1 - 7

The TRCIMSPEC<n> characteristics are:

Purpose

These registers might return information that is specific to an implementation, or enable features specific to an implementation to be programmed. The product Technical Reference Manual describes these registers.

Configuration

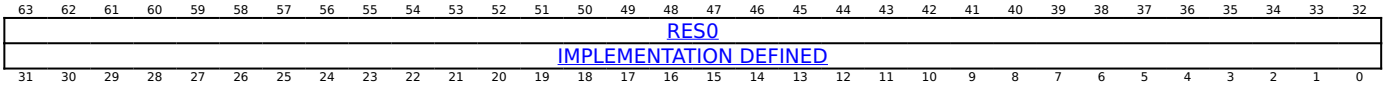
AArch64 System register TRCIMSPEC<n> bits [31:0] are architecturally mapped to External register TRCIMSPEC<n>[31:0].

This register is present only when an implementation implements TRCIMSPEC<n>, FEAT_ETE is implemented, and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCIMSPEC<n> are UNDEFINED.

Attributes

TRCIMSPEC<n> is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

This field reads as an IMPLEMENTATION DEFINED value and writes to this field have IMPLEMENTATION DEFINED behavior.

Accessing TRCIMSPEC<n>

Accesses to this register use the following encodings in the System register encoding space:

TRCIT, Trace Instrumentation

The TRCIT characteristics are:

Purpose

Generates an instrumentation packet in the trace.

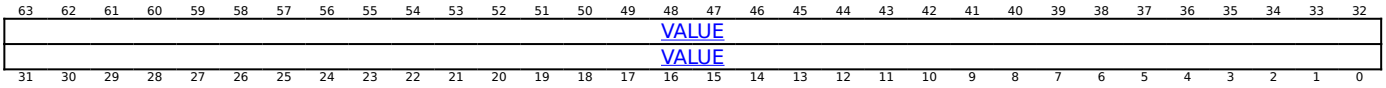
Configuration

This instruction is present only when FEAT_ITE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TRCIT are UNDEFINED.

Attributes

TRCIT is a 64-bit System instruction.

Field descriptions



VALUE, bits [63:0]

Value to be included in the Instrumentation packet.

Executing TRCIT

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TRCIT <Xt>

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0010	0b111

```
if !(IsFeatureImplemented(FEAT_ITE) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    AArch64_TRCIT(X{64}(t));
elsif PSTATE.EL == EL1 then
    AArch64_TRCIT(X{64}(t));
elsif PSTATE.EL == EL2 then
    AArch64_TRCIT(X{64}(t));
elsif PSTATE.EL == EL3 then
    AArch64_TRCIT(X{64}(t));
end;
```

TRCITECR_EL1, Instrumentation Trace Control Register (EL1)

The TRCITECR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace Instrumentation.

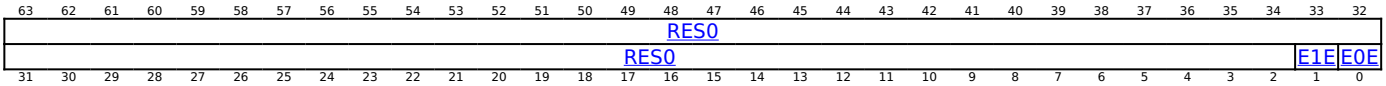
Configuration

This register is present only when FEAT_ITE is implemented, System register access to the trace unit registers is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TRCITECR_EL1 are UNDEFINED.

Attributes

TRCITECR_EL1 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

E1E, bit [1]

EL1 Instrumentation Trace Enable.

E1E	Meaning
0b0	Instrumentation trace prohibited at EL1.
0b1	Instrumentation trace not prohibited at EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0E, bit [0]

EL0 Instrumentation Trace Enable.

E0E	Meaning
0b0	Instrumentation trace prohibited at EL0.
0b1	Instrumentation trace not prohibited at EL0.

This field is ignored by the PE when EL2 is implemented and enabled in the current Security state and the Effective value of HCR_EL2.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRCITECR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TRCITECR_EL1 or TRCITECR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCITECR_EL1

TRCITECR_EL2, Instrumentation Trace Control Register (EL2)

The TRCITECR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace Instrumentation.

Configuration

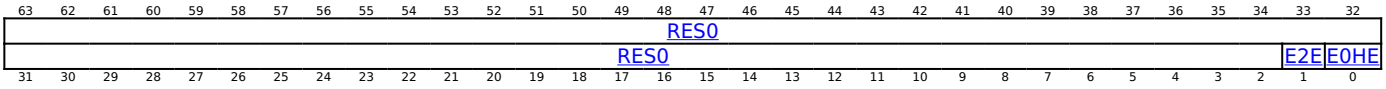
This register is present only when FEAT_ITE is implemented, System register access to the trace unit registers is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to TRCITECR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TRCITECR_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

E2E, bit [1]

EL2 Instrumentation Trace Enable.

E2E	Meaning
0b0	Instrumentation trace prohibited at EL2.
0b1	Instrumentation trace not prohibited at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0HE, bit [0]

EL0 Instrumentation Trace Enable.

E0HE	Meaning
0b0	Instrumentation trace prohibited at EL0 when the Effective value of HCR_EL2.TGE is 1.
0b1	Instrumentation trace not prohibited at EL0 when the Effective value of HCR_EL2.TGE is 1.

This field is ignored by the PE when any of the following are true:

- The Effective value of HCR_EL2.TGE is 0.
- EL2 is disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRCITECR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TRCITECR_EL2 or TRCITECR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

TRCITEEDCR, Instrumentation Trace Extension External Debug Control Register

The TRCITEEDCR characteristics are:

Purpose

Controls instrumentation trace filtering.

Configuration

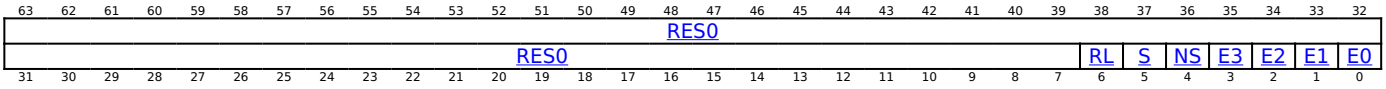
AArch64 System register TRCITEEDCR bits [31:0] are architecturally mapped to External register TRCITEEDCR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and FEAT_ITE is implemented. Otherwise, direct accesses to TRCITEEDCR are UNDEFINED.

Attributes

TRCITEEDCR is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

RL, bit [6]
When FEAT_RME is implemented:

Instrumentation Trace in Realm state.

RL	Meaning
0b0	Instrumentation trace prohibited in Realm state.
0b1	Instrumentation trace permitted in Realm state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

This field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [5]
When Secure state is implemented:

Instrumentation Trace in Secure state.

S	Meaning
0b0	Instrumentation trace prohibited in Secure state.
0b1	Instrumentation trace permitted in Secure state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

When FEAT_RME is not implemented, this field is used in conjunction with TRCCONFIGR.ITO, TRCITEEDCR.E3, and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Secure state.

When FEAT_RME is implemented, this field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NS, bit [4]
When Non-secure EL0 is implemented, or Non-secure EL1 is implemented, or Non-secure EL2 is implemented:

Instrumentation Trace in Non-secure state.

NS	Meaning
0b0	Instrumentation trace prohibited in Non-secure state.
0b1	Instrumentation trace permitted in Non-secure state.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

This field is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.E<m> to control whether Instrumentation trace is permitted or prohibited in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [3]
When EL3 is implemented:

Instrumentation Trace Enable at EL3.

E3	Meaning
0b0	Instrumentation trace prohibited at EL3.
0b1	Instrumentation trace permitted at EL3.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

When FEAT_RME is not implemented, TRCITEEDCR.E3 is used in conjunction with TRCCONFIGR.ITO and TRCITEEDCR.S to control whether Instrumentation trace is permitted or prohibited at EL3.

When FEAT_RME is implemented, TRCITEEDCR.E3 is used in conjunction with TRCCONFIGR.ITO to control whether Instrumentation trace is permitted or prohibited at EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E<m>, bit [m], for m = 2 to 0

Instrumentation Trace Enable at EL<m>.

E<m>	Meaning
0b0	Instrumentation trace prohibited at EL<m>.
0b1	Instrumentation trace permitted at EL<m>.

This field is ignored when SelfHostedTraceEnabled() returns TRUE.

This bit is used in conjunction with TRCCONFIGR.ITO, TRCITEEDCR.NS, TRCITEEDCR.S, and TRCITEEDCR.RL to control whether Instrumentation trace is permitted or prohibited at EL<m> in the specified Security states.

TRCITEEDCR.E<2> is RES0 if EL2 is not implemented in any Security states.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCITEEDCR

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCITEEDCR

TRCOSLSR, Trace OS Lock Status Register

The TRCOSLSR characteristics are:

Purpose

Returns the status of the Trace OS Lock.

Configuration

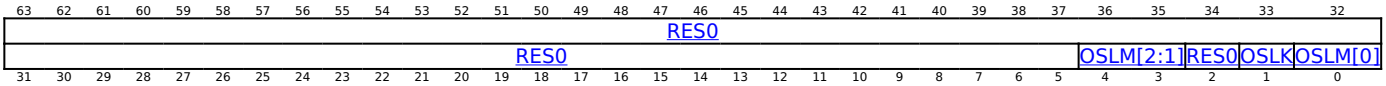
AArch64 System register TRCOSLSR bits [31:0] are architecturally mapped to External register TRCOSLSR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCOSLSR are UNDEFINED.

Attributes

TRCOSLSR is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

OSLM, bits [4:3, 0]

OS Lock model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OSLM	Meaning
0b000	Trace OS Lock is not implemented.
0b010	Trace OS Lock is implemented.
0b100	Trace OS Lock is not implemented, and the trace unit is controlled by the PE OS Lock.

All other values are reserved.

When FEAT_ETE is implemented, the values 0b000 and 0b010 are not permitted.

The OSLM field is split as follows:

- OSLM[2:1] is TRCOSLSR[4:3].
- OSLM[0] is TRCOSLSR[0].

Access to this field is RO.

Bit [2]

Reserved, RES0.

OSLK, bit [1]

OS Lock status.

OSLK	Meaning
0b0	The OS Lock is unlocked.
0b1	The OS Lock is locked.

When FEAT_ETE is implemented, this field indicates the state of the PE OS Lock.

When FEAT_ETMv4 is implemented, this field indicates the state of the Trace OS Lock.

Accessing TRCOSLSR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCOSLSR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b0001	0b100

TRCPRGCTLR, Trace Programming Control Register

The TRCPRGCTLR characteristics are:

Purpose

Enables the trace unit.

Configuration

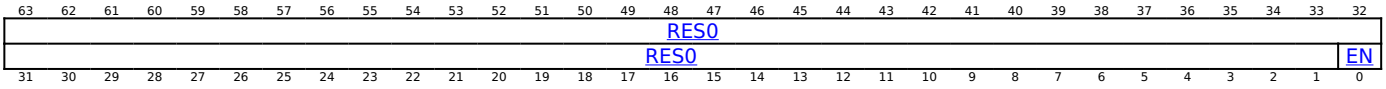
AArch64 System register TRCPRGCTLR bits [31:0] are architecturally mapped to External register TRCPRGCTLR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCPRGCTLR are UNDEFINED.

Attributes

TRCPRGCTLR is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

EN, bit [0]

Trace unit enable.

EN	Meaning
0b0	The trace unit is disabled.
0b1	The trace unit is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to '0'.

Accessing TRCPRGCTLR

Must be programmed.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCPRGCTLR

TRCQCTLR, Trace Q Element Control Register

The TRCQCTLR characteristics are:

Purpose

Controls when Q elements are enabled.

Configuration

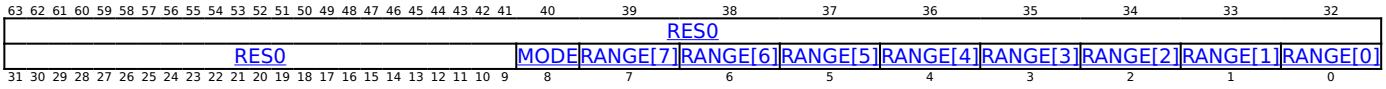
AArch64 System register TRCQCTLR bits [31:0] are architecturally mapped to External register TRCQCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR0.QFILT == '1'. Otherwise, direct accesses to TRCQCTLR are UNDEFINED.

Attributes

TRCQCTLR is a 64-bit register.

Field descriptions



Bits [63:9]

Reserved, RES0.

MODE, bit [8]

Selects whether the Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit is permitted to generate Q elements or address ranges where the trace unit is not permitted to generate Q elements:

MODE	Meaning
0b0	Exclude mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit must not generate Q elements. If no ranges are selected, Q elements are permitted across the entire memory map.
0b1	Include Mode. The Address Range Comparators selected by TRCQCTLR.RANGE indicate address ranges where the trace unit can generate Q elements. If all the implemented bits in RANGE are set to 0 then Q elements are disabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

RANGE[<m>], bit [m], for m = 7 to 0

Specifies whether Address Range Comparator <m> controls Q elements.

RANGE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines is not selected.
0b1	The address range that Address Range Comparator <m> defines is selected.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCQCTLR

Must be programmed if TRCCONFIGR.QE != 0b00.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCQCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0001	0b001

TRCRSCTLR<n>, Trace Resource Selection Control Register <n>, n = 2 - 31

The TRCRSCTLR<n> characteristics are:

Purpose

Controls the selection of the resources in the trace unit.

Configuration

AArch64 System register TRCRSCTLR<n> bits [31:0] are architecturally mapped to External register TRCRSCTLR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and (UInt(TRCIDR4.NUMRSPAIR) + 1) * 2 > n. Otherwise, direct accesses to TRCRSCTLR<n> are UNDEFINED.

Resource selector 0 always returns FALSE.

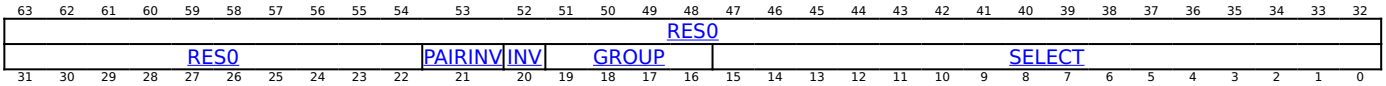
Resource selector 1 always returns TRUE.

Resource selectors are implemented in pairs. Each odd numbered resource selector is part of a pair with the even numbered resource selector that is numbered as one less than it. For example, resource selectors 2 and 3 form a pair.

Attributes

TRCRSCTLR<n> is a 64-bit register.

Field descriptions



Bits [63:22]

Reserved, RES0.

PAIRINV, bit [21]
When n is even:

Controls whether the combined result from a resource selector pair is inverted.

PAIRINV	Meaning
0b0	Do not invert the combined output of the 2 resource selectors.
0b1	Invert the combined output of the 2 resource selectors.

If:

- A is the register TRCRSCTLR<n>.
- B is the register TRCRSCTLR<n+1>.

Then the combined output of the 2 resource selectors A and B depends on the value of (A.PAIRINV, A.INV, B.INV) as follows:

- 0b000 -> A and B.
- 0b001 -> Reserved.
- 0b010 -> not(A) and B.
- 0b011 -> not(A) and not(B).
- 0b100 -> not(A) or not(B).
- 0b101 -> not(A) or B.
- 0b110 -> Reserved.
- 0b111 -> A or B.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

INV, bit [20]

Controls whether the resource, that TRCRSCTLR<n>.GROUP and TRCRSCTLR<n>.SELECT selects, is inverted.

INV	Meaning
0b0	Do not invert the output of this selector.
0b1	Invert the output of this selector.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

GROUP, bits [19:16]

Selects a group of resources.

GROUP	Meaning	SELECT
0b0000	External Input Selectors.	SELECT encoding for External Input Selectors
0b0001	PE Comparator Inputs.	SELECT encoding for PE Comparator Inputs
0b0010	Counters and Sequencer.	SELECT encoding for Counters and Sequencer
0b0011	Single-shot Comparator Controls.	SELECT encoding for Single-shot Comparator Controls
0b0100	Single Address Comparators.	SELECT encoding for Single Address Comparators
0b0101	Address Range Comparators.	SELECT encoding for Address Range Comparators
0b0110	Context Identifier Comparators.	SELECT encoding for Context Identifier Comparators
0b0111	Virtual Context Identifier Comparators.	SELECT encoding for Virtual Context Identifier Comparators

All other values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT, bits [15:0]

Resource Specific Controls. Contains the controls specific to the resource group selected by GROUP, described in the following sections.

SELECT encoding for External Input Selectors

Bits [15:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

Selects one or more External Inputs.

EXTIN[<m>]	Meaning
0b0	Ignore EXTIN <m>.
0b1	Select EXTIN <m>.

This bit is RES0 if m >= TRCIDR5.NUMEXTINSEL.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for PE Comparator Inputs

Bits [15:8]

Reserved, RES0.

PECOMP[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs.

PECOMP[<m>]	Meaning
0b0	Ignore PE Comparator Input <m>.
0b1	Select PE Comparator Input <m>.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Counters and Sequencer

Bits [15:8]

Reserved, RES0.

SEQUENCER[<m>], bit [m+4], for m = 3 to 0

Sequencer states.

SEQUENCER[<m>]	Meaning
0b0	Ignore Sequencer state <m>.
0b1	Select Sequencer state <m>.

This bit is RES0 if m >= TRCIDR5.NUMSEQSTATE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

COUNTERS[<m>], bit [m], for m = 3 to 0

Counters resources at zero.

COUNTERS[<m>]	Meaning
0b0	Ignore Counter <m>.
0b1	Select Counter <m> is zero.

This bit is RES0 if m >= TRCIDR5.NUMCNTR.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single-shot Comparator Controls

Bits [15:8]

Reserved, RES0.

SINGLE_SHOT[<m>], bit [m], for m = 7 to 0

Selects one or more Single-shot Comparator Controls.

SINGLE_SHOT[<m>]	Meaning
0b0	Ignore Single-shot Comparator Control <m>.
0b1	Select Single-shot Comparator Control <m>.

This bit is RES0 if m >= TRCIDR4.NUMSSCC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Single Address Comparators

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators.

SAC[<m>]	Meaning
0b0	Ignore Single Address Comparator <m>.
0b1	Select Single Address Comparator <m>.

This bit is RES0 if m >= 2 × TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Address Range Comparators

Bits [15:8]

Reserved, RES0.

ARC[<m>], bit [m], for m = 7 to 0

Selects one or more Address Range Comparators.

ARC[<m>]	Meaning
0b0	Ignore Address Range Comparator <m>.
0b1	Select Address Range Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMACPAIRS.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Context Identifier Comparators

Bits [15:8]

Reserved, RES0.

CID[<m>], bit [m], for m = 7 to 0

Selects one or more Context Identifier Comparators.

CID[<m>]	Meaning
0b0	Ignore Context Identifier Comparator <m>.
0b1	Select Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMCIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SELECT encoding for Virtual Context Identifier Comparators

Bits [15:8]

Reserved, RES0.

VMID[<m>], bit [m], for m = 7 to 0

Selects one or more Virtual Context Identifier Comparators.

VMID[<m>]	Meaning
0b0	Ignore Virtual Context Identifier Comparator <m>.
0b1	Select Virtual Context Identifier Comparator <m>.

This bit is RES0 if m >= TRCIDR4.NUMVMIDC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCRSCTLR<n>

Must be programmed if any of the following are true:

- TRCCNTCTLR<a>.RLDEVENT.TYPE == 0 and TRCCNTCTLR<a>.RLDEVENT.SEL == n.
- TRCCNTCTLR<a>.RLDEVENT.TYPE == 1 and TRCCNTCTLR<a>.RLDEVENT.SEL == n/2.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 0 and TRCCNTCTLR<a>.CNTEVENT.SEL == n.
- TRCCNTCTLR<a>.CNTEVENT.TYPE == 1 and TRCCNTCTLR<a>.CNTEVENT.SEL == n/2.
- TRCEVENTCTL0R.EVENT0.TYPE == 0 and TRCEVENTCTL0R.EVENT0.SEL == n.
- TRCEVENTCTL0R.EVENT0.TYPE == 1 and TRCEVENTCTL0R.EVENT0.SEL == n/2.
- TRCEVENTCTL0R.EVENT1.TYPE == 0 and TRCEVENTCTL0R.EVENT1.SEL == n.
- TRCEVENTCTL0R.EVENT1.TYPE == 1 and TRCEVENTCTL0R.EVENT1.SEL == n/2.
- TRCEVENTCTL0R.EVENT2.TYPE == 0 and TRCEVENTCTL0R.EVENT2.SEL == n.
- TRCEVENTCTL0R.EVENT2.TYPE == 1 and TRCEVENTCTL0R.EVENT2.SEL == n/2.
- TRCEVENTCTL0R.EVENT3.TYPE == 0 and TRCEVENTCTL0R.EVENT3.SEL == n.
- TRCEVENTCTL0R.EVENT3.TYPE == 1 and TRCEVENTCTL0R.EVENT3.SEL == n/2.
- TRCSEQEVR<a>.B.TYPE == 0 and TRCSEQEVR<a>.B.SEL = n.
- TRCSEQEVR<a>.B.TYPE == 1 and TRCSEQEVR<a>.B.SEL = n/2.
- TRCSEQEVR<a>.F.TYPE == 0 and TRCSEQEVR<a>.F.SEL = n.
- TRCSEQEVR<a>.F.TYPE == 1 and TRCSEQEVR<a>.F.SEL = n/2.
- TRCSEQRSTEVR.RST.TYPE == 0 and TRCSEQRSTEVR.RST.SEL == n.
- TRCSEQRSTEVR.RST.TYPE == 1 and TRCSEQRSTEVR.RST.SEL == n/2.
- TRCTSCTLR.EVENT.TYPE == 0 and TRCTSCTLR.EVENT.SEL == n.
- TRCTSCTLR.EVENT.TYPE == 1 and TRCTSCTLR.EVENT.SEL == n/2.

- TRCVICTLR.EVENT.TYPE == 0 and TRCVICTLR.EVENT.SEL == n.
- TRCVICTLR.EVENT.TYPE == 1 and TRCVICTLR.EVENT.SEL == n/2.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCRSCTLR<m> ; Where m = 2-31

TRCRSR, Trace Resources Status Register

The TRCRSR characteristics are:

Purpose

Use this to set, or read, the status of the resources.

Configuration

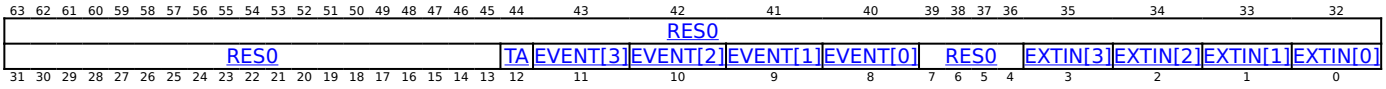
AArch64 System register TRCRSR bits [31:0] are architecturally mapped to External register TRCRSR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCRSR are UNDEFINED.

Attributes

TRCRSR is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

TA, bit [12]

Tracing active.

TA	Meaning
0b0	Tracing is not active.
0b1	Tracing is active.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

EVENT[<m>], bit [m+8], for m = 3 to 0

Untraced status of ETEEvents.

EVENT[<m>]	Meaning
0b0	An ETEEvent <m> has not occurred.
0b1	An ETEEvent <m> has occurred while the resources were in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When TRCIDR4.NUMRSPAIR == '0000', access to this field is RES0 .
- Access to this field is RES0 if all the following are true:
  - TRCIDR4.NUMRSPAIR != '0000'.
  - m > UInt(TRCIDR0.NUMEVENT).
- Otherwise, access to this field is RW.

Bits [7:4]

Reserved, RES0.

EXTIN[<m>], bit [m], for m = 3 to 0

The sticky status of the External Input Selectors.

EXTIN[<m>]	Meaning
0b0	An event selected by External Input Selector <m> has not occurred.
0b1	At least one event selected by External Input Selector <m> has occurred while the resources were in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR5.NUMEXTINSEL), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCRSR

Must always be programmed.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCRSR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1010	0b000

TRCSEQEVR<n>, Trace Sequencer State Transition Control Register <n>, n = 0 - 2

The TRCSEQEVR<n> characteristics are:

Purpose

Moves the Sequencer state:

- Backwards, from state n+1 to state n when a programmed resource event occurs.
- Forwards, from state n to state n+1 when a programmed resource event occurs.

Configuration

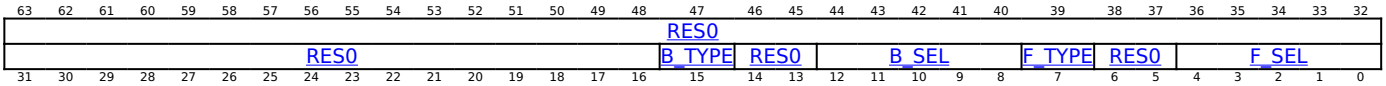
AArch64 System register TRCSEQEVR<n> bits [31:0] are architecturally mapped to External register TRCSEQEVR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR5.NUMSEQSTATE != '000'. Otherwise, direct accesses to TRCSEQEVR<n> are UNDEFINED.

Attributes

TRCSEQEVR<n> is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

B_TYPE, bit [15]

Backward field. Selects an event that causes the Sequencer to move from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14, then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

Chooses the type of Resource Selector.

B_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.B.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.B.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.B.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [14:13]

Reserved, RES0.

B_SEL, bits [12:8]

Backward field. Selects an event that causes the Sequencer to move from state n+1 to state n. For example, if TRCSEQEVR2.B.SEL == 0x14, then when event 0x14 occurs, the Sequencer moves from state 3 to state 2.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.B.TYPE controls whether TRCSEQEVR<n>.B.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

F_TYPE, bit [7]

Forward field. Selects an event that causes the Sequencer to move from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12, then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

Chooses the type of Resource Selector.

F_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQEVR<n>.F.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQEVR<n>.F.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQEVR<n>.F.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

F_SEL, bits [4:0]

Forward field. Selects an event that causes the Sequencer to move from state n to state n+1. For example, if TRCSEQEVR1.F.SEL == 0x12, then when event 0x12 occurs, the Sequencer moves from state 1 to state 2.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQEVR<n>.F.TYPE controls whether TRCSEQEVR<n>.F.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQEVR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSEQEVR<m> ; Where m = 0-2

TRCSEQRSTEVR, Trace Sequencer Reset Control Register

The TRCSEQRSTEVR characteristics are:

Purpose

Moves the Sequencer to state 0 when a programmed resource event occurs.

Configuration

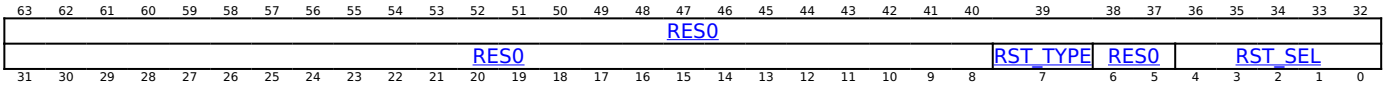
AArch64 System register TRCSEQRSTEVR bits [31:0] are architecturally mapped to External register TRCSEQRSTEVR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR5.NUMSEQSTATE != '000'. Otherwise, direct accesses to TRCSEQRSTEVR are UNDEFINED.

Attributes

TRCSEQRSTEVR is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

RST_TYPE, bit [7]

Reset field. Selects an event that causes the Sequencer to move to state 0.

Chooses the type of Resource Selector.

RST_TYPE	Meaning
0b0	A single Resource Selector. TRCSEQRSTEVR.RST.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCSEQRSTEVR.RST.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCSEQRSTEVR.RST.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

RST_SEL, bits [4:0]

Reset field. Selects an event that causes the Sequencer to move to state 0.

Defines the selected Resource Selector or pair of Resource Selectors. TRCSEQRSTEVR.RST.TYPE controls whether TRCSEQRSTEVR.RST.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQRSTEVR

TRCSEQSTR, Trace Sequencer State Register

The TRCSEQSTR characteristics are:

Purpose

Use this to set, or read, the Sequencer state.

Configuration

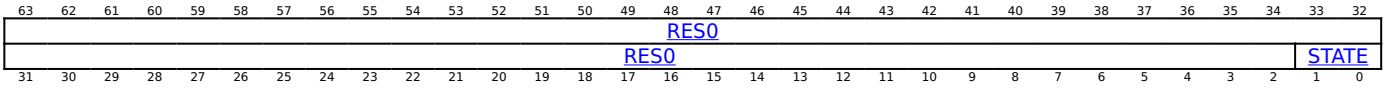
AArch64 System register TRCSEQSTR bits [31:0] are architecturally mapped to External register TRCSEQSTR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR5.NUMSEQSTATE != '000'. Otherwise, direct accesses to TRCSEQSTR are UNDEFINED.

Attributes

TRCSEQSTR is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

STATE, bits [1:0]

Set or returns the state of the Sequencer.

STATE	Meaning
0b00	State 0.
0b01	State 1.
0b10	State 2.
0b11	State 3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSEQSTR

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0010 and TRCRSCTLR<a>.SEQUENCER != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSEQSTR

op0	op1	CRn	CRm	op2

TRCSSCCR<n>, Trace Single-shot Comparator Control Register <n>, n = 0 - 7

The TRCSSCCR<n> characteristics are:

Purpose

Controls the corresponding Single-shot Comparator Control resource.

Configuration

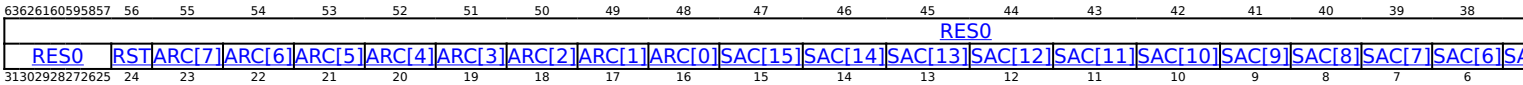
AArch64 System register TRCSSCCR<n> bits [31:0] are architecturally mapped to External register TRCSSCCR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCCR<n> are UNDEFINED.

Attributes

TRCSSCCR<n> is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

RST, bit [24]

Selects the Single-shot Comparator Control mode.

RST	Meaning
0b0	The Single-shot Comparator Control is in single-shot mode.
0b1	The Single-shot Comparator Control is in multi-shot mode.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

ARC[<m>], bit [m+16], for m = 7 to 0

Selects one or more Address Range Comparators for Single-shot control.

ARC[<m>]	Meaning
0b0	The Address Range Comparator <m>, is not selected for Single-shot control.
0b1	The Address Range Comparator <m>, is selected for Single-shot control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

SAC[<m>], bit [m], for m = 15 to 0

Selects one or more Single Address Comparators for Single-shot control.

SAC[<m>]	Meaning
0b0	The Single Address Comparator <m>, is not selected for Single-shot control.
0b1	The Single Address Comparator <m>, is selected for Single-shot control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCSSCCR<n>

Must be programmed if any TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSSCCR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b0:m[2:0]	0b010

2025-12-10 16:11:30, 2025-12_rel

TRCSSCSR<n>, Trace Single-shot Comparator Control Status Register <n>, n = 0 - 7

The TRCSSCSR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

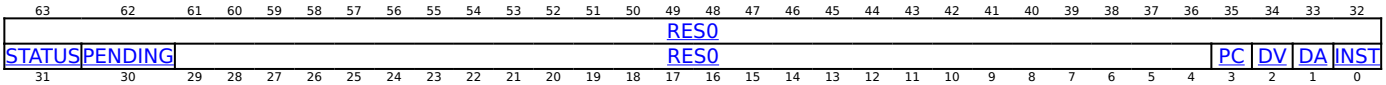
AArch64 System register TRCSSCSR<n> bits [31:0] are architecturally mapped to External register TRCSSCSR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMSSCC) > n. Otherwise, direct accesses to TRCSSCSR<n> are UNDEFINED.

Attributes

TRCSSCSR<n> is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

STATUS, bit [31]

Single-shot Comparator Control status. Indicates if any of the comparators selected by this Single-shot Comparator control have matched. The selected comparators are defined by TRCSSCCR<n>.ARC, TRCSSCCR<n>.SAC, and TRCSSPCICR<n>.PC.

STATUS	Meaning
0b0	No match has occurred. When the first match occurs, this field takes a value of 1. It remains at 1 until explicitly modified by a write to this register.
0b1	One or more matches has occurred. If TRCSSCCR<n>.RST == 0 then: • There is only one match and no more matches are possible. • Software must reset this field to 0 to re-enable the Single-shot Comparator Control.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

PENDING, bit [30]

Single-shot pending status. The Single-shot Comparator Control fired while the resources were in the Paused state.

PENDING	Meaning
0b0	No match has occurred.
0b1	One or more matches has occurred.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [29:4]

Reserved, RES0.

PC, bit [3]

PE Comparator Input support. Indicates if the Single-shot Comparator Control supports PE Comparator Inputs.

PC	Meaning
0b0	This Single-shot Comparator Control does not support PE Comparator Inputs. Selecting any PE Comparator Inputs using the associated TRCSSPCICR<n> results in CONSTRAINED UNPREDICTABLE behavior of the Single-shot Comparator Control resource. The Single-shot Comparator Control might match unexpectedly or might not match.
0b1	This Single-shot Comparator Control supports PE Comparator Inputs.

Access to this field is RO.

DV, bit [2]

Data value comparator support. Data value comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DV	Meaning
0b0	This Single-shot Comparator Control does not support data value comparisons.
0b1	This Single-shot Comparator Control supports data value comparisons.

This field reads as 0.

Access to this field is RO.

DA, bit [1]

Data Address Comparator support. Data address comparisons are not implemented in ETE and are reserved for other trace architectures. Allocated in other trace architectures.

DA	Meaning
0b0	This Single-shot Comparator Control does not support data address comparisons.
0b1	This Single-shot Comparator Control supports data address comparisons.

This field reads as 0.

Access to this field is RO.

INST, bit [0]

Instruction Address Comparator support. Indicates if the Single-shot Comparator Control supports instruction address comparisons.

INST	Meaning
0b0	This Single-shot Comparator Control does not support instruction address comparisons.
0b1	This Single-shot Comparator Control supports instruction address comparisons.

This field reads as 1.

Access to this field is RO.

Accessing TRCSSCSR<n>

Must be programmed if TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSSCSR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2

0b10	0b001	0b0001	0b1:m[2:0]	0b010

TRCSSPCICR<n>, Trace Single-shot Processing Element Comparator Input Control Register <n>, n = 0 - 7

The TRCSSPCICR<n> characteristics are:

Purpose

Returns the status of the corresponding Single-shot Comparator Control.

Configuration

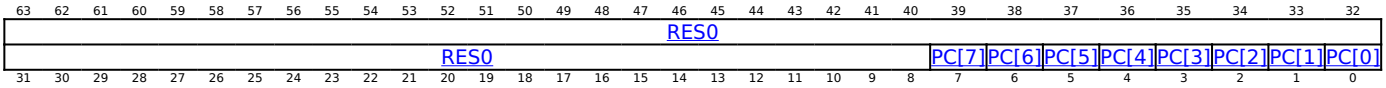
AArch64 System register TRCSSPCICR<n> bits [31:0] are architecturally mapped to External register TRCSSPCICR<n>[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMSSCC) > n, UInt(TRCIDR4.NUMPC) > 0, and TRCSSCSR<n>.PC == '1'. Otherwise, direct accesses to TRCSSPCICR<n> are UNDEFINED.

Attributes

TRCSSPCICR<n> is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

PC[<m>], bit [m], for m = 7 to 0

Selects one or more PE Comparator Inputs for Single-shot control.

PC[<m>]	Meaning
0b0	The single PE Comparator Input <m>, is not selected as for Single-shot control.
0b1	The single PE Comparator Input <m>, is selected as for Single-shot control.

This bit is RES0 if m >= TRCIDR4.NUMPC.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSSPCICR<n>

Must be programmed if implemented and any TRCRSCTLR<a>.GROUP == 0b0011 and TRCRSCTLR<a>.SINGLE_SHOT[n] == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSSPCICR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2
0b10	0b001	0b0001	0b0:m[2:0]	0b011

```
let m:integer = UInt(CRm[2:0]);

TRCSTALLCTLR, Trace Stall Control Register

The TRCSTALLCTLR characteristics are:

Purpose

Enables trace unit functionality that prevents trace unit buffer overflows.

Configuration

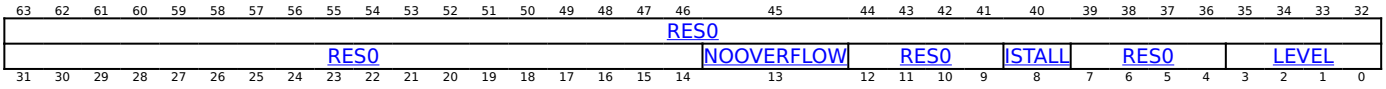
AArch64 System register TRCSTALLCTLR bits [31:0] are architecturally mapped to External register TRCSTALLCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR3.STALLCTL == '1'. Otherwise, direct accesses to TRCSTALLCTLR are UNDEFINED.

Attributes

TRCSTALLCTLR is a 64-bit register.

Field descriptions



Bits [63:14]

Reserved, RES0.

NOOVERFLOW, bit [13]
When TRCIDR3.NOOVERFLOW == '1':

Trace overflow prevention.

NOOVERFLOW	Meaning
0b0	Trace unit buffer overflow prevention is disabled.
0b1	Trace unit buffer overflow prevention is enabled.

Note

Enabling this feature might cause a significant performance impact.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:9]

Reserved, RES0.

ISTALL, bit [8]

Instruction stall control. Controls if a trace unit can stall the PE when the trace buffer space is less than LEVEL.

ISTALL	Meaning
0b0	The trace unit must not stall the PE.
0b1	The trace unit can stall the PE.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

LEVEL, bits [3:0]

Threshold level field. The field can support 16 monotonic levels from 0b0000 to 0b1111.

The value 0b0000 defines the Minimal invasion level. This setting has a greater risk of a trace unit buffer overflow.

The value 0b1111 defines the Maximum invasion level. This setting has a reduced risk of a trace unit buffer overflow.

Note

For some implementations, invasion might occur at the minimal invasion level.

One or more of the least significant bits of LEVEL are permitted to be RES0. Arm recommends that LEVEL[3:2] are fully implemented. Arm strongly recommends that LEVEL[3] is always implemented. If one or more bits are RES0 and are written with a nonzero value, the effective value of LEVEL is rounded down to the nearest power of 2 value which has the RES0 bits as zero. For example, if LEVEL[1:0] are RES0 and a value of 0b1110 is written to LEVEL, the effective value of LEVEL is 0b1100.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSTALLCTLR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSTALLCTLR

op0	op1	CRn	CRm	op2

TRCSTATR, Trace Status Register

The TRCSTATR characteristics are:

Purpose

Returns the trace unit status.

Configuration

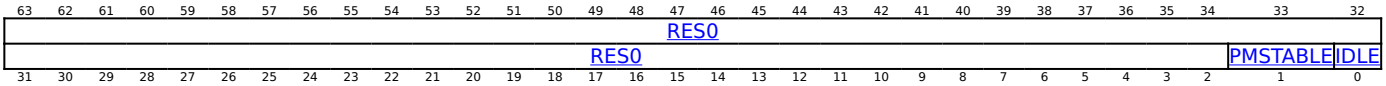
AArch64 System register TRCSTATR bits [31:0] are architecturally mapped to External register TRCSTATR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCSTATR are UNDEFINED.

Attributes

TRCSTATR is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

PMSTABLE, bit [1]

Programmers' model stable.

PMSTABLE	Meaning
0b0	The programmers' model is not stable.
0b1	The programmers' model is stable.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - TRCPRGCTLR.EN == '1'.
  - !OSLockStatus().
- Otherwise, access to this field is RO.

IDLE, bit [0]

Idle status.

IDLE	Meaning
0b0	The trace unit is not idle.
0b1	The trace unit is idle.

Accessing TRCSTATR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSTATR

TRCSYNCPR, Trace Synchronization Period Register

The TRCSYNCPR characteristics are:

Purpose

Controls how often trace protocol synchronization requests occur.

Configuration

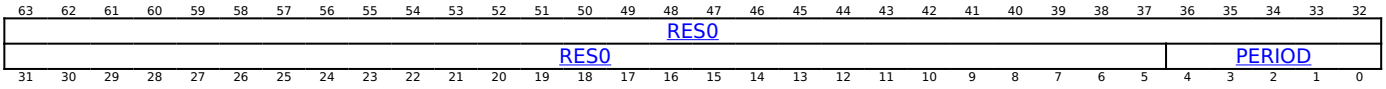
AArch64 System register TRCSYNCPR bits [31:0] are architecturally mapped to External register TRCSYNCPR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCSYNCPR are UNDEFINED.

Attributes

TRCSYNCPR is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

PERIOD, bits [4:0]

Defines the number of bytes of trace between each periodic trace protocol synchronization request.

PERIOD	Meaning
0b00000	Trace protocol synchronization is disabled.
0b01000	Trace protocol synchronization request occurs after 2^8 bytes of trace.
0b01001	Trace protocol synchronization request occurs after 2^9 bytes of trace.
0b01010	Trace protocol synchronization request occurs after 2^{10} bytes of trace.
0b01011	Trace protocol synchronization request occurs after 2^{11} bytes of trace.
0b01100	Trace protocol synchronization request occurs after 2^{12} bytes of trace.
0b01101	Trace protocol synchronization request occurs after 2^{13} bytes of trace.
0b01110	Trace protocol synchronization request occurs after 2^{14} bytes of trace.
0b01111	Trace protocol synchronization request occurs after 2^{15} bytes of trace.
0b10000	Trace protocol synchronization request occurs after 2^{16} bytes of trace.
0b10001	Trace protocol synchronization request occurs after 2^{17} bytes of trace.
0b10010	Trace protocol synchronization request occurs after 2^{18} bytes of trace.
0b10011	Trace protocol synchronization request occurs after 2^{19} bytes of trace.
0b10100	Trace protocol synchronization request occurs after 2^{20} bytes of trace.

Other values are reserved. If a reserved value is programmed into PERIOD, then the behavior of the synchronization period counter is CONSTRAINED UNPREDICTABLE and one of the following behaviors occurs:

- No trace protocol synchronization requests are generated by this counter.
- Trace protocol synchronization requests occur at the specified period.
- Trace protocol synchronization requests occur at some other UNKNOWN period which can vary.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCSYNCPR

Must be programmed if TRCIDR3.SYNCPR == 0.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCSYNCPR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b1101	0b000

TRCTRACEIDR, Trace ID Register

The TRCTRACEIDR characteristics are:

Purpose

Sets the trace ID for instruction trace.

Configuration

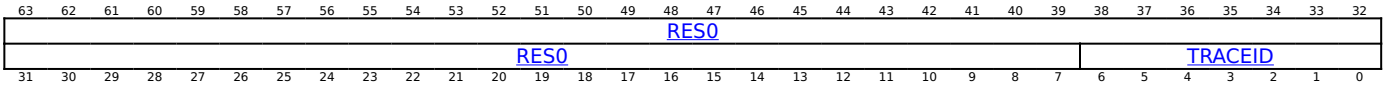
AArch64 System register TRCTRACEIDR bits [31:0] are architecturally mapped to External register TRCTRACEIDR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCTRACEIDR are UNDEFINED.

Attributes

TRCTRACEIDR is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TRACEID, bits [6:0]

Trace ID field. Sets the trace ID value for instruction trace. The width of the field is indicated by the value of TRCIDR5.TRACEIDSIZE. Unimplemented bits are RES0.

If an implementation supports AMBA ATB, then:

- The width of the field is 7 bits.
- Writing a reserved trace ID value does not affect behavior of the trace unit but it might cause UNPREDICTABLE behavior of the trace capture infrastructure.

See the AMBA ATB Protocol Specification for information about which ATID values are reserved.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCTRACEIDR

Must be programmed if implemented.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCTRACEIDR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0000	0b001

TRCTSCTLR, Trace Timestamp Control Register

The TRCTSCTLR characteristics are:

Purpose

Controls the insertion of global timestamps in the trace stream.

Configuration

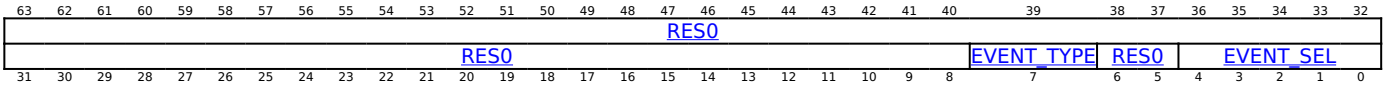
AArch64 System register TRCTSCTLR bits [31:0] are architecturally mapped to External register TRCTSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and TRCIDR0.TSSIZE != '00000'. Otherwise, direct accesses to TRCTSCTLR are UNDEFINED.

Attributes

TRCTSCTLR is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

EVENT_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != '0000':

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCTSCTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCTSCTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCTSCTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EVENT_SEL, bits [4:0]
When TRCIDR4.NUMRSPAIR != '0000':

Defines the selected Resource Selector or pair of Resource Selectors. TRCTSCTLR.EVENT.TYPE controls whether TRCTSCTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TRCTSCTLR

Must be programmed if TRCCONFIGR.TS == 1.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCTSCTLR

TRCVICTLR, Trace ViewInst Main Control Register

The TRCVICTLR characteristics are:

Purpose

Controls instruction trace filtering.

Configuration

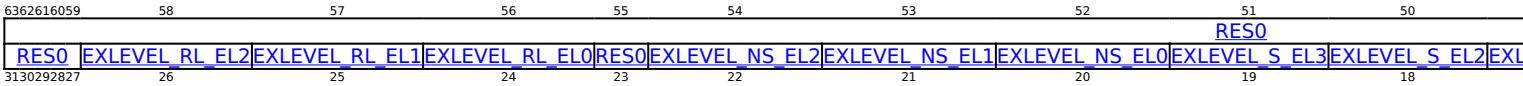
AArch64 System register TRCVICTLR bits [31:0] are architecturally mapped to External register TRCVICTLR[31:0].

This register is present only when FEAT_ETE is implemented and System register access to the trace unit registers is implemented. Otherwise, direct accesses to TRCVICTLR are UNDEFINED.

Attributes

TRCVICTLR is a 64-bit register.

Field descriptions



Bits [63:27]

Reserved, RES0.

EXLEVEL_RL_EL2, bit [26]
When FEAT_RME is implemented:

Filter instruction trace for EL2 in Realm state.

EXLEVEL_RL_EL2	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit generates instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit does not generate instruction trace for EL2 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL2 is 0 the trace unit does not generate instruction trace for EL2 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL2 is 1 the trace unit generates instruction trace for EL2 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL1, bit [25]
When FEAT_RME is implemented:

Filter instruction trace for EL1 in Realm state.

EXLEVEL_RL_EL1	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit generates instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit does not generate instruction trace for EL1 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL1 is 0 the trace unit does not generate instruction trace for EL1 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL1 is 1 the trace unit generates instruction trace for EL1 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_RL_EL0, bit [24]
When FEAT_RME is implemented:

Filter instruction trace for EL0 in Realm state.

EXLEVEL_RL_EL0	Meaning
0b0	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit generates instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit does not generate instruction trace for EL0 in Realm state.
0b1	When TRCVICTLR.EXLEVEL_NS_EL0 is 0 the trace unit does not generate instruction trace for EL0 in Realm state. When TRCVICTLR.EXLEVEL_NS_EL0 is 1 the trace unit generates instruction trace for EL0 in Realm state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

EXLEVEL_NS_EL2, bit [22]
When Non-secure EL2 is implemented:

Filter instruction trace for EL2 in Non-secure state.

EXLEVEL_NS_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL1, bit [21]
When Non-secure EL1 is implemented:

Filter instruction trace for EL1 in Non-secure state.

EXLEVEL_NS_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_NS_EL0, bit [20]
When Non-secure EL0 is implemented:

Filter instruction trace for EL0 in Non-secure state.

EXLEVEL_NS_EL0	Meaning
0b0	The trace unit generates instruction trace for EL0 in Non-secure state.
0b1	The trace unit does not generate instruction trace for EL0 in Non-secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL3, bit [19]
When EL3 is implemented:

Filter instruction trace for EL3.

EXLEVEL_S_EL3	Meaning
0b0	The trace unit generates instruction trace for EL3.
0b1	The trace unit does not generate instruction trace for EL3.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL2, bit [18]
When Secure EL2 is implemented:

Filter instruction trace for EL2 in Secure state.

EXLEVEL_S_EL2	Meaning
0b0	The trace unit generates instruction trace for EL2 in Secure state.
0b1	The trace unit does not generate instruction trace for EL2 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL1, bit [17]
When Secure EL1 is implemented:

Filter instruction trace for EL1 in Secure state.

EXLEVEL_S_EL1	Meaning
0b0	The trace unit generates instruction trace for EL1 in Secure state.
0b1	The trace unit does not generate instruction trace for EL1 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLEVEL_S_EL0, bit [16]
When Secure EL0 is implemented:

Filter instruction trace for EL0 in Secure state.

EXLEVEL_S_EL0	Meaning
0b0	The trace unit generates instruction trace for EL0 in Secure state.
0b1	The trace unit does not generate instruction trace for EL0 in Secure state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [15:12]

Reserved, RES0.

TRCERR, bit [11]
When TRCIDR3.TRCERR == '1':

Controls the forced tracing of System Error exceptions.

TRCERR	Meaning
0b0	Forced tracing of System Error exceptions is disabled.
0b1	Forced tracing of System Error exceptions is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCRESET, bit [10]

Controls the forced tracing of PE Resets.

TRCRESET	Meaning
0b0	Forced tracing of PE Resets is disabled.
0b1	Forced tracing of PE Resets is enabled.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

SSSTATUS, bit [9]

ViewInst start/stop function status.

SSSTATUS	Meaning
0b0	Stopped State. The ViewInst start/stop function is in the stopped state.
0b1	Started State. The ViewInst start/stop function is in the started state.

Before software enables the trace unit, it must write to this field to set the initial state of the ViewInst start/stop function. If the ViewInst start/stop function is not used then set this field to 1. Arm recommends that the value of this field is set before each trace session begins.

If the trace unit becomes disabled while a start point or stop point is still speculative, then the value of TRCVICTLR.SSSTATUS is UNKNOWN and might represent the result of a speculative start point or stop point.

If software which is running on the PE being traced disables the trace unit, either by clearing TRCPRGCTLR.EN or locking the OS Lock, Arm recommends that a DSB and an ISB instruction are executed before disabling the trace unit to prevent any start points or stop points being speculative at the point of disabling the trace unit. This procedure assumes that all start points or stop points occur before the barrier instructions are executed. The procedure does not guarantee that there are no speculative start points or stop points when disabling, although it helps minimize the probability.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RES1 if all the following are true:
  - TRCIDR4.NUMACPAIRS == '0000'.
  - TRCIDR4.NUMPC == '0000'.
- Otherwise, access to this field is RW.

Bit [8]

Reserved, RES0.

EVENT_TYPE, bit [7]
When TRCIDR4.NUMRSPAIR != '0000':

Chooses the type of Resource Selector.

EVENT_TYPE	Meaning
0b0	A single Resource Selector. TRCVICTLR.EVENT.SEL[4:0] selects the single Resource Selector, from 0-31, used to activate the resource event.
0b1	A Boolean-combined pair of Resource Selectors. TRCVICTLR.EVENT.SEL[3:0] selects the Resource Selector pair, from 0-15, that has a Boolean function that is applied to it whose output is used to activate the resource event. TRCVICTLR.EVENT.SEL[4] is RES0.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

Bits[4:0]
When TRCIDR4.NUMRSPAIR != '0000':

EVENT_SEL, bits [4:0] of bits [4:0]

Defines the selected Resource Selector or pair of Resource Selectors. TRCVICTLR.EVENT.TYPE controls whether TRCVICTLR.EVENT.SEL is the index of a single Resource Selector, or the index of a pair of Resource Selectors.

If an unimplemented Resource Selector is selected using this field, the behavior of the resource event is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

If an unimplemented Resource Selector is selected using this field, the value returned on a direct read of this field is UNKNOWN.

Selecting Resource Selector pair 0 using this field is UNPREDICTABLE, and the resource event might fire or might not fire when the resources are not in the Paused state.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

When TRCIDR4.NUMRSPAIR == '0000':

Reserved, bits [4:0] of bits [4:0]

This field is reserved:

- Bits [4:1] are RES0.
- Bit [0] is RES1.

Otherwise:

Reserved, RES0.

Accessing TRCVICTLR

Must be programmed.

Reads from this register might return an UNKNOWN value if the trace unit is not in either of the Idle or Stable states.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVICTLR

op0	op1	CRn	CRm	op2

TRCVIIECTLR, Trace ViewInst Include/Exclude Control Register

The TRCVIIECTLR characteristics are:

Purpose

Use this to select, or read, the Address Range Comparators for the ViewInst include/exclude function.

Configuration

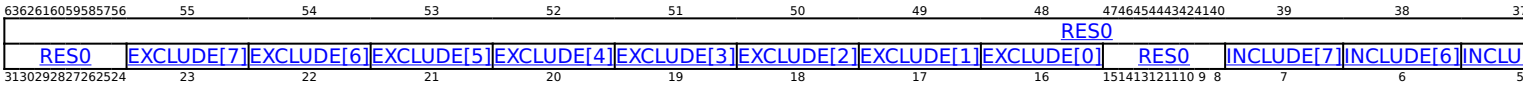
AArch64 System register TRCVIIECTLR bits [31:0] are architecturally mapped to External register TRCVIIECTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVIIECTLR are UNDEFINED.

Attributes

TRCVIIECTLR is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

EXCLUDE[<m>], bit [m+16], for m = 7 to 0

Exclude Address Range Comparator <m>. Selects whether Address Range Comparator <m> is in use with the ViewInst exclude function.

EXCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst exclude function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst exclude function.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Bits [15:8]

Reserved, RES0.

INCLUDE[<m>], bit [m], for m = 7 to 0

Include Address Range Comparator <m>.

Selects whether Address Range Comparator <m> is in use with the ViewInst include function.

Selecting no comparators for the ViewInst include function indicates that all instructions are included by default.

The ViewInst exclude function then indicates which ranges are excluded.

INCLUDE[<m>]	Meaning
0b0	The address range that Address Range Comparator <m> defines, is not selected for the ViewInst include function.
0b1	The address range that Address Range Comparator <m> defines, is selected for the ViewInst include function.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCVIIECTLR

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVIIECTLR

TRCVIPCSSCTLR, Trace ViewInst Start/Stop PE Comparator Control Register

The TRCVIPCSSCTLR characteristics are:

Purpose

Use this to select, or read, which PE Comparator Inputs can control the ViewInst start/stop function.

Configuration

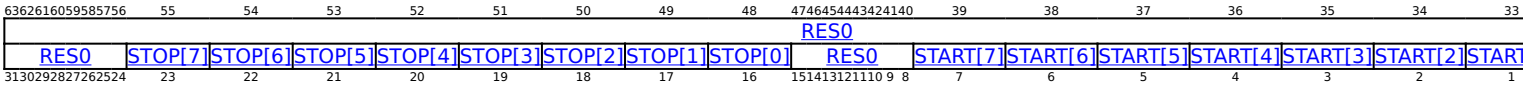
AArch64 System register TRCVIPCSSCTLR bits [31:0] are architecturally mapped to External register TRCVIPCSSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMPC) > 0. Otherwise, direct accesses to TRCVIPCSSCTLR are UNDEFINED.

Attributes

TRCVIPCSSCTLR is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with the ViewInst start/stop function for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The PE Comparator Input <m> is not selected as a stop resource.
0b1	The PE Comparator Input <m> is selected as a stop resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMPC), access to this field is RES0 .
- Otherwise, access to this field is RW.

Bits [15:8]

Reserved, RES0.

START[<m>], bit [m], for m = 7 to 0

Selects whether PE Comparator Input <m> is in use with the ViewInst start/stop function for the purpose of starting trace.

START[<m>]	Meaning
0b0	The PE Comparator Input <m> is not selected as a start resource.
0b1	The PE Comparator Input <m> is selected as a start resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMPC), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCVIPCSSCTLR

Must be programmed if TRCIDR4.NUMPC != 0b0000.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVIPCSSCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0011	0b010

TRCVISSCTLR, Trace ViewInst Start/Stop Control Register

The TRCVISSCTLR characteristics are:

Purpose

Use this to select, or read, the Single Address Comparators for the ViewInst start/stop function.

Configuration

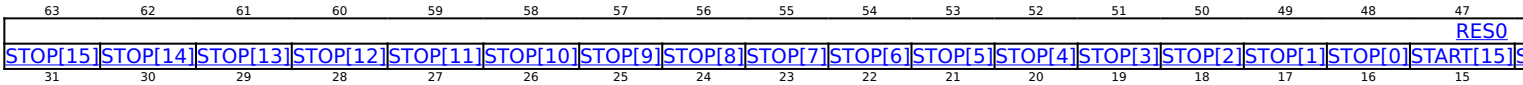
AArch64 System register TRCVISSCTLR bits [31:0] are architecturally mapped to External register TRCVISSCTLR[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMACPAIRS) > 0. Otherwise, direct accesses to TRCVISSCTLR are UNDEFINED.

Attributes

TRCVISSCTLR is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

STOP[<m>], bit [m+16], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function for the purpose of stopping trace.

STOP[<m>]	Meaning
0b0	The Single Address Comparator <m> is not selected as a stop resource.
0b1	The Single Address Comparator <m> is selected as a stop resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is RES0 .
- Otherwise, access to this field is RW.

START[<m>], bit [m], for m = 15 to 0

Selects whether Single Address Comparator <m> is used with the ViewInst start/stop function for the purpose of starting trace.

START[<m>]	Meaning
0b0	The Single Address Comparator <m> is not selected as a start resource.
0b1	The Single Address Comparator <m> is selected as a start resource.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR4.NUMACPAIRS) * 2, access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing TRCVISSCTLR

Must be programmed if TRCIDR4.NUMACPAIRS > 0b0000.

For any 2 comparators selected for the ViewInst start/stop function, the comparator containing the lower address must be a lower numbered comparator.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVISSCTLR

op0	op1	CRn	CRm	op2
0b10	0b001	0b0000	0b0010	0b010

TRCVMIDCCTLR0, Trace Virtual Context Identifier Comparator Control Register 0

The TRCVMIDCCTLR0 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=0-3.

Configuration

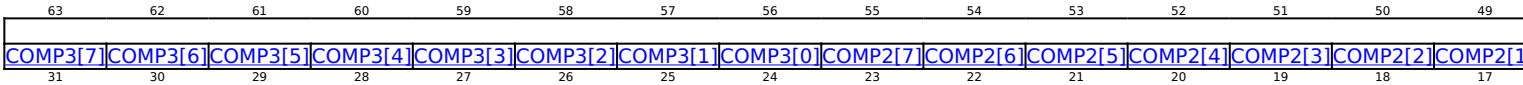
AArch64 System register TRCVMIDCCTLR0 bits [31:0] are architecturally mapped to External register TRCVMIDCCTLR0[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x0, and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR0 are UNDEFINED.

Attributes

TRCVMIDCCTLR0 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP3[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 3:

TRCVMIDCVR3 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR3. Each bit in this field corresponds to a byte in TRCVMIDCVR3.

COMP3[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR3[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP2[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 2:

TRCVMIDCVR2 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR2. Each bit in this field corresponds to a byte in TRCVMIDCVR2.

COMP2[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR2[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP1[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 1:

TRCVMIDCVR1 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR1. Each bit in this field corresponds to a byte in TRCVMIDCVR1.

COMP1[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR1[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP0[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 0:

TRCVMIDCVR0 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR0. Each bit in this field corresponds to a byte in TRCVMIDCVR0.

COMP0[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR0[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR0

If software uses the TRCVMIDCVR<n> registers, where n=0-3, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCCTLR0

TRCVMIDCCTLR1, Trace Virtual Context Identifier Comparator Control Register 1

The TRCVMIDCCTLR1 characteristics are:

Purpose

Virtual Context Identifier Comparator mask values for the TRCVMIDCVR<n> registers, where n=4-7.

Configuration

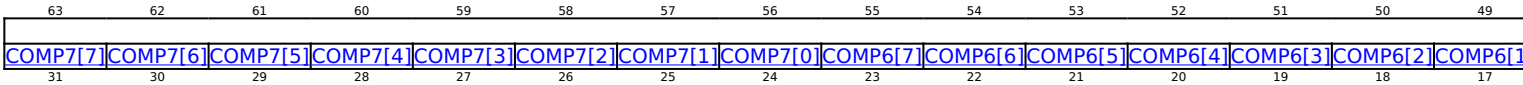
AArch64 System register TRCVMIDCCTLR1 bits [31:0] are architecturally mapped to External register TRCVMIDCCTLR1[31:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, UInt(TRCIDR4.NUMVMIDC) > 0x4, and UInt(TRCIDR2.VMIDSIZE) > 0. Otherwise, direct accesses to TRCVMIDCCTLR1 are UNDEFINED.

Attributes

TRCVMIDCCTLR1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

COMP7[<m>], bit [m+24], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 7:

TRCVMIDCVR7 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR7. Each bit in this field corresponds to a byte in TRCVMIDCVR7.

COMP7[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR7[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP6[<m>], bit [m+16], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 6:

TRCVMIDCVR6 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR6. Each bit in this field corresponds to a byte in TRCVMIDCVR6.

COMP6[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR6[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP5[<m>], bit [m+8], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 5:

TRCVMIDCVR5 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR5. Each bit in this field corresponds to a byte in TRCVMIDCVR5.

COMP5[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR5[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

COMP4[<m>], bit [m], for m = 7 to 0
When UInt(TRCIDR4.NUMVMIDC) > 4:

TRCVMIDCVR4 mask control. Specifies the mask value that the trace unit applies to TRCVMIDCVR4. Each bit in this field corresponds to a byte in TRCVMIDCVR4.

COMP4[<m>]	Meaning
0b0	The trace unit includes TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.
0b1	The trace unit ignores TRCVMIDCVR4[(m×8+7):(m×8)] when it performs the Virtual context identifier comparison.

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= UInt(TRCIDR2.VMIDSIZE), access to this field is RES0 .
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Accessing TRCVMIDCCTLR1

If software uses the TRCVMIDCVR<n> registers, where n=4-7, then it must program this register.

If software sets a mask bit to 1 then it must program the relevant byte in TRCVMIDCVR<n> to 0x00.

If any bit is 1 and the relevant byte in TRCVMIDCVR<n> is not 0x00, the behavior of the Virtual Context Identifier Comparator is CONSTRAINED UNPREDICTABLE. In this scenario the comparator might match unexpectedly or might not match.

Writes are CONSTRAINED UNPREDICTABLE if the trace unit is not in the Idle state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCCTLR1

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	0b0011	0b010

```

TRCVMIDCVR<n>, Trace Virtual Context Identifier Comparator Value Register <n>, n = 0 - 7

The TRCVMIDCVR<n> characteristics are:

Purpose

Contains the Virtual Context Identifier Comparator value.

Configuration

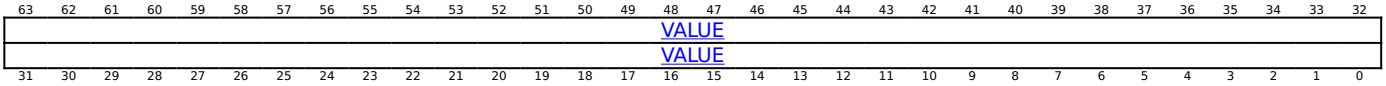
AArch64 System register TRCVMIDCVR<n> bits [63:0] are architecturally mapped to External register TRCVMIDCVR<n>[63:0].

This register is present only when FEAT_ETE is implemented, System register access to the trace unit registers is implemented, and UInt(TRCIDR4.NUMVMIDC) > n. Otherwise, direct accesses to TRCVMIDCVR<n> are UNDEFINED.

Attributes

TRCVMIDCVR<n> is a 64-bit register.

Field descriptions



VALUE, bits [63:0]

Virtual context identifier value. The width of this field is indicated by TRCIDR2.VMIDSIZE. Unimplemented bits are RES0. After a PE Reset, the trace unit assumes that the Virtual context identifier is zero until the PE updates the Virtual context identifier .

The reset behavior of this field is:

- On a Trace unit reset, this field resets to an architecturally UNKNOWN value.

Accessing TRCVMIDCVR<n>

Must be programmed if any of the following are true:

- TRCRSCTLR<a>.GROUP == 0b0111 and TRCRSCTLR<a>.VMID[n] == 1.
- TRCACATR<a>.CONTEXTTYPE == 0b10 or 0b11 and TRCACATR<a>.CONTEXT == n.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRCVMIDCVR<m> ; Where m = 0-7

op0	op1	CRn	CRm	op2
0b10	0b001	0b0011	m[2:0]:0b0	0b001

```
let m:integer = UInt(CRm[3:1]);

TRFCR_EL1, Trace Filter Control Register (EL1)

The TRFCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

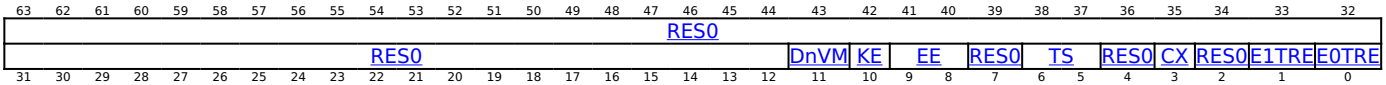
AArch64 System register TRFCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TRFCR[31:0].

This register is present only when FEAT_TRF is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TRFCR_EL1 are UNDEFINED.

Attributes

TRFCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

DnVM, bit [11]
When FEAT_TRBEv1p1 is implemented and FEAT_NV is implemented:

Reserved for software use in nested virtualization. See also TRFCR_EL2.DnVM.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KE, bit [10]
When FEAT_TRBE_EXC is implemented:

Kernel exception enable for TRBE Profiling exceptions taken to EL1.

KE	Meaning
0b0	TRBE Profiling exceptions taken to EL1 are always masked at EL1.
0b1	Enabled TRBE Profiling exceptions taken to EL1 are masked at EL1 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]
When FEAT_TRBE_EXC is implemented:

Exception Enable.

EE	Meaning	Applies when
0b00	Disabled. TRBE Profiling exceptions for EL1 are disabled. All of the following apply: • Unless enabled by a higher Exception level, TRBE Profiling exceptions are not generated. • TRBSR_EL1.IRQ drives the interrupt request signal TRBIRQ. • Accesses to TRBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1.	
0b01	Reserved for software use in nested virtualization. Behaves as 0b00 for the purpose of controlling the TRBE Profiling exception and interrupt request signal TRBIRQ, and as 0b11 for the purpose of accesses to TRBSR_EL1.	When FEAT_NV is implemented
0b10	Reserved for software use in nested virtualization. Behaves as 0b11 for the purposes of controlling the TRBE Profiling exception and interrupt request signal TRBIRQ, and accesses to TRBSR_EL1.	When FEAT_NV is implemented
0b11	Enabled. TRBE Profiling exceptions for EL1 are enabled, as follows: • All trace buffer management events are recorded in TRBSR_EL1, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE or TRBSR_EL2 by TRFCR_EL2.EE. • TRBE Profiling exceptions are generated and taken to EL1 when unmasked and TRBSR_EL1.IRQ is 1, unless the Effective value of HCR_EL2.TGE is 1, in which case the exception is taken to EL2. • The interrupt request signal TRBIRQ is not asserted.	

For more information on the values reserved for software use in nested virtualization, see TRFCR_EL2.EE.

If the Effective value of TRFCR_EL2.EE is 0b00, then the Effective value of TRFCR_EL1.EE is 0b00.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b00	Reserved for software use in nested virtualization. Behaves as 0b01. See also TRFCR_EL2.TS,	When FEAT_NV2p1 is implemented
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF_EL2.	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, then the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn == 0. • CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

If any of the following are true, then this field is ignored by the PE:

- EL2 is implemented and TRFCR_EL2.TS is not 0b00.

- SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

CX, bit [3]
When FEAT_NV2p1 is implemented:

Reserved for software use in nested virtualization. See also TRFCR_EL2.CX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Trace is prohibited at EL1.
0b1	Trace is allowed at EL1.

If any of the following are true, then this field is ignored by the PE:

- SelfHostedTraceEnabled() == FALSE.
- The Effective value of HCR_EL2.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Trace is prohibited at EL0.
0b1	Trace is allowed at EL0.

If any of the following are true, then this field is ignored by the PE:

- SelfHostedTraceEnabled() == FALSE.
- The Effective value of HCR_EL2.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRFCR_EL1

op0	op1	CRn	CRm	op2

0b11	0b000	0b0001	0b0010	0b001

```

TRFCR_EL2, Trace Filter Control Register (EL2)

The TRFCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Trace.

Configuration

AArch64 System register TRFCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTRFCR[31:0].

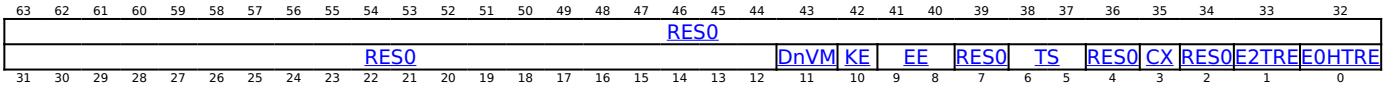
This register is present only when FEAT_TRF is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TRFCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TRFCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

DnVM, bit [11]
When FEAT_TRBEv1p1 is implemented:

Disable use of physical address trace buffer pointers.

DnVM	Meaning
0b0	Use of physical address trace buffer pointers is permitted.
0b1	Use of physical address trace buffer pointers is disabled. The PE behaves as if TRBLIMITR_EL1.nVM is 0.

If EL2 is disabled in the owning Security state, or the trace buffer owning Exception level is EL2, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL2.
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.

Otherwise:

Reserved, RES0.

KE, bit [10]
When FEAT_TRBE_EXC is implemented:

Kernel exception enable for TRBE Profiling exceptions taken to EL2.

KE	Meaning
0b0	TRBE Profiling exceptions taken to EL2 are always masked at EL2.
0b1	Enabled TRBE Profiling exceptions taken to EL2 are masked at EL2 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]
When FEAT_TRBE_EXC is implemented:

Exception Enable.

EE	Meaning
0b00	Disabled. TRBE Profiling exceptions for EL2 and EL1 are disabled. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL2. • Unless enabled by a higher Exception level, TRBE Profiling exceptions are not generated. • TRBSR_EL1.IRQ drives the interrupt request signal TRBIRQ. • Accesses to TRBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to TRBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. TRBE Profiling exceptions for EL2 are disabled, but might be enabled for EL1 by TRFCR_EL1.EE. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL2. • TRBSR_EL2.IRQ is ignored and TRBE Profiling exceptions are not taken to EL2, other than for the case when the Effective value of HCR_EL2.TGE is 1.
0b10	Enabled. TRBE Profiling exceptions for EL2 are enabled for trace buffer management events targeting EL2, as follows: • Trace buffer management events due to a fault on a write to the trace buffer that would generate a Data Abort exception taken to EL2 if generated by a store instruction executed at the owning Exception level are recorded in TRBSR_EL2, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE. If the trace buffer owning Exception level is EL2, then this means any fault on a write to the trace buffer. If the trace buffer owning Exception level is EL1, then this means any of the following faults on a write to the trace buffer: ◦ Stage 2 faults. ◦ If HCR_EL2.TEA is 1, synchronous External aborts. ◦ If HCR_EL2.GPF is 1, Granule Protection Faults (GPFs). • Trace buffer management events due to Granule Protection Check faults other than GPFs on a write to the trace buffer are recorded in TRBSR_EL2, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE. • TRBE Profiling exceptions are generated and taken to EL2 when unmasked and TRBSR_EL2.IRQ is 1.
0b11	Trap all. TRBE Profiling exceptions for EL2 are enabled for all trace buffer management events, as follows: • All trace buffer management events are recorded in TRBSR_EL2, unless they are configured to be recorded in TRBSR_EL3 by MDCR_EL3.TRBEE. • TRBE Profiling exceptions are generated and taken to EL2 when unmasked and TRBSR_EL2.IRQ is 1.

If the Effective value of MDCR_EL3.TRBEE is 0b00, then the Effective value of TRFCR_EL2.EE is 0b00. Otherwise, if EL2 is not implemented or the Effective value of SCR_EL3.{NS, EEL2} is {0, 0}, then the Effective value of TRFCR_EL2.EE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b00	Timestamp controlled by TRFCR_EL1.TS or TRFCR.TS.	
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF_EL2.	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn == 0. • CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

If SelfHostedTraceEnabled() == FALSE, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Bit [4]

Reserved, RES0.

CX, bit [3]

CONTEXTIDR_EL2 and VMID trace enable.

CX	Meaning
0b0	CONTEXTIDR_EL2 and VMID trace prohibited.
0b1	CONTEXTIDR_EL2 and VMID trace allowed.

If SelfHostedTraceEnabled() == FALSE, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [2]

Reserved, RES0.

E2TRE, bit [1]

EL2 Trace Enable.

E2TRE	Meaning
0b0	Trace is prohibited at EL2.
0b1	Trace is allowed at EL2.

If SelfHostedTraceEnabled() == FALSE, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0HTRE, bit [0]

EL0 Trace Enable.

E0HTRE	Meaning
0b0	Trace is prohibited at EL0.
0b1	Trace is allowed at EL0.

If any of the following are true, then this field is ignored by the PE:

- SelfHostedTraceEnabled() == FALSE.
- The Effective value of HCR_EL2.TGE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRFCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TRFCR_EL2

2025-12-10 16:11:30, 2025-12_rel

TTBR0_EL1, Translation Table Base Register 0 (EL1)

The TTBR0_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL1&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR0[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR0_EL1 are UNDEFINED.

TTBR0_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

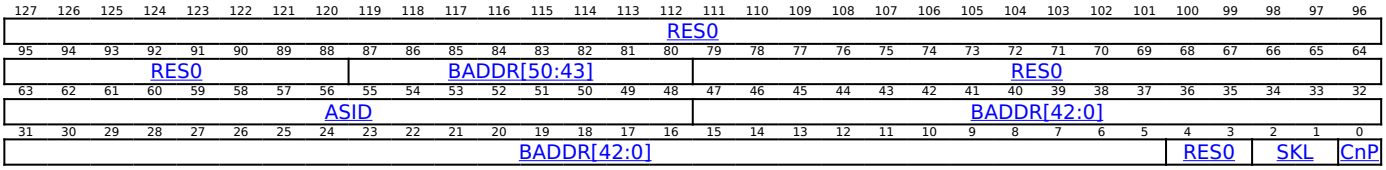
Attributes

TTBR0_EL1 is a:

- 128-bit register when FEAT_D128 is implemented and TCR2_EL1.D128 == '1'
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL1.D128 == '0'

Field descriptions

When FEAT_D128 is implemented and TCR2_EL1.D128 == '1':



Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR0_EL1[87:80].
- BADDR[42:0] is TTBR0_EL1[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL1.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL1&0 translation table walks using TTBR0_EL1.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

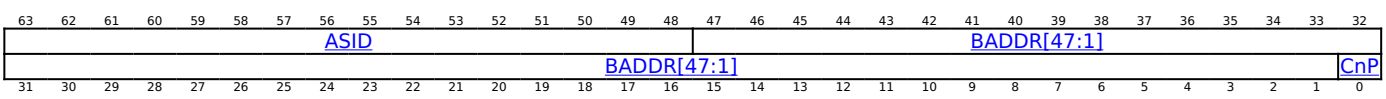
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL1.D128 == '0':



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T0SZ, the translation stage, and the translation granule size.

The BADDR field represents a 52-bit address if any of the following apply:

- The value of TCR_EL1.IPS represents an OA size of 52 bits.
- The Effective value of TCR_EL1.DS is 1.

When TTBR0_EL1.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Otherwise, all of the following apply:

- Register bits[(x-1):1] are RES0.
- If 52-bit PA is supported, then bits A[51:48] of the stage 1 translation table base address are treated as 0b0000.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if 52-bit PA is not supported, and the value of TCR_EL1.IPS is 0b110 or 0b111, one of the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR0_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR0_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TTBR0_EL1 or TTBR0_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR0_EL1

TTBR0_EL2, Translation Table Base Register 0 (EL2)

The TTBR0_EL2 characteristics are:

Purpose

When the Effective value of HCR_EL2.E2H is not 1, holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL2 translation regime, and other information for this translation regime.

When the Effective value of HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the EL2&0 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR0_EL2 bits [47:0] are architecturally mapped to AArch32 System register HTTBR[47:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR0_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

TTBR0_EL2 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

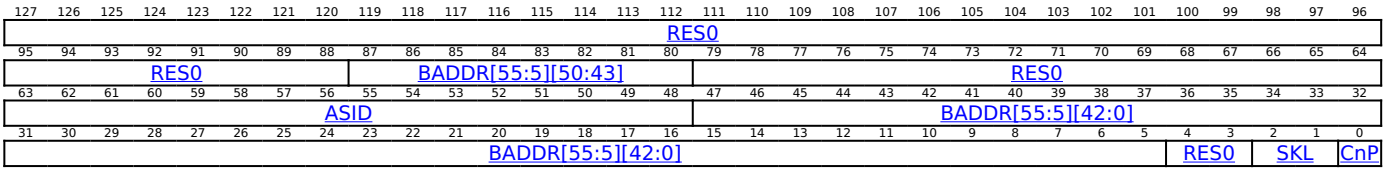
Attributes

TTBR0_EL2 is a:

- 128-bit register when FEAT_D128 is implemented, TCR2_EL2.D128 == '1', and EffectiveHCR_EL2_E2H() == '1'
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL2.D128 == '0'

Field descriptions

When FEAT_D128 is implemented, TCR2_EL2.D128 == '1', and EffectiveHCR_EL2_E2H() == '1':



Bits [127:88]

Reserved, RES0.

BADDR[55:5], bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR[55:5] field is split as follows:

- BADDR[55:5][50:43] is TTBR0_EL2[87:80].
- BADDR[55:5][42:0] is TTBR0_EL2[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]
When FEAT_VHE is implemented:

When the Effective value of HCR_EL2.E2H is 1, it holds an ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL2.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL2&0 translation table walks using TTBR0_EL2.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL2.CnP on those other PEs. • When the current translation regime is the EL2&0 regime, the value of the current ASID.
0b1	The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL2. • The translation tables relate to the same translation regime. • If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

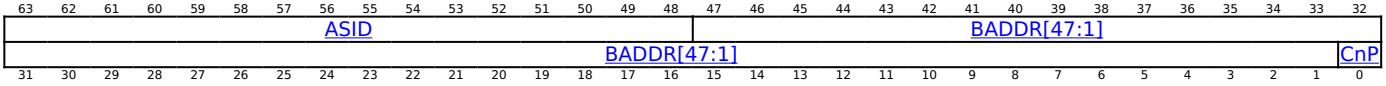
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL2.D128 == '0':



ASID, bits [63:48]
When FEAT_VHE is implemented:

When the Effective value of HCR_EL2.E2H is not 1, this field is RES0.

When the Effective value of HCR_EL2.E2H is 1, it holds an ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T0SZ, the translation stage, and the translation granule size.

The BADDR field represents a 52-bit address if any of the following apply:

- The value of TCR_EL2.{I}PS represents an OA size of 52 bits.
- The Effective value of TCR_EL2.DS is 1.

When TTBR0_EL2.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Otherwise, all of the following apply:

- Register bits[(x-1):1] are RES0.
- If 52-bit PA is supported, then bits A[51:48] of the stage 1 translation table base address are treated as 0b0000.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

The OA size specified by TCR_EL2.{I}PS is determined as follows:

- The value of TCR_EL2.PS when the Effective value of HCR_EL2.E2H is not 1.
- The value of TCR_EL2.IPS when the Effective value of HCR_EL2.E2H is 1.

For the 64KB granule, if 52-bit PA is not supported, and the value of TCR_EL2.{I}PS is 0b110 or 0b111, one of the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL2 for the current translation regime, and ASID if applicable, are permitted to differ from corresponding entries for TTBR0_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0_EL2.CnP on those other PEs. • When the current translation regime is the EL2&0 regime, the value of the current ASID.
0b1	The translation table entries pointed to by TTBR0_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR0_EL2. • The translation tables relate to the same translation regime. • If that translation regime is the EL2&0 regime, the ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TTBR0_EL2 or TTBR0_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

TTBR0_EL3, Translation Table Base Register 0 (EL3)

The TTBR0_EL3 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of an address translation in the EL3 translation regime, and other information for this translation regime.

Configuration

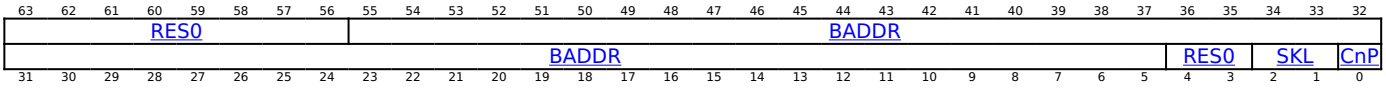
This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR0_EL3 are UNDEFINED.

Attributes

TTBR0_EL3 is a 64-bit register.

Field descriptions

When FEAT_D128 is implemented and TCR_EL3.D128 == '1':



Bits [63:56]

Reserved, RES0.

BADDR, bits [55:5]

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[55:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR0_EL3.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL3 translation table walks using TTBR0_EL3.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.
0b1	The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This bit is permitted to be cached in a TLB.

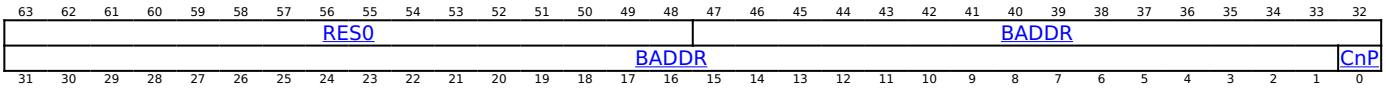
Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented or TCR_EL3.D128 == '0':



Bits [63:48]

Reserved, RES0.

BADDR, bits [47:1]

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL3.T0SZ, the translation stage, and the translation granule size.

The BADDR field represents a 52-bit address if any of the following apply:

- The value of TCR_EL3.PS represents an OA size of 52 bits.
- The Effective value of TCR_EL3.DS is 1.

When TTBR0_EL3.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Otherwise, all of the following apply:

- Register bits[(x-1):1] are RES0.
- If 52-bit PA is supported, then bits A[51:48] of the stage 1 translation table base address are treated as 0b0000.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if 52-bit PA is not supported, and the value of TCR_EL3.PS is 0b110 or 0b111, one of the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR0_EL3, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TTBR0_EL3 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR0_EL3, for the current translation regime, are permitted to differ from corresponding entries for TTBR0_EL3 for other PEs in the Inner Shareable domain. This is not affected by the value of TTBR0_EL3.CnP on those other PEs.
0b1	The translation table entries pointed to by TTBR0_EL3 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0_EL3.CnP is 1 and the translation table entries are pointed to by TTBR0_EL3.

This bit is permitted to be cached in a TLB.

Note

If the value of the TTBR0_EL3.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0_EL3s do not point to the same translation table entries the results of translations using TTBR0_EL3 are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR0_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b000

TTBR1_EL1, Translation Table Base Register 1 (EL1)

The TTBR1_EL1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL1&0 stage 1 translation regime, and other information for this translation regime.

Configuration

AArch64 System register TTBR1_EL1 bits [63:0] are architecturally mapped to AArch32 System register TTBR1[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR1_EL1 are UNDEFINED.

TTBR1_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

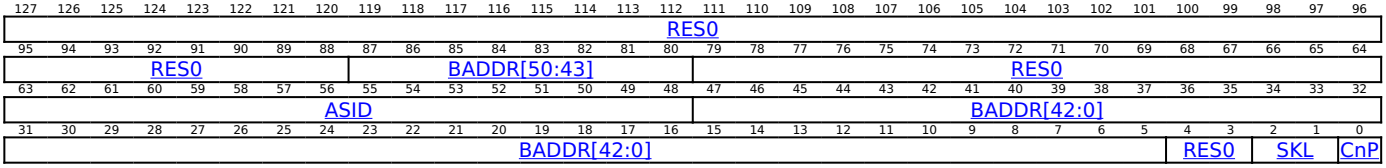
Attributes

TTBR1_EL1 is a:

- 128-bit register when FEAT_D128 is implemented and TCR2_EL1.D128 == '1'
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL1.D128 == '0'

Field descriptions

When FEAT_D128 is implemented and TCR2_EL1.D128 == '1':



Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR1_EL1[87:80].
- BADDR[42:0] is TTBR1_EL1[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR1_EL1.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL1&0 translation table walks using TTBR1_EL1.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

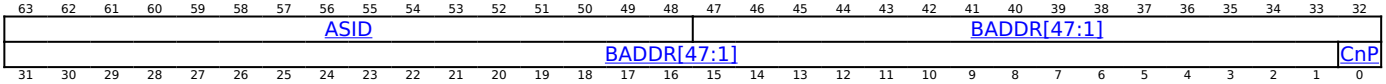
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL1.D128 == '0':



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL1.A1 field selects either TTBR0_EL1.ASID or TTBR1_EL1.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL1.T1SZ, the translation stage, and the translation granule size.

The BADDR field represents a 52-bit address if any of the following apply:

- The value of TCR_EL1.IPS represents an OA size of 52 bits.
- The Effective value of TCR_EL1.DS is 1.

When TTBR1_EL1.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Otherwise, all of the following apply:

- Register bits[(x-1):1] are RES0.
- If 52-bit PA is supported, then bits A[51:48] of the stage 1 translation table base address are treated as 0b0000.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

For the 64KB granule, if 52-bit PA is not supported, and the value of TCR_EL1.IPS is 0b110 or 0b111, one of the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL1, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL1, for the current translation regime and ASID, are permitted to differ from corresponding entries for TTBR1_EL1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL1.CnP on those other PEs. • The value of the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.
0b1	The translation table entries pointed to by TTBR1_EL1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL1.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL1. • The translation tables relate to the same translation regime. • The ASID is the same as the current ASID. • If EL2 is implemented and enabled in the current Security state, the value of the current VMID.

This bit is permitted to be cached in a TLB.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1_EL1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TTBR1_EL1 or TTBR1_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TTBR1_EL1

TTBR1_EL2, Translation Table Base Register 1 (EL2)

The TTBR1_EL2 characteristics are:

Purpose

When the Effective value of HCR_EL2.E2H is 1, holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the EL2&0 translation regime, and other information for this translation regime.

Note

When the Effective value of HCR_EL2.E2H is not 1, the contents of this register are ignored by the PE, except for a direct read or write of the register.

Configuration

This register is present only when FEAT_VHE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TTBR1_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

TTBR1_EL2 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

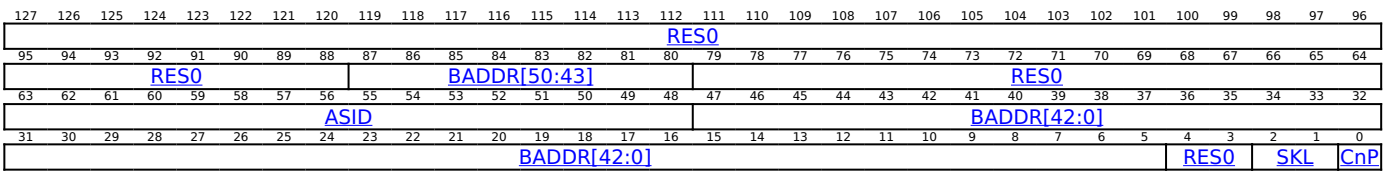
Attributes

TTBR1_EL2 is a:

- 128-bit register when FEAT_D128 is implemented, TCR2_EL2.D128 == '1', and EffectiveHCR_EL2_E2H() == '1'
- 64-bit register when FEAT_D128 is not implemented or TCR2_EL2.D128 == '0'

Field descriptions

When FEAT_D128 is implemented, TCR2_EL2.D128 == '1', and EffectiveHCR_EL2_E2H() == '1':



Bits [127:88]

Reserved, RES0.

BADDR, bits [87:80, 47:5]

Translation table base address:

- Bits A[55:x] of the stage 1 translation table base address bits are in register bits[87:80, 47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. x is calculated based on LOG2(StartTableSize), as described in VMSAv9-128. The smallest permitted value of x is 5.

The BADDR field is split as follows:

- BADDR[50:43] is TTBR1_EL2[87:80].
- BADDR[42:0] is TTBR1_EL2[47:5].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [79:64]

Reserved, RES0.

ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:3]

Reserved, RES0.

SKL, bits [2:1]

Skip Level associated with translation table walks using TTBR1_EL2.

This determines the number of levels to be skipped from the regular start level of the stage 1 EL2&0 translation table walks using TTBR1_EL2.

SKL	Meaning
0b00	Skip 0 level from the regular start level.
0b01	Skip 1 level from the regular start level.
0b10	Skip 2 levels from the regular start level.
0b11	Skip 3 levels from the regular start level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL2.CnP on those other PEs. • The value of the current ASID.
0b1	The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL2. • The ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the Effective value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

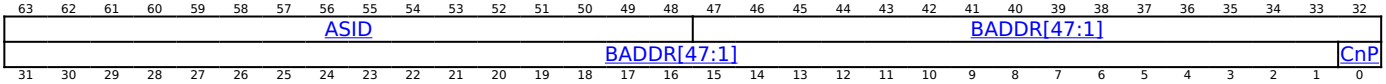
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When FEAT_D128 is not implemented or TCR2_EL2.D128 == '0':



ASID, bits [63:48]

An ASID for the translation table base address. The TCR_EL2.A1 field selects either TTBR0_EL2.ASID or TTBR1_EL2.ASID.

If the implementation has only 8 bits of ASID, then the upper 8 bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR[47:1], bits [47:1]

Translation table base address:

- Bits A[47:x] of the stage 1 translation table base address bits are in register bits[47:x].
- Bits A[(x-1):0] of the stage 1 translation table base address are zero.

Address bit x is the minimum address bit required to align the translation table to the size of the table. The AArch64 Virtual Memory System Architecture chapter describes how x is calculated based on the value of TCR_EL2.T1SZ, the translation stage, and the translation granule size.

The BADDR field represents a 52-bit address if any of the following apply:

- The value of TCR_EL2.{I}PS represents an OA size of 52 bits.
- The Effective value of TCR_EL2.DS is 1.

When TTBR1_EL2.BADDR represents a 52-bit addresses, all of the following apply:

- Bits A[51:48] of the stage 1 translation table base address bits are in register bits[5:2].
- Register bit[1] is RES0.
- The smallest permitted value of x is 6.
- When x>6, register bits[(x-1):6] are RES0.

Otherwise, all of the following apply:

- Register bits[(x-1):1] are RES0.
- If 52-bit PA is supported, then bits A[51:48] of the stage 1 translation table base address are treated as 0b0000.

Note

If BADDR represents a 52-bit address, and the translation table has fewer than eight entries, the table must be aligned to 64 bytes. Otherwise the translation table must be aligned to the size of the table.

The OA size specified by TCR_EL2.{I}PS is determined as follows:

- The value of TCR_EL2.PS when the Effective value of HCR_EL2.E2H is not 1.
- The value of TCR_EL2.IPS when the Effective value of HCR_EL2.E2H is 1.

For the 64KB granule, if 52-bit PA is not supported, and the value of TCR_EL2.{I}PS is 0b110 or 0b111, one of the following IMPLEMENTATION DEFINED behaviors occur:

- BADDR uses the extended format to represent a 52-bit base address.
- BADDR does not use the extended format.

When the value of ID_AA64MMFR0_EL1.PARange indicates that the implementation supports a 56 bit PA size, bits A[55:52] of the stage 1 translation table base address are zero.

If any register bit[47:1] that is defined as RES0 has the value 1 when a translation table walk is done using TTBR1_EL2, then the translation table base address might be misaligned, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Bits A[(x-1):0] of the stage 1 translation table base address are treated as if all the bits are zero. The value read back from the corresponding register bits is either the value written to the register or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by TBR1_EL2 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by TTBR1_EL2 for the current ASID are permitted to differ from corresponding entries for TTBR1_EL2 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1_EL2.CnP on those other PEs. • The value of the current ASID.
0b1	The translation table entries pointed to by TTBR1_EL2 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1_EL2.CnP is 1 and all of the following apply: • The translation table entries are pointed to by TTBR1_EL2. • The ASID is the same as the current ASID.

This bit is permitted to be cached in a TLB.

Note

- TTBR1_EL2 is accessible only when the Effective value of HCR_EL2.E2H is 1, meaning the current translation regime is the EL2&0 regime.
- If the value of the TTBR1_EL2.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1_EL2s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TTBR1_EL2 or TTBR1_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

TTTBRP_EL1, TIndex Transition Table Base Register Privileged (EL1)

The TTTBRP_EL1 characteristics are:

Purpose

Configuration of the base address for the region of memory that contains the TIndex Transition Table used for EL1 execution.

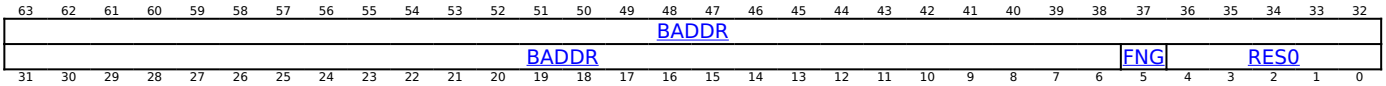
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TTTBRP_EL1 are UNDEFINED.

Attributes

TTTBRP_EL1 is a 64-bit register.

Field descriptions



BADDR, bits [63:6]

Base address of the TIndex transition Table.

Bits [63:6] of the address are the value in this field.

Bits [5:0] of the address are zero.

The least significant bits of this field are RES0, so that the base address of the table is aligned to the size of the table.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FNG, bit [5]

Force non-global.

FNG	Meaning
0b0	No effect on the interpretation of the TTT nG bit.
0b1	For TTT entries reached using this register, the nG bit is treated as 1, regardless of the programmed value.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:0]

Reserved, RES0.

Accessing TTTBRP_EL1

Accesses to this register use the following encodings in the System register encoding space:

TTTBRU_EL2, TIndex Transition Table Base Register Unprivileged (EL2)

The TTTBRU_EL2 characteristics are:

Purpose

Configuration of the base address for the region of memory that contains the TIndex Transition Table used for EL0 execution when HCR_EL2.{EL2, TGE} is {1,1}.

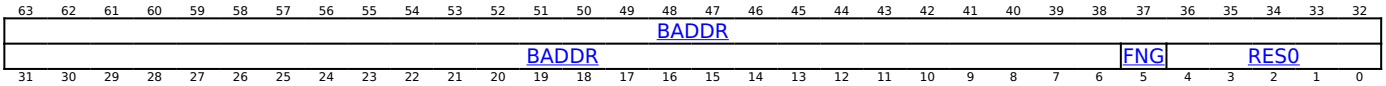
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TTTBRU_EL2 are UNDEFINED.

Attributes

TTTBRU_EL2 is a 64-bit register.

Field descriptions



BADDR, bits [63:6]

Base address of the TIndex transition Table.

Bits [63:6] of the address are the value in this field.

Bits [5:0] of the address are zero.

The least significant bits of this field are RES0, so that the base address of the table is aligned to the size of the table.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FNG, bit [5]

Force non-global.

FNG	Meaning
0b0	No effect on the interpretation of the TTT nG bit.
0b1	For TTT entries reached using this register, the nG bit is treated as 1, regardless of the programmed value.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:0]

Reserved, RES0.

UAO, User Access Override

The UAO characteristics are:

Purpose

Allows access to the User Access Override bit.

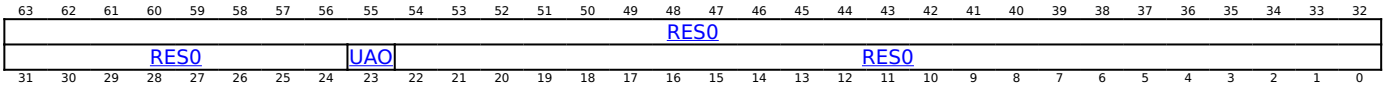
Configuration

This register is present only when FEAT_UAO is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to UAO are UNDEFINED.

Attributes

UAO is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

UAO, bit [23]

User Access Override.

UAO	Meaning
0b0	Explicit Memory Effects generated by unprivileged memory access instructions and described as unprivileged are unprivileged.
0b1	Explicit Memory Effects generated by unprivileged memory access instructions and described as unprivileged are privileged.

The Effective value of PSTATE.UAO is 0 when execution is at EL0.

The Effective value of PSTATE.UAO is 1 when any of the following is true:

- Execution is at EL1, and HCR_EL2.{NV, NV1} is {1, 1}.
- Execution is at EL2, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- Execution is at EL3.

Bits [22:0]

Reserved, RES0.

Accessing UAO

For more information about the operation of the MSR (immediate) accessor, see 'MSR (immediate)'.

Accesses to this register use the following encodings in the System register encoding space:

VBAR_EL1, Vector Base Address Register (EL1)

The VBAR_EL1 characteristics are:

Purpose

Holds the vector base address for any exception that is taken to EL1.

Configuration

AArch64 System register VBAR_EL1 bits [31:0] are architecturally mapped to AArch32 System register VBAR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to VBAR_EL1 are UNDEFINED.

Attributes

VBAR_EL1 is a 64-bit register.
