- Accesses to the following registers at EL1 are trapped to EL2 and reported using EC syndrome value 0x18:
  - GCR_EL1.
  - RGSR_EL1.
  - TFSRE0_EL1.
  - TFSR_EL1.
  - Accesses with the register name TFSR_EL2 that are not UNDEFINED.

Note

Prior to FEAT_VMTE, the only memory tagging is Physical Tagging.

ATA	Meaning
0b0	Disables the use of Physical tagging at EL1 and EL0. If HCRX_EL2.VTE is 0, the specified registers are trapped to EL2. If HCRX_EL2.VTE is 1, this field does not trap the specified registers to EL2.
0b1	This field has no effect on the use of Physical tagging at EL1 and EL0. The field does not trap the specified registers to EL2.

The Effective value of this field is 1 when the Effective value of SCR_EL3.ATA is 1 and any of the following are true:

- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.ATA == '1'.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]
When FEAT_EVT2 is implemented:

Trap TLB maintenance instructions that operate on the Outer Shareable domain. Traps execution of those TLB maintenance instructions at EL1 using AArch64 to EL2, when EL2 is enabled in the current Security state. The following instructions are trapped and reported with EC syndrome value 0x18:

- TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS,TLBI VAAE1OS, TLBI VALE1OS, and TLBI VAALE1OS.
- If FEAT_TLBIRANGE is implemented, TLBI RVAE1OS, TLBI RVAAE1OS,TLBI RVALE1OS, and TLBI RVAALE1OS.
- If FEAT_XS is implemented, then the *OSNXS variants are also trapped.

TTLBOS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Effective value of NVHCR_EL2.TGE is 1 and the Effective value of HCRX_EL2.NVnTTLBOS is 1, TLBI OS instructions that apply to stage 1 of the EL1&0 translation regime have their architected effect instead of being trapped by HCR_EL2.TTLBOS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TTLBOS == '1'.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]
When FEAT_EVT2 is implemented:

Trap TLB maintenance instructions that operate on the Inner Shareable domain. Traps execution of those TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, TLBI VAALE1IS, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, and TLBI RVAALE1IS.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x03:
  - TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, and TLBIMVAALIS.
- If FEAT_XS is implemented, then the *ISNXS variants are also trapped.

TTLBIS	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions are trapped to EL2.

If the Effective value of NVHCR_EL2.TGE is 1 and the Effective value of HCRX_EL2.NVnTTLBIS is 1, TLBI IS instructions that apply to stage 1 of the EL1&0 translation regime have their architected effect instead of being trapped by HCR_EL2.TTLBIS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TTLBIS == '1'.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enable Access to the SCXTNUM_EL1 and SCXTNUM_EL0 registers. The defined values are:

EnSCXT	Meaning
0b0	When EL2 is enabled in the current Security state, EL1 accesses to SCXTNUM_EL0 and SCXTNUM_EL1 are disabled, causing an exception to EL2, and the value of the registers to be treated as 0. When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1} and EL2 is enabled in the current Security state, EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the value of the register to be treated as 0.
0b1	This control does not cause accesses to SCXTNUM_EL0 or SCXTNUM_EL1 to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1} and the value of this field is 0, accesses at EL0 are not trapped by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.EnSCXT == '1'.

Otherwise:

Reserved, RES0.

TOCU, bit [52]
When FEAT_EVT is implemented:

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL0 is using AArch64, the value of SCTLR_EL1.UCI is 1, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then the following instructions at EL0 are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, and DC CVAU.
- If EL1 is using AArch64, then the following instructions at EL1 are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, IC IALLU, and DC CVAU.
- If EL1 is using AArch32, then the following instructions are trapped at EL1 to EL2 and reported with EC syndrome value 0x03:
  - ICIMVAU, ICIALLU, and DCCMVAU.

Note

When SCTLR_EL1.UCI is 0, the trap on execution of instructions at EL0 is higher priority than this control.

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TOCU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	For each of the specified instructions, if the execution of the instruction can be trapped, accesses are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TOCU == '1'.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]
When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Virtualization of the Activity Monitors is disabled. Indirect reads of the virtual offset registers are zero.
0b1	Virtualization of the Activity Monitors is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.AMVOFFEN == '1'.

Otherwise:

Reserved, RES0.

TICAB, bit [50]
When FEAT_EVT is implemented:

Trap ICIALLUIS and IC IALLUIS cache maintenance instructions. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instruction is trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IALLUIS.
- If EL1 is using AArch32, then the following instruction is trapped to EL2 and reported with EC syndrome value 0x03:
  - ICIALLUIS.

TICAB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	For each of the specified instructions, if the execution of the instruction can be trapped, EL1 access is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TICAB == '1'.

Otherwise:

Reserved, RES0.

TID4, bit [49]
When FEAT_EVT is implemented:

Trap ID group 4. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state:

AArch64:

- EL1 reads of CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1.
- EL1 writes to CSSELR_EL1.

AArch32:

- EL1 reads of CCSIDR, CCSIDR2, CLIDR, and CSSELR.
- EL1 writes to CSSELR.

TID4	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 accesses to ID group 4 registers are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TID4 == '1'.

Otherwise:

Reserved, RES0.

GPF, bit [48]
When FEAT_RME is implemented:

Controls the reporting of Granule protection faults at EL0 and EL1.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0 and EL1 to EL2.
0b1	Instruction Abort exceptions and Data Abort exceptions due to GPFs from EL0 and EL1 are routed to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.GPF == '1'.

Otherwise:

Reserved, RES0.

FIEN, bit [47]
When FEAT_RASv1p1 is implemented:

Fault Injection Enable. Unless this bit is set to 1, accesses to the ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 registers from EL1 generate a Trap exception to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

If EL2 is disabled in the current Security state, the Effective value of HCR_EL2.FIEN is 1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.FIEN == '1'.

Otherwise:

Reserved, RES0.

FWB, bit [46]
When FEAT_S2FWB is implemented:

Forced Write-Back. Defines the combined cacheability attributes in a 2 stage translation regime.

FWB	Meaning
0b0	When this bit is 0, then the combination of stage 1 and stage 2 translations on memory type and cacheability attributes are as described in the Armv8.0 architecture. For more information, see 'Combining stage 1 and stage 2 memory type attributes'.
0b1	When this bit is 1, then the encoding of the stage 2 memory type and cacheability attributes in bits[5:2] of the stage 2 Page or Block descriptors are as described in 'Stage 2 memory type and Cacheability attributes when FEAT_S2FWB is enabled'.

In Secure state, this bit applies to both the Secure stage 2 translation and the Non-secure stage 2 translation.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.FWB == '1'.

Otherwise:

Reserved, RES0.

NV2, bit [45]
When FEAT_NV2 is implemented:

Nested Virtualization. Changes the behaviors of HCR_EL2.{NV1, NV} to provide a mechanism for hardware to transform reads and writes from System registers into reads and writes from memory.

NV2	Meaning
0b0	This bit has no effect on the behavior of HCR_EL2.{NV1, NV}. The behavior of HCR_EL2.{NV1, NV} is as defined for FEAT_NV.
0b1	Redefines behavior of HCR_EL2{NV1, NV} to enable: • Transformation of read/writes to registers into read/writes to memory. • Redirection of EL2 registers to EL1 registers. Any exception taken from EL1 and taken to EL1 causes SPSR_EL1.M[3:2] to be set to 0b10 and not 0b01.

When the Effective value of HCR_EL2.NV is 0, the Effective value of this field is 0 and this field is treated as 0 for all purposes other than direct reads and writes of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.NV2 == '1'.

Otherwise:

Reserved, RES0.

AT, bit [44]
When FEAT_NV is implemented:

Address Translation. EL1 execution of the following address translation instructions is trapped to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- AT S1E0R, AT S1E0W, AT S1E1R, AT S1E1W, AT S1E1RP, and AT S1E1WP.
- If FEAT_ATS1A is implemented, AT S1E1A.

AT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified instructions is trapped to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.AT == '1'.

Otherwise:

Reserved, RES0.

NV1, bit [43]
When FEAT_NV2 is implemented:

Nested Virtualization.

NV1	Meaning
0b0	If the Effective value of HCR_EL2.{NV2, NV} is {1, 1}, accesses executed from EL1 to implemented EL12, EL02, or EL2 registers are transformed to loads and stores. If the Effective value of HCR_EL2.{NV2, NV} is not {1, 1}, this control does not cause any instructions to be trapped.
0b1	If the Effective value of HCR_EL2.NV2 is 1, accesses executed from EL1 to implemented EL2 registers are transformed to loads and stores. If the Effective value of HCR_EL2.NV2 is 0, EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If the Effective value of HCR_EL2.NV2 is 1, the Effective value of HCR_EL2.NV1 defines which EL1 register accesses are transformed to loads and stores.

The trapping of EL1 registers caused by other control bits has priority over the transformation of these accesses.

If a register is specified that is not implemented by an implementation, then access to that register are UNDEFINED.

For the list of registers affected, see 'Enhanced support for nested virtualization'.

If the Effective value of HCR_EL2.{NV1, NV} is {0, 1}, any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If the Effective value of HCR_EL2.{NV1, NV} is {1, 1}, then:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - The Effective value of UXN is 0.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.

- When executing at EL1, the Effective value of PSTATE.PAN is 0 for all purposes except reading the value of the bit.
- When executing at EL1, the Effective value of PSTATE.UAO is 1 for all purposes except reading the value of the bit.

If the Effective value of HCR_EL2.{NV1, NV} are {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {1, 1} for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {0, 0} for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the Effective value of HCR_EL2.{NV1, NV} behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.NV1 == '1'.

When FEAT_NV is implemented:

Nested Virtualization. EL1 accesses to certain registers are trapped to EL2, when EL2 is enabled in the current Security state.

NV1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to VBAR_EL1, ELR_EL1, SPSR_EL1, and, when FEAT_CSV2_2 or FEAT_CSV2_1p2 is implemented, SCXTNUM_EL1, are trapped to EL2, when EL2 is enabled in the current Security state, and are reported using EC syndrome value 0x18.

If the Effective value of HCR_EL2.{NV1, NV} is {0, 1}, then the following effects also apply:

- Any exception taken from EL1, and taken to EL1, causes the SPSR_EL1.M[3:2] to be set to 0b10, and not 0b01.

If the Effective value of HCR_EL2.{NV1, NV} is {1, 1}, then the following effects also apply:

- The EL1 translation table Block and Page descriptors:
  - Bit[54] holds the PXN instead of the UXN.
  - The Effective value of UXN is 0.
  - Bit[53] is RES0.
  - Bit[6] is treated as 0 regardless of the actual value.
- If Hierarchical Permissions are enabled, the EL1 translation table Table descriptors are as follows:
  - Bit[61] is treated as 0 regardless of the actual value.
  - Bit[60] holds the PXNTable instead of the UXNTable.
  - Bit[59] is RES0.
- When executing at EL1, the Effective value of PSTATE.PAN is 0 for all purposes except reading the value of the bit.
- When executing at EL1, the Effective value of PSTATE.UAO is 1 for all purposes except reading the value of the bit.

If the Effective value of HCR_EL2.{NV1, NV} is {1, 0}, then the behavior is a CONSTRAINED UNPREDICTABLE choice of:

- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {1, 1} for all purposes other than reading back the value of the HCR_EL2.NV bit.
- Behaving as if the Effective value of HCR_EL2.{NV1, NV} is {0, 0} for all purposes other than reading back the value of the HCR_EL2.NV1 bit.
- Behaving with regard to the Effective value of HCR_EL2.{NV1, NV} behavior as defined in the rest of this description.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.

◦ HCRMASK_EL2.NV1 == '1'.

Otherwise:

Reserved, RES0.

NV, bit [42]
When FEAT_NV2 is implemented:

Nested Virtualization.

When the Effective value of HCR_EL2.NV2 is 1, redefines register accesses so that:

- Instructions accessing the Special purpose registers SPSR_EL2 and ELR_EL2 instead access SPSR_EL1 and ELR_EL1 respectively.
- Instructions accessing the System registers ESR_EL2 and FAR_EL2 instead access ESR_EL1 and FAR_EL1.

When the Effective value of HCR_EL2.NV2 is 0, traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	When this bit is set to 0, then the PE behaves as if the Effective value of HCR_EL2.NV2 is 0 for all purposes other than reading this register. This control does not cause any instructions to be trapped. When the Effective value of HCR_EL2.NV2 is 1, no FEAT_NV2 functionality is implemented.
0b1	When the Effective value of HCR_EL2.NV2 is 0, EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2. When the Effective value of HCR_EL2.NV2 is 1, this control redefines EL1 register accesses so that instructions accessing SPSR_EL2, ELR_EL2, ESR_EL2, and FAR_EL2 instead access SPSR_EL1, ELR_EL1, ESR_EL1, and FAR_EL1 respectively.

When the Effective value of HCR_EL2.NV2 is 0, then:

- The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:
  - Registers accessed using MRS or MSR with a name ending in _EL2, except the following:
    - SP_EL2.
    - If FEAT_MEC is implemented, MECID_A0_EL2, MECID_A1_EL2, MECID_P0_EL2, MECID_P1_EL2, MECIDR_EL2, VMECID_A_EL2, and VMECID_P_EL2.
  - Registers accessed using MRS or MSR with a name ending in _EL12.
  - Registers accessed using MRS or MSR with a name ending in _EL02.
  - Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und, and SPSR_fiq, accessed using MRS or MSR.
  - Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.
- The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:
  - EL2 translation regime Address Translation instructions and TLB maintenance instructions.
  - EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.
- The instructions for which the execution is trapped as follows:
  - SMC in an implementation that does not include EL3 and when HCR_EL2.TSC is 1. HCR_EL2.TSC bit is not RES0 in this case. This is reported using EC syndrome value 0x17.
  - The ERET, ERETAA, and ERETAB instructions, reported using EC syndrome value 0x1A.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.NV == '1'.

When FEAT_NV is implemented:

Nested Virtualization. Traps functionality that is permitted at EL2 and would be UNDEFINED at EL1 if this field was 0, when EL2 is enabled in the current Security state. This applies to the following operations:

- EL1 accesses to Special-purpose registers that are not UNDEFINED at EL2.
- EL1 accesses to System registers that are not UNDEFINED at EL2.
- Execution of EL1 or EL2 translation regime address translation and TLB maintenance instructions for EL2 and above.

NV	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers or the execution of the specified instructions are trapped to EL2, when EL2 is enabled in the current Security state. EL1 read accesses to the CurrentEL register return a value of 0x2.

The System or Special-purpose registers for which accesses are trapped and reported using EC syndrome value 0x18 are as follows:

- Registers accessed using MRS or MSR with a name ending in _EL2, except the following:
  - SP_EL2.
  - If FEAT_MEC is implemented, MECID_A0_EL2, MECID_A1_EL2, MECID_P0_EL2, MECID_P1_EL2, MECIDR_EL2, VMECID_A_EL2, and VMECID_P_EL2.
- Registers accessed using MRS or MSR with a name ending in _EL12.
- Registers accessed using MRS or MSR with a name ending in _EL02.
- Special-purpose registers SPSR_irq, SPSR_abt, SPSR_und, and SPSR_fiq, accessed using MRS or MSR.
- Special-purpose register SP_EL1 accessed using the dedicated MRS or MSR instruction.

The instructions for which the execution is trapped and reported using EC syndrome value 0x18 are as follows:

- EL2 translation regime Address Translation instructions and TLB maintenance instructions.
- EL1 translation regime Address Translation instructions and TLB maintenance instructions that are accessible only from EL2 and EL3.

The execution of the ERET, ERETAA, and ERETAB instructions are trapped and reported using EC syndrome value 0x1A.

Note

The priority of this trap is higher than the priority of the HCR_EL2.API trap. If both of these bits are set so that EL1 execution of an ERETAA or ERETAB instruction is trapped to EL2, then the syndrome reported is 0x1A.

The execution of the SMC instructions in an implementation that does not include EL3 and when HCR_EL2.TSC is 1 are trapped and reported using EC syndrome value 0x17. HCR_EL2.TSC bit is not RES0 in this case.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.NV == '1'.

Otherwise:

Reserved, RES0.

API, bit [41]
When FEAT_PAuth is implemented:

Controls the use of instructions related to Pointer Authentication:

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB.
- PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB.
- RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ.
- ERETAA, ERETAB, LDRAA, and LDRAB.

- When FEAT_PAuth_LR is implemented, AUTIASPPC, AUTIASPPCR, AUTIA171615, AUTIBSPPC, AUTIBSPPCR, AUTIB171615, PACIASPPC, PACNBIASPPC, PACIA171615, PACIBSPPC, PACNBIBSPPC, PACIB171615, RETAASPPC, RETAASPPCR, RETABSPPC, RETABSPPCR.

This field is ignored if the instruction is disabled as a result of the SCTLR_ELx.{EnIB, EnIA, EnDA, EnDB} fields.

API	Meaning
0b0	The instructions related to Pointer Authentication are trapped to EL2 and reported using EC syndrome value 0x09, when EL2 is enabled in the current Security state and the instructions are enabled for the EL1&0 translation regime, from: • When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL0. • EL1. If the Effective value of HCR_EL2.NV is 1, the HCR_EL2.NV trap takes precedence over the HCR_EL2.API trap for the ERETAA and ERETAB instructions. If EL2 is implemented and enabled in the current Security state and the Effective value of HFGITR_EL2.ERET is 1, execution at EL1 using AArch64 of ERETAA or ERETAB instructions is reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by HCR_EL2.API == 0.
0b1	This control does not cause any instructions to be trapped.

If FEAT_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.API == '1'.

Otherwise:

Reserved, RES0.

APK, bit [40]
When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers from EL1 to EL2, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x18:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1, APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1, APGAKeyLo_EL1, and APGAKeyHi_EL1.

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 are trapped to EL2, when EL2 is enabled in the current Security state.
0b1	This control does not cause any instructions to be trapped.

Note

If FEAT_PAuth is implemented but EL2 is not implemented or is disabled in the current Security state, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.APK == '1'.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TEA, bit [37]
When FEAT_RAS is implemented:

Route synchronous External abort exceptions to EL2.

TEA	Meaning
0b0	Synchronous External abort exceptions are unaffected by this mechanism. That is, synchronous External abort exceptions are not taken to EL2 unless routed to EL2 by another control.
0b1	When executing at Exception levels below EL2, and EL2 is enabled in the current Security state, synchronous External abort exceptions are taken to EL2, unless they are routed to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TEA == '1'.

Otherwise:

Reserved, RES0.

TERR, bit [36]
When FEAT_RAS is implemented:

Trap accesses of Error Record registers. Enables a trap to EL2 on accesses of Error Record registers.

TERR	Meaning
0b0	Accesses of the specified Error Record registers are not trapped by this mechanism.
0b1	Accesses of the specified Error Record registers at EL1 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
- MRS accesses to ERRIDR_EL1 and ERXFR_EL1.
- If FEAT_RASv1p1 is implemented, MRS and MSR accesses to ERXMISC2_EL1 and ERXMISC3_EL1.
- If FEAT_RASv2 is implemented, MRS accesses to ERXGSR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
- MRC accesses to ERRIDR, ERXFR, and ERXFR2.
- If FEAT_RASv1p1 is implemented, MRC and MCR accesses to ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL2.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TERR == '1'.

Otherwise:

Reserved, RES0.

TLOR, bit [35]
When FEAT_LOR is implemented:

Trap LOR registers. Traps Non-secure and Realm EL1 accesses to LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure and Realm EL1 accesses to the LOR registers are trapped to EL2.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TLOR == '1'.

Otherwise:

Reserved, RES0.

E2H, bit [34]
When FEAT_VHE is implemented:

EL2 Host. Enables a configuration where a Host Operating System is running in EL2, and the Host Operating System's applications are running in EL0.

E2H	Meaning
0b0	The facilities to support a Host Operating System at EL2 are disabled.
0b1	The facilities to support a Host Operating System at EL2 are enabled.

For information on the behavior of this bit see 'Behavior of HCR_EL2.E2H'.

When FEAT_E2H0 is not implemented, this field is RES1 and behaves as if it is 1 for all purposes other than a direct read.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.E2H == '1'.

Otherwise:

Reserved, RES0.

ID, bit [33]

Stage 2 Instruction access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

ID	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime.
0b1	Forces all stage 2 translations for instruction accesses to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.ID == '1'.

CD, bit [32]

Stage 2 Data access cacheability disable. For the EL1&0 translation regime, when EL2 is enabled in the current Security state and HCR_EL2.VM==1, this control forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

CD	Meaning
0b0	This control has no effect on stage 2 of the EL1&0 translation regime for data accesses and translation table walks.
0b1	Forces all stage 2 translations for data accesses and translation table walks to Normal memory to be Non-cacheable.

This bit has no effect on the EL2, EL2&0, or EL3 translation regimes.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.CD == '1'.

RW, bit [31]
When FEAT_AA32EL1 is implemented:

Execution state control for lower Exception levels:

RW	Meaning
0b0	Lower levels are all AArch32.
0b1	The Execution state for EL1 is AArch64. The Execution state for EL0 is determined by the current value of PSTATE.nRW when executing at EL0.

In an implementation that includes EL3, when EL2 is not enabled in Secure state, the PE behaves as if this bit has the same value as the SCR_EL3.RW bit for all purposes other than a direct read or write access of HCR_EL2.

The RW bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

TRVM, bit [30]

Trap Reads of Virtual Memory controls. Traps reads of the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, EL1 accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x18 for MRS and 0x14 for MRRS:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, and CONTEXTIDR_EL1.
  - If FEAT_AIE is implemented, MAIR2_EL1 and AMAIR2_EL1.
  - If FEAT_S1PIE is implemented, PIRE0_EL1 and PIR_EL1.
  - If FEAT_S1POE is implemented, POR_EL0 and POR_EL1.
  - If FEAT_S2POE is implemented, S2POR_EL1.
  - If FEAT_TCR2 is implemented, TCR2_EL1.
  - If FEAT_SCTLR2 is implemented, SCTLR2_EL1.
- If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and EL0 is using AArch64, EL0 accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x18 for MRS:
  - If FEAT_S1POE is implemented, POR_EL0.
- If EL1 is using AArch32, EL1 accesses using MRC to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MRRC are trapped to EL2 and reported using EC syndrome value 0x04:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, and CONTEXTIDR.

TRVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Read accesses to the specified Virtual Memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

EL2 provides a second stage of address translation, that a hypervisor can use to remap the address map defined by a Guest OS. In addition, a hypervisor can trap attempts by a Guest OS to write to the registers that control the memory system. A hypervisor might use this trap as part of its virtualization of memory management.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TRVM == '1'.

HCD, bit [29]
When EL3 is not implemented:

HVC instruction disable. Disables EL1 and EL2 execution of HVC instructions, from both Execution states, when EL2 is enabled in the current Security state, reported using EC syndrome value 0x00.

HCD	Meaning
0b0	HVC instruction execution is enabled at EL2 and EL1.
0b1	HVC instructions are UNDEFINED at EL2 and EL1. Any resulting exception is taken to the Exception level at which the HVC instruction is executed.

Note

HVC instructions are always UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - HCRMASK_EL2.HCD == '1'.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Traps EL0 and EL1 execution of the following instructions to EL2, when EL2 is enabled in the current Security state, from AArch64 state only, reported using EC syndrome value 0x18:

- DC ZVA.
- If FEAT_MTE is implemented, DC GVA and DC GZVA.
- If FEAT_MTETC is implemented, DC GBVA and DC ZGBVA.

TDZ	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	In AArch64 state, any attempt to execute an instruction this trap applies to at EL1, or at EL0 when the instruction is not UNDEFINED at EL0, is trapped to EL2 when EL2 is enabled in the current Security state. Reading the DCZID_EL0 returns a value that indicates that the instructions this trap applies to are not supported.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TDZ == '1'.

TGE, bit [27]

Trap General Exceptions, from EL0.

TGE	Meaning
0b0	This control has no effect on execution at EL0.
0b1	When EL2 is not enabled in the current Security state, the Effective value of this field is 0. When EL2 is enabled in the current Security state, in all cases: • All exceptions that would be routed to EL1 are routed to EL2. • If EL1 is using AArch64, the SCTLR_EL1.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR_EL1. • If EL1 is using AArch32, the SCTLR.M field is treated as being 0 for all purposes other than returning the result of a direct read of SCTLR. • All virtual interrupts and virtual exceptions are disabled. • Any IMPLEMENTATION DEFINED mechanisms for signaling virtual interrupts are disabled. • An exception return to EL1 is treated as an illegal exception return. • The MDCR_EL2.{TDRA, TDOSA, TDA, TDE} fields are treated as being 1 for all purposes other than returning the result of a direct read of MDCR_EL2. In addition, when EL2 is enabled in the current Security state, if: • The Effective value of HCR_EL2.E2H is not 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 1. • The Effective value of HCR_EL2.E2H is 1, the Effective values of the HCR_EL2.{FMO, IMO, AMO} fields are 0. For further information on the behavior of this bit when the Effective value of E2H is 1, see 'Behavior of HCR_EL2.E2H'.

HCR_EL2.TGE must not be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TGE == '1'.

TVM, bit [26]

Trap Virtual Memory controls. Traps writes to the virtual memory control registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, the following registers are trapped to EL2 and reported using EC syndrome value 0x18 for MSR and 0x14 for MSRR:
  - SCTLR_EL1, TTBR0_EL1, TTBR1_EL1, TCR_EL1, ESR_EL1, FAR_EL1, AFSR0_EL1, AFSR1_EL1, MAIR_EL1, AMAIR_EL1, and CONTEXTIDR_EL1.
  - If FEAT_AIE is implemented, MAIR2_EL1 and AMAIR2_EL1.
  - If FEAT_S1PIE is implemented, PIRE0_EL1 and PIR_EL1.
  - If FEAT_S1POE is implemented, POR_EL0 and POR_EL1.
  - If FEAT_S2POE is implemented, S2POR_EL1.
  - If FEAT_TCR2 is implemented, TCR2_EL1.
  - If FEAT_SCTLR2 is implemented, SCTLR2_EL1.
- If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and EL0 is using AArch64, EL0 accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x18 for MSR:
  - If FEAT_S1POE is implemented, POR_EL0.
- If EL1 is using AArch32, EL1 accesses using MCR to the following registers are trapped to EL2 and reported using EC syndrome value 0x03, accesses using MCRR are trapped to EL2 and reported using EC syndrome value 0x04:
  - SCTLR, TTBR0, TTBR1, TTBCR, TTBCR2, DACR, DFSR, IFSR, DFAR, IFAR, ADFSR, AIFSR, PRRR, NMRR, MAIR0, MAIR1, AMAIR0, AMAIR1, and CONTEXTIDR.

TVM	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Write accesses to the specified Virtual Memory control registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TVM == '1'.

TTLB, bit [25]

Trap TLB maintenance instructions. Traps execution of TLB maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instructions are trapped to EL2 and reported using EC syndrome value 0x18:
  - TLBI VMALLE1, TLBI VAE1, TLBI ASIDE1, TLBI VAAE1, TLBI VALE1, and TLBI VAALE1.
  - TLBI VMALLE1IS, TLBI VAE1IS, TLBI ASIDE1IS, TLBI VAAE1IS, TLBI VALE1IS, and TLBI VAALE1IS.
  - If FEAT_TLBIOS is implemented, TLBI VMALLE1OS, TLBI VAE1OS, TLBI ASIDE1OS, TLBI VAAE1OS, TLBI VALE1OS, and TLBI VAALE1OS.
  - If FEAT_TLBIRANGE is implemented, TLBI RVAE1, TLBI RVAAE1, TLBI RVALE1, TLBI RVAALE1, TLBI RVAE1IS, TLBI RVAAE1IS, TLBI RVALE1IS, and TLBI RVAALE1IS.
  - If FEAT_TLBIOS and FEAT_TLBIRANGE are implemented, TLBI RVAE1OS, TLBI RVAAE1OS, TLBI RVALE1OS, and TLBI RVAALE1OS.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported using EC syndrome value 0x03:
  - TLBIALLIS, TLBIMVAIS, TLBIASIDIS, TLBIMVAAIS, TLBIMVALIS, and TLBIMVAALIS.
  - TLBIALL, TLBIMVA, TLBIASID, TLBIMVAA, TLBIMVAL, and TLBIMVAAL
  - ITLBIALL, ITLBIMVA, and ITLBIASID.
  - DTLBIALL, DTLBIMVA, and DTLBIASID.

TTLB	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 execution of the specified TLB maintenance instructions are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

If the Effective value of NVHCR_EL2.TGE is 1, TLBI instructions that apply to stage 1 of the EL1&0 translation regime have their architected effect instead of being trapped, in each of the following cases:

- TLBI instructions that do not specify IS or OS, if HCRX_EL2.NVnTTLB is 1.
- TLBI instructions that specify IS, if HCRX_EL2.NVnTTLBIS is 1.
- TLBI instructions that specify OS, if HCRX_EL2.NVnTTLBOS is 1.

Note

The TLB maintenance instructions are UNDEFINED at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TTLB == '1'.

TPU, bit [24]

Trap cache maintenance instructions that operate to the Point of Unification. Traps execution of those cache maintenance instructions at EL0 and EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL0 is using AArch64 and the value of SCTLR_EL1.UCI is 1, then the following instructions at EL0 are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU and DC CVAU.
- If EL1 is using AArch64, then the following instructions at EL1 are trapped to EL2 and reported with EC syndrome value 0x18:
  - IC IVAU, IC IALLU, IC IALLUIS, and DC CVAU.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x03:
  - ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU.

Note

When SCTLR_EL1.UCI is 0, the trap on execution of instructions at EL0 is higher priority than this control.

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- IC IALLUIS and IC IALLU are always UNDEFINED at EL0 using AArch64.
- ICIMVAU, ICIALLU, ICIALLUIS, and DCCMVAU are always UNDEFINED at EL0 using AArch32.

TPU	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	For each of the specified instructions, if the execution of the instruction can be trapped, access is trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TPU == '1'.

TPCP, bit [23]

Trap data or unified cache maintenance instructions that operate to the Point of Coherency, Persistence, or Physical Storage. When EL2 is enabled in the current Security state, traps execution of cache maintenance instructions at EL0 and EL1 to EL2 as follows:

- If EL0 is using AArch64 and the value of SCTLR_EL1.UCI is 1, then the following instructions at EL0 are trapped to EL2 and reported using EC syndrome value 0x18:
  - DC CIVAC and DC CVAC.
  - If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC CGVAC, and DC CGDVAC.
  - If FEAT_DPB is implemented, DC CVAP.
  - If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
  - If FEAT_DPB2 is implemented, DC CVADP.
  - If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.
- If EL1 is using AArch64, then the following instructions at EL1 are trapped to EL2 and reported using EC syndrome value 0x18:
  - DC IVAC, DC CIVAC and DC CVAC.
  - If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC IGVAC, DC IGDVAC, DC CGVAC, and DC CGDVAC.
  - If FEAT_DPB is implemented, DC CVAP.
  - If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
  - If FEAT_DPB2 is implemented, DC CVADP.
  - If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
  - If FEAT_PoPS is implemented, DC CIVAPS.
  - If FEAT_PoPS and FEAT_MTE2 are implemented, DC CIGDVAPS.
- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.
- If EL1 is using AArch32, then the following instructions at EL1 are trapped to EL2 and reported using EC syndrome value 0x03:
  - DCIMVAC, DCCIMVAC, and DCCMVAC.

Note

This field was previously named TPC.

When SCTLR_EL1.UCI is 0, the trap on execution of instructions at EL0 is higher priority than this control.

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2. In addition:

- AArch64 instructions which invalidate by VA to the Point of Coherency or Physical Storage are always UNDEFINED at EL0 using AArch64.
- DCIMVAC, DCCIMVAC, and DCCMVAC are always UNDEFINED at EL0 using AArch32.

TPCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	For each of the specified instructions, if the execution of the instruction can be trapped, it is trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TPCP == '1'.

TSW, bit [22]

Trap data or unified cache maintenance instructions that operate by Set/Way. Traps execution of those cache maintenance instructions at EL1 to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x18:
  - DC ISW, DC CSW, and DC CISW.
  - If FEAT_MTE2 is implemented, DC IGSW, DC IGDSW, DC CGSW, DC CGDW, DC CIGSW, and DC CIGDSW.
- If EL1 is using AArch32, then the following instructions are trapped to EL2 and reported with EC syndrome value 0x03:
  - DCISW, DCCSW, and DCCISW.

Note

An exception generated because an instruction is UNDEFINED at EL0 is higher priority than this trap to EL2, and these instructions are always UNDEFINED at EL0.

TSW	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Execution of the specified instructions is trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TSW == '1'.

TACR, bit [21]

Trap Auxiliary Control Registers. Traps EL1 accesses to the Auxiliary Control Registers to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, accesses to ACTLR_EL1 to EL2, are trapped to EL2 and reported using EC syndrome value 0x18.
- If EL1 is using AArch32, accesses to ACTLR and, if implemented, ACTLR2 are trapped to EL2 and reported using EC syndrome value 0x03.
- If FEAT_S1POE2 is implemented, accesses to AFGDTP<n>_EL1 and AFGDTU<n>_EL1 are trapped to EL2 and reported using EC syndrome value 0x18.

TACR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to the specified registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

Note

ACTLR_EL1 is not accessible at EL0.

ACTLR and ACTLR2 are not accessible at EL0.

The Auxiliary Control Registers are IMPLEMENTATION DEFINED registers that might implement global control bits for the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TACR == '1'.

TIDCP, bit [20]

Trap IMPLEMENTATION DEFINED functionality. Traps EL1 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped:
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}, and are reported using EC syndrome value 0x18.
  - IMPLEMENTATION DEFINED System instructions, which are accessed using SYSP, with CRn == {11, 15}, and are reported using EC syndrome value 0x14.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome 0x18.
  - IMPLEMENTATION DEFINED System registers, which are accessed using MRRS and MSRR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome 0x14.
- In AArch32 state, MCR and MRC access to instructions with the following encodings are trapped and reported using EC syndrome value 0x03:
  - All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}.
  - All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

When this functionality is accessed from EL0:

- If FEAT_TIDCP1 is implemented and the Effective value of SCTLR_EL1.TIDCP is 1, any accesses from EL0 are trapped to EL1.
- Otherwise, if FEAT_TIDCP1 is implemented and the Effective value of SCTLR_EL2.TIDCP is 1, any accesses from EL0 are trapped to EL2.
- Otherwise:
  - If HCR_EL2.TIDCP is 1, it is IMPLEMENTATION DEFINED whether any accesses from EL0 are trapped to EL2.
  - If HCR_EL2.TIDCP is 0, any accesses from EL0 are UNDEFINED and generate an exception that is taken to EL1 or EL2.

TIDCP	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 accesses to or execution of the specified encodings reserved for IMPLEMENTATION DEFINED functionality are trapped to EL2, when EL2 is enabled in the current Security state.

An implementation can also include IMPLEMENTATION DEFINED registers that provide additional controls, to give finer-grained control of the trapping of IMPLEMENTATION DEFINED features.

Note

The trapping of accesses to these registers from EL1 is higher priority than an exception resulting from the register access being UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TIDCP == '1'.

TSC, bit [19]

Trap SMC instructions. Traps EL1 execution of SMC instructions to EL2, when EL2 is enabled in the current Security state.

If execution is in AArch64 state, the trap is reported using EC syndrome value 0x17.

If execution is in AArch32 state, the trap is reported using EC syndrome value 0x13.

Note

HCR_EL2.TSC traps execution of the SMC instruction. It is not a routing control for the SMC exception. Trap exceptions and SMC exceptions have different preferred return addresses.

TSC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	If EL3 is implemented, then any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state, regardless of the value of SCR_EL3.SMD. If EL3 is not implemented and the Effective value of HCR_EL2.NV is 1, then any attempt to execute an SMC instruction at EL1 using AArch64 is trapped to EL2. If EL3 is not implemented and the Effective value of HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether: • Any attempt to execute an SMC instruction at EL1 is trapped to EL2, when EL2 is enabled in the current Security state. • Any attempt to execute an SMC instruction is UNDEFINED.

In AArch32 state, the Armv8-A architecture permits, but does not require, this trap to apply to conditional SMC instructions that fail their condition code check, in the same way as with traps on other conditional instructions.

SMC instructions are UNDEFINED at EL0.

If EL3 is not implemented, and the Effective value of HCR_EL2.NV is 0, then it is IMPLEMENTATION DEFINED whether this bit is:

- RES0.
- Implemented with the functionality as described in HCR_EL2.TSC.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TSC == '1'.

TID3, bit [18]

Trap ID group 3. Traps EL1 reads of group 3 ID registers to EL2, when EL2 is enabled in the current Security state, as follows:

In AArch64 state:

- Reads of the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - ID_PFR0_EL1, ID_PFR1_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, MVFR0_EL1, MVFR1_EL1, and MVFR2_EL1.

        - ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64AFR0_EL1, and ID_AA64AFR1_EL1.
        - If FEAT_FGT is implemented, reads of the following registers are trapped to EL2. If FEAT_FGT is not implemented, reads of the following registers are trapped to EL2, unless the registers are implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses are trapped to EL2.
            - ID_PFR2_EL1, ID_MMFR4_EL1 and ID_MMFR5_EL1.
            - ID_AA64MMFR3_EL1.
            - ID_AA64MMFR4_EL1.
            - ID_AA64PFR2_EL1.
            - ID_AA64MMFR2_EL1 and ID_ISAR6_EL1.
            - ID_DFR1_EL1.
            - ID_AA64ZFR0_EL1.
            - ID_AA64SMFR0_EL1.
            - ID_AA64ISAR2_EL1.
        - If FEAT_FGT is implemented, this field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: op0 == 3, op1 == 0, CRn == 0, CRm == {2-7}, op2 == {0-7}. If FEAT_FGT is not implemented, it is IMPLEMENTATION DEFINED whether this field traps accesses to registers in the range.

In AArch32 state:

- VMRS access to MVFR0, MVFR1, and MVFR2, are trapped to EL2, reported using EC syndrome value 0x08, unless access is also trapped by HCPTR which takes priority.
- MRC access to the following registers are trapped to EL2, reported using EC syndrome value 0x03:
    - ID_PFR0, ID_PFR1, ID_PFR2, ID_DFR0, ID_AFR0, ID_MMFR0, ID_MMFR1, ID_MMFR2, ID_MMFR3, ID_ISAR0, ID_ISAR1, ID_ISAR2, ID_ISAR3, ID_ISAR4, and ID_ISAR5.
    - If FEAT_FGT is implemented:
        - ID_MMFR4 and ID_MMFR5.
        - ID_ISAR6.
        - ID_DFR1.
        - This field traps all MRC accesses to encodings in the following range that are not already mentioned in this field description: coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.
    - If FEAT_FGT is not implemented:
        - ID_MMFR4 and ID_MMFR5 are trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_MMFR4 or ID_MMFR5 are trapped.
        - ID_ISAR6 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_ISAR6 are trapped to EL2.
        - ID_DFR1 is trapped to EL2, unless implemented as RAZ, when it is IMPLEMENTATION DEFINED whether accesses to ID_DFR1 are trapped to EL2.
        - Otherwise, it is IMPLEMENTATION DEFINED whether this bit traps all MRC accesses to registers in the following range not already mentioned in this field description with coproc == p15, opc1 == 0, CRn == c0, CRm == {c2-c7}, opc2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 3 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
    - FEAT_SRMASK2 is implemented.
    - PSTATE.EL == EL2.
    - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
    - HCRMASK_EL2.TID3 == '1'.

TID2, bit [17]

Trap ID group 2. Traps the following register accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- If EL1 is using AArch64, reads of CTR_EL0, CCSIDR_EL1, CCSIDR2_EL1, CLIDR_EL1, and CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 is using AArch64 and the value of SCTLR_EL1.UCT is not 0, reads of CTR_EL0 are trapped to EL2, reported using EC syndrome value 0x18. If the value of SCTLR_EL1.UCT is 0, then EL0 reads of CTR_EL0 are trapped to EL1 and the resulting exception takes precedence over this trap.
- If EL1 is using AArch64, writes to CSSELR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL1 is using AArch32, reads of CTR, CCSIDR, CCSIDR2, CLIDR, and CSSELR are trapped to EL2, reported using EC syndrome value 0x03.
- If EL1 is using AArch32, writes to CSSELR are trapped to EL2, reported using EC syndrome value 0x03.

TID2	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 and EL0 accesses to ID group 2 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TID2 == '1'.

TID1, bit [16]

Trap ID group 1. Traps EL1 reads of the following registers to EL2, when EL2 is enabled in the current Security state as follows:

- In AArch64 state, accesses of REVIDR_EL1, AIDR_EL1, and SMIDR_EL1, reported using EC syndrome value 0x18.
- In AArch32 state, accesses of TCMTR, TLBTR, REVIDR, and AIDR, reported using EC syndrome value 0x03.

TID1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 1 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TID1 == '1'.

TID0, bit [15]
When FEAT_AA32 is implemented:

Trap ID group 0. Traps the following register accesses to EL2:

- EL1 reads of the JIDR, reported using EC syndrome value 0x05.
- If the JIDR is RAZ from EL0, EL0 reads of the JIDR, reported using EC syndrome value 0x05.
- EL1 accesses using VMRS of the FPSID, reported using EC syndrome value 0x08.

Note

- It is IMPLEMENTATION DEFINED whether the JIDR is RAZ or UNDEFINED at EL0. If it is UNDEFINED at EL0, then any resulting exception takes precedence over this trap.
- The FPSID is not accessible at EL0 using AArch32.
- Writes to the FPSID are ignored, and not trapped by this control.

TID0	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL1 read accesses to ID group 0 registers are trapped to EL2, when EL2 is enabled in the current Security state.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TID0 == '1'.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Traps EL0 and EL1 execution of WFE instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE or SCTLR_EL1.nTWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFE can complete at any time, even without a Wakeup event, the traps on WFE are not guaranteed to be taken, even if the WFE is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TWE == '1'.

TWI, bit [13]

Traps EL0 and EL1 execution of WFI instructions to EL2, when EL2 is enabled in the current Security state, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at EL0 or EL1 is trapped to EL2, when EL2 is enabled in the current Security state, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI or SCTLR_EL1.nTWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is trapped only if the instruction passes its condition code check.

Note

Since a WFI can complete at any time, even without a Wakeup event, the traps on WFI are not guaranteed to be taken, even if the WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.TWI == '1'.

DC, bit [12]

Default Cacheability.

DC	Meaning
0b0	This control has no effect on the EL1&0 translation regime.
0b1	In any Security state: • When EL1 is using AArch64, the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of SCTLR_EL1. • When EL1 is using AArch32, the PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of SCTLR. • The PE behaves as if the value of the HCR_EL2.VM field is 1 for all purposes other than returning the value of a direct read of HCR_EL2. • The memory type produced by stage 1 of the EL10 translation regime is Normal Non-Shareable, Inner Write-Back Read-Allocate Write-Allocate, Outer Write-Back Read-Allocate Write-Allocate.

This field has no effect on the EL2, EL2&0, and EL3 translation regimes.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.DC == '1'.

BSU, bits [11:10]

Barrier Shareability upgrade. This field determines the minimum shareability domain that is applied to any barrier instruction executed from EL1 or EL0:

BSU	Meaning
0b00	No effect.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Full system.

This value is combined with the specified level of the barrier held in its instruction, using the same principles as combining the shareability attributes from two stages of address translation.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.BSU == '1'.

FB, bit [9]
When FEAT_TLBID is implemented:

Force broadcast. Configures how TLBI and IC instructions are broadcast when executed from EL1.

The Non-shareable invalidate instructions affected by this bit are:

- In AArch32 state: BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, and TLBIMVAAL.
- In AArch64 state:
  - All TLBI instructions that are executable at EL1 and do not specify IS or OS.
  - All TLBIP instructions that are executable at EL1 and do not specify IS or OS.
  - IC IALLU.

The Inner-shareable invalidate instructions affected by this bit are:

- In AArch64 state:
  - All TLBI instructions that are executable at EL1 and specify IS.
  - All TLBIP instructions that are executable at EL1 and specify IS.
  - IC IALLUIS.

This field is used in combination with HCRX_EL2.FNB control, as follows:

FNB	FB	Meaning
0b0	0b0	The specified instructions are not affected by this control.
0b0	0b1	When one of the specified Non-shareable instructions is executed at EL1, the operation is broadcast within the Inner Shareable shareability domain. The specified Inner-shareable instructions are not affected by this control.
0b1	0b0	The specified Non-shareable instructions are not affected by this control. When one of the specified Inner-shareable instructions is executed at EL1, the operation affects only the PE on which the instruction was executed.
0b1	0b1	The specified Non-shareable instructions are not affected by this control. When one of the specified Inner-shareable instructions is executed at EL1, the operation is broadcast only to PEs which would share TLB entries with the current PE if CnP were 1.

Regardless of the value of HCRX_EL2.FNB, if HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.FB == '1'.

Otherwise:

Force broadcast. Causes the following Non-shareable invalidate instructions to be broadcast within the Inner Shareable domain when executed from EL1:

- In AArch32 state: BPIALL, TLBIALL, TLBIMVA, TLBIASID, DTLBIALL, DTLBIMVA, DTLBIASID, ITLBIALL, ITLBIMVA, ITLBIASID, TLBIMVAA, ICIALLU, TLBIMVAL, and TLBIMVAAL.
- In AArch64 state:
  - All TLBI instructions that are executable at EL1 and do not specify IS or OS.
  - All TLBIP instructions that are executable at EL1 and do not specify IS or OS.
  - IC IALLU.

For more information, see 'A64 System instructions for TLB maintenance'.

FB	Meaning
0b0	The specified instructions are not affected by this control.
0b1	When one of the specified Non-shareable instructions is executed at EL1, the operation is broadcast within the Inner Shareable shareability domain.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.FB == '1'.

VSE, bit [8]

Virtual SError exception.

VSE	Meaning
0b0	This mechanism is not making a virtual SError exception pending.
0b1	A virtual SError exception is pending because of this mechanism.

The virtual SError exception is enabled only when HCR_EL2.TGE is 0 and either HCR_EL2.AMO is 1 or FEAT_DoubleFault2 is implemented and the Effective value of HCRX_EL2.TMEA is 1.

When FEAT_E3DSE is implemented, virtual SError exceptions pended by this field have priority over delegated SError exceptions pended by SCR_EL3.DSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.VSE == '1'.

VI, bit [7]

Virtual IRQ Interrupt.

VI	Meaning
0b0	This mechanism is not making a virtual IRQ pending.
0b1	A virtual IRQ is pending because of this mechanism.

The virtual IRQ is enabled only when the value of HCR_EL2.{TGE, IMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.

- PSTATE.EL == EL2.
- EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
- HCRMASK_EL2.VI == '1'.

VF, bit [6]

Virtual FIQ Interrupt.

VF	Meaning
0b0	This mechanism is not making a virtual FIQ pending.
0b1	A virtual FIQ is pending because of this mechanism.

The virtual FIQ is enabled only when the value of HCR_EL2.{TGE, FMO} is {0, 1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.VF == '1'.

AMO, bit [5]

Physical SError exception routing.

AMO	Meaning
0b0	When executing at Exception levels below EL3 and the Effective value of HCR_EL2.TGE is 0: • The routing of physical SError exceptions is unaffected by this mechanism. • If FEAT_E3DSE is implemented, then delegated SError exceptions enabled by SCR_EL3.DSE are not taken to EL2. • Virtual SError exceptions are not enabled by this mechanism.
0b1	When executing at Exception levels below EL3, EL2 is enabled in the current Security state, and the Effective value of HCR_EL2.TGE is 0: • Physical SError exceptions are taken to EL2, unless they are routed to EL3. • If FEAT_E3DSE is implemented, then delegated SError exceptions enabled by SCR_EL3.DSE are taken to EL2. • Virtual SError exceptions are enabled.

When executing at EL3, the value of HCR_EL2.AMO has no impact on the behavior of the PE.

When executing at Exception levels below EL3, and EL2 is not enabled in the current Security state, the Effective value of HCR_EL2.AMO is 0.

When the Effective value of HCR_EL2.TGE is 1, regardless of the value of the AMO bit, all of the following are true:

- Physical SError exceptions target EL2 unless they are routed to EL3.
- If FEAT_E3DSE is implemented, delegated SError exceptions target EL2.
- Virtual SError exceptions are disabled.

When executing at EL2 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 0}, it is IMPLEMENTATION DEFINED whether the Effective value of HCR_EL2.AMO is 1 or the value programmed.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.AMO == '1'.

IMO, bit [4]

Physical IRQ Routing.

IMO	Meaning
0b0	When executing at Exception levels below EL3 and the Effective value of HCR_EL2.TGE is 0: • Physical IRQ interrupts are not taken to EL2. • Virtual IRQ interrupts are disabled.
0b1	When executing at Exception levels below EL3, EL2 is enabled in the current Security state, and the Effective value of HCR_EL2.TGE is 0: • Physical IRQ exceptions are taken to EL2, unless they are routed to EL3. • Virtual IRQ interrupts are enabled.

When executing at EL3, the Effective value of HCR_EL2.IMO has no impact on the behavior of the PE.

When executing at Exception levels below EL3, and EL2 is not enabled in the current Security state, the Effective value of HCR_EL2.IMO is 0.

When the Effective value of HCR_EL2.TGE is 1, regardless of the value of the IMO bit, all of the following are true:

- Physical IRQ Interrupts target EL2 unless they are routed to EL3.
- Virtual IRQ interrupts are disabled.

When executing at EL2 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 0}, it is IMPLEMENTATION DEFINED whether the Effective value of HCR_EL2.IMO is 1 or the value programmed.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.IMO == '1'.

FMO, bit [3]

Physical FIQ Routing.

FMO	Meaning
0b0	When executing at Exception levels below EL3 and the Effective value of HCR_EL2.TGE is 0: • Physical FIQ interrupts are not taken to EL2. • Virtual FIQ interrupts are disabled.
0b1	When executing at Exception levels below EL3, EL2 is enabled in the current Security state, and the Effective value of HCR_EL2.TGE is 0: • Physical FIQ exceptions are taken to EL2, unless they are routed to EL3. • Virtual FIQ interrupts are enabled.

When executing at EL3, the Effective value of HCR_EL2.FMO has no impact on the behavior of the PE.

When executing at Exception levels below EL3, and EL2 is not enabled in the current Security state, the Effective value of HCR_EL2.FMO is 0.

When the Effective value of HCR_EL2.TGE is 1, regardless of the value of the FMO bit, all of the following are true:

- Physical FIQ Interrupts target EL2 unless they are routed to EL3.
- Virtual FIQ interrupts are disabled.

When executing at EL2 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 0}, it is IMPLEMENTATION DEFINED whether the Effective value of HCR_EL2.FMO is 1 or the value programmed.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.FMO == '1'.

PTW, bit [2]

Protected Table Walk. In the EL1&0 translation regime, a translation table access made as part of a stage 1 translation table walk is subject to a stage 2 translation. The combining of the memory type attributes from the two stages of translation means the access might be made to a type of Device memory. If this occurs, then the value of this bit determines the behavior:

PTW	Meaning
0b0	The translation table walk occurs as if it is to Normal Non-cacheable memory. This means it can be made speculatively.
0b1	The memory access generates a stage 2 Permission fault.

This bit is permitted to be cached in a TLB.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.PTW == '1'.

SWIO, bit [1]

Set/Way Invalidation Override. Causes EL1 execution of the data cache invalidate by set/way instructions to perform a data cache clean and invalidate by set/way:

SWIO	Meaning
0b0	This control has no effect on the operation of data cache invalidate by set/way instructions.
0b1	Data cache invalidate by set/way instructions perform a data cache clean and invalidate by set/way.

When the value of this bit is 1:

AArch32: DCISW performs the same invalidation as a DCCISW instruction.

AArch64: DC ISW performs the same invalidation as a DC CISW instruction.

This bit can be implemented as RES1.

When HCR_EL2.TGE is 1, the PE ignores the value of this field for all purposes other than a direct read of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.SWIO == '1'.

VM, bit [0]

Virtualization enable. Enables stage 2 address translation for the EL1&0 translation regime, when EL2 is enabled in the current Security state.

VM	Meaning
0b0	EL1&0 stage 2 address translation disabled.
0b1	EL1&0 stage 2 address translation enabled.

When the value of this bit is 1, data cache invalidate instructions executed at EL1 perform a data cache clean and invalidate. For the invalidate by set/way instruction this behavior applies regardless of the value of the HCR_EL2.SWIO bit.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_S1POE2 is implemented.
  - PSTATE.EL == EL2.
  - FGDTState.nVTT == '1'.
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRMASK_EL2.VM == '1'.

Accessing HCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if IsFeatureImplemented(FEAT_NV3) && EffectiveHCRX_EL2_NVTGE() == '1' then
        X{64}(t) = NVHCR_EL2();
    elsif EffectiveHCR_EL2_NVx() IN {'1x1'} then
        X{64}(t) = NVMem(0x078);
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = HCR_EL2();
elsif PSTATE.EL == EL3 then
    X{64}(t) = HCR_EL2();
end;
```

MSR HCR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if IsFeatureImplemented(FEAT_NV3) && EffectiveHCRX_EL2_NVTGE() == '1' then
        NVHCR_EL2() = X{64}(t);
    elsif EffectiveHCR_EL2_NVx() IN {'1x1'} then

HCRMASK_EL2, Hypervisor Configuration Masking Register

The HCRMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in HCR_EL2 on direct writes to HCR_EL2.

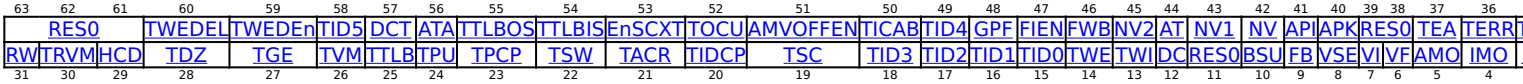
Configuration

This register is present only when FEAT_SRMASK2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HCRMASK_EL2 are UNDEFINED.

Attributes

HCRMASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:61]

Reserved, RES0.

TWEDEL, bit [60]
When FEAT_TWED is implemented:

Mask bit for TWEDEL.

TWEDEL	Meaning
0b0	HCR_EL2.TWEDEL is writeable.
0b1	HCR_EL2.TWEDEL is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [59]
When FEAT_TWED is implemented:

Mask bit for TWEDEn.

TWEDEn	Meaning
0b0	HCR_EL2.TWEDEn is writeable.
0b1	HCR_EL2.TWEDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]
When FEAT_MTE2 is implemented:

Mask bit for TID5.

TID5	Meaning
0b0	HCR_EL2.TID5 is writeable.
0b1	HCR_EL2.TID5 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]
When FEAT_MTE2 is implemented:

Mask bit for DCT.

DCT	Meaning
0b0	HCR_EL2.DCT is writeable.
0b1	HCR_EL2.DCT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]
When FEAT_MTE2 is implemented:

Mask bit for ATA.

ATA	Meaning
0b0	HCR_EL2.ATA is writeable.
0b1	HCR_EL2.ATA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]
When FEAT_EVT2 is implemented:

Mask bit for TTLBOS.

TTLBOS	Meaning
0b0	HCR_EL2.TTLBOS is writeable.
0b1	HCR_EL2.TTLBOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]
When FEAT_EVT2 is implemented:

Mask bit for TTLBIS.

TTLBIS	Meaning
0b0	HCR_EL2.TTLBIS is writeable.
0b1	HCR_EL2.TTLBIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Mask bit for EnSCXT.

EnSCXT	Meaning
0b0	HCR_EL2.EnSCXT is writeable.
0b1	HCR_EL2.EnSCXT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TOCU, bit [52]
When FEAT_EVT is implemented:

Mask bit for TOCU.

TOCU	Meaning
0b0	HCR_EL2.TOCU is writeable.
0b1	HCR_EL2.TOCU is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]
When FEAT_AMUv1p1 is implemented:

Mask bit for AMVOFFEN.

AMVOFFEN	Meaning
0b0	HCR_EL2.AMVOFFEN is writeable.
0b1	HCR_EL2.AMVOFFEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TICAB, bit [50]
When FEAT_EVT is implemented:

Mask bit for TICAB.

TICAB	Meaning
0b0	HCR_EL2.TICAB is writeable.
0b1	HCR_EL2.TICAB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]
When FEAT_EVT is implemented:

Mask bit for TID4.

TID4	Meaning
0b0	HCR_EL2.TID4 is writeable.
0b1	HCR_EL2.TID4 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]
When FEAT_RME is implemented:

Mask bit for GPF.

GPF	Meaning
0b0	HCR_EL2.GPF is writeable.
0b1	HCR_EL2.GPF is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIEN, bit [47]
When FEAT_RASv1p1 is implemented:

Mask bit for FIEN.

FIEN	Meaning
0b0	HCR_EL2.FIEN is writeable.
0b1	HCR_EL2.FIEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]
When FEAT_S2FWB is implemented:

Mask bit for FWB.

FWB	Meaning
0b0	HCR_EL2.FWB is writeable.
0b1	HCR_EL2.FWB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]
When FEAT_NV2 is implemented:

Mask bit for NV2.

NV2	Meaning
0b0	HCR_EL2.NV2 is writeable.
0b1	HCR_EL2.NV2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]
When FEAT_NV is implemented:

Mask bit for AT.

AT	Meaning
0b0	HCR_EL2.AT is writeable.
0b1	HCR_EL2.AT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]
When FEAT_NV is implemented:

Mask bit for NV1.

NV1	Meaning
0b0	HCR_EL2.NV1 is writeable.
0b1	HCR_EL2.NV1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]
When FEAT_NV is implemented:

Mask bit for NV.

NV	Meaning
0b0	HCR_EL2.NV is writeable.
0b1	HCR_EL2.NV is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]
When FEAT_PAuth is implemented:

Mask bit for API.

API	Meaning
0b0	HCR_EL2.API is writeable.
0b1	HCR_EL2.API is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]
When FEAT_PAuth is implemented:

Mask bit for APK.

APK	Meaning
0b0	HCR_EL2.APK is writeable.
0b1	HCR_EL2.APK is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TEA, bit [37]
When FEAT_RAS is implemented:

Mask bit for TEA.

TEA	Meaning
0b0	HCR_EL2.TEA is writeable.
0b1	HCR_EL2.TEA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [36]
When FEAT_RAS is implemented:

Mask bit for TERR.

TERR	Meaning
0b0	HCR_EL2.TERR is writeable.
0b1	HCR_EL2.TERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]
When FEAT_LOR is implemented:

Mask bit for TLOR.

TLOR	Meaning
0b0	HCR_EL2.TLOR is writeable.
0b1	HCR_EL2.TLOR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]
When FEAT_VHE is implemented:

Mask bit for E2H.

E2H	Meaning
0b0	HCR_EL2.E2H is writeable.
0b1	HCR_EL2.E2H is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Mask bit for ID.

ID	Meaning
0b0	HCR_EL2.ID is writeable.
0b1	HCR_EL2.ID is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CD, bit [32]

Mask bit for CD.

CD	Meaning
0b0	HCR_EL2.CD is writeable.
0b1	HCR_EL2.CD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

RW, bit [31]
When FEAT_AA32EL1 is implemented:

Mask bit for RW.

RW	Meaning
0b0	HCR_EL2.RW is writeable.
0b1	HCR_EL2.RW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRVM, bit [30]

Mask bit for TRVM.

TRVM	Meaning
0b0	HCR_EL2.TRVM is writeable.
0b1	HCR_EL2.TRVM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]
When EL3 is not implemented:

Mask bit for HCD.

HCD	Meaning
0b0	HCR_EL2.HCD is writeable.
0b1	HCR_EL2.HCD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Mask bit for TDZ.

TDZ	Meaning
0b0	HCR_EL2.TDZ is writeable.
0b1	HCR_EL2.TDZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Mask bit for TGE.

TGE	Meaning
0b0	HCR_EL2.TGE is writeable.
0b1	HCR_EL2.TGE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Mask bit for TVM.

TVM	Meaning
0b0	HCR_EL2.TVM is writeable.
0b1	HCR_EL2.TVM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Mask bit for TTLB.

TTLB	Meaning
0b0	HCR_EL2.TTLB is writeable.
0b1	HCR_EL2.TTLB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Mask bit for TPU.

TPU	Meaning
0b0	HCR_EL2.TPU is writeable.
0b1	HCR_EL2.TPU is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPCP, bit [23]

Mask bit for TPCP.

TPCP	Meaning
0b0	HCR_EL2.TPCP is writeable.
0b1	HCR_EL2.TPCP is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Mask bit for TSW.

TSW	Meaning
0b0	HCR_EL2.TSW is writeable.
0b1	HCR_EL2.TSW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Mask bit for TACR.

TACR	Meaning
0b0	HCR_EL2.TACR is writeable.
0b1	HCR_EL2.TACR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Mask bit for TIDCP.

TIDCP	Meaning
0b0	HCR_EL2.TIDCP is writeable.
0b1	HCR_EL2.TIDCP is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Mask bit for TSC.

TSC	Meaning
0b0	HCR_EL2.TSC is writeable.
0b1	HCR_EL2.TSC is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Mask bit for TID3.

TID3	Meaning
0b0	HCR_EL2.TID3 is writeable.
0b1	HCR_EL2.TID3 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Mask bit for TID2.

TID2	Meaning
0b0	HCR_EL2.TID2 is writeable.
0b1	HCR_EL2.TID2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Mask bit for TID1.

TID1	Meaning
0b0	HCR_EL2.TID1 is writeable.
0b1	HCR_EL2.TID1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]
When FEAT_AA32 is implemented:

Mask bit for TID0.

TID0	Meaning
0b0	HCR_EL2.TID0 is writeable.
0b1	HCR_EL2.TID0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Mask bit for TWE.

TWE	Meaning
0b0	HCR_EL2.TWE is writeable.
0b1	HCR_EL2.TWE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Mask bit for TWI.

TWI	Meaning
0b0	HCR_EL2.TWI is writeable.
0b1	HCR_EL2.TWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DC, bit [12]

Mask bit for DC.

DC	Meaning
0b0	HCR_EL2.DC is writeable.
0b1	HCR_EL2.DC is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

BSU, bit [10]

Mask bit for BSU.

BSU	Meaning
0b0	HCR_EL2.BSU is writeable.
0b1	HCR_EL2.BSU is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

FB, bit [9]

Mask bit for FB.

FB	Meaning
0b0	HCR_EL2.FB is writeable.
0b1	HCR_EL2.FB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Mask bit for VSE.

VSE	Meaning
0b0	HCR_EL2.VSE is writeable.
0b1	HCR_EL2.VSE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VI, bit [7]

Mask bit for VI.

VI	Meaning
0b0	HCR_EL2.VI is writeable.
0b1	HCR_EL2.VI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VF, bit [6]

Mask bit for VF.

VF	Meaning
0b0	HCR_EL2.VF is writeable.
0b1	HCR_EL2.VF is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Mask bit for AMO.

AMO	Meaning
0b0	HCR_EL2.AMO is writeable.
0b1	HCR_EL2.AMO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Mask bit for IMO.

IMO	Meaning
0b0	HCR_EL2.IMO is writeable.
0b1	HCR_EL2.IMO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Mask bit for FMO.

FMO	Meaning
0b0	HCR_EL2.FMO is writeable.
0b1	HCR_EL2.FMO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Mask bit for PTW.

PTW	Meaning
0b0	HCR_EL2.PTW is writeable.
0b1	HCR_EL2.PTW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Mask bit for SWIO.

SWIO	Meaning
0b0	HCR_EL2.SWIO is writeable.
0b1	HCR_EL2.SWIO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

VM, bit [0]

Mask bit for VM.

VM	Meaning
0b0	HCR_EL2.VM is writeable.
0b1	HCR_EL2.VM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HCRMASK_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCRMASK_EL2

op0	op1	CRn	CRm	op2

0b11	0b100	0b0001	0b0101	0b110

```
if !(IsFeatureImplemented(FEAT_SRMASK2) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCRX_EL2_NVTGE() == '1' && (!HaveEL(EL3) || SCR2_EL3().SRMASK2En == '1') then
        X{64}(t) = NVHCRMASK_EL2();
    elsif EffectiveHCR_EL2_NVx() IN {'xx1'} then

HCRX_EL2, Extended Hypervisor Configuration Register

The HCRX_EL2 characteristics are:

Purpose

Provides configuration controls for virtualization, including defining whether various operations are trapped to EL2.

Configuration

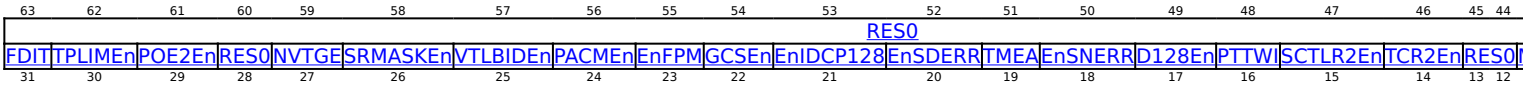
This register is present only when FEAT_HCX is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HCRX_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HCRX_EL2 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

VTCO, bit [39]
When FEAT_VMTETC is implemented:

Guest tag check override.

VTCO	Meaning
0b0	This control has no effect on tag checking in the EL1&0 translation regime.
0b1	If Virtual tagging is selected, Tag checking is disabled in the EL1&0 translation regime.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.
- SCTLR_EL1.VT is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.VTCO == '1'.

Otherwise:

Reserved, RES0.

VTAO, bit [38]
When FEAT_VMTE is implemented:

Guest tag access override.

VTAO	Meaning
0b0	This control has no effect on enabling Virtual tagging in the EL1&0 translation regime.
0b1	If Virtual tagging is selected, Memory tagging is disabled in the EL1&0 translation regime.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.
- SCTLR_EL1.VT is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.VTAO == '1'.

Otherwise:

Reserved, RES0.

VTE, bit [37]
When FEAT_VMTE is implemented:

Virtual tagging enable override:

- Overrides enabling of Virtual tagging at EL1 and EL0.
- Accesses to the following registers at EL1 are trapped to EL2 and reported using EC syndrome value 0x18:
  - GCR_EL1.
  - RGSR_EL1.
  - TFSRE0_EL1.
  - TFSR_EL1.
  - Accesses with the register name TFSR_EL2 that are not UNDEFINED.

VTE	Meaning
0b0	Disables the use of Virtual tagging at EL1 and EL0. If HCR_EL2.ATA is 0, the specified registers are trapped to EL2. If HCR_EL2.ATA is 1, this field does not trap the specified registers to EL2.
0b1	This field does not disable the use of Virtual tagging at EL1 and EL0. The field does not trap the specified registers to EL2.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.VTE == '1'.

Otherwise:

Reserved, RES0.

FNB, bit [36]
When FEAT_TLBID is implemented:

This field, evaluated with HCR_EL2.FB, configures how TLBI and IC instructions are broadcast when executed from EL1.

For a description of the values derived by evaluating FB and FNB together, see HCR_EL2.FB.

The Effective value of this field is 0 if any of the following apply:

- SCR_EL3.VTLBIDEn is 0.
- EL2 is not enabled in the current Security state.
- SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.FNB == '1'.

Otherwise:

The Effective value of this bit is 0.

Access to this field is RES0 .

VTLBIDOSEn, bit [35]
When FEAT_TLBID is implemented:

Enable application of VTLBIDOS transformations.

This control applies to TLBI OS instructions executed at EL1.

VTLBIDOSEn	Meaning
0b0	TLBI OS operations executed at EL1 are not transformed by VTLBIDOS<n>_EL2.
0b1	TLBI OS operations executed at EL1 are transformed by VTLBIDOS<n>_EL2.

The Effective value of this field is 0 if any of the following apply:

- SCR_EL3.VTLBIDEn is 0.
- EL2 is not enabled in the current Security state.
- SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.

- EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
- HCRXMASK_EL2.VTLBIDOSEn == '1'.

Otherwise:

Reserved, RES0.

NVnTTLBOS, bit [34]
When FEAT_NV3 is implemented:

Nested Virtualization override of HCR_EL2.{TTLB, TTLBOS} for TLBI E1 instructions that specify the OS Shareability domain.

NVnTTLBOS	Meaning
0b0	This control does not affect trapping of the specified instructions.
0b1	If NVHCR_EL2.TGE is 1, TLBI E1OS instructions that apply to stage 1 of the EL1&0 translation regime have their architected effect instead of being trapped by HCR_EL2.{TTLB, TTLBOS}.

If the Effective value of HCRX_EL2.NVTGE is 0, this field is ignored and has an Effective value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.NVnTTLBOS == '1'.

Otherwise:

Reserved, RES0.

NVnTTLBIS, bit [33]
When FEAT_NV3 is implemented:

Nested Virtualization override of HCR_EL2.{TTLB, TTLBIS} for TLBI E1 instructions that specify the IS Shareability domain.

NVnTTLBIS	Meaning
0b0	This control does not affect trapping of the specified instructions.
0b1	If NVHCR_EL2.TGE is 1, TLBI E1IS instructions that apply to stage 1 of the EL1&0 translation regime have their architected effect instead of being trapped by HCR_EL2.{TTLB, TTLBIS}.

If the Effective value of HCRX_EL2.NVTGE is 0, this field is ignored and has an Effective value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.NVnTTLBIS == '1'.

Otherwise:

Reserved, RES0.

NVnTTLB, bit [32]
When FEAT_NV3 is implemented:

Nested Virtualization override of HCR_EL2.TTLB for TLBI E1 instructions that do not specify an IS or OS Shareability domain.

NVnTTLB	Meaning
0b0	This control does not affect trapping of the specified instructions.
0b1	If NVHCR_EL2.TGE is 1, TLBI E1 instructions that apply to stage 1 of the EL1&0 translation regime and do not specify an IS or OS Shareability domain have their architected effect instead of being trapped by HCR_EL2.TTLB.

If the Effective value of HCRX_EL2.NVTGE is 0, this field is ignored and has an Effective value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.NVnTTLB == '1'.

Otherwise:

Reserved, RES0.

FDIT, bit [31]
When FEAT_FDIT is implemented:

Enforce data-independent timing for execution at EL1 and EL0.

FDIT	Meaning
0b0	This control does not affect data-independent timing of execution.
0b1	Data-independent timing of execution is enforced.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.FDIT == '1'.

Otherwise:

Reserved, RES0.

TPLIMEn, bit [30]
When FEAT_TPS is implemented:

Enable access to TP limit registers at EL1 and EL0.

If EL0 is using AArch64 and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x18:

- TPMAX0_EL0, TPMIN0_EL0.
- TPMAX1_EL0, TPMIN1_EL0.

If EL1 is using AArch64, then accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x18:

- TPMAX0_EL0, TPMIN0_EL0.
- TPMAX1_EL0, TPMIN1_EL0.
- If FEAT_TPSP is implemented, TPMAX0_EL1, TPMIN0_EL1, TPMAX1_EL1, TPMIN1_EL1.

TPLIMEn	Meaning
0b0	Accesses to the specified registers are trapped to EL2, unless the access generates a higher priority exception. No Permission faults are generated as a result of TPLIM checks for the EL1&0 translation regime.
0b1	This control does not cause any instructions to be trapped.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.TPLIMEn == '1'.

Otherwise:

Reserved, RES0.

POE2En, bit [29]
When FEAT_S1POE2 is implemented:

Enable access to POE2 registers at EL1 and EL0.

When disabled by this control, direct MRS and MSR accesses at EL1 to the following registers are trapped to EL2 and reported using EC syndrome value 0x18:

- DPOTBR0_EL1, DPOTBR1_EL1.
- IRTBRU_EL1, IRTBRP_EL1.
- TTTBRU_EL1, TTTBRP_EL1.
- FGDTU<n>_EL1, FGDTP<n>_EL1.
- AFGDTU<n>_EL1, AFGDTP<n>_EL1.
- TINDEX_EL1, TINDEX_EL0.
- STINDEX_EL1.
- LDSTT_EL1.
- TPIDR3_EL1, TPIDR3_EL0.

If HCR_EL2.{E2H, TGE} is not {1, 1}, MRS accesses from EL0 to TINDEX_EL0 using AArch64 are also trapped to EL2.

If HCR_EL2.{E2H, TGE} is not {1, 1}, MSR and MRS accesses from EL0 to TPIDR3_EL0 using AArch64 are also trapped to EL2.

POE2En	Meaning
0b0	EL0 and EL1 accesses to the specified registers are disabled, and trapped to EL2. The Effective value of TCR2_EL1.POE2F is 0.
0b1	This control does not cause any instructions to be trapped.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.

- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.POE2En == '1'.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

NVTGE, bit [27]
When FEAT_NV3 is implemented:

Nested Virtualization Guest TGE behavior enable.

NVTGE	Meaning
0b0	NVHCR_EL2.TGE is ignored and EL1 acceses to HCR_EL2 are not redirected to NVHCR_EL2.
0b1	EL1 acceses to HCR_EL2 are redirected to NVHCR_EL2 instead of being transformed to loads and stores. NVHCR_EL2.TGE is considered for ERET and TLBI traps.

This field has an Effective value of 0 if any of the following apply:

- The Effective value of HCR_EL2.{NV, NV1, NV2} is not {1, 0, 1}.
- EL3 is implemented and SCR_EL3.HXEn is 0.
- EL3 is implemented and SCR2_EL3.NV3En is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.NVTGE == '1'.

Otherwise:

Reserved, RES0.

SRMASKEn, bit [26]
When FEAT_SRMASK is implemented:

If EL1 is using AArch64, accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x18:

- CPACRMASK_EL1.
- SCTLRMASK_EL1.
- SCTLR2MASK_EL1.
- TCRMASK_EL1.
- TCR2MASK_EL1.
- ACTLRMASK_EL1, if it is implemented.

SRMASKEn	Meaning
0b0	EL1 accesses to the specified EL1 registers are trapped to EL2. The values in the registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps generated by this control have a lower priority than traps generated by the HFGRTR2_EL2 and HFGWTR2_EL2 controls.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.SRMASKEn == '1'.

Otherwise:

Reserved, RES0.

VTLBIDEn, bit [25]
When FEAT_TLBID is implemented:

Enable application of VTLBID transformations.

This control applies to TLBI IS and IC IALLUIS instructions executed at EL1.

This control additionally applies to TLBI and IC IALLU instructions executed at EL1, if they apply to the Inner Shareable shareability domain as the result of HCR_EL2.FB configuration.

VTLBIDEn	Meaning
0b0	TLBI operations executed at EL1 are not transformed by VTLBID<n>_EL2.
0b1	TLBI operations executed at EL1 are transformed by VTLBID<n>_EL2.

The Effective value of this field is 0 if any of the following apply:

- SCR_EL3.VTLBIDEn is 0.
- EL2 is not enabled in the current Security state.
- SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.VTLBIDEn == '1'.

Otherwise:

Reserved, RES0.

PACMEn, bit [24]
When FEAT_PAuth_LR is implemented:

PACM Enable. Controls the effect of a PACM instruction at EL1 and EL0.

PACMEn	Meaning
0b0	The effects of PACM are disabled at EL1 and EL0, regardless of the value in any other controls.
0b1	This control does not disable the effect of PACM at EL1 and EL0.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.PACMEn == '1'.

Otherwise:

Reserved, RES0.

EnFPM, bit [23]
When FEAT_FPMR is implemented:

Enables direct and indirect accesses to FPMR from EL0 and EL1.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL0 and EL1 are trapped to EL2 and reported using EC syndrome value 0x18.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL0 and EL1.

EnFPM	Meaning
0b0	Direct and indirect accesses to FPMR are disabled at EL1 and EL0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
◦ FEAT_SRMASK2 is implemented.
◦ PSTATE.EL == EL2.
◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
◦ HCRXMASK_EL2.EnFPM == '1'.

Otherwise:

Reserved, RES0.

GCSEn, bit [22]
When FEAT_GCS is implemented:

Guarded Control Stack enable. Controls Guarded Control Stack behavior at EL1 and EL0.

GCSEn	Meaning
0b0	The Guarded Control Stack is disabled at EL1 and EL0.
0b1	Guarded Control Stack behavior at EL1 and EL0 is not affected by mechanism.

The Effective value of this field is 1 when any of the following are true:

• EL2 is not implemented or not enabled in the current Security state.
• The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

• EL2 is implemented and enabled in the current Security state.
• The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
• The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

• On a Warm reset:
◦ When the highest implemented Exception level is EL2, this field resets to '0'.
◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
◦ FEAT_SRMASK2 is implemented.
◦ PSTATE.EL == EL2.
◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
◦ HCRXMASK_EL2.GCSEn == '1'.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [21]
When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL1, EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL2 using EC syndrome value 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL2.
0b1	No accesses are trapped by this control.

The Effective value of this field is 1 when any of the following are true:

• EL2 is not implemented or not enabled in the current Security state.
• The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.EnIDCP128 == '1'.

Otherwise:

Reserved, RES0.

EnSDERR, bit [20]
When FEAT_ADERR is implemented:

Enable Synchronous Device Read Error. Override SCTLR2_EL1.EnADERR.

EnSDERR	Meaning
0b0	This field has no effect on External aborts on Device memory reads in the EL1&0 translation regime.
0b1	External abort on Device memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 1 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, HCRX_EL2.EnSDERR is 1, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 1 might have a performance impact for Device memory reads.

This field is ignored by the PE and has an Effective value of 0 when any of the following are true:

- All of the following are true:
  - FEAT_ANERR is implemented.
  - ID_AA64MMFR3_EL1.ADERR reads as 0b0010.
  - HCRX_EL2.{EnSDERR, EnSNERR} == {1, 0}.
- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.EnSDERR == '1'.

Otherwise:

Reserved, RES0.

TMEA, bit [19]
When FEAT_DoubleFault2 is implemented:

Trap Masked External Aborts. Controls whether a masked error exception at a lower Exception level is taken to EL2.

TMEA	Meaning
0b0	Synchronous External abort exceptions, physical SError exceptions, and delegated SError exceptions at EL1 and EL0 are unaffected by this mechanism. That is, these exceptions are not taken to EL2 unless routed to EL2 by another control. Virtual SError exceptions are not enabled by this mechanism.
0b1	When executing at Exception levels below EL2, if EL2 is enabled in the current Security state, then all of the following apply: • When PSTATE.A is 1, synchronous External abort exceptions are taken to EL2, unless they are routed to EL3. • Masked physical SError exceptions are taken to EL2, unless they are routed to EL3. • If FEAT_E3DSE is implemented, then masked delegated SError exceptions enabled by SCR_EL3.DSE are taken to EL2. • If HCR_EL2.TGE is 0, then virtual SError exceptions are enabled.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

Virtual SError exceptions are disabled when the Effective value of HCR_EL2.AMO is 0 and the Effective value of HCRX_EL2.TMEA is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.TMEA == '1'.

Otherwise:

Reserved, RES0.

EnSNERR, bit [18]
When FEAT_ANERR is implemented:

Enable Synchronous Normal Read Error. Override SCTLR2_EL1.EnANERR.

EnSNERR	Meaning
0b0	This field has no effect on External aborts on Normal memory reads in the EL1&0 translation regime.
0b1	External abort on Normal memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 1 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, HCRX_EL2.EnSNERR is 1, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 1 might have a performance impact for Normal memory reads.

This field is ignored by the PE and has an Effective value of 0 when any of the following are true:

- All of the following are true:
  - FEAT_ADERR is implemented.
  - ID_AA64MMFR3_EL1.ANERR reads as 0b0010.
  - HCRX_EL2.{EnSDERR, EnSNERR} == {0, 1}.
- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.EnSNERR == '1'.

Otherwise:

Reserved, RES0.

D128En, bit [17]
When FEAT_D128 is implemented:

128-bit System Register trap control. Enable access to 128-bit System Registers that relate to VMSAv9-128 via MRRS, MSRR instructions.

If EL1 is using AArch64, accesses to the following registers are trapped to EL2 and reported using EC syndrome value 0x14:

- TTBR0_EL1.
- TTBR1_EL1.
- If FEAT_THE is implemented, RCWMASK_EL1, RCWSMASK_EL1.
- PAR_EL1.

D128En	Meaning
0b0	EL1 accesses to the specified registers are disabled, and trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.D128En == '1'.

Otherwise:

Reserved, RES0.

PTTWI, bit [16]
When FEAT_THE is implemented:

Permit Translation Table Walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL1 and EL0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL1 and EL0 have the Reduced Coherence property, if enabled by TCR2_EL1.PTTWI.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

This field is permitted to be cached in TLB.

This field is permitted to be implemented as a read-only field with a fixed value of 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.PTTWI == '1'.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [15]
When FEAT_SCTLR2 is implemented:

SCTLR2_EL1 Enable. In AArch64 state, accesses to SCTLR2_EL1 are trapped to EL2 and reported using EC syndrome value 0x18.

SCTLR2En	Meaning
0b0	Accesses to SCTLR2_EL1 at EL1 are trapped to EL2, unless the access generates a higher priority exception. The value in SCTLR2_EL1 is treated as 0.
0b1	This control does not cause any instructions to be trapped.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.SCTLR2En == '1'.

Otherwise:

Reserved, RES0.

TCR2En, bit [14]
When FEAT_TCR2 is implemented:

TCR2_EL1 Enable. In AArch64 state, accesses to TCR2_EL1 are trapped to EL2 and reported using EC syndrome value 0x18.

TCR2En	Meaning
0b0	Accesses to TCR2_EL1 at EL1 are trapped to EL2, unless the access generates a higher priority exception. The value in TCR2_EL1 is treated as 0.
0b1	This control does not cause any instructions to be trapped.

When EL2 is not implemented or not enabled in the current Security state, the Effective value of this field is 1.

Otherwise, when the Effective value of SCR_EL3.HXEn is 0, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.TCR2En == '1'.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

MSCEn, bit [11]
When FEAT_MOPS is implemented:

Memory Set and Memory Copy instructions Enable. Enables execution of the CPY*, SETG*, SETP*, SETM*, and SETE* instructions at EL1 or EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL1 or EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.

◦ HCRXMASK_EL2.MSCEn == '1'.

Otherwise:

Reserved, RES0.

MCE2, bit [10]
When FEAT_MOPS is implemented:

Controls Memory Copy and Memory Set exceptions generated as part of attempting to execute the Memory Copy and Memory Set instructions from EL1.

MCE2	Meaning
0b0	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL1.
0b1	Memory Copy and Memory Set exceptions generated from EL1 are taken to EL2.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.MCE2 == '1'.

Otherwise:

Reserved, RES0.

CMOW, bit [9]
When FEAT_CMOW is implemented:

Controls the required permissions for the following cache maintenance instructions executed at EL1 or EL0:

- Any DC instruction that operates by VA and performs a clean and invalidate operation.
- Any IC instruction that operates by VA.

CMOW	Meaning
0b0	This control does not cause any instructions to generate a stage 2 Permission fault.
0b1	For these instructions, when executed at EL1 or EL0, the absence of stage 2 write permission generates a stage 2 permission fault.

For more information, see:

- Stage 2 permissions.
- Implications of enabling the dirty state management mechanism.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.CMOW == '1'.

Otherwise:

Reserved, RES0.

VFNMI, bit [8]
When FEAT_NMI is implemented:

Virtual FIQ Interrupt with Superpriority. Enables signaling of virtual FIQ interrupts with Superpriority.

VFNMI	Meaning
0b0	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VF is 1, a signaled pending virtual FIQ interrupt has Superpriority.

When HCR_EL2.VF is 0, this field has no effect.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.VFNMI == '1'.

Otherwise:

Reserved, RES0.

VINMI, bit [7]
When FEAT_NMI is implemented:

Virtual IRQ Interrupt with Superpriority. Enables signaling of virtual IRQ interrupts with Superpriority.

VINMI	Meaning
0b0	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt does not have Superpriority.
0b1	When HCR_EL2.VI is 1, a signaled pending virtual IRQ interrupt has Superpriority.

When HCR_EL2.VI is 0, this field has no effect.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.VINMI == '1'.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]
When FEAT_NMI is implemented:

Traps the following writes at EL1 using AArch64 to EL2, when EL2 is implemented and enabled:

- MSR (register) writes of ALLINT.
- MSR (immediate) writes of ALLINT with a value of 1.

TALLINT	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified MSR accesses at EL1 using AArch64 are trapped to EL2.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.TALLINT == '1'.

Otherwise:

Reserved, RES0.

SMPME, bit [5]
When FEAT_SME is implemented:

Streaming Mode Priority Mapping Enable.

Controls mapping of the value of SMPRI_EL1.Priority for streaming execution priority at EL0 or EL1.

SMPME	Meaning
0b0	The effective priority value is taken from SMPRI_EL1.Priority.
0b1	The effective priority value is: • When the current Exception level is EL2 or EL3, the value of SMPRI_EL1.Priority. • When the current Exception level is EL0 or EL1, the value of the SMPRIMAP_EL2 field corresponding to the value of SMPRI_EL1.Priority.

When SMIDR_EL1.SMPS is '0', this field is RES0.

The Effective value of this field is 0 when any of the following are true:

- The Effective value of SCR_EL3.HXEn is 0.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.
- EL2 is not implemented or not enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.SMPME == '1'.

Otherwise:

Reserved, RES0.

FGTnXS, bit [4]
When FEAT_XS is implemented:

Determines if the fine-grained traps in HFGITR_EL2 that apply to each of the TLBI maintenance instructions that are accessible at EL1 also apply to the corresponding TLBI maintenance instructions with the nXS qualifier.

FGTnXS	Meaning
0b0	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 also applies to the corresponding TLBI instruction with the nXS qualifier at EL1.
0b1	The fine-grained trap in the HFGITR_EL2 that applies to a TLBI maintenance instruction at EL1 does not apply to the corresponding TLBI instruction with the nXS qualifier at EL1.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.FGTnXS == '1'.

Otherwise:

Reserved, RES0.

FnXS, bit [3]
When FEAT_XS is implemented:

Determines the behavior of TLBI instructions affected by the XS attribute.

This control field also determines whether an AArch64 DSB instruction behaves as a DSB instruction with an nXS qualifier when executed at EL0 and EL1.

FnXS	Meaning
0b0	This control does not have any effect on the behavior of the TLBI maintenance instructions.
0b1	A TLBI maintenance instruction without the nXS qualifier executed at EL1 behaves in the same way as the corresponding TLBI maintenance instruction with the nXS qualifier. An AArch64 DSB instruction that applies to both loads and stores executed at EL1 or EL0 behaves in the same way as the corresponding DSB instruction with the nXS qualifier executed at EL1 or EL0.

The Effective value of this field is 0 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of SCR_EL3.HXEn is 0.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.FnXS == '1'.

Otherwise:

Reserved, RES0.

EnASR, bit [2]
When FEAT_LS64_V is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV instruction at EL0 or EL1 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnASR. Execution of an ST64BV instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000000.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.

◦ HCRXMASK_EL2.EnASR == '1'.

Otherwise:

Reserved, RES0.

EnALS, bit [1]
When FEAT_LS64 is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 or EL1 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnALS. Execution of an LD64B or ST64B instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000002.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.EnALS == '1'.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]
When FEAT_LS64_ACCDATA is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV0 instruction at EL0 or EL1 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2 if the execution is not trapped by SCTLR_EL1.EnAS0. Execution of an ST64BV0 instruction at EL1 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The Effective value of this field is 1 when any of the following are true:

- EL2 is not implemented or not enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Effective value of this field is 0 when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The Effective value of SCR_EL3.HXEn is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - HCRXMASK_EL2.EnAS0 == '1'.

Otherwise:

Reserved, RES0.

Accessing HCRX_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HCRX_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b010

```
if !(IsFeatureImplemented(FEAT_HCX) && IsFeatureImplemented(FEAT_AA64)) then

HCRXMASK_EL2, Extended Hypervisor Configuration Masking Register

The HCRXMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in HCRX_EL2 on direct writes to HCRX_EL2.

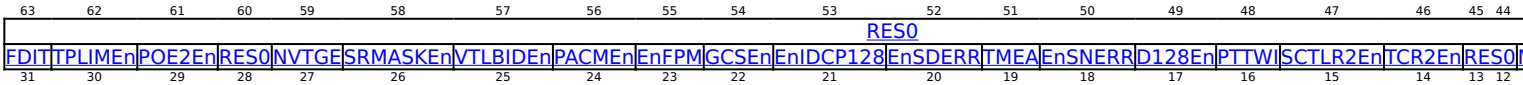
Configuration

This register is present only when FEAT_SRMASK2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HCRXMASK_EL2 are UNDEFINED.

Attributes

HCRXMASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

VTCO, bit [39]
When FEAT_VMTETC is implemented:

Mask bit for VTCO.

VTCO	Meaning
0b0	HCRX_EL2.VTCO is writeable.
0b1	HCRX_EL2.VTCO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTAO, bit [38]
When FEAT_VMTE is implemented:

Mask bit for VTAO.

VTAO	Meaning
0b0	HCRX_EL2.VTAO is writeable.
0b1	HCRX_EL2.VTAO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTE, bit [37]
When FEAT_VMTE is implemented:

Mask bit for VTE.

VTE	Meaning
0b0	HCRX_EL2.VTE is writeable.
0b1	HCRX_EL2.VTE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNB, bit [36]
When FEAT_TLBID is implemented:

Mask bit for FNB.

FNB	Meaning
0b0	HCRX_EL2.FNB is writeable.
0b1	HCRX_EL2.FNB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTLBIDOSEn, bit [35]
When FEAT_TLBID is implemented:

Mask bit for VTLBIDOSEn.

VTLBIDOSEn	Meaning
0b0	HCRX_EL2.VTLBIDOSEn is writeable.
0b1	HCRX_EL2.VTLBIDOSEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NVnTTLBOS, bit [34]
When FEAT_NV3 is implemented:

Mask bit for NVnTTLBOS.

NVnTTLBOS	Meaning
0b0	HCRX_EL2.NVnTTLBOS is writeable.
0b1	HCRX_EL2.NVnTTLBOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NVnTTLBIS, bit [33]
When FEAT_NV3 is implemented:

Mask bit for NVnTTLBIS.

NVnTTLBIS	Meaning
0b0	HCRX_EL2.NVnTTLBIS is writeable.
0b1	HCRX_EL2.NVnTTLBIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NVnTTLB, bit [32]
When FEAT_NV3 is implemented:

Mask bit for NVnTTLB.

NVnTTLB	Meaning
0b0	HCRX_EL2.NVnTTLB is writeable.
0b1	HCRX_EL2.NVnTTLB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FDIT, bit [31]
When FEAT_FDIT is implemented:

Mask bit for FDIT.

FDIT	Meaning
0b0	HCRX_EL2.FDIT is writeable.
0b1	HCRX_EL2.FDIT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPLIMEn, bit [30]
When FEAT_TPS is implemented:

Mask bit for TPLIMEn.

TPLIMEn	Meaning
0b0	HCRX_EL2.TPLIMEn is writeable.
0b1	HCRX_EL2.TPLIMEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE2En, bit [29]
When FEAT_S1POE2 is implemented:

Mask bit for POE2En.

POE2En	Meaning
0b0	HCRX_EL2.POE2En is writeable.
0b1	HCRX_EL2.POE2En is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

NVTGE, bit [27]
When FEAT_NV3 is implemented:

Mask bit for NVTGE.

NVTGE	Meaning
0b0	HCRX_EL2.NVTGE is writeable.
0b1	HCRX_EL2.NVTGE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRMASKEn, bit [26]
When FEAT_SRMASK is implemented:

Mask bit for SRMASKEn.

SRMASKEn	Meaning
0b0	HCRX_EL2.SRMASKEn is writeable.
0b1	HCRX_EL2.SRMASKEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTLBIDEn, bit [25]
When FEAT_TLBID is implemented:

Mask bit for VTLBIDEn.

VTLBIDEn	Meaning
0b0	HCRX_EL2.VTLBIDEn is writeable.
0b1	HCRX_EL2.VTLBIDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACMEn, bit [24]
When FEAT_PAuth_LR is implemented:

Mask bit for PACMEn.

PACMEn	Meaning
0b0	HCRX_EL2.PACMEn is writeable.
0b1	HCRX_EL2.PACMEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [23]
When FEAT_FPMR is implemented:

Mask bit for EnFPM.

EnFPM	Meaning
0b0	HCRX_EL2.EnFPM is writeable.
0b1	HCRX_EL2.EnFPM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCSEn, bit [22]
When FEAT_GCS is implemented:

Mask bit for GCSEn.

GCSEn	Meaning
0b0	HCRX_EL2.GCSEn is writeable.
0b1	HCRX_EL2.GCSEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [21]
When FEAT_SYSREG128 is implemented:

Mask bit for EnIDCP128.

EnIDCP128	Meaning
0b0	HCRX_EL2.EnIDCP128 is writeable.
0b1	HCRX_EL2.EnIDCP128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSDERR, bit [20]
When FEAT_ADERR is implemented:

Mask bit for EnSDERR.

EnSDERR	Meaning
0b0	HCRX_EL2.EnSDERR is writeable.
0b1	HCRX_EL2.EnSDERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMEA, bit [19]
When FEAT_DoubleFault2 is implemented:

Mask bit for TMEA.

TMEA	Meaning
0b0	HCRX_EL2.TMEA is writeable.
0b1	HCRX_EL2.TMEA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSNERR, bit [18]
When FEAT_ANERR is implemented:

Mask bit for EnSNERR.

EnSNERR	Meaning
0b0	HCRX_EL2.EnSNERR is writeable.
0b1	HCRX_EL2.EnSNERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128En, bit [17]
When FEAT_D128 is implemented:

Mask bit for D128En.

D128En	Meaning
0b0	HCRX_EL2.D128En is writeable.
0b1	HCRX_EL2.D128En is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [16]
When FEAT_THE is implemented:

Mask bit for PTTWI.

PTTWI	Meaning
0b0	HCRX_EL2.PTTWI is writeable.
0b1	HCRX_EL2.PTTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [15]
When FEAT_SCTLR2 is implemented:

Mask bit for SCTLR2En.

SCTLR2En	Meaning
0b0	HCRX_EL2.SCTLR2En is writeable.
0b1	HCRX_EL2.SCTLR2En is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2En, bit [14]
When FEAT_TCR2 is implemented:

Mask bit for TCR2En.

TCR2En	Meaning
0b0	HCRX_EL2.TCR2En is writeable.
0b1	HCRX_EL2.TCR2En is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

MSCEn, bit [11]
When FEAT_MOPS is implemented:

Mask bit for MSCEn.

MSCEn	Meaning
0b0	HCRX_EL2.MSCEn is writeable.
0b1	HCRX_EL2.MSCEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MCE2, bit [10]
When FEAT_MOPS is implemented:

Mask bit for MCE2.

MCE2	Meaning
0b0	HCRX_EL2.MCE2 is writeable.
0b1	HCRX_EL2.MCE2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [9]
When FEAT_CMOW is implemented:

Mask bit for CMOW.

CMOW	Meaning
0b0	HCRX_EL2.CMOW is writeable.
0b1	HCRX_EL2.CMOW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFNMI, bit [8]
When FEAT_NMI is implemented:

Mask bit for VFNMI.

VFNMI	Meaning
0b0	HCRX_EL2.VFNMI is writeable.
0b1	HCRX_EL2.VFNMI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VINMI, bit [7]
When FEAT_NMI is implemented:

Mask bit for VINMI.

VINMI	Meaning
0b0	HCRX_EL2.VINMI is writeable.
0b1	HCRX_EL2.VINMI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]
When FEAT_NMI is implemented:

Mask bit for TALLINT.

TALLINT	Meaning
0b0	HCRX_EL2.TALLINT is writeable.
0b1	HCRX_EL2.TALLINT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SMPME, bit [5]
When FEAT_SME is implemented:

Mask bit for SMPME.

SMPME	Meaning
0b0	HCRX_EL2.SMPME is writeable.
0b1	HCRX_EL2.SMPME is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTnXS, bit [4]
When FEAT_XS is implemented:

Mask bit for FGTnXS.

FGTnXS	Meaning
0b0	HCRX_EL2.FGTnXS is writeable.
0b1	HCRX_EL2.FGTnXS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnXS, bit [3]
When FEAT_XS is implemented:

Mask bit for FnXS.

FnXS	Meaning
0b0	HCRX_EL2.FnXS is writeable.
0b1	HCRX_EL2.FnXS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [2]
When FEAT_LS64_V is implemented:

Mask bit for EnASR.

EnASR	Meaning
0b0	HCRX_EL2.EnASR is writeable.
0b1	HCRX_EL2.EnASR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [1]
When FEAT_LS64 is implemented:

Mask bit for EnALS.

EnALS	Meaning
0b0	HCRX_EL2.EnALS is writeable.
0b1	HCRX_EL2.EnALS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]
When FEAT_LS64_ACCDATA is implemented:

Mask bit for EnAS0.

EnAS0	Meaning
0b0	HCRX_EL2.EnAS0 is writeable.
0b1	HCRX_EL2.EnAS0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HCRXMASK_EL2

HDBSSBR_EL2, Hardware Dirty State Tracking Structure Base Register

The HDBSSBR_EL2 characteristics are:

Purpose

Control register for HDBSS base address.

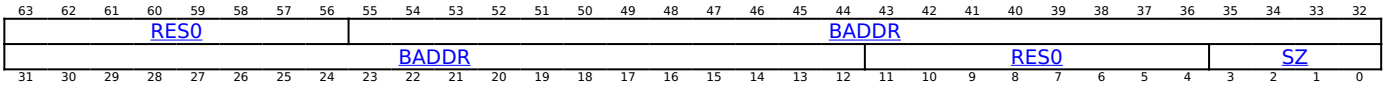
Configuration

This register is present only when FEAT_HDBSS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDBSSBR_EL2 are UNDEFINED.

Attributes

HDBSSBR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

BADDR, bits [55:12]

HDBSS base address, bits [55:12].

- Bits [55:12] of the base address are the value of this field.
- Bits [11:0] of the base address are 0.

Bits of this field above the implemented physical address size, indicated in ID_AA64MMFR0_EL1.PARange, are RES0.

Based on the value of the SZ field of this register, for encodings of the SZ field greater than 4KB, bits [(SZ+12-1):12] of this field are RES0 such that the base address of the HDBSS is aligned to its size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:4]

Reserved, RES0.

SZ, bits [3:0]

Size of the HDBSS.

SZ	Meaning
0b0000	4KB
0b0001	8KB
0b0010	16KB
0b0011	32KB
0b0100	64KB
0b0101	128KB
0b0110	256KB
0b0111	512KB
0b1000	1MB
0b1001	2MB

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDBSSBR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDBSSBR_EL2

op0	op1	CRn	CRm	op2

HDBSSPROD_EL2, Hardware Dirty State Tracking Structure Producer Register

The HDBSSPROD_EL2 characteristics are:

Purpose

Allows producer to update write index for HDBSS.

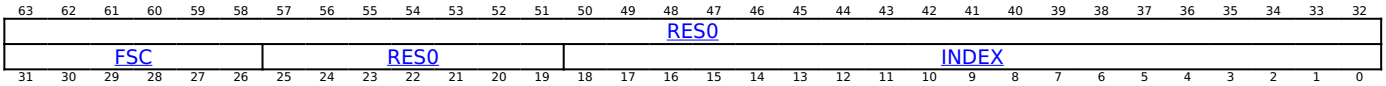
Configuration

This register is present only when FEAT_HDBSS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDBSSPROD_EL2 are UNDEFINED.

Attributes

HDBSSPROD_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FSC, bits [31:26]

Fault Status Code.

FSC	Meaning	Applies when
0b000000	The PE has not experienced any error on writes to the HDBSS.	
0b010000	External Abort on write to HDBSS.	
0b101000	Granule Protection Fault on write to HDBSS.	When FEAT_RME is implemented

If this field is non-zero then one or more HDBSS writes have experienced a fault since this field was last set to zero, and the associated HDBSS entries have been lost.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:19]

Reserved, RES0.

INDEX, bits [18:0]

This field indicates the index of the HDBSS entry that will be written to next.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing HDBSSPROD_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDBSSPROD_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0011	0b011

HDFGRTR2_EL2, Hypervisor Debug Fine-Grained Read Trap Register 2

The HDFGRTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

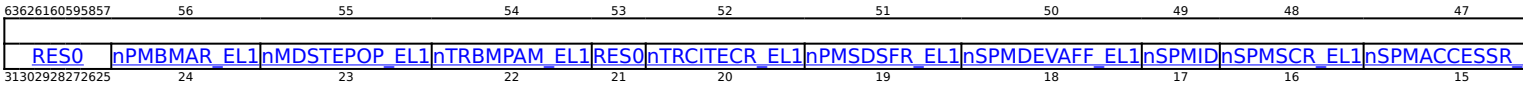
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGRTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGRTR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

nPMBMAR_EL1, bit [24]
When FEAT_SPE_nVM is implemented:

Trap MRS reads of PMBMAR_EL1 at EL1 using AArch64 to EL2.

nPMBMAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMBMAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMDSTEPOP_EL1, bit [23]
When FEAT_STEP2 is implemented:

Trap MRS reads of MDSTEPOP_EL1 at EL1 using AArch64 to EL2.

nMDSTEPOP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of MDSTEPOP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MDSTEPOP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRBMPAM_EL1, bit [22]
When FEAT_TRBE_MPAM is implemented:

Trap MRS reads of TRBMPAM_EL1 at EL1 using AArch64 to EL2.

nTRBMPAM_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TRBMPAM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TRBMPAM_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

nTRCITECR_EL1, bit [20]
When FEAT_ITE is implemented:

Trap MRS reads of TRCITECR_EL1 at EL1 using AArch64 to EL2.

nTRCITECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TRCITECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TRCITECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSDSFR_EL1, bit [19]
When FEAT_SPE_FDS is implemented:

Trap MRS reads of PMSDSFR_EL1 at EL1 using AArch64 to EL2.

nPMSDSFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMSDSFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSDSFR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMDEVAFF_EL1, bit [18]
When FEAT_SPMU is implemented:

Trap MRS reads of SPMDEVAFF_EL1 at EL1 using AArch64 to EL2.

nSPMDEVAFF_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SPMDEVAFF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMDEVAFF_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMID, bit [17]
When FEAT_SPMU is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMCFGR_EL1.
- SPMCGCR<n>_EL1.
- SPMDEVARCH_EL1.
- SPMIIDR_EL1.

nSPMID	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSCR_EL1, bit [16]
When FEAT_SPMU is implemented:

Trap MRS reads of SPMSCR_EL1 at EL1 using AArch64 to EL2.

nSPMSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SPMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMACCESSR_EL1, bit [15]
When FEAT_SPMU is implemented:

Trap MRS reads of SPMACCESSR_EL1 at EL1 using AArch64 to EL2.

nSPMACCESSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SPMACCESSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMACCESSR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCR_EL0, bit [14]
When FEAT_SPMU is implemented:

Trap MRS reads of SPMCR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMCR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of SPMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMCR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMOVS, bit [13]
When FEAT_SPMU is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMOVSCLR_EL0.
- SPMOVSSET_EL0.

nSPMOVS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMINTEN, bit [12]
When FEAT_SPMU is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMINTENCLR_EL1.
- SPMINTENSET_EL1.

nSPMINTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCNTEN, bit [11]
When FEAT_SPMU is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMCNTENCLR_EL0.
- SPMCNTENSET_EL0.

nSPMCNTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSELR_EL0, bit [10]
When FEAT_SPMU is implemented:

Trap MRS reads of SPMSELR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMSELR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of SPMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMSELR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVTYPERn_EL0, bit [9]
When FEAT_SPMU is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMEVTYPER<n>_EL0.
- SPMEVFILTR<n>_EL0.
- SPMEVFILT2R<n>_EL0.

nSPMEVTYPERn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVCNTRn_EL0, bit [8]
When FEAT_SPMU is implemented:

Trap MRS reads of SPMEVCNTR<n>_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMEVCNTRn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of SPMEVCNTR<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SPMEVCNTR<n>_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSCR_EL1, bit [7]
When FEAT_PMUv3_SS is implemented:

Trap MRS reads of PMSSCR_EL1 at EL1 using AArch64 to EL2.

nPMSSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMSSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSDATA, bit [6]
When FEAT_PMUv3_SS is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMCCNTSVR_EL1.
- PMEVCNTSVR<n>_EL1.
- PMICNTSVR_EL1, if FEAT_PMUv3_ICNTR is implemented.

nPMSSDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMDSELR_EL1, bit [5]
When FEAT_Debugv8p9 is implemented:

Trap MRS reads of MDSELR_EL1 at EL1 using AArch64 to EL2.

nMDSELR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of MDSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MDSELR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMUACR_EL1, bit [4]
When FEAT_PMUv3p9 is implemented:

Trap MRS reads of PMUACR_EL1 at EL1 using AArch64 to EL2.

nPMUACR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMUACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMUACR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICFILTR_EL0, bit [3]
When FEAT_PMUv3_ICNTR is implemented:

Trap MRS reads of PMICFILTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICFILTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then: • MRS reads of PMICFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception. • PMCNTENCLR_EL0.F0, PMCNTENSET_EL0.F0, PMOVSCLR_EL0.F0, and PMOVSSET_EL0.F0 read as zero at EL1 and EL0. • PMINTENCLR_EL1.F0 and PMINTENSET_EL1.F0 read as zero at EL1.
0b1	MRS reads of PMICFILTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICNTR_EL0, bit [2]
When FEAT_PMUv3_ICNTR is implemented:

Trap MRS reads of PMICNTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICNTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of PMICNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMICNTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMIAR_EL1, bit [1]
When FEAT_SEBEP is implemented:

Trap MRS reads of PMIAR_EL1 at EL1 using AArch64 to EL2.

nPMIAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMIAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMIAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMECR_EL1, bit [0]
When FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented:

Trap MRS reads of PMECR_EL1 at EL1 using AArch64 to EL2.

nPMECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PMECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HDFGRTR2_EL2

HDFGRTR_EL2, Hypervisor Debug Fine-Grained Read Trap Register

The HDFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS and MRC reads of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

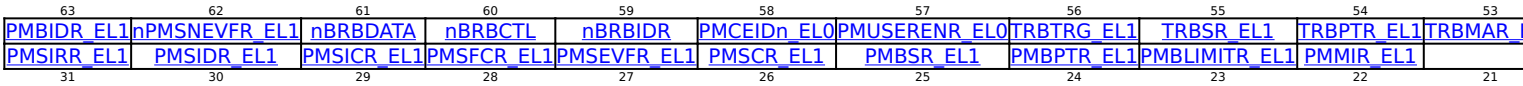
This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGRTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGRTR_EL2 is a 64-bit register.

Field descriptions



PMBIDR_EL1, bit [63]
When FEAT_SPE is implemented:

Trap MRS reads of PMBIDR_EL1 at EL1 using AArch64 to EL2.

PMBIDR_EL1	Meaning
0b0	MRS reads of PMBIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSNEVFR_EL1, bit [62]
When FEAT_SPE_FnE is implemented:

Trap MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBDATA, bit [61]
When FEAT_BRBE is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBINF<n>_EL1.
- BRBINFINJ_EL1.
- BRBSRC<n>_EL1.
- BRBSRCINJ_EL1.
- BRBTGT<n>_EL1.
- BRBTGTINJ_EL1.
- BRBTS_EL1.

nBRBDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBCTL, bit [60]
When FEAT_BRBE is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBCR_EL1.
- BRBFCR_EL1.

nBRBCTL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBIDR, bit [59]
When FEAT_BRBE is implemented:

Trap MRS reads of BRBIDR0_EL1 at EL1 using AArch64 to EL2.

nBRBIDR	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of BRBIDR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of BRBIDR0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCEIDn_EL0, bit [58]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCEIDn_EL0	Meaning
0b0	MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCEID<n> at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMCEID<n>_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCEID<n> at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMUSERENR_EL0, bit [57]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMUSERENR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMUSERENR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMUSERENR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBTRG_EL1, bit [56]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBTRG_EL1 at EL1 using AArch64 to EL2.

TRBTRG_EL1	Meaning
0b0	MRS reads of TRBTRG_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBSR_EL1, bit [55]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBSR_EL1 at EL1 using AArch64 to EL2.

TRBSR_EL1	Meaning
0b0	MRS reads of TRBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBPTR_EL1, bit [54]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBPTR_EL1 at EL1 using AArch64 to EL2.

TRBPTR_EL1	Meaning
0b0	MRS reads of TRBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBMAR_EL1, bit [53]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBMAR_EL1 at EL1 using AArch64 to EL2.

TRBMAR_EL1	Meaning
0b0	MRS reads of TRBMAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBLIMITR_EL1, bit [52]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBLIMITR_EL1 at EL1 using AArch64 to EL2.

TRBLIMITR_EL1	Meaning
0b0	MRS reads of TRBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBIDR_EL1, bit [51]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBIDR_EL1 at EL1 using AArch64 to EL2.

TRBIDR_EL1	Meaning
0b0	MRS reads of TRBIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBBASER_EL1, bit [50]
When FEAT_TRBE is implemented:

Trap MRS reads of TRBBASER_EL1 at EL1 using AArch64 to EL2.

TRBBASER_EL1	Meaning
0b0	MRS reads of TRBBASER_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [49]

Reserved, RES0.

TRCVICTLR, bit [48]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCVICTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MRS reads of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSTATR, bit [47]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCSTATR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSTATR at EL1 using AArch64 to EL2.

TRCSTATR	Meaning
0b0	MRS reads of TRCSTATR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSTATR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSSCSRn, bit [46]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCSSCSR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MRS reads of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Single-shot Comparator n is not implementented, a read of TRCSSCSR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCSEQSTR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MRS reads of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCPRGCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MRS reads of TRCPRGCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCOSLSR, bit [43]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCOSLSR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCOSLSR at EL1 using AArch64 to EL2.

TRCOSLSR	Meaning
0b0	MRS reads of TRCOSLSR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCOSLSR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TRCIMSPECn, bit [41]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MRS reads of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a read of TRCIMSPEC<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCID, bit [40]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
  - TRCDEVARCH.
  - TRCDEVID.
  - All of the TRCIDR<n> registers.
- In an Armv8 implementation:
  - ETM TRCDEVARCH.
  - ETM TRCDEVID.
  - All of the ETM TRCIDR<n> registers.

TRCID	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TRCCNTVRn, bit [37]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCCNTVR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MRS reads of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If Counter n is not implemented, a read of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation: TRCCLAIMCLR and TRCCLAIMSET.
- In an Armv8 implementation: ETM TRCCLAIMCLR and ETM TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCAUXCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MRS reads of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCAUTHSTATUS, bit [34]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MRS reads of TRCAUTHSTATUS at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MRS reads of ETM TRCAUTHSTATUS at EL1 using AArch64 to EL2.

TRCAUTHSTATUS	Meaning
0b0	MRS reads of TRCAUTHSTATUS are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TRCAUTHSTATUS at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRC, bit [33]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
  - TRCACATR<n>.
  - TRCACVR<n>.
  - TRCBBCTLR.
  - TRCCCCTLR.
  - TRCCIDCCTLR0.
  - TRCCIDCCTLR1.
  - TRCCIDCVR<n>.
  - TRCCNTCTLR<n>.
  - TRCCNTRLDVR<n>.
  - TRCCONFIGR.
  - TRCEVENTCTL0R.
  - TRCEVENTCTL1R.
  - TRCEXTINSELR<n>.
  - TRCQCTLR.
  - TRCRSCTLR<n>.
  - TRCRSR.
  - TRCSEQEVR<n>.
  - TRCSEQRSTEVR.
  - TRCSSCCR<n>.
  - TRCSSPCICR<n>.
  - TRCSTALLCTLR.
  - TRCSYNCPR.
  - TRCTRACEIDR.
  - TRCTSCTLR.
  - TRCVIIECTLR.
  - TRCVIPCSSCTLR.
  - TRCVISSCTLR.
  - TRCVMIDCCTLR0.
  - TRCVMIDCCTLR1.
  - TRCVMIDCVR<n>.
- In an Armv8 implementation:
  - ETM TRCACATR<n>.
  - ETM TRCACVR<n>.
  - ETM TRCBBCTLR.
  - ETM TRCCCCTLR.
  - ETM TRCCIDCCTLR0.

- ETM TRCCIDCCTLR1.
- ETM TRCCIDCVR<n>.
- ETM TRCCNTCTLR<n>.
- ETM TRCCNTRLDVR<n>.
- ETM TRCCONFIGR.
- ETM TRCEVENTCTL0R.
- ETM TRCEVENTCTL1R.
- ETM TRCEXTINSELR.
- ETM TRCQCTLR.
- ETM TRCRSCTLR<n>.
- ETM TRCSEQEVR<n>.
- ETM TRCSEQRSTEVR.
- ETM TRCSSCCR<n>.
- ETM TRCSSPCICR<n>.
- ETM TRCSTALLCTLR.
- ETM TRCSYNCPR.
- ETM TRCTRACEIDR.
- ETM TRCTSCTLR.
- ETM TRCVIIECTLR.
- ETM TRCVIPCSSCTLR.
- ETM TRCVISSCTLR.
- ETM TRCVMIDCCTLR0.
- ETM TRCVMIDCCTLR1.
- ETM TRCVMIDCVR<n>.

TRC	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

A read of an unimplemented register is UNDEFINED.

TRCEXTINSELR<n> and TRCRSR are implemented only if FEAT_ETE is implemented.

TRCEXTINSELR is implemented only if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]
When FEAT_SPE is implemented:

Trap MRS reads of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MRS reads of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]
When FEAT_SPE is implemented:

Trap MRS reads of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MRS reads of PMSIRR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSIDR_EL1, bit [30]
When FEAT_SPE is implemented:

Trap MRS reads of PMSIDR_EL1 at EL1 using AArch64 to EL2.

PMSIDR_EL1	Meaning
0b0	MRS reads of PMSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSICR_EL1, bit [29]
When FEAT_SPE is implemented:

Trap MRS reads of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MRS reads of PMSICR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]
When FEAT_SPE is implemented:

Trap MRS reads of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MRS reads of PMSFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]
When FEAT_SPE is implemented:

Trap MRS reads of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MRS reads of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]
When FEAT_SPE is implemented:

Trap MRS reads of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MRS reads of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]
When FEAT_SPE is implemented:

Trap MRS reads of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MRS reads of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]
When FEAT_SPE is implemented:

Trap MRS reads of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MRS reads of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]
When FEAT_SPE is implemented:

Trap MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MRS reads of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMMIR_EL1, bit [22]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMMIR_EL1 at EL1 using AArch64 to EL2.

PMMIR_EL1	Meaning
0b0	MRS reads of PMMIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PMMIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

PMSELR_EL0, bit [19]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMSELR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]
When FEAT_PMUv3 is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MRC and MRRC reads of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03. • MRRC reads of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x04.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]
When FEAT_PMUv3 is implemented:

Trap MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MRC reads of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVTYPER<n>_EL0, or, if n is not 31, a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a read of PMEVTYPER<n>, or, if n is not 31, a read of PMXEVTYPER when PMSELR.SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a read of PMEVTYPER<n>_EL0, or a read of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a read of PMEVTYPER<n>, or a read of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value 0x03.

See also HDFGRTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]
When FEAT_PMUv3 is implemented:

Trap MRS reads and MRC reads of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
0b0	MRS reads at EL1 and EL0 using AArch64 and MRC reads at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n.
  - In AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL is n.
- If event counter n is implemented, n is greater than or equal to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a read of PMEVCNTR<n>_EL0, or a read of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n, reported with EC syndrome value 0x18.
  - In AArch32 state, a read of PMEVCNTR<n>, or a read of PMXEVCNTR when PMSELR.SEL is n, reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]
When FEAT_DoubleLock is implemented:

Trap MRS reads of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MRS reads of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MRS reads of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MRS reads of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

OSLSR_EL1, bit [9]

Trap MRS reads of OSLSR_EL1 at EL1 using AArch64 to EL2.

OSLSR_EL1	Meaning
0b0	MRS reads of OSLSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of OSLSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

DBGPRCR_EL1, bit [7]

Trap MRS reads of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MRS reads of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGAUTHSTATUS_EL1, bit [6]

Trap MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 to EL2.

DBGAUTHSTATUS_EL1	Meaning
0b0	MRS reads of DBGAUTHSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGAUTHSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGCLAIM, bit [5]

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MDSCR_EL1, bit [4]

Trap MRS reads of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MRS reads of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWVRn_EL1, bit [3]

Trap MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MRS reads of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWCRn_EL1, bit [2]

Trap MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MRS reads of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If watchpoint n is not implemented, a read of DBGWCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBVRn_EL1, bit [1]

Trap MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MRS reads of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBCRn_EL1, bit [0]

Trap MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MRS reads of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

If breakpoint n is not implemented, a read of DBGBCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HDFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGRTR_EL2

op0	op1	CRn	CRm	op2

HDFGWTR2_EL2, Hypervisor Debug Fine-Grained Write Trap Register 2

The HDFGWTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

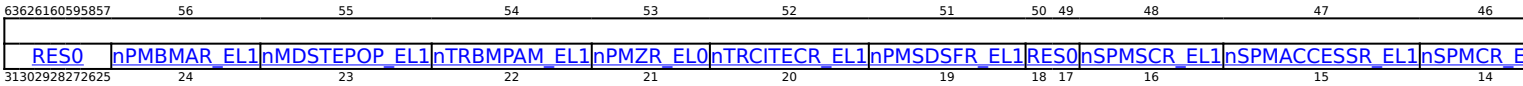
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGWTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGWTR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

nPMBMAR_EL1, bit [24]
When FEAT_SPE_nVM is implemented:

Trap MSR writes of PMBMAR_EL1 at EL1 using AArch64 to EL2.

nPMBMAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMBMAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMDSTEPOP_EL1, bit [23]
When FEAT_STEP2 is implemented:

Trap MSR writes of MDSTEPOP_EL1 at EL1 using AArch64 to EL2.

nMDSTEPOP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of MDSTEPOP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MDSTEPOP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRBMPAM_EL1, bit [22]
When FEAT_TRBE_MPAM is implemented:

Trap MSR writes of TRBMPAM_EL1 at EL1 using AArch64 to EL2.

nTRBMPAM_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TRBMPAM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TRBMPAM_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMZR_EL0, bit [21]
When FEAT_PMUv3p9 is implemented:

Trap MSR writes of PMZR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMZR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of PMZR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMZR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRCITECR_EL1, bit [20]
When FEAT_ITE is implemented:

Trap MSR writes of TRCITECR_EL1 at EL1 using AArch64 to EL2.

nTRCITECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TRCITECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TRCITECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSDSFR_EL1, bit [19]
When FEAT_SPE_FDS is implemented:

Trap MSR writes of PMSDSFR_EL1 at EL1 using AArch64 to EL2.

nPMSDSFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMSDSFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSDSFR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [18:17]

Reserved, RES0.

nSPMSCR_EL1, bit [16]
When FEAT_SPMU is implemented:

Trap MSR writes of SPMSCR_EL1 at EL1 using AArch64 to EL2.

nSPMSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SPMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMACCESSR_EL1, bit [15]
When FEAT_SPMU is implemented:

Trap MSR writes of SPMACCESSR_EL1 at EL1 using AArch64 to EL2.

nSPMACCESSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SPMACCESSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMACCESSR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCR_EL0, bit [14]
When FEAT_SPMU is implemented:

Trap MSR writes of SPMCR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMCR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of SPMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMCR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMOVS, bit [13]
When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMOVSCLR_EL0.
- SPMOVSSET_EL0.

nSPMOVS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMINTEN, bit [12]
When FEAT_SPMU is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMINTENCLR_EL1.
- SPMINTENSET_EL1.

nSPMINTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMCNTEN, bit [11]
When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMCNTENCLR_EL0.
- SPMCNTENSET_EL0.

nSPMCNTEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMSELR_EL0, bit [10]
When FEAT_SPMU is implemented:

Trap MSR writes of SPMSELR_EL0 at EL1 and EL0 using AArch64 to EL2.

nSPMSELR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of SPMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SPMSELR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVTYPERn_EL0, bit [9]
When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMEVTYPER<n>_EL0.
- SPMEVFILTR<n>_EL0.
- SPMEVFILT2R<n>_EL0.

nSPMEVTYPERn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSPMEVCNTRn_EL0, bit [8]
When FEAT_SPMU is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- SPMEVCNTR<n>_EL0.
- SPMZR_EL0.

nSPMEVCNTRn_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMSSCR_EL1, bit [7]
When FEAT_PMUv3_SS is implemented:

Trap MSR writes of PMSSCR_EL1 at EL1 using AArch64 to EL2.

nPMSSCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMSSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSSCR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [6]

Reserved, RES0.

nMDSELR_EL1, bit [5]
When FEAT_Debugv8p9 is implemented:

Trap MSR writes of MDSELR_EL1 at EL1 using AArch64 to EL2.

nMDSELR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of MDSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MDSELR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMUACR_EL1, bit [4]
When FEAT_PMUv3p9 is implemented:

Trap MSR writes of PMUACR_EL1 at EL1 using AArch64 to EL2.

nPMUACR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMUACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMUACR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICFILTR_EL0, bit [3]
When FEAT_PMUv3_ICNTR is implemented:

Trap MSR writes of PMICFILTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICFILTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then: • MSR writes of PMICFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception. • PMCNTENCLR_EL0.F0, PMCNTENSET_EL0.F0, PMOVSCLR_EL0.F0, and PMOVSSET_EL0.F0 ignore writes at EL1 and EL0. • PMINTENCLR_EL1.F0 and PMINTENSET_EL1.F0 ignore writes at EL1.
0b1	MSR writes of PMICFILTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

• EL3 is implemented.
• SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

• On a Warm reset:
◦ When the highest implemented Exception level is EL2, this field resets to '0'.
◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMICNTR_EL0, bit [2]
When FEAT_PMUv3_ICNTR is implemented:

Trap MSR writes of PMICNTR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPMICNTR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then: • MSR writes of PMICNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception. • PMZR_EL0.F0 ignores writes at EL1 and EL0.
0b1	MSR writes of PMICNTR_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

• EL3 is implemented.
• SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

• On a Warm reset:
◦ When the highest implemented Exception level is EL2, this field resets to '0'.
◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMIAR_EL1, bit [1]
When FEAT_SEBEP is implemented:

Trap MSR writes of PMIAR_EL1 at EL1 using AArch64 to EL2.

nPMIAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMIAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMIAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPMECR_EL1, bit [0]
When FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented:

Trap MSR writes of PMECR_EL1 at EL1 using AArch64 to EL2.

nPMECR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PMECR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMECR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDFGWTR_EL2, Hypervisor Debug Fine-Grained Write Trap Register

The HDFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR and MCR writes of debug, trace, PMU, and Statistical Profiling System registers.

Configuration

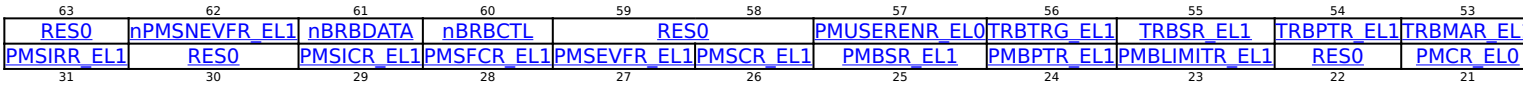
This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HDFGWTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HDFGWTR_EL2 is a 64-bit register.

Field descriptions



Bit [63]

Reserved, RES0.

nPMSNEVFR_EL1, bit [62]
When FEAT_SPE_FnE is implemented:

Trap MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 to EL2.

nPMSNEVFR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSNEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PMSNEVFR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBDATA, bit [61]
When FEAT_BRBE is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBINFINJ_EL1.
- BRBSRCINJ_EL1.
- BRBTGTINJ_EL1.
- BRBTS_EL1.

nBRBDATA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBCTL, bit [60]
When FEAT_BRBE is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- BRBCR_EL1.
- BRBFCR_EL1.

nBRBCTL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

PMUSERENR_EL0, bit [57]
When FEAT_PMUv3 is implemented:

Trap MSR writes of PMUSERENR_EL0 at EL1 using AArch64 to EL2.

PMUSERENR_EL0	Meaning
0b0	MSR writes of PMUSERENR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMUSERENR_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBTRG_EL1, bit [56]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBTRG_EL1 at EL1 using AArch64 to EL2.

TRBTRG_EL1	Meaning
0b0	MSR writes of TRBTRG_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBTRG_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBSR_EL1, bit [55]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBSR_EL1 at EL1 using AArch64 to EL2.

TRBSR_EL1	Meaning
0b0	MSR writes of TRBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBPTR_EL1, bit [54]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBPTR_EL1 at EL1 using AArch64 to EL2.

TRBPTR_EL1	Meaning
0b0	MSR writes of TRBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBMAR_EL1, bit [53]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBMAR_EL1 at EL1 using AArch64 to EL2.

TRBMAR_EL1	Meaning
0b0	MSR writes of TRBMAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBMAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBLIMITR_EL1, bit [52]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBLIMITR_EL1 at EL1 using AArch64 to EL2.

TRBLIMITR_EL1	Meaning
0b0	MSR writes of TRBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

TRBBASER_EL1, bit [50]
When FEAT_TRBE is implemented:

Trap MSR writes of TRBBASER_EL1 at EL1 using AArch64 to EL2.

TRBBASER_EL1	Meaning
0b0	MSR writes of TRBBASER_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRBBASER_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRFCR_EL1, bit [49]
When FEAT_TRF is implemented:

Trap MSR writes of TRFCR_EL1 at EL1 using AArch64 to EL2.

TRFCR_EL1	Meaning
0b0	MSR writes of TRFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCVICTLR, bit [48]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCVICTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCVICTLR at EL1 using AArch64 to EL2.

TRCVICTLR	Meaning
0b0	MSR writes of TRCVICTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCVICTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [47]

Reserved, RES0.

TRCSSCSRn, bit [46]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSSCSR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCSSCSR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSSCSR<n> at EL1 using AArch64 to EL2.

TRCSSCSRn	Meaning
0b0	MSR writes of TRCSSCSR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSSCSR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Single-shot Comparator n is not implementented, a write of TRCSSCSR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCSEQSTR, bit [45]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCSEQSTR is implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCSEQSTR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCSEQSTR at EL1 using AArch64 to EL2.

TRCSEQSTR	Meaning
0b0	MSR writes of TRCSEQSTR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCSEQSTR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCPRGCTLR, bit [44]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCPRGCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCPRGCTLR at EL1 using AArch64 to EL2.

TRCPRGCTLR	Meaning
0b0	MSR writes of TRCPRGCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCPRGCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [43]

Reserved, RES0.

TRCOSLAR, bit [42]
When FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented:

In an Armv8 implementation, trap MSR writes of ETM TRCOSLAR at EL1 using AArch64 to EL2.

TRCOSLAR	Meaning
0b0	MSR writes of ETM TRCOSLAR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ETM TRCOSLAR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCIMSPECn, bit [41]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCIMSPEC<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCIMSPEC<n> at EL1 using AArch64 to EL2.

TRCIMSPECn	Meaning
0b0	MSR writes of TRCIMSPEC<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCIMSPEC<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

TRCIMSPEC<1-7> are optional. If TRCIMSPEC<n> is not implemented, a write of TRCIMSPEC<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [40:38]

Reserved, RES0.

TRCCNTVRn, bit [37]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented, TRCCNTVR<n> are implemented, and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCCNTVR<n> at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCCNTVR<n> at EL1 using AArch64 to EL2.

TRCCNTVRn	Meaning
0b0	MSR writes of TRCCNTVR<n> are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCCNTVR<n> at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If Counter n is not implemented, a write of TRCCNTVR<n> is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCCLAIM, bit [36]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation: TRCCLAIMCLR and TRCCLAIMSET.
- In an Armv8 implementation: ETM TRCCLAIMCLR and ETM TRCCLAIMSET.

TRCCLAIM	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRCAUXCTLR, bit [35]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

In an Armv9 implementation, trap MSR writes of TRCAUXCTLR at EL1 using AArch64 to EL2.

In an Armv8 implementation, trap MSR writes of ETM TRCAUXCTLR at EL1 using AArch64 to EL2.

TRCAUXCTLR	Meaning
0b0	MSR writes of TRCAUXCTLR are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TRCAUXCTLR at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TRC, bit [33]
When FEAT_ETE is implemented or (FEAT_ETMv4 is implemented and System register access to the trace unit registers is implemented):

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- In an Armv9 implementation:
  - TRCACATR<n>.
  - TRCACVR<n>.
  - TRCBBCTLR.
  - TRCCCCTLR.
  - TRCCIDCCTLR0.
  - TRCCIDCCTLR1.
  - TRCCIDCVR<n>.
  - TRCCNTCTLR<n>.
  - TRCCNTRLDVR<n>.
  - TRCCONFIGR.
  - TRCEVENTCTL0R.
  - TRCEVENTCTL1R.
  - TRCEXTINSELR<n>.
  - TRCQCTLR.
  - TRCRSCTLR<n>.
  - TRCRSR.
  - TRCSEQEVR<n>.
  - TRCSEQRSTEVR.
  - TRCSSCCR<n>.
  - TRCSSPCICR<n>.
  - TRCSTALLCTLR.
  - TRCSYNCPR.
  - TRCTRACEIDR.
  - TRCTSCTLR.
  - TRCVIIECTLR.
  - TRCVIPCSSCTLR.
  - TRCVISSCTLR.
  - TRCVMIDCCTLR0.
  - TRCVMIDCCTLR1.
  - TRCVMIDCVR<n>.
- In an Armv8 implementation:
  - ETM TRCACATR<n>.
  - ETM TRCACVR<n>.
  - ETM TRCBBCTLR.
  - ETM TRCCCCTLR.
  - ETM TRCCIDCCTLR0.
  - ETM TRCCIDCCTLR1.
  - ETM TRCCIDCVR<n>.
  - ETM TRCCNTCTLR<n>.
  - ETM TRCCNTRLDVR<n>.
  - ETM TRCCONFIGR.
  - ETM TRCEVENTCTL0R.
  - ETM TRCEVENTCTL1R.
  - ETM TRCEXTINSELR.
  - ETM TRCQCTLR.
  - ETM TRCRSCTLR<n>.
  - ETM TRCSEQEVR<n>.
  - ETM TRCSEQRSTEVR.
  - ETM TRCSSCCR<n>.
  - ETM TRCSSPCICR<n>.
  - ETM TRCSTALLCTLR.
  - ETM TRCSYNCPR.
  - ETM TRCTRACEIDR.
  - ETM TRCTSCTLR.
  - ETM TRCVIIECTLR.
  - ETM TRCVIPCSSCTLR.
  - ETM TRCVISSCTLR.
  - ETM TRCVMIDCCTLR0.
  - ETM TRCVMIDCCTLR1.
  - ETM TRCVMIDCVR<n>.

TRC	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

A write of an unimplemented register is UNDEFINED.

TRCEXTINSELR<n> and TRCRSR are implemented only if FEAT_ETE is implemented.

TRCEXTINSELR is implemented only if FEAT_ETE is not implemented and FEAT_ETMv4 is implemented.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSLATFR_EL1, bit [32]
When FEAT_SPE is implemented:

Trap MSR writes of PMSLATFR_EL1 at EL1 using AArch64 to EL2.

PMSLATFR_EL1	Meaning
0b0	MSR writes of PMSLATFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSLATFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSIRR_EL1, bit [31]
When FEAT_SPE is implemented:

Trap MSR writes of PMSIRR_EL1 at EL1 using AArch64 to EL2.

PMSIRR_EL1	Meaning
0b0	MSR writes of PMSIRR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSIRR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [30]

Reserved, RES0.

PMSICR_EL1, bit [29]
When FEAT_SPE is implemented:

Trap MSR writes of PMSICR_EL1 at EL1 using AArch64 to EL2.

PMSICR_EL1	Meaning
0b0	MSR writes of PMSICR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSICR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSFCR_EL1, bit [28]
When FEAT_SPE is implemented:

Trap MSR writes of PMSFCR_EL1 at EL1 using AArch64 to EL2.

PMSFCR_EL1	Meaning
0b0	MSR writes of PMSFCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSFCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSEVFR_EL1, bit [27]
When FEAT_SPE is implemented:

Trap MSR writes of PMSEVFR_EL1 at EL1 using AArch64 to EL2.

PMSEVFR_EL1	Meaning
0b0	MSR writes of PMSEVFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSEVFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSCR_EL1, bit [26]
When FEAT_SPE is implemented:

Trap MSR writes of PMSCR_EL1 at EL1 using AArch64 to EL2.

PMSCR_EL1	Meaning
0b0	MSR writes of PMSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBSR_EL1, bit [25]
When FEAT_SPE is implemented:

Trap MSR writes of PMBSR_EL1 at EL1 using AArch64 to EL2.

PMBSR_EL1	Meaning
0b0	MSR writes of PMBSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBPTR_EL1, bit [24]
When FEAT_SPE is implemented:

Trap MSR writes of PMBPTR_EL1 at EL1 using AArch64 to EL2.

PMBPTR_EL1	Meaning
0b0	MSR writes of PMBPTR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBPTR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMBLIMITR_EL1, bit [23]
When FEAT_SPE is implemented:

Trap MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 to EL2.

PMBLIMITR_EL1	Meaning
0b0	MSR writes of PMBLIMITR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PMBLIMITR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

PMCR_EL0, bit [21]
When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCR_EL0	Meaning
0b0	MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMCR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSWINC_EL0, bit [20]
When FEAT_PMUv3 is implemented:

Trap MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSWINC_EL0	Meaning
0b0	MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSWINC at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMSWINC_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSWINC at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSELR_EL0, bit [19]
When FEAT_PMUv3 is implemented:

Trap MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMSELR_EL0	Meaning
0b0	MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMSELR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMSELR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMSELR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMOVS, bit [18]
When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMOVSCLR_EL0 and PMOVSSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMOVSR and PMOVSSET.

PMOVS	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMINTEN, bit [17]
When FEAT_PMUv3 is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- PMINTENCLR_EL1.
- PMINTENSET_EL1.

PMINTEN	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCNTEN, bit [16]
When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMCNTENCLR_EL0 and PMCNTENSET_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMCNTENCLR and PMCNTENSET.

PMCNTEN	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCNTR_EL0, bit [15]
When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCNTR_EL0	Meaning
0b0	MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 and MCR and MCRR writes of PMCCNTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMCCNTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03. • MCRR writes of PMCCNTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x04.

PMCCNTR_EL0 can also be indirectly set to zero by a write of 1 to PMCR_EL0.C or PMZR_EL0.C in AArch64 state, or a write of 1 to PMCR.C in AArch32 state. Setting this field to 1 has no effect on indirect writes to PMCCNTR_EL0 using PMCR_EL0, PMZR_EL0, or PMCR.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMCCFILTR_EL0, bit [14]
When FEAT_PMUv3 is implemented:

Trap MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 to EL2.

PMCCFILTR_EL0	Meaning
0b0	MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 and MCR writes of PMCCFILTR at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PMCCFILTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of PMCCFILTR at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

PMCCFILTR_EL0 can also be accessed in AArch64 state using PMXEVTYPER_EL0 when PMSELR_EL0.SEL == 31, and PMCCFILTR can also be accessed in AArch32 state using PMXEVTYPER when PMSELR.SEL == 31.

Setting this field to 1 has no effect on accesses to PMXEVTYPER_EL0 and PMXEVTYPER, regardless of the value of PMSELR_EL0.SEL or PMSELR.SEL.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVTYPERn_EL0, bit [13]
When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVTYPER<n>_EL0 and PMXEVTYPER_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVTYPER<n> and PMXEVTYPER.

PMEVTYPERn_EL0	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of PMEVTYPER<n>_EL0, or, if n is not 31, a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n.
  - In AArch32 state, a write of PMEVTYPER<n>, or, if n is not 31, a write of PMXEVTYPER when PMSELR.SEL == n.
- If event counter n is implemented, n is greater-than-or-equal-to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a write of PMEVTYPER<n>_EL0, or a write of PMXEVTYPER_EL0 when PMSELR_EL0.SEL == n, reported with EC syndrome value 0x18.
  - In AArch32 state, a write of PMEVTYPER<n>, or a write of PMXEVTYPER when PMSELR.SEL == n, reported with EC syndrome value 0x03.

See also HDFGWTR_EL2.PMCCFILTR_EL0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEVCNTRn_EL0, bit [12]
When FEAT_PMUv3 is implemented:

Trap MSR writes and MCR writes of any of the following System registers to EL2:

- At EL1 and EL0 using AArch64: PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- At EL0 using AArch32 when EL1 is using AArch64: PMEVCNTR<n> and PMXEVCNTR.

PMEVCNTRn_EL0	Meaning
0b0	MSR writes at EL1 and EL0 using AArch64 and MCR writes at EL0 using AArch32 of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes at EL1 and EL0 using AArch64 of any of the specified AArch64 System registers are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes at EL0 using AArch32 when EL1 is using AArch64 of any of the specified AArch32 System registers are trapped to EL2 and reported with EC syndrome value 0x03.

Regardless of the value of this field, for each value n:

- If event counter n is not implemented, the following accesses are UNDEFINED:
  - In AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n.
  - In AArch32 state, a write of PMEVCNTR<n>, or a write of PMXEVCNTR when PMSELR.SEL is n.
- If event counter n is implemented, n is greater than or equal to MDCR_EL2.HPMN, and EL2 is implemented and enabled in the current Security state, the following generate a Trap exception to EL2 from EL0 or EL1:
  - In AArch64 state, a write of PMEVCNTR<n>_EL0, or a write of PMXEVCNTR_EL0 when PMSELR_EL0.SEL is n, reported with EC syndrome value 0x18.
  - In AArch32 state, a write of PMEVCNTR<n>, or a write of PMXEVCNTR when PMSELR.SEL is n, reported with EC syndrome value 0x03.

For values of n less than MDCR_EL2.HPMN, PMEVCNTR<n>_EL0 can also be indirectly set to zero by a write of 1 to PMCR_EL0.P or PMZR_EL0.P<n> in AArch64 state, or a write of 1 to PMCR.P in AArch32 state. Setting this field to 1 has no effect on indirect writes to PMEVCNTR<n>_EL0 using PMCR_EL0, PMZR_EL0, or PMCR.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSDLR_EL1, bit [11]
When FEAT_DoubleLock is implemented:

Trap MSR writes of OSDLR_EL1 at EL1 using AArch64 to EL2.

OSDLR_EL1	Meaning
0b0	MSR writes of OSDLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSDLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OSECCR_EL1, bit [10]

Trap MSR writes of OSECCR_EL1 at EL1 using AArch64 to EL2.

OSECCR_EL1	Meaning
0b0	MSR writes of OSECCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSECCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

OSLAR_EL1, bit [8]

Trap MSR writes of OSLAR_EL1 at EL1 using AArch64 to EL2.

OSLAR_EL1	Meaning
0b0	MSR writes of OSLAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of OSLAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGPRCR_EL1, bit [7]

Trap MSR writes of DBGPRCR_EL1 at EL1 using AArch64 to EL2.

DBGPRCR_EL1	Meaning
0b0	MSR writes of DBGPRCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGPRCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

DBGCLAIM, bit [5]

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- DBGCLAIMCLR_EL1.
- DBGCLAIMSET_EL1.

DBGCLAIM	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MDSCR_EL1, bit [4]

Trap MSR writes of MDSCR_EL1 at EL1 using AArch64 to EL2.

MDSCR_EL1	Meaning
0b0	MSR writes of MDSCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MDSCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWVRn_EL1, bit [3]

Trap MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWVRn_EL1	Meaning
0b0	MSR writes of DBGWVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGWCRn_EL1, bit [2]

Trap MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGWCRn_EL1	Meaning
0b0	MSR writes of DBGWCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGWCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If watchpoint n is not implemented, a write of DBGWCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBVRn_EL1, bit [1]

Trap MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBVRn_EL1	Meaning
0b0	MSR writes of DBGBVR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBVR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBVR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DBGBCRn_EL1, bit [0]

Trap MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 to EL2.

DBGBCRn_EL1	Meaning
0b0	MSR writes of DBGBCR<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of DBGBCR<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

If breakpoint n is not implemented, a write of DBGBCR<n>_EL1 is UNDEFINED.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HDFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HDFGWTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b101

HFGITR2_EL2, Hypervisor Fine-Grained Instruction Trap Register 2

The HFGITR2_EL2 characteristics are:

Purpose

Provides instruction trap controls.

Configuration

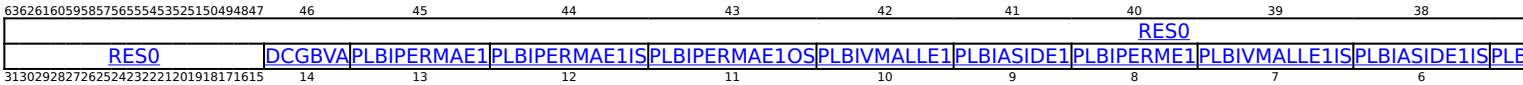
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGITR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGITR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:15]

Reserved, RES0.

DCGBVA, bit [14]
When FEAT_MTETC is implemented:

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC GBVA.
- DC ZGBVA.

DCGBVA	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIPERMAE1, bit [13]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI PERMAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI PERMAE1NXS.

PLBIPERMAE1	Meaning
0b0	Execution of PLBI PERMAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI PERMAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIPERMAE1IS, bit [12]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI PERMAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI PERMAE1ISNXS.

PLBIPERMAE1IS	Meaning
0b0	Execution of PLBI PERMAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI PERMAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIPERMAE1OS, bit [11]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI PERMAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI PERMAE1OSNXS.

PLBIPERMAE1OS	Meaning
0b0	Execution of PLBI PERMAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI PERMAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIVMALLE1, bit [10]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI VMALLE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI VMALLE1NXS.

PLBIVMALLE1	Meaning
0b0	Execution of PLBI VMALLE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI VMALLE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIASIDE1, bit [9]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI ASIDE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI ASIDE1NXS.

PLBIASIDE1	Meaning
0b0	Execution of PLBI ASIDE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI ASIDE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIPERME1, bit [8]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI PERME1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI PERME1NXS.

PLBIPERME1	Meaning
0b0	Execution of PLBI PERME1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI PERME1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIVMALLE1IS, bit [7]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI VMALLE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI VMALLE1ISNXS.

PLBIVMALLE1IS	Meaning
0b0	Execution of PLBI VMALLE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI VMALLE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIASIDE1IS, bit [6]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI ASIDE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI ASIDE1ISNXS.

PLBIASIDE1IS	Meaning
0b0	Execution of PLBI ASIDE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI ASIDE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIPERME1IS, bit [5]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI PERME1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI PERME1ISNXS.

PLBIPERME1IS	Meaning
0b0	Execution of PLBI PERME1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI PERME1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIVMALLE1OS, bit [4]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI VMALLE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI VMALLE1OSNXS.

PLBIVMALLE1OS	Meaning
0b0	Execution of PLBI VMALLE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI VMALLE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIASIDE1OS, bit [3]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI ASIDE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI ASIDE1OSNXS.

PLBIASIDE1OS	Meaning
0b0	Execution of PLBI ASIDE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI ASIDE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PLBIPERME1OS, bit [2]
When FEAT_S1POE2 is implemented:

Trap execution of PLBI PERME1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of PLBI PERME1OSNXS.

PLBIPERME1OS	Meaning
0b0	Execution of PLBI PERME1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then execution of PLBI PERME1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nDCCIVAPS, bit [1]
When FEAT_PoPS is implemented:

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC CIVAPS.
- DC CIGDVAPS, if FEAT_MTE2 is implemented.

If the Point of Physical Storage is before any level of data cache, it is IMPLEMENTATION DEFINED whether the execution of the affected instruction is trapped when the value of this control is 1.

nDCCIVAPS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of the specified instructions is not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSBCSYNC, bit [0]
When FEAT_TRBEv1p1 is implemented:

Trap execution of TSB CSYNC at EL1 and EL0 using AArch64 to EL2.

TSBCSYNC	Meaning
0b0	Execution of TSB CSYNC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then execution of TSB CSYNC at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x0A, unless the instruction generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HFGITR_EL2, Hypervisor Fine-Grained Instruction Trap Register

The HFGITR_EL2 characteristics are:

Purpose

Provides instruction trap controls.

Configuration

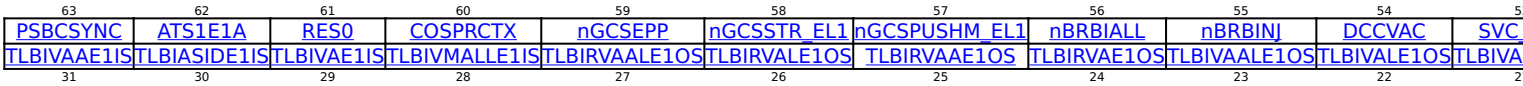
This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGITR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGITR_EL2 is a 64-bit register.

Field descriptions



PSBCSYNC, bit [63]
When FEAT_SPEv1p5 is implemented:

Trap execution of PSB CSYNC at EL1 and EL0 using AArch64 to EL2.

PSBCSYNC	Meaning
0b0	Execution of PSB CSYNC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of PSB CSYNC at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x0A, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E1A, bit [62]
When FEAT_ATS1A is implemented:

Trap execution of AT S1E1A at EL1 using AArch64 to EL2.

ATS1E1A	Meaning
0b0	Execution of AT S1E1A is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1A at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [61]

Reserved, RES0.

COSPRCTX, bit [60]
When FEAT_SPECRES2 is implemented:

Trap execution of COSP RCTX at EL1 and EL0 using AArch64 and execution of COSPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

COSPRCTX	Meaning
0b0	Execution of COSP RCTX at EL1 and EL0 using AArch64 and execution of COSPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of COSP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of COSPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCSEPP, bit [59]
When FEAT_GCS is implemented:

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- GCSPUSHX.
- GCSPOPCX.

nGCSEPP	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of the specified instructions is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCSSTR_EL1, bit [58]
When FEAT_GCS is implemented:

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- GCSSTR.
- GCSSTTR when PSTATE.UAO is 1.

• GCSSTTR when the Effective value of HCR_EL2.{NV, NV1} is {1, 1}.

nGCSSTR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions generates a GCS exception with EC syndrome value 0x2D, unless the instruction generates a higher priority exception.
0b1	Execution of the specified instructions is not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset:
  ◦ When the highest implemented Exception level is EL2, this field resets to '0'.
  ◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCSPUSHM_EL1, bit [57]
When FEAT_GCS is implemented:

Trap execution of GCSPUSHM at EL1 using AArch64 to EL2.

nGCSPUSHM_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of GCSPUSHM at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GCSPUSHM is not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset:
  ◦ When the highest implemented Exception level is EL2, this field resets to '0'.
  ◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBIALL, bit [56]
When FEAT_BRBE is implemented:

Trap execution of BRB IALL at EL1 using AArch64 to EL2.

nBRBIALL	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of BRB IALL at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of BRB IALL is not trapped by this mechanism.

The reset behavior of this field is:

• On a Warm reset:
  ◦ When the highest implemented Exception level is EL2, this field resets to '0'.
  ◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nBRBINJ, bit [55]
When FEAT_BRBE is implemented:

Trap execution of BRB INJ at EL1 using AArch64 to EL2.

nBRBINJ	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of BRB INJ at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of BRB INJ is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCCVAC, bit [54]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CVAC.
- DC CGVAC, if FEAT_MTE is implemented.
- DC CGDVAC, if FEAT_MTE is implemented.
- DC CVAOC, if FEAT_OCCMO is implemented.
- DC CGDVAOC, if FEAT_OCCMO is implemented.

DCCVAC	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SVC_EL1, bit [53]

Trap execution of SVC at EL1 using AArch64 to EL2.

SVC_EL1	Meaning
0b0	Execution of SVC is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of SVC at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SVC_EL0, bit [52]

Trap execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 when EL1 is using AArch64 to EL2.

SVC_EL0	Meaning
0b0	Execution of SVC at EL0 using AArch64 and execution of SVC at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of SVC at EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x15. • Execution of SVC at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x11.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ERET, bit [51]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- ERET.
- ERETAA, if FEAT_PAuth is implemented.
- ERETAB, if FEAT_PAuth is implemented.

ERET	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x1A, unless the instruction generates a higher priority exception.

If EL2 is implemented and enabled in the current Security state, HCR_EL2.API == 0, and this field enables a fine-grained trap on the instruction, then execution at EL1 using AArch64 of ERETAA or ERETAB instructions is trapped to EL2 and reported with EC syndrome value 0x1A with its associated ISS field, as the fine-grained trap has higher priority than the trap enabled by HCR_EL2.API == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CPPRCTX, bit [50]
When FEAT_SPECRES is implemented:

Trap execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CPPRCTX	Meaning
0b0	Execution of CPP RCTX at EL1 and EL0 using AArch64 and execution of CPPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of CPP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of CPPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DVPRCTX, bit [49]
When FEAT_SPECRES is implemented:

Trap execution of DVP RCTX at EL1 and EL0 using AArch64 and execution of DVPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

DVPRCTX	Meaning
0b0	Execution of DVP RCTX at EL1 and EL0 using AArch64 and execution of DVPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of DVP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of DVPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CFPRCTX, bit [48]
When FEAT_SPECRES is implemented:

Trap execution of CFP RCTX at EL1 and EL0 using AArch64 and execution of CFPRCTX at EL0 using AArch32 when EL1 is using AArch64 to EL2.

CFPRCTX	Meaning
0b0	Execution of CFP RCTX at EL1 and EL0 using AArch64 and execution of CFPRCTX at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the instruction generates a higher priority exception: • Execution of CFP RCTX at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18. • Execution of CFPRCTX at EL0 using AArch32 when EL1 is using AArch64 is trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAALE1, bit [47]

Trap execution of TLBI VAALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAALE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAALE1NXS.

TLBIVAALE1	Meaning
0b0	Execution of TLBI VAALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVALE1, bit [46]

Trap execution of TLBI VALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VALE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VALE1NXS.

TLBIVALE1	Meaning
0b0	Execution of TLBI VALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAAE1, bit [45]

Trap execution of TLBI VAAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAAE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAAE1NXS.

TLBIVAAE1	Meaning
0b0	Execution of TLBI VAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIASIDE1, bit [44]

Trap execution of TLBI ASIDE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP ASIDE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP ASIDE1NXS.

TLBIASIDE1	Meaning
0b0	Execution of TLBI ASIDE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAE1, bit [43]

Trap execution of TLBI VAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAE1NXS.

TLBIVAE1	Meaning
0b0	Execution of TLBI VAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVMALLE1, bit [42]

Trap execution of TLBI VMALLE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VMALLE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VMALLE1NSX.

TLBIVMALLE1	Meaning
0b0	Execution of TLBI VMALLE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIRVAALE1, bit [41]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAALE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAALE1NXS.

TLBIRVAALE1	Meaning
0b0	Execution of TLBI RVAALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVALE1, bit [40]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVALE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVALE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVALE1NXS.

TLBIRVALE1	Meaning
0b0	Execution of TLBI RVALE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAAE1, bit [39]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAAE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAAE1NXS.

TLBIRVAAE1	Meaning
0b0	Execution of TLBI RVAAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAE1, bit [38]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAE1 at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1NXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAE1.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAE1NXS.

TLBIRVAE1	Meaning
0b0	Execution of TLBI RVAE1 is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1 at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAALE1IS, bit [37]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAALE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAALE1ISNXS.

TLBIRVAALE1IS	Meaning
0b0	Execution of TLBI RVAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVALE1IS, bit [36]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVALE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVALE1ISNXS.

TLBIRVALE1IS	Meaning
0b0	Execution of TLBI RVALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAAE1IS, bit [35]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAAE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAAE1ISNXS.

TLBIRVAAE1IS	Meaning
0b0	Execution of TLBI RVAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAE1IS, bit [34]
When FEAT_TLBIRANGE is implemented:

Trap execution of TLBI RVAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAE1ISNXS.

TLBIRVAE1IS	Meaning
0b0	Execution of TLBI RVAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAALE1IS, bit [33]

Trap execution of TLBI VAALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAALE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAALE1ISNXS.

TLBIVAALE1IS	Meaning
0b0	Execution of TLBI VAALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVALE1IS, bit [32]

Trap execution of TLBI VALE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VALE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VALE1ISNXS.

TLBIVALE1IS	Meaning
0b0	Execution of TLBI VALE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAAE1IS, bit [31]

Trap execution of TLBI VAAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAAE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAAE1ISNXS.

TLBIVAAE1IS	Meaning
0b0	Execution of TLBI VAAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIASIDE1IS, bit [30]

Trap execution of TLBI ASIDE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP ASIDE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP ASIDE1ISNXS.

TLBIASIDE1IS	Meaning
0b0	Execution of TLBI ASIDE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVAE1IS, bit [29]

Trap execution of TLBI VAE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAE1ISNXS.

TLBIVAE1IS	Meaning
0b0	Execution of TLBI VAE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIVMALLE1IS, bit [28]

Trap execution of TLBI VMALLE1IS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1ISNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VMALLE1IS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VMALLE1ISNXS.

TLBIVMALLE1IS	Meaning
0b0	Execution of TLBI VMALLE1IS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1IS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TLBIRVAALE1OS, bit [27]
When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAALE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAALE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAALE1OSNXS.

TLBIRVAALE1OS	Meaning
0b0	Execution of TLBI RVAALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVALE1OS, bit [26]
When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVALE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVALE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVALE1OSNXS.

TLBIRVALE1OS	Meaning
0b0	Execution of TLBI RVALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAAE1OS, bit [25]
When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAAE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAAE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of x[TLBIP RVAAE1OSNXS]#(AArch64.tlbip_rvaae1osnxs).

TLBIRVAAE1OS	Meaning
0b0	Execution of TLBI RVAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIRVAE1OS, bit [24]
When FEAT_TLBIRANGE is implemented and FEAT_TLBIOS is implemented:

Trap execution of TLBI RVAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI RVAE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP RVAE1OSNXS.

TLBIRVAE1OS	Meaning
0b0	Execution of TLBI RVAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI RVAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAALE1OS, bit [23]
When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAALE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAALE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAALE1OSNXS.

TLBIVAALE1OS	Meaning
0b0	Execution of TLBI VAALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVALE1OS, bit [22]
When FEAT_TLBIOS is implemented:

Trap execution of TLBI VALE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VALE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VALE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VALE1OSNXS.

TLBIVALE1OS	Meaning
0b0	Execution of TLBI VALE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VALE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAAE1OS, bit [21]
When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAAE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAAE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAAE1OSNXS.

TLBIVAAE1OS	Meaning
0b0	Execution of TLBI VAAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIASIDE1OS, bit [20]
When FEAT_TLBIOS is implemented:

Trap execution of TLBI ASIDE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI ASIDE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP ASIDE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP ASIDE1OSNXS.

TLBIASIDE1OS	Meaning
0b0	Execution of TLBI ASIDE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI ASIDE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVAE1OS, bit [19]
When FEAT_TLBIOS is implemented:

Trap execution of TLBI VAE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VAE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VAE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VAE1OSNXS.

TLBIVAE1OS	Meaning
0b0	Execution of TLBI VAE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VAE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

◦ Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLBIVMALLE1OS, bit [18]
When FEAT_TLBIOS is implemented:

Trap execution of TLBI VMALLE1OS at EL1 using AArch64 to EL2.

If FEAT_XS is implemented and HCRX_EL2.FGTnXS == 0, this field also traps execution of TLBI VMALLE1OSNXS.

If FEAT_D128 is implemented, then this field also traps execution of TLBIP VMALLE1OS.

If FEAT_XS and FEAT_D128 is implemented, then this field also traps execution of TLBIP VMALLE1OSNXS.

TLBIVMALLE1OS	Meaning
0b0	Execution of TLBI VMALLE1OS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of TLBI VMALLE1OS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E1WP, bit [17]
When FEAT_PAN2 is implemented:

Trap execution of AT S1E1WP at EL1 using AArch64 to EL2.

ATS1E1WP	Meaning
0b0	Execution of AT S1E1WP is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1WP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E1RP, bit [16]
When FEAT_PAN2 is implemented:

Trap execution of AT S1E1RP at EL1 using AArch64 to EL2.

ATS1E1RP	Meaning
0b0	Execution of AT S1E1RP is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1RP at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATS1E0W, bit [15]

Trap execution of AT S1E0W at EL1 using AArch64 to EL2.

ATS1E0W	Meaning
0b0	Execution of AT S1E0W is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ATS1E0R, bit [14]

Trap execution of AT S1E0R at EL1 using AArch64 to EL2.

ATS1E0R	Meaning
0b0	Execution of AT S1E0R is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E0R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ATS1E1W, bit [13]

Trap execution of AT S1E1W at EL1 using AArch64 to EL2.

ATS1E1W	Meaning
0b0	Execution of AT S1E1W is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1W at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ATS1E1R, bit [12]

Trap execution of AT S1E1R at EL1 using AArch64 to EL2.

ATS1E1R	Meaning
0b0	Execution of AT S1E1R is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution of AT S1E1R at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCZVA, bit [11]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC ZVA.
- DC GVA, if FEAT_MTE is implemented.
- DC GZVA, if FEAT_MTE is implemented.

Note

Unlike HCR_EL2.TDZ, this field has no effect on DCZID_EL0.DZP.

DCZVA	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCIVAC, bit [10]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CIVAC.
- DC CIGVAC, if FEAT_MTE is implemented.
- DC CIGDVAC, if FEAT_MTE is implemented.
- DC CIVAOC, if FEAT_OCCMO is implemented.
- DC CIGDVAOC, if FEAT_OCCMO is implemented.

DCCIVAC	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCVADP, bit [9]
When FEAT_DPB2 is implemented:

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CVADP.
- DC CGVADP, if FEAT_MTE is implemented.
- DC CGDVADP, if FEAT_MTE is implemented.

DCCVADP	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCCVAP, bit [8]

Trap execution of any of the following AArch64 instructions at EL1 and EL0 to EL2:

- DC CVAP.
- DC CGVAP, if FEAT_MTE is implemented.
- DC CGDVAP, if FEAT_MTE is implemented.

DCCVAP	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 and EL0 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCVAU, bit [7]

Trap execution of DC CVAU at EL1 and EL0 using AArch64 to EL2.

DCCVAU	Meaning
0b0	Execution of DC CVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of DC CVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCISW, bit [6]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC CISW.
- DC CIGSW, if FEAT_MTE2 is implemented.
- DC CIGDSW, if FEAT_MTE2 is implemented.

DCCISW	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCCSW, bit [5]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC CSW.
- DC CGSW, if FEAT_MTE2 is implemented.
- DC CGDSW, if FEAT_MTE2 is implemented.

DCCSW	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCISW, bit [4]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC ISW.
- DC IGSW, if FEAT_MTE2 is implemented.
- DC IGDSW, if FEAT_MTE2 is implemented.

DCISW	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCIVAC, bit [3]

Trap execution of any of the following AArch64 instructions at EL1 to EL2:

- DC IVAC.
- DC IGVAC, if FEAT_MTE2 is implemented.
- DC IGDVAC, if FEAT_MTE2 is implemented.

DCIVAC	Meaning
0b0	Execution of the specified instructions is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution at EL1 using AArch64 of any of the specified instructions is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ICIVAU, bit [2]

Trap execution of IC IVAU at EL1 and EL0 using AArch64 to EL2.

ICIVAU	Meaning
0b0	Execution of IC IVAU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of IC IVAU at EL1 and EL0 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ICIALLU, bit [1]

Trap execution of IC IALLU at EL1 using AArch64 to EL2.

ICIALLU	Meaning
0b0	Execution of IC IALLU is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of IC IALLU at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ICIALLUIS, bit [0]

Trap execution of IC IALLUIS at EL1 using AArch64 to EL2.

ICIALLUIS	Meaning
0b0	Execution of IC IALLUIS is not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then if the execution can be trapped, execution of IC IALLUIS at EL1 using AArch64 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HFGITR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGITR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b110

```
if !(IsFeatureImplemented(FEAT_FGT) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'1x1'} then

HFGRTR2_EL2, Hypervisor Fine-Grained Read Trap Register 2

The HFGRTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MRRS, MRS and MRC reads of System registers.

Configuration

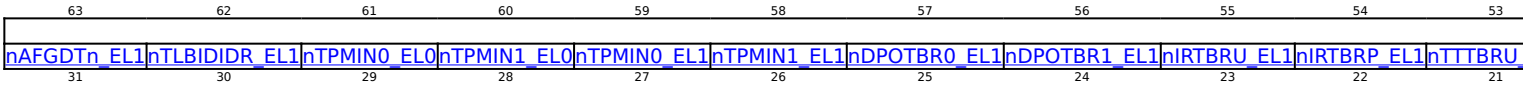
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGRTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGRTR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:38]

Reserved, RES0.

nTPIDR3_EL1, bit [37]
When FEAT_S1POE2 is implemented:

Trap MRS reads of TPIDR3_EL1 at EL1 using AArch64 to EL2.

nTPIDR3_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TPIDR3_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TPIDR3_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPIDR3_EL0, bit [36]
When FEAT_S1POE2 is implemented:

Trap MRS reads of TPIDR3_EL0 at EL1 and EL0 using AArch64 to EL2.

nTPIDR3_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of TPIDR3_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TPIDR3_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCR_EL1, bit [35]
When FEAT_MTEFGT is implemented:

Trap MRS reads of GCR_EL1 at EL1 using AArch64 to EL2.

GCR_EL1	Meaning
0b0	MRS reads of GCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then MRS reads of GCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RGSR_EL1, bit [34]
When FEAT_MTEFGT is implemented:

Trap MRS reads of RGSR_EL1 at EL1 using AArch64 to EL2.

RGSR_EL1	Meaning
0b0	MRS reads of RGSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then MRS reads of RGSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TFSR_EL1, bit [33]
When FEAT_MTEFGT is implemented and FEAT_MTE_ASYNC is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TFSRE0_EL1.
- TFSR_EL1.

TFSR_EL1	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nAFGDTn_EL1, bits [32:31]
When FEAT_S1POE2 is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- AFGDTP<n>_EL1.
- AFGDTU<n>_EL1.

nAFGDTn_EL1	Meaning
0b00	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers when n = 0..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the read generates a higher priority exception.
0b01	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers when n = 4..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the read generates a higher priority exception.
0b10	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers when n = 8..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the read generates a higher priority exception.
0b11	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTLBIDIDR_EL1, bit [30]
When FEAT_TLBID is implemented:

Trap MRS reads of TLBIDIDR_EL1 at EL1 using AArch64 to EL2.

nTLBIDIDR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TLBIDIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TLBIDIDR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPMIN0_EL0, bit [29]
When FEAT_TPS is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN0_EL0.
- TPMAX0_EL0.

nTPMIN0_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPMIN1_EL0, bit [28]
When FEAT_TPS is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN1_EL0.
- TPMAX1_EL0.

nTPMIN1_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPMIN0_EL1, bit [27]
When FEAT_TPSP is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN0_EL1.
- TPMAX0_EL1.

nTPMIN0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPMIN1_EL1, bit [26]
When FEAT_TPSP is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN1_EL1.
- TPMAX1_EL1.

nTPMIN1_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nDPOTBR0_EL1, bit [25]
When FEAT_S1POE2 is implemented:

Trap MRS reads of DPOTBR0_EL1 at EL1 using AArch64 to EL2.

nDPOTBR0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of DPOTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of DPOTBR0_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nDPOTBR1_EL1, bit [24]
When FEAT_S1POE2 is implemented:

Trap MRS reads of DPOTBR1_EL1 at EL1 using AArch64 to EL2.

nDPOTBR1_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of DPOTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of DPOTBR1_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nIRTBRU_EL1, bit [23]
When FEAT_S1POE2 is implemented:

Trap MRS reads of IRTBRU_EL1 at EL1 using AArch64 to EL2.

nIRTBRU_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of IRTBRU_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of IRTBRU_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nIRTBRP_EL1, bit [22]
When FEAT_S1POE2 is implemented:

Trap MRS reads of IRTBRP_EL1 at EL1 using AArch64 to EL2.

nIRTBRP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of IRTBRP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of IRTBRP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTTTBRU_EL1, bit [21]
When FEAT_S1POE2 is implemented:

Trap MRS reads of TTTBRU_EL1 at EL1 using AArch64 to EL2.

nTTTBRU_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TTTBRU_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TTTBRU_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTTTBRP_EL1, bit [20]
When FEAT_S1POE2 is implemented:

Trap MRS reads of TTTBRP_EL1 at EL1 using AArch64 to EL2.

nTTTBRP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TTTBRP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TTTBRP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nFGDTn_EL1, bits [19:18]
When FEAT_S1POE2 is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- FGDTP<n>_EL1.
- FGDTU<n>_EL1.

nFGDTn_EL1	Meaning
0b00	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers when n = 0..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the read generates a higher priority exception.
0b01	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers when n = 4..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the read generates a higher priority exception.
0b10	If EL2 is implemented and enabled in the current Security state, then MRS reads at EL1 using AArch64 of any of the specified System registers when n = 8..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the read generates a higher priority exception.
0b11	MRS reads of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.

- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSTINDEX_EL1, bit [17]
When FEAT_S1POE2 is implemented:

Trap MRS reads of STINDEX_EL1 at EL1 using AArch64 to EL2.

nSTINDEX_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of STINDEX_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of STINDEX_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTINDEX_EL1, bit [16]
When FEAT_S1POE2 is implemented:

Trap MRS reads of TINDEX_EL1 at EL1 using AArch64 to EL2.

nTINDEX_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TINDEX_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TINDEX_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTINDEX_EL0, bit [15]
When FEAT_S1POE2 is implemented:

Trap MRS reads of TINDEX_EL0 at EL1 and EL0 using AArch64 to EL2.

nTINDEX_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MRS reads of TINDEX_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TINDEX_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nACTLRALIAS_EL1, bit [14]
When FEAT_SRMASK is implemented:

Trap MRS reads of ACTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nACTLRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of ACTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nACTLRMASK_EL1, bit [13]
When FEAT_SRMASK is implemented:

Trap MRS reads of ACTLRMASK_EL1 at EL1 using AArch64 to EL2.

nACTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of ACTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2ALIAS_EL1, bit [12]
When FEAT_SRMASK is implemented:

Trap MRS reads of TCR2ALIAS_EL1 at EL1 using AArch64 to EL2.

nTCR2ALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCR2ALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCR2ALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRALIAS_EL1, bit [11]
When FEAT_SRMASK is implemented:

Trap MRS reads of TCRALIAS_EL1 at EL1 using AArch64 to EL2.

nTCRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLR2ALIAS_EL1, bit [10]
When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLR2ALIAS_EL1 at EL1 using AArch64 to EL2.

nSCTLR2ALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLR2ALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLR2ALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRALIAS_EL1, bit [9]
When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nSCTLRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRALIAS_EL1, bit [8]
When FEAT_SRMASK is implemented:

Trap MRS reads of CPACRALIAS_EL1 at EL1 using AArch64 to EL2.

nCPACRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of CPACRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of CPACRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2MASK_EL1, bit [7]
When FEAT_SRMASK is implemented:

Trap MRS reads of TCR2MASK_EL1 at EL1 using AArch64 to EL2.

nTCR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRMASK_EL1, bit [6]
When FEAT_SRMASK is implemented:

Trap MRS reads of TCRMASK_EL1 at EL1 using AArch64 to EL2.

nTCRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of TCRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TCRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLR2MASK_EL1, bit [5]
When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLR2MASK_EL1 at EL1 using AArch64 to EL2.

nSCTLR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRMASK_EL1, bit [4]
When FEAT_SRMASK is implemented:

Trap MRS reads of SCTLRMASK_EL1 at EL1 using AArch64 to EL2.

nSCTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of SCTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SCTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRMASK_EL1, bit [3]
When FEAT_SRMASK is implemented:

Trap MRS reads of CPACRMASK_EL1 at EL1 using AArch64 to EL2.

nCPACRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of CPACRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of CPACRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWSMASK_EL1, bit [2]
When FEAT_THE is implemented:

Trap MRS or MRRS reads of RCWSMASK_EL1 at EL1 using AArch64 to EL2.

nRCWSMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then unless the read generates a higher priority exception: • MRS reads of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MRS and MRRS reads of RCWSMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nERXGSR_EL1, bit [1]
When FEAT_RASv2 is implemented:

Trap MRS reads of ERXGSR_EL1 at EL1 using AArch64 to EL2.

nERXGSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of ERXGSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ERXGSR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPFAR_EL1, bit [0]
When FEAT_PFAR is implemented:

Trap MRS reads of PFAR_EL1 at EL1 using AArch64 to EL2.

nPFAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of PFAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PFAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HFGRTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGRTR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b010

```

HFGRTR_EL2, Hypervisor Fine-Grained Read Trap Register

The HFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRRS, MRS and MRC reads of System registers.

Configuration

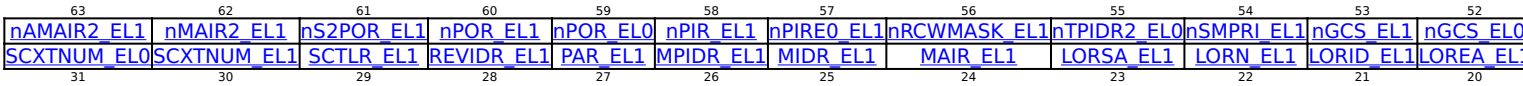
This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGRTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGRTR_EL2 is a 64-bit register.

Field descriptions



nAMAIR2_EL1, bit [63]
When FEAT_AIE is implemented:

Trap MRS reads of AMAIR2_EL1 at EL1 using AArch64 to EL2.

nAMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AMAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of AMAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMAIR2_EL1, bit [62]
When FEAT_AIE is implemented:

Trap MRS reads of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nS2POR_EL1, bit [61]
When FEAT_S2POE is implemented:

Trap MRS reads of S2POR_EL1 at EL1 using AArch64 to EL2.

nS2POR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of S2POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of S2POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL1, bit [60]
When FEAT_S1POE is implemented:

Trap MRS reads of POR_EL1 at EL1 using AArch64 to EL2.

nPOR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL0, bit [59]
When FEAT_S1POE is implemented:

Trap MRS reads of POR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPOR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of POR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of POR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIR_EL1, bit [58]
When FEAT_S1PIE is implemented:

Trap MRS reads of PIR_EL1 at EL1 using AArch64 to EL2.

nPIR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PIR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIRE0_EL1, bit [57]
When FEAT_S1PIE is implemented:

Trap MRS reads of PIRE0_EL1 at EL1 using AArch64 to EL2.

nPIRE0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of PIRE0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of PIRE0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWMASK_EL1, bit [56]
When FEAT_THE is implemented:

Trap MRS or MRRS reads of RCWMASK_EL1 at EL1 using AArch64 to EL2.

nRCWMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MRS and MRRS reads of RCWMASK_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPIDR2_EL0, bit [55]
When FEAT_SME is implemented:

Trap MRS reads of TPIDR2_EL0 at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of TPIDR2_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]
When FEAT_SME is implemented:

Trap MRS reads of SMPRI_EL1 at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL1, bit [53]
When FEAT_GCS is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCR_EL1.
- GCSPR_EL1.

nGCS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL0, bit [52]
When FEAT_GCS is implemented:

Trap MRS reads at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCRE0_EL1, at EL1 only.
- GCSPR_EL0.

nGCS_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

nACCDATA_EL1, bit [50]
When FEAT_LS64_ACCDATA is implemented:

Trap MRS reads of ACCDATA_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]
When FEAT_RAS is implemented:

Trap MRS reads of ERXADDR_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MRS reads of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]
When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MRS reads of ERXPFGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]
When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MRS reads of ERXPFGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGF_EL1, bit [46]
When FEAT_RASv1p1 is implemented:

Trap MRS reads of ERXPFGF_EL1 at EL1 using AArch64 to EL2.

ERXPFGF_EL1	Meaning
0b0	MRS reads of ERXPFGF_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXPFGF_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXMISCn_EL1, bit [45]
When FEAT_RAS is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- ERXMISC0_EL1.
- ERXMISC1_EL1.
- ERXMISC2_EL1.
- ERXMISC3_EL1.

ERXMISCn_EL1	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]
When FEAT_RAS is implemented:

Trap MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MRS reads of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]
When FEAT_RAS is implemented:

Trap MRS reads of ERXCTLR_EL1 at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MRS reads of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXFR_EL1, bit [42]
When FEAT_RAS is implemented:

Trap MRS reads of ERXFR_EL1 at EL1 using AArch64 to EL2.

ERXFR_EL1	Meaning
0b0	MRS reads of ERXFR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERXFR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERRSELR_EL1, bit [41]
When FEAT_RAS is implemented:

Trap MRS reads of ERRSELR_EL1 at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MRS reads of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERRIDR_EL1, bit [40]
When FEAT_RAS is implemented:

Trap MRS reads of ERRIDR_EL1 at EL1 using AArch64 to EL2.

ERRIDR_EL1	Meaning
0b0	MRS reads of ERRIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ERRIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]
When GICv3 is implemented or FEAT_GCIE_LEGACY is implemented:

Trap MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MRS reads of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MRS reads of VBAR_EL1 at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MRS reads of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR1_EL1, bit [37]

Trap MRS or MRRS reads of TTBR1_EL1 at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MRS and MRRS reads of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR0_EL1, bit [36]

Trap MRS or MRRS reads of TTBR0_EL1 at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MRS and MRRS reads of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL0, bit [35]

Trap MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDRRO_EL0, bit [34]

Trap MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 and MRC reads of TPIDRURO at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of TPIDRRO_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRC reads of TPIDRURO at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL1, bit [33]

Trap MRS reads of TPIDR_EL1 at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MRS reads of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TCR_EL1, bit [32]

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TCR_EL1.
- TCR2_EL1, if FEAT_TCR2 is implemented.

TCR_EL1	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SCXTNUM_EL0, bit [31]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MRS reads of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MRS reads of SCXTNUM_EL1 at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MRS reads of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SCTLR_EL1.
- SCTLR2_EL1, if FEAT_SCTLR2 is implemented.

SCTLR_EL1	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

REVIDR_EL1, bit [28]

Trap MRS reads of REVIDR_EL1 at EL1 using AArch64 to EL2.

REVIDR_EL1	Meaning
0b0	MRS reads of REVIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of REVIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

PAR_EL1, bit [27]

Trap MRS or MRRS reads of PAR_EL1 at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MRS and MRRS reads of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the read generates a higher priority exception: • MRS reads of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MRRS reads of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MPIDR_EL1, bit [26]

Trap MRS reads of MPIDR_EL1 at EL1 using AArch64 to EL2.

MPIDR_EL1	Meaning
0b0	MRS reads of MPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MIDR_EL1, bit [25]

Trap MRS reads of MIDR_EL1 at EL1 using AArch64 to EL2.

MIDR_EL1	Meaning
0b0	MRS reads of MIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

MAIR_EL1, bit [24]

Trap MRS reads of MAIR_EL1 at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MRS reads of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

LORSA_EL1, bit [23]
When FEAT_LOR is implemented:

Trap MRS reads of LORSA_EL1 at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MRS reads of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]
When FEAT_LOR is implemented:

Trap MRS reads of LORN_EL1 at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MRS reads of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORID_EL1, bit [21]
When FEAT_LOR is implemented:

Trap MRS reads of LORID_EL1 at EL1 using AArch64 to EL2.

LORID_EL1	Meaning
0b0	MRS reads of LORID_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORID_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LOREA_EL1, bit [20]
When FEAT_LOR is implemented:

Trap MRS reads of LOREA_EL1 at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MRS reads of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]
When FEAT_LOR is implemented:

Trap MRS reads of LORC_EL1 at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MRS reads of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ISR_EL1, bit [18]

Trap MRS reads of ISR_EL1 at EL1 using AArch64 to EL2.

ISR_EL1	Meaning
0b0	MRS reads of ISR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ISR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

FAR_EL1, bit [17]

Trap MRS reads of FAR_EL1 at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MRS reads of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ESR_EL1, bit [16]

Trap MRS reads of ESR_EL1 at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MRS reads of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DCZID_EL0, bit [15]

Trap MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 to EL2.

DCZID_EL0	Meaning
0b0	MRS reads of DCZID_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of DCZID_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CTR_EL0, bit [14]

Trap MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 to EL2.

CTR_EL0	Meaning
0b0	MRS reads of CTR_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CTR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CSSELR_EL1, bit [13]

Trap MRS reads of CSSELR_EL1 at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MRS reads of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CPACR_EL1, bit [12]

Trap MRS reads of CPACR_EL1 at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MRS reads of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bit [11]

Trap MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MRS reads of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CLIDR_EL1, bit [10]

Trap MRS reads of CLIDR_EL1 at EL1 using AArch64 to EL2.

CLIDR_EL1	Meaning
0b0	MRS reads of CLIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CLIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CCSIDR_EL1, bit [9]

Trap MRS reads of CCSIDR_EL1 at EL1 using AArch64 to EL2.

CCSIDR_EL1	Meaning
0b0	MRS reads of CCSIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of CCSIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

APIBKey, bit [8]
When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIBKeyHi_EL1.
- APIBKeyLo_EL1.

APIBKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]
When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIAKeyHi_EL1.
- APIAKeyLo_EL1.

APIAKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]
When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.

APGAKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]
When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1.
- APDBKeyLo_EL1.

APDBKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]
When FEAT_PAuth is implemented:

Trap MRS reads at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDAKeyHi_EL1.
- APDAKeyLo_EL1.

APDAKey	Meaning
0b0	MRS reads of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MRS reads of AMAIR_EL1 at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MRS reads of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AIDR_EL1, bit [2]

Trap MRS reads of AIDR_EL1 at EL1 using AArch64 to EL2.

AIDR_EL1	Meaning
0b0	MRS reads of AIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AFSR1_EL1, bit [1]

Trap MRS reads of AFSR1_EL1 at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MRS reads of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AFSR0_EL1, bit [0]

Trap MRS reads of AFSR0_EL1 at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MRS reads of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MRS reads of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HFGRTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGRTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b100

```
if !(IsFeatureImplemented(FEAT_FGT) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();

HFGWTR2_EL2, Hypervisor Fine-Grained Write Trap Register 2

The HFGWTR2_EL2 characteristics are:

Purpose

Provides controls for traps of MSRR, MSR and MCR writes of System registers.

Configuration

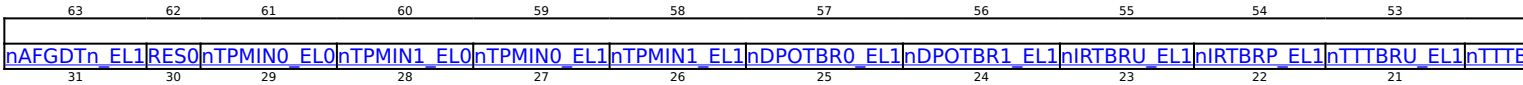
This register is present only when FEAT_FGT2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGWTR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGWTR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:38]

Reserved, RES0.

nTPIDR3_EL1, bit [37]
When FEAT_S1POE2 is implemented:

Trap MSR writes of TPIDR3_EL1 at EL1 using AArch64 to EL2.

nTPIDR3_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TPIDR3_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TPIDR3_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPIDR3_EL0, bit [36]
When FEAT_S1POE2 is implemented:

Trap MSR writes of TPIDR3_EL0 at EL1 and EL0 using AArch64 to EL2.

nTPIDR3_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of TPIDR3_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TPIDR3_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCR_EL1, bit [35]
When FEAT_MTEFGT is implemented:

Trap MSR writes of GCR_EL1 at EL1 using AArch64 to EL2.

GCR_EL1	Meaning
0b0	MSR writes of GCR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then MSR writes of GCR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RGSR_EL1, bit [34]
When FEAT_MTEFGT is implemented:

Trap MSR writes of RGSR_EL1 at EL1 using AArch64 to EL2.

RGSR_EL1	Meaning
0b0	MSR writes of RGSR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then MSR writes of RGSR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TFSR_EL1, bit [33]
When FEAT_MTEFGT is implemented and FEAT_MTE_ASYNC is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TFSRE0_EL1.
- TFSR_EL1.

TFSR_EL1	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nAFGDTn_EL1, bits [32:31]
When FEAT_S1POE2 is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- AFGDTP<n>_EL1.
- AFGDTU<n>_EL1.

nAFGDTn_EL1	Meaning
0b00	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers when n = 0..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the write generates a higher priority exception.
0b01	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers when n = 4..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the write generates a higher priority exception.
0b10	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers when n = 8..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the write generates a higher priority exception.
0b11	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [30]

Reserved, RES0.

nTPMIN0_EL0, bit [29]
When FEAT_TPS is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN0_EL0.
- TPMAX0_EL0.

nTPMIN0_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPMIN1_EL0, bit [28]
When FEAT_TPS is implemented:

Trap MSR writes at EL1 and EL0 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN1_EL0.
- TPMAX1_EL0.

nTPMIN1_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes at EL1 and EL0 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPMIN0_EL1, bit [27]
When FEAT_TPSP is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN0_EL1.

- TPMAX0_EL1.

nTPMIN0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPMIN1_EL1, bit [26]
When FEAT_TPSP is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TPMIN1_EL1.
- TPMAX1_EL1.

nTPMIN1_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nDPOTBR0_EL1, bit [25]
When FEAT_S1POE2 is implemented:

Trap MSR writes of DPOTBR0_EL1 at EL1 using AArch64 to EL2.

nDPOTBR0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of DPOTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of DPOTBR0_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nDPOTBR1_EL1, bit [24]
When FEAT_S1POE2 is implemented:

Trap MSR writes of DPOTBR1_EL1 at EL1 using AArch64 to EL2.

nDPOTBR1_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of DPOTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of DPOTBR1_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nIRTBRU_EL1, bit [23]
When FEAT_S1POE2 is implemented:

Trap MSR writes of IRTBRU_EL1 at EL1 using AArch64 to EL2.

nIRTBRU_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of IRTBRU_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of IRTBRU_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nIRTBRP_EL1, bit [22]
When FEAT_S1POE2 is implemented:

Trap MSR writes of IRTBRP_EL1 at EL1 using AArch64 to EL2.

nIRTBRP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of IRTBRP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of IRTBRP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTTTBRU_EL1, bit [21]
When FEAT_S1POE2 is implemented:

Trap MSR writes of TTTBRU_EL1 at EL1 using AArch64 to EL2.

nTTTBRU_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TTTBRU_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TTTBRU_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTTTBRP_EL1, bit [20]
When FEAT_S1POE2 is implemented:

Trap MSR writes of TTTBRP_EL1 at EL1 using AArch64 to EL2.

nTTTBRP_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TTTBRP_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TTTBRP_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nFGDTn_EL1, bits [19:18]
When FEAT_S1POE2 is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- FGDTP<n>_EL1.
- FGDTU<n>_EL1.

nFGDTn_EL1	Meaning
0b00	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers when n = 0..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the write generates a higher priority exception.
0b01	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers when n = 4..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the write generates a higher priority exception.
0b10	If EL2 is implemented and enabled in the current Security state, then MSR writes at EL1 using AArch64 of any of the specified System registers when n = 8..15 are trapped to EL2 and reported with EC syndrome value 0x18,unless the write generates a higher priority exception.
0b11	MSR writes of the specified System registers are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSTINDEX_EL1, bit [17]
When FEAT_S1POE2 is implemented:

Trap MSR writes of STINDEX_EL1 at EL1 using AArch64 to EL2.

nSTINDEX_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of STINDEX_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of STINDEX_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.

- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTINDEX_EL1, bit [16]
When FEAT_S1POE2 is implemented:

Trap MSR writes of TINDEX_EL1 at EL1 using AArch64 to EL2.

nTINDEX_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TINDEX_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TINDEX_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTINDEX_EL0, bit [15]
When FEAT_S1POE2 is implemented:

Trap MSR writes of TINDEX_EL0 at EL1 and EL0 using AArch64 to EL2.

nTINDEX_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then MSR writes of TINDEX_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TINDEX_EL0 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nACTLRALIAS_EL1, bit [14]
When FEAT_SRMASK is implemented:

Trap MSR writes of ACTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nACTLRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of ACTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nACTLRMASK_EL1, bit [13]
When FEAT_SRMASK is implemented:

Trap MSR writes of ACTLRMASK_EL1 at EL1 using AArch64 to EL2.

nACTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of ACTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2ALIAS_EL1, bit [12]
When FEAT_SRMASK is implemented:

Trap MSR writes of TCR2ALIAS_EL1 at EL1 using AArch64 to EL2.

nTCR2ALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCR2ALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCR2ALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRALIAS_EL1, bit [11]
When FEAT_SRMASK is implemented:

Trap MSR writes of TCRALIAS_EL1 at EL1 using AArch64 to EL2.

nTCRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLR2ALIAS_EL1, bit [10]
When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLR2ALIAS_EL1 at EL1 using AArch64 to EL2.

nSCTLR2ALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLR2ALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLR2ALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRALIAS_EL1, bit [9]
When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLRALIAS_EL1 at EL1 using AArch64 to EL2.

nSCTLRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRALIAS_EL1, bit [8]
When FEAT_SRMASK is implemented:

Trap MSR writes of CPACRALIAS_EL1 at EL1 using AArch64 to EL2.

nCPACRALIAS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of CPACRALIAS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of CPACRALIAS_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCR2MASK_EL1, bit [7]
When FEAT_SRMASK is implemented:

Trap MSR writes of TCR2MASK_EL1 at EL1 using AArch64 to EL2.

nTCR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTCRMASK_EL1, bit [6]
When FEAT_SRMASK is implemented:

Trap MSR writes of TCRMASK_EL1 at EL1 using AArch64 to EL2.

nTCRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of TCRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TCRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLR2MASK_EL1, bit [5]
When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLR2MASK_EL1 at EL1 using AArch64 to EL2.

nSCTLR2MASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLR2MASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLR2MASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSCTLRMASK_EL1, bit [4]
When FEAT_SRMASK is implemented:

Trap MSR writes of SCTLRMASK_EL1 at EL1 using AArch64 to EL2.

nSCTLRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of SCTLRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SCTLRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nCPACRMASK_EL1, bit [3]
When FEAT_SRMASK is implemented:

Trap MSR writes of CPACRMASK_EL1 at EL1 using AArch64 to EL2.

nCPACRMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of CPACRMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of CPACRMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWSMASK_EL1, bit [2]
When FEAT_THE is implemented:

Trap MSR or MSRR writes of RCWSMASK_EL1 at EL1 using AArch64 to EL2.

nRCWSMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then unless the write generates a higher priority exception: • MSR writes of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of RCWSMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MSR and MSRR writes of RCWSMASK_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [1]

Reserved, RES0.

nPFAR_EL1, bit [0]
When FEAT_PFAR is implemented:

Trap MSR writes of PFAR_EL1 at EL1 using AArch64 to EL2.

nPFAR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of PFAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PFAR_EL1 are not trapped by this mechanism.

This field is ignored by the PE and treated as zero when all of the following are true:

- EL3 is implemented.
- SCR_EL3.FGTEn2 == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing HFGWTR2_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGWTR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0011	0b0001	0b011

```
if !(IsFeatureImplemented(FEAT_FGT2) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then

HFGWTR_EL2, Hypervisor Fine-Grained Write Trap Register

The HFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSRR, MSR and MCR writes of System registers.

Configuration

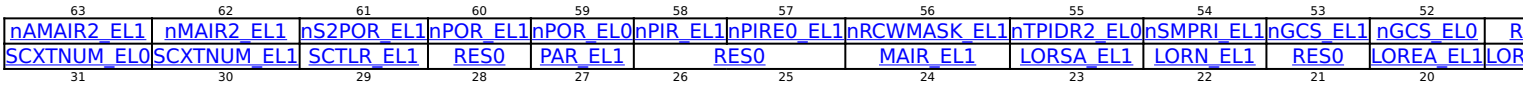
This register is present only when FEAT_FGT is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to HFGWTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

HFGWTR_EL2 is a 64-bit register.

Field descriptions



nAMAIR2_EL1, bit [63]
When FEAT_AIE is implemented:

Trap MSR writes of AMAIR2_EL1 at EL1 using AArch64 to EL2.

nAMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of AMAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nMAIR2_EL1, bit [62]
When FEAT_AIE is implemented:

Trap MSR writes of MAIR2_EL1 at EL1 using AArch64 to EL2.

nMAIR2_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR2_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of MAIR2_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nS2POR_EL1, bit [61]
When FEAT_S2POE is implemented:

Trap MSR writes of S2POR_EL1 at EL1 using AArch64 to EL2.

nS2POR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of S2POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of S2POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL1, bit [60]
When FEAT_S1POE is implemented:

Trap MSR writes of POR_EL1 at EL1 using AArch64 to EL2.

nPOR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of POR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of POR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPOR_EL0, bit [59]
When FEAT_S1POE is implemented:

Trap MSR writes of POR_EL0 at EL1 and EL0 using AArch64 to EL2.

nPOR_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of POR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of POR_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIR_EL1, bit [58]
When FEAT_S1PIE is implemented:

Trap MSR writes of PIR_EL1 at EL1 using AArch64 to EL2.

nPIR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PIR_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nPIRE0_EL1, bit [57]
When FEAT_S1PIE is implemented:

Trap MSR writes of PIRE0_EL1 at EL1 using AArch64 to EL2.

nPIRE0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of PIRE0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of PIRE0_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nRCWMASK_EL1, bit [56]
When FEAT_THE is implemented:

Trap MSR or MSRR writes of RCWMASK_EL1 at EL1 using AArch64 to EL2.

nRCWMASK_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of RCWMASK_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.
0b1	MSR and MSRR writes of RCWMASK_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTPIDR2_EL0, bit [55]
When FEAT_SME is implemented:

Trap MSR writes of TPIDR2_EL0 at EL1 and EL0 using AArch64 to EL2.

nTPIDR2_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR2_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of TPIDR2_EL0 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nSMPRI_EL1, bit [54]
When FEAT_SME is implemented:

Trap MSR writes of SMPRI_EL1 at EL1 using AArch64 to EL2.

nSMPRI_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SMPRI_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of SMPRI_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL1, bit [53]
When FEAT_GCS is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCR_EL1.
- GCSPR_EL1.

nGCS_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nGCS_EL0, bit [52]
When FEAT_GCS is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- GCSCRE0_EL1.
- GCSPR_EL0.

nGCS_EL0	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of the specified System registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [51]

Reserved, RES0.

nACCDATA_EL1, bit [50]
When FEAT_LS64_ACCDATA is implemented:

Trap MSR writes of ACCDATA_EL1 at EL1 using AArch64 to EL2.

nACCDATA_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ACCDATA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.
0b1	MSR writes of ACCDATA_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXADDR_EL1, bit [49]
When FEAT_RAS is implemented:

Trap MSR writes of ERXADDR_EL1 at EL1 using AArch64 to EL2.

ERXADDR_EL1	Meaning
0b0	MSR writes of ERXADDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXADDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCDN_EL1, bit [48]
When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 to EL2.

ERXPFGCDN_EL1	Meaning
0b0	MSR writes of ERXPFGCDN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCDN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXPFGCTL_EL1, bit [47]
When FEAT_RASv1p1 is implemented:

Trap MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 to EL2.

ERXPFGCTL_EL1	Meaning
0b0	MSR writes of ERXPFGCTL_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXPFGCTL_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [46]

Reserved, RES0.

ERXMISCn_EL1, bit [45]
When FEAT_RAS is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- ERXMISC0_EL1.
- ERXMISC1_EL1.
- ERXMISC2_EL1.
- ERXMISC3_EL1.

ERXMISCn_EL1	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXSTATUS_EL1, bit [44]
When FEAT_RAS is implemented:

Trap MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 to EL2.

ERXSTATUS_EL1	Meaning
0b0	MSR writes of ERXSTATUS_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXSTATUS_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ERXCTLR_EL1, bit [43]
When FEAT_RAS is implemented:

Trap MSR writes of ERXCTLR_EL1 at EL1 using AArch64 to EL2.

ERXCTLR_EL1	Meaning
0b0	MSR writes of ERXCTLR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERXCTLR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

ERRSELR_EL1, bit [41]
When FEAT_RAS is implemented:

Trap MSR writes of ERRSELR_EL1 at EL1 using AArch64 to EL2.

ERRSELR_EL1	Meaning
0b0	MSR writes of ERRSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ERRSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [40]

Reserved, RES0.

ICC_IGRPENn_EL1, bit [39]
When GICv3 is implemented or FEAT_GCIE_LEGACY is implemented:

Trap MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 to EL2.

ICC_IGRPENn_EL1	Meaning
0b0	MSR writes of ICC_IGRPEN<n>_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ICC_IGRPEN<n>_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VBAR_EL1, bit [38]

Trap MSR writes of VBAR_EL1 at EL1 using AArch64 to EL2.

VBAR_EL1	Meaning
0b0	MSR writes of VBAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of VBAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR1_EL1, bit [37]

Trap MSR or MSRR writes of TTBR1_EL1 at EL1 using AArch64 to EL2.

TTBR1_EL1	Meaning
0b0	MSR and MSRR writes of TTBR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of TTBR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TTBR0_EL1, bit [36]

Trap MSR or MSRR writes of TTBR0_EL1 at EL1 using AArch64 to EL2.

TTBR0_EL1	Meaning
0b0	MSR and MSRR writes of TTBR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of TTBR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL0, bit [35]

Trap MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 to EL2.

TPIDR_EL0	Meaning
0b0	MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 and MCR writes of TPIDRURW at EL0 using AArch32 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of TPIDR_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MCR writes of TPIDRURW at EL0 using AArch32 when EL1 is using AArch64 are trapped to EL2 and reported with EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDRRO_EL0, bit [34]

Trap MSR writes of TPIDRRO_EL0 at EL1 using AArch64 to EL2.

TPIDRRO_EL0	Meaning
0b0	MSR writes of TPIDRRO_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDRRO_EL0 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TPIDR_EL1, bit [33]

Trap MSR writes of TPIDR_EL1 at EL1 using AArch64 to EL2.

TPIDR_EL1	Meaning
0b0	MSR writes of TPIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of TPIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TCR_EL1, bit [32]

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- TCR_EL1.
- TCR2_EL1, if FEAT_TCR2 is implemented.

TCR_EL1	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SCXTNUM_EL0, bit [31]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 to EL2.

SCXTNUM_EL0	Meaning
0b0	MSR writes of SCXTNUM_EL0 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL0 at EL1 and EL0 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCXTNUM_EL1, bit [30]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap MSR writes of SCXTNUM_EL1 at EL1 using AArch64 to EL2.

SCXTNUM_EL1	Meaning
0b0	MSR writes of SCXTNUM_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of SCXTNUM_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR_EL1, bit [29]

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- SCTLR_EL1.
- SCTLR2_EL1, if FEAT_SCTLR2 is implemented.

SCTLR_EL1	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [28]

Reserved, RES0.

PAR_EL1, bit [27]

Trap MSR or MSRR writes of PAR_EL1 at EL1 using AArch64 to EL2.

PAR_EL1	Meaning
0b0	MSR and MSRR writes of PAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then unless the write generates a higher priority exception: • MSR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18. • MSRR writes of PAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x14.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [26:25]

Reserved, RES0.

MAIR_EL1, bit [24]

Trap MSR writes of MAIR_EL1 at EL1 using AArch64 to EL2.

MAIR_EL1	Meaning
0b0	MSR writes of MAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of MAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

LORSA_EL1, bit [23]
When FEAT_LOR is implemented:

Trap MSR writes of LORSA_EL1 at EL1 using AArch64 to EL2.

LORSA_EL1	Meaning
0b0	MSR writes of LORSA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORSA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORN_EL1, bit [22]
When FEAT_LOR is implemented:

Trap MSR writes of LORN_EL1 at EL1 using AArch64 to EL2.

LORN_EL1	Meaning
0b0	MSR writes of LORN_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORN_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

LOREA_EL1, bit [20]
When FEAT_LOR is implemented:

Trap MSR writes of LOREA_EL1 at EL1 using AArch64 to EL2.

LOREA_EL1	Meaning
0b0	MSR writes of LOREA_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LOREA_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LORC_EL1, bit [19]
When FEAT_LOR is implemented:

Trap MSR writes of LORC_EL1 at EL1 using AArch64 to EL2.

LORC_EL1	Meaning
0b0	MSR writes of LORC_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of LORC_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

FAR_EL1, bit [17]

Trap MSR writes of FAR_EL1 at EL1 using AArch64 to EL2.

FAR_EL1	Meaning
0b0	MSR writes of FAR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of FAR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

ESR_EL1, bit [16]

Trap MSR writes of ESR_EL1 at EL1 using AArch64 to EL2.

ESR_EL1	Meaning
0b0	MSR writes of ESR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of ESR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [15:14]

Reserved, RES0.

CSSELR_EL1, bit [13]

Trap MSR writes of CSSELR_EL1 at EL1 using AArch64 to EL2.

CSSELR_EL1	Meaning
0b0	MSR writes of CSSELR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CSSELR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CPACR_EL1, bit [12]

Trap MSR writes of CPACR_EL1 at EL1 using AArch64 to EL2.

CPACR_EL1	Meaning
0b0	MSR writes of CPACR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CPACR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CONTEXTIDR_EL1, bit [11]

Trap MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 to EL2.

CONTEXTIDR_EL1	Meaning
0b0	MSR writes of CONTEXTIDR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of CONTEXTIDR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [10:9]

Reserved, RES0.

APIBKey, bit [8]
When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIBKeyHi_EL1.
- APIBKeyLo_EL1.

APIBKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APIAKey, bit [7]
When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APIAKeyHi_EL1.
- APIAKeyLo_EL1.

APIAKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APGAKey, bit [6]
When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APGAKeyHi_EL1.
- APGAKeyLo_EL1.

APGAKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDBKey, bit [5]
When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDBKeyHi_EL1.
- APDBKeyLo_EL1.

APDBKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APDAKey, bit [4]
When FEAT_PAuth is implemented:

Trap MSR writes at EL1 using AArch64 of any of the following AArch64 System registers to EL2:

- APDAKeyHi_EL1.
- APDAKeyLo_EL1.

APDAKey	Meaning
0b0	MSR writes of the specified System registers are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes at EL1 using AArch64 of any of the specified System registers are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMAIR_EL1, bit [3]

Trap MSR writes of AMAIR_EL1 at EL1 using AArch64 to EL2.

AMAIR_EL1	Meaning
0b0	MSR writes of AMAIR_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AMAIR_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

AFSR1_EL1, bit [1]

Trap MSR writes of AFSR1_EL1 at EL1 using AArch64 to EL2.

AFSR1_EL1	Meaning
0b0	MSR writes of AFSR1_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR1_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AFSR0_EL1, bit [0]

Trap MSR writes of AFSR0_EL1 at EL1 using AArch64 to EL2.

AFSR0_EL1	Meaning
0b0	MSR writes of AFSR0_EL1 are not trapped by this mechanism.
0b1	If EL2 is implemented and enabled in the current Security state, and either EL3 is not implemented or SCR_EL3.FGTEn == 1, then MSR writes of AFSR0_EL1 at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the write generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing HFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HFGWTR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b101

```

HPFAR_EL2, Hypervisor IPA Fault Address Register

The HPFAR_EL2 characteristics are:

Purpose

Holds the faulting IPA for some aborts on a stage 2 translation taken to EL2 and GPC exceptions due to a fault on an access for a stage 2 translation.

Configuration

AArch64 System register HPFAR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HPFAR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to HPFAR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

The HPFAR_EL2 is written for:

- A Translation fault, Access Flag fault, or Address Size fault on a stage 2 translation not on a stage 1 translation table walk.
- A Translation fault, Access Flag fault, Address Size fault, or Permission fault on stage 2 translation of an address accessed in a stage 1 translation table walk.
- If FEAT_RME is implemented, a Granule Protection Check fault in the second stage of translation.

For all other exceptions taken to EL2, this register is UNKNOWN.

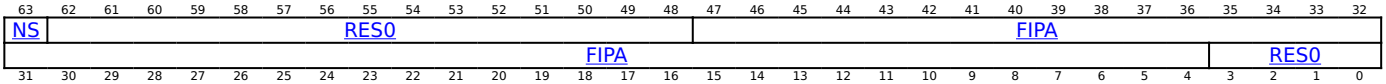
Note

The address held in this register is an address accessed by the instruction fetch or data access that caused the exception that gave rise to the Instruction Abort exception or Data Abort exception. It is the lower address that gave rise to the fault that is reported. Where different faults from different addresses arise from the same instruction, such as for an instruction that loads or stores an unaligned address that crosses a page boundary, the architecture does not prioritize which fault is reported.

Attributes

HPFAR_EL2 is a 64-bit register.

Field descriptions



Execution at EL1 or EL0 makes HPFAR_EL2 become UNKNOWN.

NS, bit [63]
When FEAT_SEL2 is implemented:

Faulting IPA address space.

NS	Meaning
0b0	Faulting IPA is from the Secure IPA space.
0b1	Faulting IPA is from the Non-secure IPA space.

For Data Abort exceptions or Instruction Abort exceptions taken to Non-secure EL2:

- This field is RES0.
- The address is from the Non-secure IPA space.

If FEAT_RME is implemented, for Data Abort exceptions or Instruction Abort exceptions taken to Realm EL2:

- This field is RES0.
- The address is from the Realm IPA space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

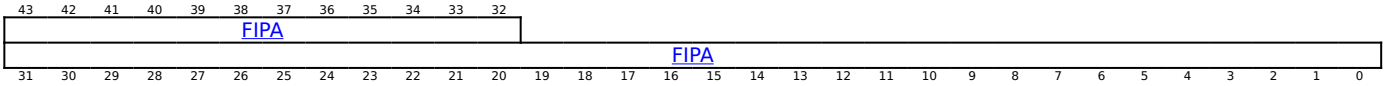
Reserved, RES0.

Bits [62:48]

Reserved, RES0.

FIPA, bits [47:4]

FIPA encoding when FEAT_D128 is implemented



FIPA, bits [43:0]

Bits [55:12] of the Faulting Intermediate Physical Address.

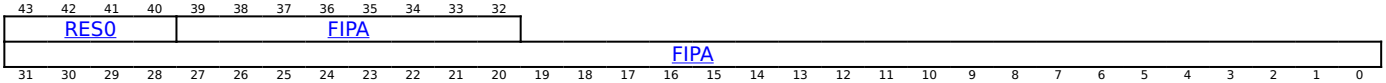
For implementations with fewer than 55 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort. In this case, bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIPA encoding when FEAT_LPA is implemented and FEAT_D128 is not implemented



Bits [43:40]

Reserved, RES0.

FIPA, bits [39:0]

Bits [51:12] of the Faulting Intermediate Physical Address.

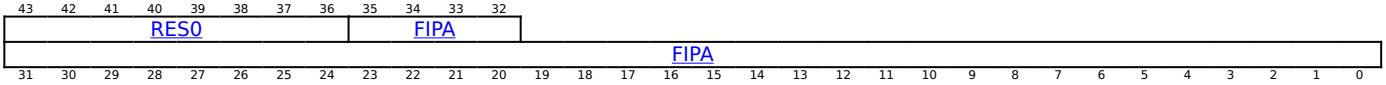
For implementations with fewer than 52 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort. In this case, bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIPA encoding when FEAT_LPA is not implemented



Bits [43:36]

Reserved, RES0.

FIPA, bits [35:0]

Bits[47:12] Faulting Intermediate Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

When FEAT_MOPS is implemented, the value presented in FIPA on a synchronous exception that set the HPFAR_EL2 from any of the Memory Copy and Memory Set instructions is within the address range of the current stage 2 translation granule, aligned to the size of the current stage 2 translation granule, of the address that generated the Data abort. In this case, bits[(n-1):0] of the value are UNKNOWN, where 2^n is the current stage 2 translation granule size in bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:0]

Reserved, RES0.

Accessing HPFAR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HPFAR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = HPFAR_EL2();
elsif PSTATE.EL == EL3 then
    X{64}(t) = HPFAR_EL2();
end;
```

MSR HPFAR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b100

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    HPFAR_EL2() = X{64}(t);
elsif PSTATE.EL == EL3 then
    HPFAR_EL2() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

HSTR_EL2, Hypervisor System Trap Register

The HSTR_EL2 characteristics are:

Purpose

Controls trapping to EL2 of EL1 or lower AArch32 accesses to the System register in the coproc == 0b1111 encoding space, by the CRn value used to access the register using MCR or MRC instruction. When the register is accessible using an MCRR or MRRC instruction, this is the CRm value used to access the register.

Configuration

AArch64 System register HSTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSTR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to HSTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

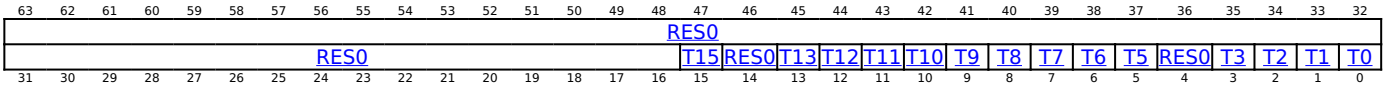
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

HSTR_EL2 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:16, 14, 4]

Reserved, RES0.

T<n>, bit [n], for n = 15, 13 to 5, 3 to 0

The remaining fields control whether EL0 and EL1 accesses, using MCR, MRC, MCRR, and MRRC instructions, to the System registers in the coproc == 0b1111 encoding space, are trapped to EL2 as follows:

- MCR or MRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x03, unless the access is UNDEFINED.
- MCRR or MRRC accesses to these registers that are trapped to EL2 are reported using EC syndrome value 0x04, unless the access is UNDEFINED.

T<n>	Meaning
0b0	This control has no effect on EL0 or EL1 accesses to System registers.
0b1	System registers in the coproc == 0b1111 encoding space and CRn == <n> or CRm == <n> where T<n> is the name of this field, are trapped as follows: • An EL1 MCR or MRC access is trapped to EL2. • An EL0 MCR or MRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. • An EL1 MCRR or MRRC access is trapped to EL2. • An EL0 MCRR or MRRC access is trapped to EL2, if the access is not UNDEFINED when the value of this field is 0. It is IMPLEMENTATION DEFINED whether an EL0 access using AArch32 is trapped to EL2, or is UNDEFINED. If the access is UNDEFINED, and generates an exception that is taken to EL1 or EL2 using AArch64, this is reported with EC syndrome value 0x00. Note Arm expects that trapping to EL2 of EL0 accesses to these registers is unusual and used only when the hypervisor must virtualize EL0 operation. Arm recommends that, whenever possible, EL0 accesses to these registers behave as they would if the implementation did not include EL2. This means that, if the architecture does not support the EL0 access, then the register access instruction is treated as UNDEFINED and generates an exception that is taken to EL1.

For example, when HSTR_EL2.T7 is 1, for instructions executed at EL1:

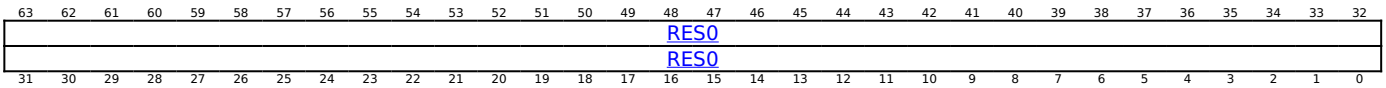
- An MCR or MRC instruction with coproc set to 0b1111 and <CRn> set to c7 is trapped to EL2.
- An MCRR or MRRC instruction with coproc set to 0b1111 and <CRm> set to c7 is trapped to EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field behaves as 0 for all purposes other than a direct read of the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:0]

Reserved, RES0.

Accessing HSTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, HSTR_EL2

IC IALLU, Instruction Cache Invalidate All to PoU

The IC IALLU characteristics are:

Purpose

Invalidate all instruction caches of the PE executing the instruction to the Point of Unification.

Configuration

AArch64 System instruction IC IALLU performs the same function as AArch32 System instruction ICIALLU.

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to IC IALLU are UNDEFINED.

Attributes

IC IALLU is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing IC IALLU

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_IC() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

IC IALLU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b000	0b0111	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

IC IVAU, Instruction Cache line Invalidate by VA to PoU

The IC IVAU characteristics are:

Purpose

Invalidate instruction cache by address to Point of Unification.

Configuration

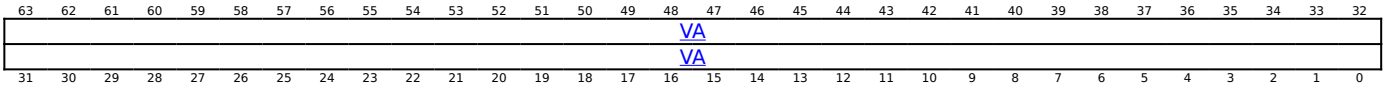
AArch64 System instruction IC IVAU performs the same function as AArch32 System instruction ICIMVAU.

This instruction is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to IC IVAU are UNDEFINED.

Attributes

IC IVAU is a 64-bit System instruction.

Field descriptions



VA, bits [63:0]

Virtual address to use. No alignment restrictions apply to this VA.

Executing IC IVAU

If EL0 access is enabled, when executed at EL0, the instruction may generate a Permission fault, subject to the constraints described in 'MMU faults generated by cache maintenance operations'.

Execution of this instruction might require an address translation from VA to PA, and that translation might fault. For more information, see 'The instruction cache maintenance instruction (IC)'.

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

IC IVAU{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b011	0b0111	0b0101	0b001

ICC_AP0R<n>_EL1, Interrupt Controller Active Priorities Group 0 Registers, n = 0 - 3

The ICC_AP0R<n>_EL1 characteristics are:

Purpose

Provides information about Group 0 active priorities.

Configuration

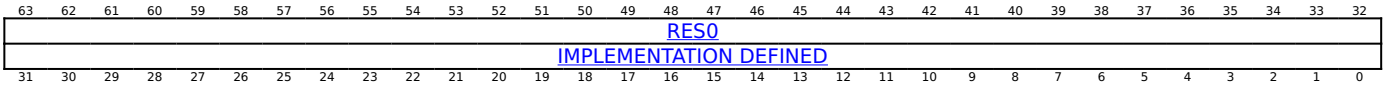
AArch64 System register ICC_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_AP0R<n>[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_AP0R<n>_EL1 are UNDEFINED.

Attributes

ICC_AP0R<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00000000`.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP0R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP0R1_EL1 is implemented only in implementations that support 6 or more bits of priority. ICC_AP0R2_EL1 and ICC_AP0R3_EL1 are implemented only in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>_EL1.
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

ICC_AP1R<n>_EL1, Interrupt Controller Active Priorities Group 1 Registers, n = 0 - 3

The ICC_AP1R<n>_EL1 characteristics are:

Purpose

Provides information about Group 1 active priorities.

Configuration

This register is banked between ICC_AP1R<n>_EL1 and ICC_AP1R<n>_EL1_S and ICC_AP1R<n>_EL1_NS.

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (ICC_AP1R<n>_EL1_S) are architecturally mapped to AArch32 System register ICC_AP1R<n>[31:0] (ICC_AP1R<n>_S).

AArch64 System register ICC_AP1R<n>_EL1 bits [31:0] (ICC_AP1R<n>_EL1_NS) are architecturally mapped to AArch32 System register ICC_AP1R<n>[31:0] (ICC_AP1R<n>_NS).

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_AP1R<n>_EL1 are UNDEFINED.

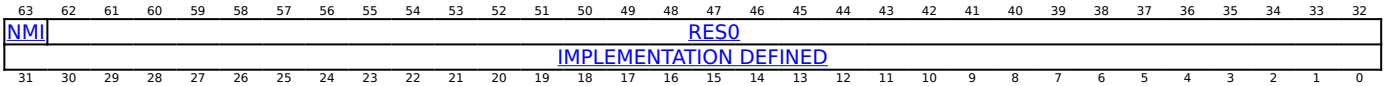
Attributes

ICC_AP1R<n>_EL1 is a 64-bit register.

This register has the following instances:

- ICC_AP1R<n>_EL1, when EL3 is not implemented.
- ICC_AP1R<n>_EL1_S, when EL3 is implemented.
- ICC_AP1R<n>_EL1_NS, when EL3 is implemented.

Field descriptions



NMI, bit [63]
When FEAT_GICv3_NMI is implemented and n == 0:

Indicates whether there is an active NMI priority.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
0b1	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00000000`.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICC_AP1R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

ICC_AP1R1_EL1 is implemented only in implementations that support 6 or more bits of priority. ICC_AP1R2_EL1 and ICC_AP1R3_EL1 are implemented only in implementations that support 7 or more bits of priority. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICC_AP0R<n>_EL1.
- Secure ICC_AP1R<n>_EL1.
- Non-secure ICC_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

ICC_APR_EL1, Interrupt Controller Physical Active Priorities Register (EL1)

The ICC_APR_EL1 characteristics are:

Purpose

Records physical active priorities for the Non-secure, Realm, and Secure Interrupt Domains.

Configuration

This register is banked between ICC_APR_EL1 and ICC_APR_EL1_NS and ICC_APR_EL1_RL and ICC_APR_EL1_S.

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_APR_EL1 are UNDEFINED.

There are separate banked copies of this register for Non-secure, Realm and Secure state.

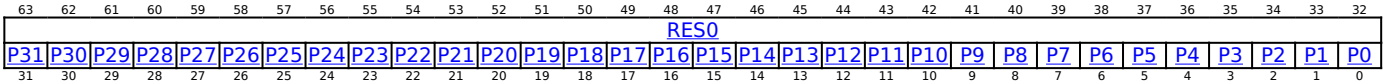
Attributes

ICC_APR_EL1 is a 64-bit register.

This register has the following instances:

- ICC_APR_EL1, when EL3 is not implemented.
- ICC_APR_EL1_NS, when EL3 is implemented.
- ICC_APR_EL1_RL, when FEAT_RME is implemented.
- ICC_APR_EL1_S, when (EL3 is implemented and FEAT_RME is not implemented) or (FEAT_RME is implemented and FEAT_SEL2 is implemented).

Field descriptions



Bits [63:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Provides access to the active priorities.

P<x>	Meaning
0b0	Priority not active
0b1	Priority active

Fields in this register are indexed using the 5-bit priority as an unsigned integer, P[Priority].

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICC_APR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_APR_EL1

op0	op1	CRn	CRm	op2

ICC_APR_EL3, Interrupt Controller Physical Active Priorities Register for EL3

The ICC_APR_EL3 characteristics are:

Purpose

Records active priorities for the EL3 Interrupt Domain.

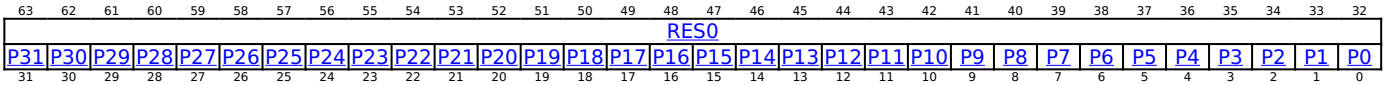
Configuration

This register is present only when FEAT_GCIE is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_APR_EL3 are UNDEFINED.

Attributes

ICC_APR_EL3 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Provides access to the active priorities.

P<x>	Meaning
0b0	Priority not active
0b1	Priority active

Fields in this register are indexed using the 5-bit priority as an unsigned integer, P[Priority].

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICC_APR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_APR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1000	0b000

elsif PSTATE.EL == EL3 then
    ICC_APR_EL3() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICC_ASGI1R_EL1, Interrupt Controller Alias Software Generated Interrupt Group 1 Register

The ICC_ASGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the Security state that is not the current Security state.

Configuration

AArch64 System register ICC_ASGI1R_EL1 performs the same function as AArch32 System register ICC_ASGI1R.

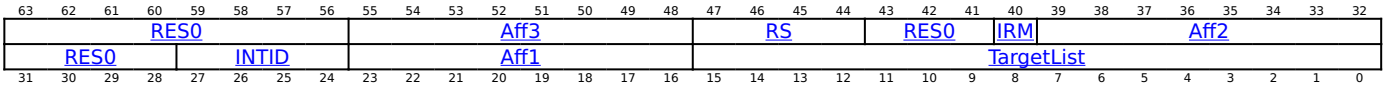
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_ASGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_ASGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_ASGI1R_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_ASGI1R_EL1

This register allows software executing in a Secure state to generate Non-secure Group 1 SGIs. It will also allow software executing in a Non-secure state to generate Secure Group 1 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding'.

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_ASGI1R_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b110

ICC_BPR0_EL1, Interrupt Controller Binary Point Register 0

The ICC_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

Configuration

AArch64 System register ICC_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_BPR0[31:0].

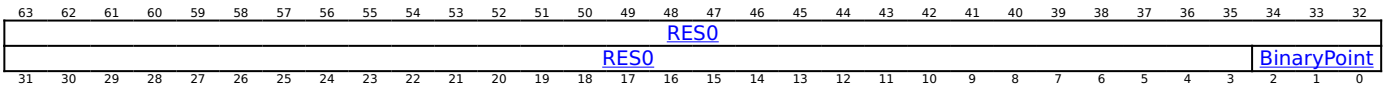
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_BPR0_EL1 are UNDEFINED.

Virtual accesses to this register update ICH_VMCR_EL2.VBPR0.

Attributes

ICC_BPR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.ssssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR0_EL1

The minimum binary point value is derived from the number of implemented priority bits. The number of priority bits is IMPLEMENTATION DEFINED, and reported by:

- ICC_CTLR_EL1.PRIbits
- ICC_CTLR_EL3.PRIbits An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b011

ICC_BPR1_EL1, Interrupt Controller Binary Point Register 1

The ICC_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

This register is banked between ICC_BPR1_EL1 and ICC_BPR1_EL1_S and ICC_BPR1_EL1_NS.

AArch64 System register ICC_BPR1_EL1 bits [31:0] (ICC_BPR1_EL1_S) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (ICC_BPR1_S).

AArch64 System register ICC_BPR1_EL1 bits [31:0] (ICC_BPR1_EL1_NS) are architecturally mapped to AArch32 System register ICC_BPR1[31:0] (ICC_BPR1_NS).

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_BPR1_EL1 are UNDEFINED.

Virtual accesses to this register update ICH_VMCR_EL2.VBPR1.

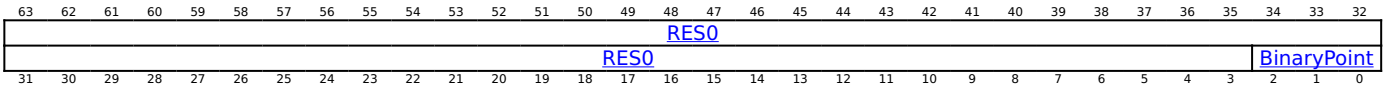
Attributes

ICC_BPR1_EL1 is a 64-bit register.

This register has the following instances:

- ICC_BPR1_EL1, when EL3 is not implemented.
- ICC_BPR1_EL1_S, when EL3 is implemented.
- ICC_BPR1_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The minimum value of the Non-secure copy of this register is the minimum value of ICC_BPR0_EL1 + 1. The minimum value of the Secure copy of this register is the minimum value of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1S is 1:

- Accesses to this register from Secure EL2 access the state of ICC_BPR0_EL1.
- Accesses to this register from Secure EL1:
  - When SCR_EL3.EEL2 is 1 and HCR_EL2.IMO is 1, access the state of ICV_BPR1_EL1.
  - Otherwise, access the state of ICC_BPR0_EL1.

If EL3 is implemented and ICC_CTLR_EL3.CBPR_EL1NS is 1, Non-secure accesses to this register at EL1 and EL2 behave as follows, depending on the values of HCR_EL2.IMO and SCR_EL3.IRQ:

HCR_EL2.IMO	SCR_EL3.IRQ	Behavior
0b0	0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b0	0b1	Non-secure EL1 and EL2 accesses trap to EL3.
0b1	0b0	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.
0b1	0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 accesses trap to EL3.

If EL3 is not implemented and ICC_CTLR_EL1.CBPR is 1, Non-secure accesses to this register at EL1 and EL2 behave as follows, depending on the values of HCR_EL2.IMO:

HCR_EL2.IMO	Behavior
0b0	Non-secure EL1 and EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 and EL2 writes are ignored.
0b1	Non-secure EL1 accesses affect virtual interrupts. Non-secure EL2 reads return ICC_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL2 writes are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_BPR1_EL1

On a reset, the binary point field is UNKNOWN.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b011

ICC_CR0_EL1, Interrupt Controller Physical Control Register (EL1)

The ICC_CR0_EL1 characteristics are:

Purpose

Controls behavior of the physical CPU interface for the Non-secure, Realm, and Secure Interrupt Domains.

Configuration

This register is banked between ICC_CR0_EL1 and ICC_CR0_EL1_NS and ICC_CR0_EL1_RL and ICC_CR0_EL1_S.

AArch64 System register ICC_CR0_EL1 bits [2:1] are architecturally mapped to AArch64 System register ICC_CR0_EL3[2:1] when EL3 is implemented.

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_CR0_EL1 are UNDEFINED.

There are separate banked copies of this register for Non-secure, Realm and Secure state.

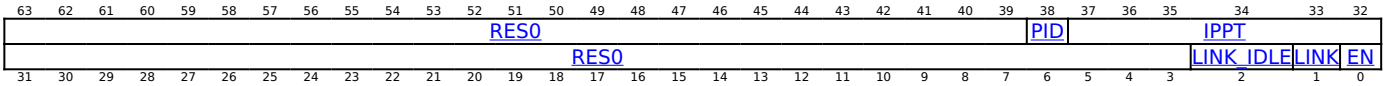
Attributes

ICC_CR0_EL1 is a 64-bit register.

This register has the following instances:

- ICC_CR0_EL1, when EL3 is not implemented.
- ICC_CR0_EL1_NS, when EL3 is implemented.
- ICC_CR0_EL1_RL, when FEAT_RME is implemented.
- ICC_CR0_EL1_S, when (EL3 is implemented and FEAT_RME is not implemented) or (FEAT_RME is implemented and FEAT_SEL2 is implemented).

Field descriptions



Bits [63:39]

Reserved, RES0.

PID, bit [38]
When EL3 is implemented:

Preemptive Interrupt Domain. Indicates whether the Interrupt Domain associated with the Security state selected by SCR_EL3.{NSE,NS} is the Preemptive Interrupt Domain.

Access to this field is RO.

Otherwise:

Reserved, RAZ/WI.

IPPT, bits [37:32]
When ICC_CR0_EL1.PID == '1':

Interrupt Preemptive Priority Threshold value for the Preemptive Interrupt Domain.

Note

ICC_CR0_EL1.IPPT is a 6 bits field to ensure it can be strictly higher than the interrupt priority, which is a 5-bit unsigned value.

See 'Preemptive interrupts' in Arm® Generic Interrupt Controller Architecture Specification, GIC architecture version 5 (ARM AES 0070) for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:3]

Reserved, RES0.

LINK_IDLE, bit [2]

Whether the link between the CPU interface and the IRI is in the process of connecting or disconnecting.

LINK_IDLE	Meaning
0b0	The link between the CPU interface and the IRI is in the process of connecting or disconnecting.
0b1	The link between the CPU interface and the IRI is not in the process of connecting or disconnecting.

When this field is 0, if the system has been properly configured and a connection can be made between the CPU interface and the IRI, the field will become 1 in finite time. If the system has not been properly configured and an attempt to connect the CPU interface to the IRI is made, this field may remain 0 indefinitely.

In an implementation where the CPU interface is always connected to the IRI, this field is permitted to be implemented as RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Access to this field is RO.

LINK, bit [1]

Whether the link between the CPU interface and the IRI is connected.

LINK	Meaning
0b0	The link between the CPU interface and the IRI is disconnected.
0b1	The link between the CPU interface and the IRI is connected.

On a read, all of the following are true:

- If LINK_IDLE is 1, LINK indicates whether the link is connected.
- If LINK_IDLE is 0 and LINK is 0, the link is in the process of disconnecting.
- If LINK_IDLE is 0 and LINK is 1, the link is in the process of connecting.

On a write, all of the following are true:

- Writing 1 connects the link.
- Writing 0 disconnects the link.
- The process of connecting or disconnecting the link is complete when LINK_IDLE is 1.
- A write that does not change the value of this field has no effect.

In an implementation where the CPU interface is always connected to the IRI, this field is permitted to be implemented as RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- Access to this field is RO if any the following are true:
  - EL3 is implemented.
  - ICC_CR0_EL1.LINK_IDLE == '0'.
- Otherwise, access to this field is RW.

EN, bit [0]

Enable interrupts for the Interrupt Domain.

When this field is 0, there is no HPPI of Sufficient priority for the Interrupt Domain.

EN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_CR0_EL1

ICC_CR0_EL3, Interrupt Controller Physical Control Register (EL3)

The ICC_CR0_EL3 characteristics are:

Purpose

Controls behavior of the CPU interface in the EL3 Interrupt Domain.

Configuration

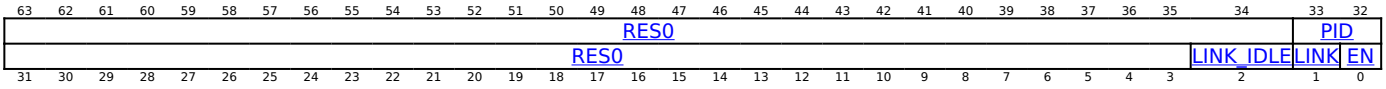
AArch64 System register ICC_CR0_EL3 bits [2:1] are architecturally mapped to AArch64 System register ICC_CR0_EL1[2:1].

This register is present only when FEAT_GCIE is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_CR0_EL3 are UNDEFINED.

Attributes

ICC_CR0_EL3 is a 64-bit register.

Field descriptions



Bits [63:34]

Reserved, RES0.

PID, bits [33:32]

Preemptive Interrupt Domain.

The PE behaves as if there is no Preemptive Interrupt Domain when any of the following are true:

- This field is set to 0b10.
- This field is set to an Interrupt Domain that is not implemented.

PID	Meaning
0b00	Secure Interrupt Domain
0b01	Non-secure Interrupt Domain
0b10	None
0b11	Realm Interrupt Domain

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [31:3]

Reserved, RES0.

LINK_IDLE, bit [2]

Whether the link between the CPU interface and the IRI is in the process of connecting or disconnecting.

LINK_IDLE	Meaning
0b0	The link between the CPU interface and the IRI is in the process of connecting or disconnecting.
0b1	The link between the CPU interface and the IRI is not in the process of connecting or disconnecting.

When this field is 0, if the system has been properly configured and a connection can be made between the CPU interface and the IRI, the field will become 1 in finite time. If the system has not been properly configured and an attempt to connect the CPU interface to the IRI is made, this field may remain 0 indefinitely.

In an implementation where the CPU interface is always connected to the IRI, this field is permitted to be implemented as RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Access to this field is RO.

LINK, bit [1]

Whether the link between the CPU interface and the IRI is connected.

LINK	Meaning
0b0	The link between the CPU interface and the IRI is disconnected.
0b1	The link between the CPU interface and the IRI is connected.

On a read, all of the following are true:

- If LINK_IDLE is 1, LINK indicates whether the link is connected.
- If LINK_IDLE is 0 and LINK is 0, the link is in the process of disconnecting.
- If LINK_IDLE is 0 and LINK is 1, the link is in the process of connecting.

On a write, all of the following are true:

- Writing 1 connects the link.
- Writing 0 disconnects the link.
- The process of connecting or disconnecting the link is complete when LINK_IDLE is 1.
- A write that does not change the value of this field has no effect.

In an implementation where the CPU interface is always connected to the IRI, this field is permitted to be implemented as RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When ICC_CR0_EL3.LINK_IDLE == '0', access to this field is RO.
- Otherwise, access to this field is RW.

EN, bit [0]

Enable interrupts for the EL3 Interrupt Domain.

When this field is set to 0, the PE behaves as if there is no HPPI of Sufficient priority in the EL3 Interrupt Domain.

EN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_CR0_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CR0_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1001	0b000

```
if !(IsFeatureImplemented(FEAT_GCIE) && HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = ICC_CR0_EL3();
end;
```

MSR ICC_CR0_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1001	0b000

```
if !(IsFeatureImplemented(FEAT_GCIE) && HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    ICC_CR0_EL3() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICC_CTLR_EL1, Interrupt Controller Control Register (EL1)

The ICC_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

Configuration

This register is banked between ICC_CTLR_EL1 and ICC_CTLR_EL1_S and ICC_CTLR_EL1_NS.

AArch64 System register ICC_CTLR_EL1 bits [31:0] (ICC_CTLR_EL1_S) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (ICC_CTLR_S).

AArch64 System register ICC_CTLR_EL1 bits [31:0] (ICC_CTLR_EL1_NS) are architecturally mapped to AArch32 System register ICC_CTLR[31:0] (ICC_CTLR_NS).

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_CTLR_EL1 are UNDEFINED.

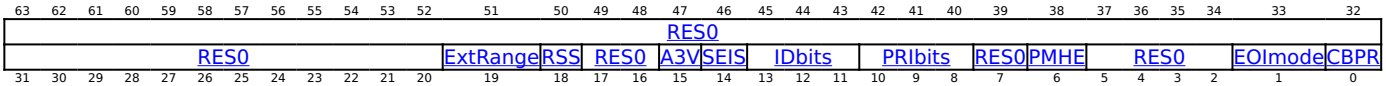
Attributes

ICC_CTLR_EL1 is a 64-bit register.

This register has the following instances:

- ICC_CTLR_EL1, when EL3 is not implemented.
- ICC_CTLR_EL1_S, when EL3 is implemented.
- ICC_CTLR_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

If EL3 is implemented, ICC_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL3.ExtRange.

RSS, bit [18]

Range Selector Support. Possible values are:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored. Possible values are:

A3V	Meaning
0b0	The CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.A3V.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports local generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support local generation of SEIs.
0b1	The CPU interface logic supports local generation of SEIs.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.SEIS.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. The number of physical interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is implemented, this field is an alias of ICC_CTLR_EL3.IDbits.

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the Security state of the access or the value of GICD_CTLR.DS.

For physical accesses, this field determines the minimum value of ICC_BPR0_EL1.

If EL3 is implemented, physical accesses return the value from ICC_CTLR_EL3.PRIbits.

If EL3 is not implemented, physical accesses return the value from this field.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable. Controls whether the priority mask register is used as a hint for interrupt distribution:

PMHE	Meaning
0b0	Disables use of ICC_PMR_EL1 as a hint for interrupt distribution.
0b1	Enables use of ICC_PMR_EL1 as a hint for interrupt distribution.

If EL3 is implemented, this bit is an alias of ICC_CTLR_EL3.PMHE. Whether this bit can be written as part of an access to this register depends on the value of GICD_CTLR.DS:

- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, it is IMPLEMENTATION DEFINED whether this bit is read-only or read/write:

- If this bit is read-only, an implementation can choose to make this field RAZ/WI or RAO/WI.
- If this bit is read/write, it resets to zero.

Bits [5:2]

Reserved, RES0.

EOImode, bit [1]

EOI mode for the current Security state. Controls whether a write to an End of Interrupt register also deactivates the interrupt:

EOImode	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The Secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The Non-secure ICC_CTLR_EL1.EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for both Group 0 and Group 1 interrupts.

If EL3 is implemented:

- This bit is an alias of ICC_CTLR_EL3.CBPR_EL1{S,NS} where S or NS corresponds to the current Security state.
- If GICD_CTLR.DS == 0, this bit is read-only.
- If GICD_CTLR.DS == 1, this bit is read/write.

If EL3 is not implemented, this bit is read/write.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CTLR_EL1

ICC_CTLR_EL3, Interrupt Controller Control Register (EL3)

The ICC_CTLR_EL3 characteristics are:

Purpose

Controls aspects of the behavior of the GIC CPU interface and provides information about the features implemented.

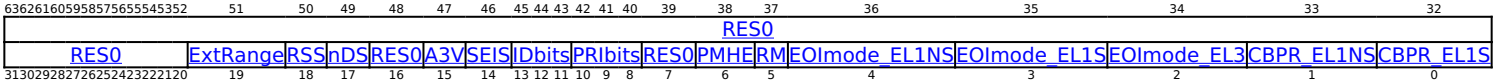
Configuration

This register is present only when GICv3 is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_CTLR_EL3 are UNDEFINED.

Attributes

ICC_CTLR_EL3 is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

RSS, bit [18]

Range Selector Support.

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0-15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0-255 are supported.

This bit is read-only.

nDS, bit [17]

Disable Security not supported. Read-only and writes are ignored.

nDS	Meaning
0b0	The CPU interface logic supports disabling of security.
0b1	The CPU interface logic does not support disabling of security, and requires that security is not disabled.

When a PE implements FEAT_RME and FEAT_SEL2, this field is RAO/WI.

Bit [16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

A3V	Meaning
0b0	The CPU interface logic does not support nonzero values of the Aff3 field in SGI generation System registers.
0b1	The CPU interface logic supports nonzero values of the Aff3 field in SGI generation System registers.

If EL3 is present, ICC_CTLR_EL1.A3V is an alias of ICC_CTLR_EL3.A3V

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The CPU interface logic does not support generation of SEIs.
0b1	The CPU interface logic supports generation of SEIs.

If EL3 is present, ICC_CTLR_EL1.SEIS is an alias of ICC_CTLR_EL3.SEIS

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of physical interrupt identifier bits supported.

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

If EL3 is present, ICC_CTLR_EL1.IDbits is an alias of ICC_CTLR_EL3.IDbits

PRIbits, bits [10:8]

Priority bits. Read-only and writes are ignored. The number of priority bits implemented, minus one.

An implementation that supports two Security states must implement at least 32 levels of physical priority (5 priority bits).

An implementation that supports only a single Security state must implement at least 16 levels of physical priority (4 priority bits).

Note

This field always returns the number of priority bits implemented, regardless of the value of SCR_EL3.NS or the value of GICD_CTLR.DS.

The division between group priority and subpriority is defined in the binary point registers ICC_BPR0_EL1 and ICC_BPR1_EL1.

This field determines the minimum value of ICC_BPR0_EL1.

Bit [7]

Reserved, RES0.

PMHE, bit [6]

Priority Mask Hint Enable.

PMHE	Meaning
0b0	Disables use of the priority mask register as a hint for interrupt distribution.
0b1	Enables use of the priority mask register as a hint for interrupt distribution.

Software must write ICC_PMR_EL1 to 0xFF before clearing this field to 0.

- An implementation might choose to make this field RAO/WI if priority-based routing is always used
- An implementation might choose to make this field RAZ/WI if priority-based routing is never used

If EL3 is present, ICC_CTLR_EL1.PMHE is an alias of ICC_CTLR_EL3.PMHE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

RM, bit [5]

Routing Modifier. This bit controls whether EL3 can acknowledge, or observe as the Highest Priority Pending Interrupt, Secure Group 0 and Non-secure Group 1 interrupts.

RM	Meaning
0b0	Secure Group 0 and Non-secure Group 1 interrupts can be acknowledged and observed as the highest priority interrupt at EL3.
0b1	Secure Group 0 and Non-secure Group 1 interrupts cannot be acknowledged and observed as the highest priority interrupt at EL3. Secure Group 0 interrupts return a special INTID value of 1020. This affects accesses to ICC_IAR0_EL1 and ICC_HPPIR0_EL1. Non-secure Group 1 interrupts return a special INTID value of 1021. This affects accesses to ICC_IAR1_EL1 and ICC_HPPIR1_EL1.

Note

The Routing Modifier bit is supported in AArch64 only. In systems without EL3 the behavior is as if the value is 0. Software must ensure this bit is 0 when the Secure copy of ICC_SRE_EL1.SRE is 1, otherwise system behavior is UNPREDICTABLE. In systems without EL3 or where the Secure copy of ICC_SRE_EL1.SRE is RAO/WI, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1NS, bit [4]

EOI mode for interrupts handled at Non-secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1NS	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(NS).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL1S, bit [3]

EOI mode for interrupts handled at Secure EL1 and EL2. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL1S	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

If EL3 is present, ICC_CTLR_EL1(S).EOImode is an alias of ICC_CTLR_EL3.EOImode_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EOImode_EL3, bit [2]

EOI mode for interrupts handled at EL3. Controls whether a write to an End of Interrupt register also deactivates the interrupt.

EOImode_EL3	Meaning
0b0	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICC_DIR_EL1 are UNPREDICTABLE.
0b1	ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide priority drop functionality only. ICC_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1NS, bit [1]

Common Binary Point Register, EL1 Non-secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Non-secure interrupts at EL1 and EL2.

CBPR_EL1NS	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Non-secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Non-secure Group 1 interrupts. Non-secure accesses to GICC_BPR and ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(NS).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR_EL1S, bit [0]

Common Binary Point Register, EL1 Secure. Controls whether the same register is used for interrupt preemption of both Group 0 and Group 1 Secure interrupts at EL1 and EL2.

CBPR_EL1S	Meaning
0b0	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts only. ICC_BPR1_EL1 determines the preemption group for Secure Group 1 interrupts.
0b1	ICC_BPR0_EL1 determines the preemption group for Group 0 interrupts and Secure Group 1 interrupts. Secure EL1 and Secure EL2 accesses to ICC_BPR1_EL1 access the state of ICC_BPR0_EL1.

If EL3 is present, ICC_CTLR_EL1(S).CBPR is an alias of ICC_CTLR_EL3.CBPR_EL1S.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICC_CTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CTLR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b100

```

        ICC_CTLR_EL3() = X{64}(t);
    end;
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICC_DIR_EL1, Interrupt Controller Deactivate Interrupt Register

The ICC_DIR_EL1 characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

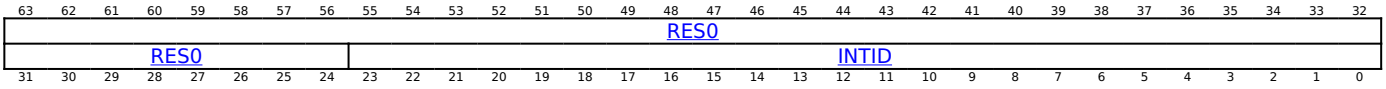
AArch64 System register ICC_DIR_EL1 bits [31:0] performs the same function as AArch32 System register ICC_DIR[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_DIR_EL1 are UNDEFINED.

Attributes

ICC_DIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_DIR_EL1

There are two cases when writing to ICC_DIR_EL1 that were UNPREDICTABLE for a corresponding GICv2 write to GICC_DIR:

- When EOImode == 0. GICv3 implementations must ignore such writes. In systems supporting system error generation, an implementation might generate an SEI.
- When EOImode == 1 but no EOI has been issued. The interrupt will be deactivated by the Distributor, however the active priority in the CPU interface for the interrupt will remain set (because no EOI was issued).

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_DIR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b001

```

ICC_DOMHPPIR_EL3, Interrupt Controller Domain Highest Priority Pending Interrupt Register

The ICC_DOMHPPIR_EL3 characteristics are:

Purpose

Reports whether there are HPPIs for non-EL3 Interrupt Domains.

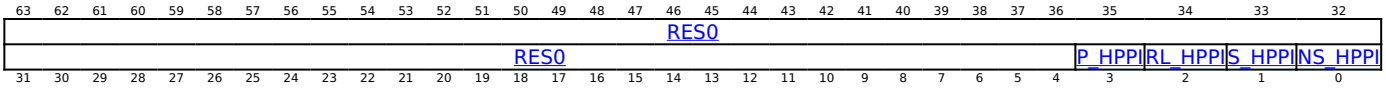
Configuration

This register is present only when FEAT_GCIE is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_DOMHPPIR_EL3 are UNDEFINED.

Attributes

ICC_DOMHPPIR_EL3 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

P_HPPI, bit [3]

Preemptive HPPI for the Preemptive Interrupt Domain valid bit.

P_HPPI	Meaning
0b0	There is no Preemptive HPPI of Sufficient priority for the Preemptive Interrupt Domain.
0b1	There is a Preemptive HPPI of Sufficient priority for the Preemptive Interrupt Domain.

Accessing this field has the following behavior:

- When HavePreemptiveDomain(), access to this field is RO.
- Otherwise, access to this field is RES0 .

RL_HPPI, bit [2]

HPPI for Realm Interrupt Domain valid bit.

RL_HPPI	Meaning
0b0	There is no HPPI of Sufficient priority for Realm Interrupt Domain.
0b1	There is an HPPI of Sufficient priority for Realm Interrupt Domain.

Accessing this field has the following behavior:

- When HaveDomain(GICDomain_RL), access to this field is RO.
- Otherwise, access to this field is RES0 .

S_HPPI, bit [1]

HPPI for Secure Interrupt Domain valid bit.

S_HPPI	Meaning
0b0	There is no HPPI of Sufficient priority for Secure Interrupt Domain.
0b1	There is an HPPI of Sufficient priority for Secure Interrupt Domain.

Accessing this field has the following behavior:

- When HaveDomain(GICDomain_S), access to this field is RO.
- Otherwise, access to this field is RES0 .

NS_HPPI, bit [0]

HPPI for Non-secure Interrupt Domain valid bit.

NS_HPPI	Meaning
0b0	There is no HPPI of Sufficient priority for Non-secure Interrupt Domain.
0b1	There is an HPPI of Sufficient priority for Non-secure Interrupt Domain.

Accessing this field has the following behavior:

- When HaveDomain(GICDomain_NS), access to this field is RO.
- Otherwise, access to this field is RES0 .

Accessing ICC_DOMHPPIR_EL3

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_DOMHPPIR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1000	0b010

```
if !(IsFeatureImplemented(FEAT_GCIE) && HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = ICC_DOMHPPIR_EL3();
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICC_EOIR0_EL1, Interrupt Controller End Of Interrupt Register 0

The ICC_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 0 interrupt.

Configuration

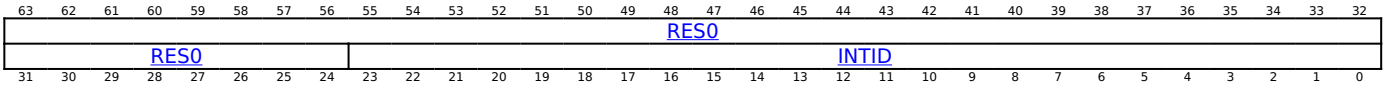
AArch64 System register ICC_EOIR0_EL1 bits [31:0] performs the same function as AArch32 System register ICC_EOIR0[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_EOIR0_EL1 are UNDEFINED.

Attributes

ICC_EOIR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOIMode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.

Accessing ICC_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_EOIR0_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

ICC_EOIR1_EL1, Interrupt Controller End Of Interrupt Register 1

The ICC_EOIR1_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified Group 1 interrupt.

Configuration

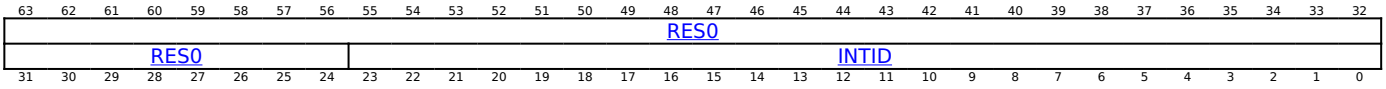
AArch64 System register ICC_EOIR1_EL1 bits [31:0] performs the same function as AArch32 System register ICC_EOIR1[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_EOIR1_EL1 are UNDEFINED.

Attributes

ICC_EOIR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICC_IAR1_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the EOImode bit for the current Exception level and Security state is 0, a write to this register drops the priority for the interrupt, and also deactivates the interrupt.

If the EOImode bit for the current Exception level and Security state is 1, a write to this register only drops the priority for the interrupt. Software must write to ICC_DIR_EL1 to deactivate the interrupt.

The EOImode bit for the current Exception level and Security state is determined as follows:

- If EL3 is not implemented, the appropriate bit is ICC_CTLR_EL1.EOIMode.
- If EL3 is implemented and the software is executing at EL3, the appropriate bit is ICC_CTLR_EL3.EOImode_EL3.
- If EL3 is implemented and the software is not executing at EL3, the bit depends on the current Security state:
  - If the software is executing in Secure state, the bit is ICC_CTLR_EL3.EOImode_EL1S.
  - If the software is executing in Non-secure state, the bit is ICC_CTLR_EL3.EOImode_EL1NS.

Accessing ICC_EOIR1_EL1

A write to this register must correspond to the most recent valid read by this PE from an Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICC_IAR1_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

A write of a Special INTID is ignored. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_EOIR1_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b001

ICC_HAPR_EL1, Interrupt Controller Physical Highest Active Priority Register

The ICC_HAPR_EL1 characteristics are:

Purpose

Reports the running priority of the Current Physical Interrupt Domain.

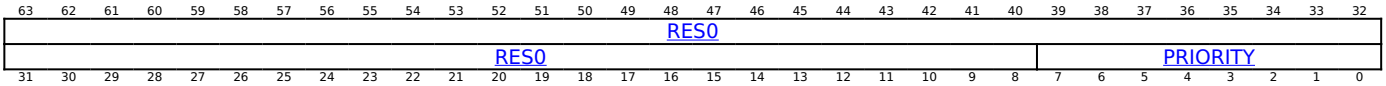
Configuration

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_HAPR_EL1 are UNDEFINED.

Attributes

ICC_HAPR_EL1 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

PRIORITY, bits [7:0]

The running priority for the Current Physical Interrupt Domain.

If there are no active priorities on the CPU interface in the applicable Interrupt Domain, or all active priorities have undergone a priority drop, the value returned is the Idle priority.

Accessing ICC_HAPR_EL1

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_HAPR_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b1100	0b0000	0b011

ICC_HPPIR_EL1, Interrupt Controller Physical Highest Priority Pending Interrupt Register (EL1)

The ICC_HPPIR_EL1 characteristics are:

Purpose

Reports the HPPI for the Physical Interrupt Domain associated with the Security state selected by SCR_EL3.{NS, NSE}.

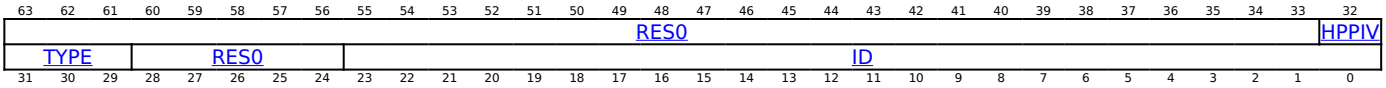
Configuration

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_HPPIR_EL1 are UNDEFINED.

Attributes

ICC_HPPIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

HPPIV, bit [32]

HPPI valid.

There is an HPPI with Sufficient priority for the Interrupt Domain.

HPPIV	Meaning
0b0	Invalid: There is no HPPI with Sufficient priority for the Interrupt Domain.
0b1	VALID: There is an HPPI with Sufficient priority for the Interrupt Domain.

If ICC_HPPIR_EL1.HPPIV is 1, ID and TYPE together form the INTID of the HPPI for the Interrupt Domain.

TYPE, bits [31:29]

The encoding of this field depends on the value of HPPIV as described below:

- If ICC_HPPIR_EL1.HPPIV is 0, TYPE is RES0.
- If ICC_HPPIR_EL1.HPPIV is 1, TYPE specifies the Type of the interrupt.

TYPE	Meaning
0b001	PPI
0b010	LPI
0b011	SPI

Values not defined above are reserved.

Bits [28:24]

Reserved, RES0.

ID, bits [23:0]

The encoding of this field depends on the value of HPPIV as described below:

- If ICC_HPPIR_EL1.HPPIV is 0, ID is RES0.
- If ICC_HPPIR_EL1.HPPIV is 1, ID specifies the interrupt ID.

Accessing ICC_HPPIR_EL1

This register is Read-only.

When accessed at EL3, if SCR_EL3.{NS, NSE} select a reserved value, the behavior is CONSTRAINED UNPREDICTABLE with the permitted options:

- SCR_EL3.{NS, NSE} is treated as having an UNKNOWN value.
- The access is treated as a NOP.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_HPPIR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1010	0b011

```
if !(IsFeatureImplemented(FEAT_GCIE) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2().IMO == '1' && IsFeatureImplemented(FEAT_GCIE_LEGACY) && ICH_VCTLR_EL2().V3 == '1' then
        Undefined();
    elsif EL2Enabled() && ICH_HFGRTR_EL2().ICC_HPPIR_EL1 == '0' then
        AArch64_SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && HCR_EL2().IMO == '1' then
        X{64}(t) = ICV_HPPIR_EL1();
    else
        X{64}(t) = ICC_HPPIR_EL1();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = ICC_HPPIR_EL1();
elsif PSTATE.EL == EL3 then
    X{64}(t) = ICC_HPPIR_EL1();
end;
```

ICC_HPPIR_EL3, Interrupt Controller Physical Highest Priority Pending Interrupt Register (EL3)

The ICC_HPPIR_EL3 characteristics are:

Purpose

Reports the HPPI for the EL3 Interrupt Domain.

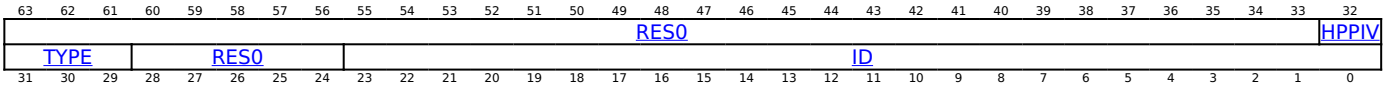
Configuration

This register is present only when FEAT_GCIE is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_HPPIR_EL3 are UNDEFINED.

Attributes

ICC_HPPIR_EL3 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

HPPIV, bit [32]

HPPI valid.

There is an HPPI with Sufficient priority for the Interrupt Domain.

HPPIV	Meaning
0b0	Invalid: There is no HPPI with Sufficient priority for the Interrupt Domain.
0b1	VALID: There is an HPPI with Sufficient priority for the Interrupt Domain.

If ICC_HPPIR_EL3.HPPIV is 1, ID and TYPE together form the INTID of the HPPI for the Interrupt Domain.

TYPE, bits [31:29]

The encoding of this field depends on the value of HPPIV as described below:

- If ICC_HPPIR_EL3.HPPIV is 0, TYPE is RES0.
- If ICC_HPPIR_EL3.HPPIV is 1, TYPE specifies the Type of the interrupt.

TYPE	Meaning
0b001	PPI
0b010	LPI
0b011	SPI

Values not defined above are reserved.

Bits [28:24]

Reserved, RES0.

ID, bits [23:0]

The encoding of this field depends on the value of HPPIV as described below:

- If ICC_HPPIR_EL3.HPPIV is 0, ID is RES0.
- If ICC_HPPIR_EL3.HPPIV is 1, ID specifies the interrupt ID.

Accessing ICC_HPPIR_EL3

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_HPPIR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1001	0b001

```

end;
```

2025-12-10 16:11:30, 2025-12_rel

ICC_IAFFIDR_EL1, Interrupt Controller PE Interrupt Affinity ID Register

The ICC_IAFFIDR_EL1 characteristics are:

Purpose

Reports the PE interrupt Affinity ID for the PE.

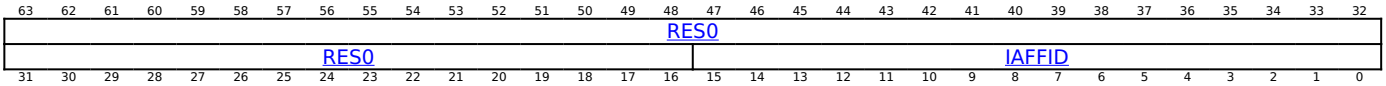
Configuration

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IAFFIDR_EL1 are UNDEFINED.

Attributes

ICC_IAFFIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

IAFFID, bits [15:0]

PE interrupt Affinity ID.

Accessing ICC_IAFFIDR_EL1

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_IAFFIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1010	0b101

```

elsif PSTATE.EL == EL3 then
    X{64}(t) = ICC_IAFFIDR_EL1();
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICC_IAR0_EL1, Interrupt Controller Interrupt Acknowledge Register 0

The ICC_IAR0_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICC_IAR0_EL1 bits [31:0] performs the same function as AArch32 System register ICC_IAR0[31:0].

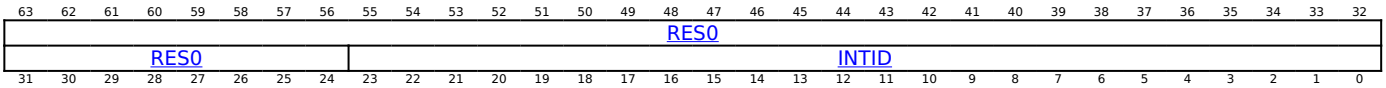
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IAR0_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE. For information on PE interrupt masking see Arm® Architecture Reference Manual for A-profile architecture. This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers'.

Attributes

ICC_IAR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

ICC_IAR1_EL1, Interrupt Controller Interrupt Acknowledge Register 1

The ICC_IAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICC_IAR1_EL1 bits [31:0] performs the same function as AArch32 System register ICC_IAR1[31:0].

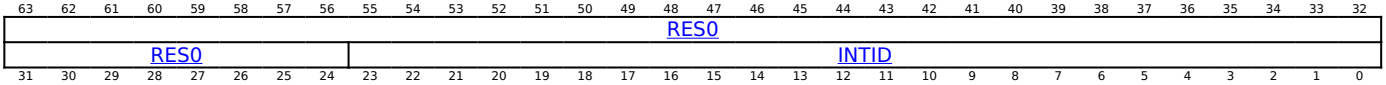
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE. For information on PE interrupt masking, see Arm® Architecture Reference Manual for A-profile architecture. This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_IAR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

ICC_ICSR_EL1, Interrupt Controller Interrupt Configuration and State Register

The ICC_ICSR_EL1 characteristics are:

Purpose

Reports the configuration and state of the INTID specified to a previous GIC request interrupt configuration instruction.

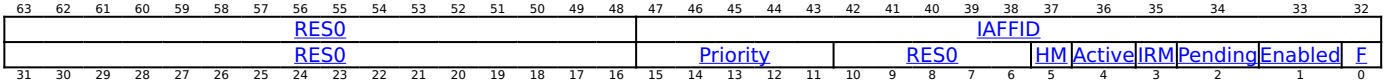
Configuration

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_ICSR_EL1 are UNDEFINED.

Attributes

ICC_ICSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

IAFFID, bits [47:32]

The interrupt Affinity value.

The IRS may support fewer than 16 bits of IAFFID. Upper bits not implemented by the IRS are returned as zero.

When IRM is 1, this field is IMPSPEC.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [31:16]

Reserved, RES0.

Priority, bits [15:11]

The priority of the interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [10:6]

Reserved, RES0.

HM, bit [5]

The Handling mode of the interrupt.

HM	Meaning
0b0	Edge-triggered
0b1	Level-sensitive

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Active, bit [4]

The interrupt's Active state.

Active	Meaning
0b0	Inactive
0b1	Active

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

IRM, bit [3]

Interrupt Routing mode.

IRM	Meaning
0b0	The interrupt Routing mode is Targeted.
0b1	The interrupt Routing mode is 1ofN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Pending, bit [2]

The interrupt's Pending state.

Pending	Meaning
0b0	Not pending
0b1	Pending

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Enabled, bit [1]

The interrupt's individual enable.

Enabled	Meaning
0b0	Disabled
0b1	Enabled

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

F, bit [0]

Indicates whether the IRS returned valid data.

F	Meaning
0b0	Request completed successfully.
0b1	Request did not complete successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICC_ICSR_EL1

ICC_IDR0_EL1, Interrupt Controller ID Register 0

The ICC_IDR0_EL1 characteristics are:

Purpose

Contains information about features implemented by the GICv5 CPU interface.

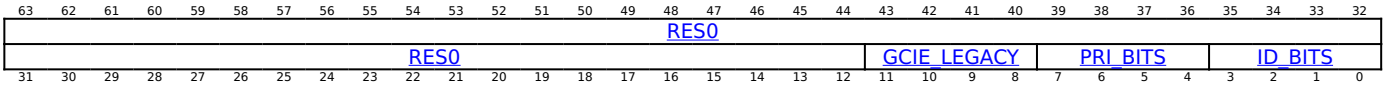
Configuration

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IDR0_EL1 are UNDEFINED.

Attributes

ICC_IDR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

GCIE_LEGACY, bits [11:8]

Indicates support for legacy GICv3.3 virtual CPU interface.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GCIE_LEGACY	Meaning
0b0000	Legacy GICv3.3 virtual CPU interface is not implemented
0b0001	Legacy GICv3.3 virtual CPU interface is implemented

FEAT_GCIE_LEGACY extension implements the functionality identified by the value 0b0001.

Access to this field is RO.

PRI_BITS, bits [7:4]

The number of priority bits implemented, minus one.

The number of supported priority bits is 5.

Other values are reserved.

Reads as 0b0100.

Access to this field is RO.

ID_BITS, bits [3:0]

Identifier bits.

The number of interrupt identifier bits supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ID_BITS	Meaning
0b0000	16 bits
0b0001	24 bits

Access to this field is RO.

Accessing ICC_IDR0_EL1

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_IDR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1010	0b010

```

ICC_IGRPEN0_EL1, Interrupt Controller Interrupt Group 0 Enable Register

The ICC_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether Group 0 interrupts are enabled or not.

Configuration

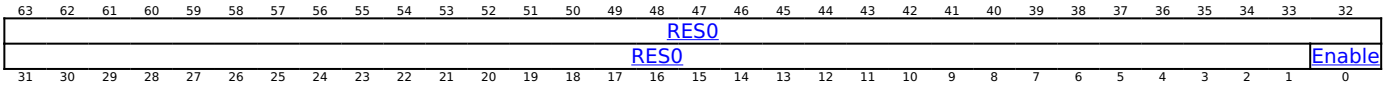
AArch64 System register ICC_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_IGRPEN0[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICC_IGRPEN0_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 0 interrupts.

Enable	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

Virtual accesses to this register update ICH_VMCR_EL2.VENG0.

If the highest priority pending interrupt for that PE is a Group 0 interrupt using 1 of N model, then the interrupt will be targeted to another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_IGRPEN0_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICC_IGRPEN1_EL1, Interrupt Controller Interrupt Group 1 Enable Register

The ICC_IGRPEN1_EL1 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled for the current Security state.

Configuration

This register is banked between ICC_IGRPEN1_EL1 and ICC_IGRPEN1_EL1_S and ICC_IGRPEN1_EL1_NS.

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (ICC_IGRPEN1_EL1_S) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (ICC_IGRPEN1_S).

AArch64 System register ICC_IGRPEN1_EL1 bits [31:0] (ICC_IGRPEN1_EL1_NS) are architecturally mapped to AArch32 System register ICC_IGRPEN1[31:0] (ICC_IGRPEN1_NS).

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IGRPEN1_EL1 are UNDEFINED.

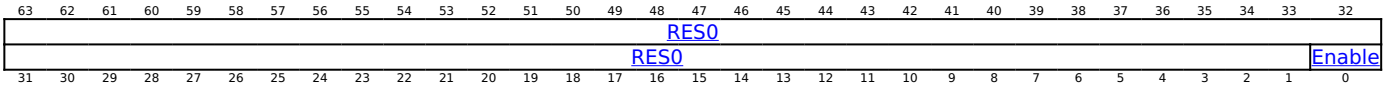
Attributes

ICC_IGRPEN1_EL1 is a 64-bit register.

This register has the following instances:

- ICC_IGRPEN1_EL1, when EL3 is not implemented.
- ICC_IGRPEN1_EL1_S, when EL3 is implemented.
- ICC_IGRPEN1_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables Group 1 interrupts for the current Security state.

Enable	Meaning
0b0	Group 1 interrupts are disabled for the current Security state.
0b1	Group 1 interrupts are enabled for the current Security state.

Virtual accesses to this register update ICH_VMCR_EL2.VENG1.

If EL3 is present:

- The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.
- The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_IGRPEN1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_IGRPEN1_EL1

ICC_IGRPEN1_EL3, Interrupt Controller Interrupt Group 1 Enable Register (EL3)

The ICC_IGRPEN1_EL3 characteristics are:

Purpose

Controls whether Group 1 interrupts are enabled or not.

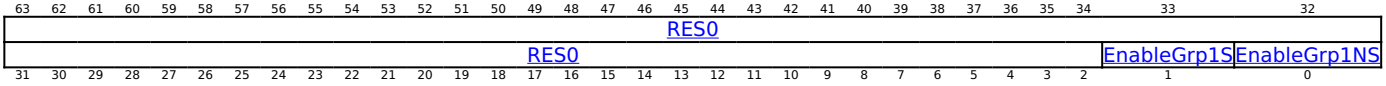
Configuration

This register is present only when GICv3 is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_IGRPEN1_EL3 are UNDEFINED.

Attributes

ICC_IGRPEN1_EL3 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

EnableGrp1S, bit [1]

Enables Group 1 interrupts for the Secure state.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

The Secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1S bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EnableGrp1NS, bit [0]

Enables Group 1 interrupts for the Non-secure state.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

The Non-secure ICC_IGRPEN1_EL1.Enable bit is a read/write alias of the ICC_IGRPEN1_EL3.EnableGrp1NS bit.

If the highest priority pending interrupt for that PE is a Group 1 interrupt using 1 of N model, then the interrupt will target another PE as a result of the Enable bit changing from 1 to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

ICC_NMIAR1_EL1, Interrupt Controller Non-maskable Interrupt Acknowledge Register 1

The ICC_NMIAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled Group 1 non-maskable interrupt. This read acts as an acknowledge for the interrupt.

Configuration

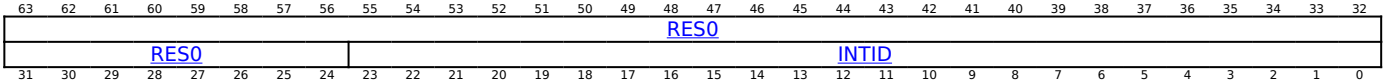
This register is present only when (FEAT_GICv3_NMI is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_NMIAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE. For information on PE interrupt masking see Arm® Architecture Reference Manual for A-profile architecture. This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_NMIAR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

This is the INTID of the highest priority pending interrupt, if that interrupt has the Non-maskable property and is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICC_CTLR_EL1.IDbits and ICC_CTLR_EL3.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICC_NMIAR1_EL1

2025-12-10 16:11:30, 2025-12_rel

ICC_PCR_EL1, Interrupt Controller Physical Interrupt Priority Control Register (EL1)

The ICC_PCR_EL1 characteristics are:

Purpose

Controls the Physical priority mask for the Non-secure, Realm, and Secure Interrupt Domains.

Configuration

This register is banked between ICC_PCR_EL1 and ICC_PCR_EL1_NS and ICC_PCR_EL1_RL and ICC_PCR_EL1_S.

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_PCR_EL1 are UNDEFINED.

There are separate banked copies of this register for Non-secure, Realm and Secure state.

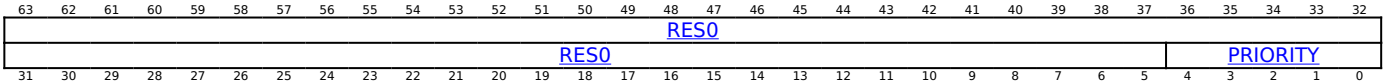
Attributes

ICC_PCR_EL1 is a 64-bit register.

This register has the following instances:

- ICC_PCR_EL1, when EL3 is not implemented.
- ICC_PCR_EL1_NS, when EL3 is implemented.
- ICC_PCR_EL1_RL, when FEAT_RME is implemented.
- ICC_PCR_EL1_S, when (EL3 is implemented and FEAT_RME is not implemented) or (FEAT_RME is implemented and FEAT_SEL2 is implemented).

Field descriptions



Bits [63:5]

Reserved, RES0.

PRIORITY, bits [4:0]

The priority mask for the Interrupt Domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICC_PCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICC_PCR_EL3, Interrupt Controller Interrupt Priority Control Register (EL3)

The ICC_PCR_EL3 characteristics are:

Purpose

Controls the Physical priority mask for the physical CPU interface for the EL3 Interrupt Domain.

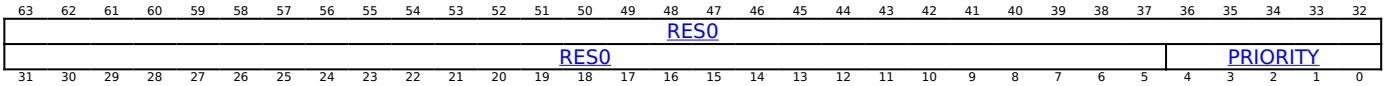
Configuration

This register is present only when FEAT_GCIE is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_PCR_EL3 are UNDEFINED.

Attributes

ICC_PCR_EL3 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

PRIORITY, bits [4:0]

The priority mask for the EL3 Interrupt Domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICC_PCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1000	0b001

```
if !(IsFeatureImplemented(FEAT_GCIE) && HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = ICC_PCR_EL3();
end;
```

MSR ICC_PCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1000	0b001

```
if !(IsFeatureImplemented(FEAT_GCIE) && HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then

elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    ICC_PCR_EL3() = X{64}(t);
end;
```

ICC_PMR_EL1, Interrupt Controller Interrupt Priority Mask Register

The ICC_PMR_EL1 characteristics are:

Purpose

Provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Writes to this register must be high performance and must ensure that no interrupt of lower priority than the written value occurs after the write, without requiring an ISB or an exception boundary.

Configuration

AArch64 System register ICC_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_PMR[31:0].

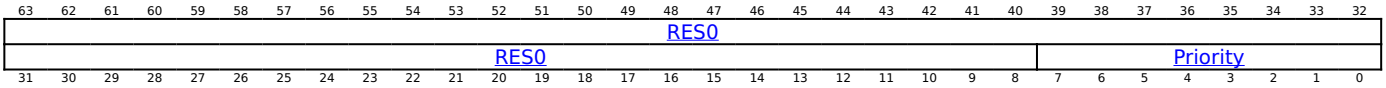
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_PMR_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronising. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_PMR_EL1 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00`.

Accessing ICC_PMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PMR_EL1

DOM<x>, bits [2x+1:2x], for x = 31 to 0

Controls the Physical Interrupt Domain that a PPI is assigned to.

If a physical PPI is assigned to an unimplemented Interrupt Domain, all of the following are true:

- The physical PPI is not selected as the candidate HPPI in any Interrupt Domain.
- Access to the state and configuration of the PPI using an ICC_PPI_ System register is only permitted at EL3.
- Attempts to deactivate the PPI by executing a GIC xDDI System instruction are treated as NOPs.

DOM<x>	Meaning
0b00	Secure
0b01	Non-secure
0b10	EL3
0b11	Realm

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 32) + x), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing ICC_PPI_DOMAINR<n>_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PPI_DOMAINR<n>_EL3 ; Where n = 0-3

ICC_PPI_ENABLER<n>_EL1, Interrupt Controller Physical PPI Enable Registers, n = 0 - 1

The ICC_PPI_ENABLER<n>_EL1 characteristics are:

Purpose

Access to Enable state for physical PPIs.

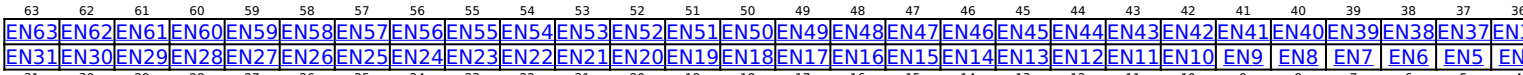
Configuration

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_PPI_ENABLER<n>_EL1 are UNDEFINED.

Attributes

ICC_PPI_ENABLER<n>_EL1 is a 64-bit register.

Field descriptions



EN<x>, bit [x], for x = 63 to 0

Configures whether PPIs are enabled.

Reads return the current state of the INTID.

EN<x>	Meaning
0b0	Disabled
0b1	Enabled

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 64) + x), access to this field is RES0 .
- Access to this field is RAZ/WI if all the following are true:
  - !IsPPIAssignedToCurrentDomain((n * 64) + x).
  - PSTATE.EL IN {EL2, EL1}.
- Otherwise, access to this field is RW.

Accessing ICC_PPI_ENABLER<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PPI_ENABLER<n>_EL1 ; Where n = 0-1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1010	0b11:n[0]

```

ICC_PPI_PRIORITYR<n>_EL1, Interrupt Controller Physical PPI Priority Registers, n = 0 - 15

The ICC_PPI_PRIORITYR<n>_EL1 characteristics are:

Purpose

Configures the priority of physical PPIs.

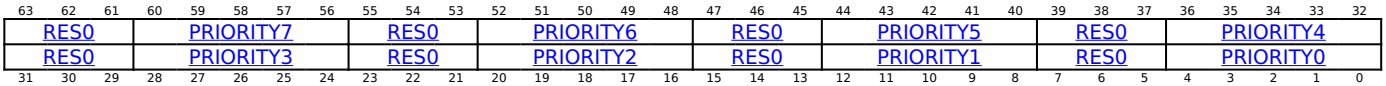
Configuration

This register is present only when FEAT_GCIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_PPI_PRIORITYR<n>_EL1 are UNDEFINED.

Attributes

ICC_PPI_PRIORITYR<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:61, 55:53, 47:45, 39:37, 31:29, 23:21, 15:13, 7:5]

Reserved, RES0.

PRIORITY<x>, bits [60:56, 52:48, 44:40, 36:32, 28:24, 20:16, 12:8, 4:0], for x = 7 to 0, where each field is 5 bits wide

Configures the priority of the corresponding PPI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 8) + x), access to this field is RES0 .
- Access to this field is RAZ/WI if all the following are true:

ICC_RPR_EL1, Interrupt Controller Running Priority Register

The ICC_RPR_EL1 characteristics are:

Purpose

Indicates the Running priority of the CPU interface.

Configuration

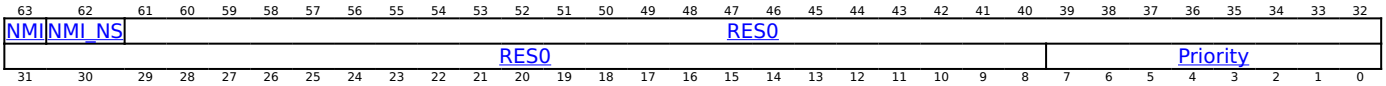
AArch64 System register ICC_RPR_EL1 bits [31:0] performs the same function as AArch32 System register ICC_RPR[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_RPR_EL1 are UNDEFINED.

Attributes

ICC_RPR_EL1 is a 64-bit register.

Field descriptions



NMI, bit [63]
When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

NMI	Meaning
0b0	When GICD_CTLR.DS==1, there are no Active NMIs, or all Active NMIs have undergone priority drop. When GICD_CTLR.DS==0: • For Non-secure and Realm reads, there are no Active Non-secure Group 1 NMIs, or all Active Non-secure Group 1 NMIs have undergone priority drop. • For Secure and Root reads, there are no Active Secure Group 1 NMIs, or all Active Secure Group 1 NMIs have undergone priority drop.
0b1	When GICD_CTLR.DS==1, there is an Active NMI. When GICD_CTLR.DS==0: • For Non-secure and Realm reads, there is an Active Non-secure Group 1 NMI. • For Secure and Root reads, there is an Active Secure Group 1 NMI.

Otherwise:

Reserved, RES0.

NMI_NS, bit [62]
When FEAT_GICv3_NMI is implemented and EL3 is implemented:

Indicates whether the running priority is from a Non-secure Group 1 NMI.

NMI_NS	Meaning
0b0	There are no Active Non-secure Group 1 NMIs, or all Active Non-secure Group 1 NMIs have undergone priority drop.
0b1	There is an Active Non-secure Group 1 NMI which has not undergone priority drop.

For Non-secure and Realm accesses, this field is RES0.

Otherwise:

Reserved, RES0.

Bits [61:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

The group priority of a Secure NMI, or NMI when GICD_CTLR.DS is 1, is 0x00. The group priority of a Non-secure NMI is 0x80, saturated to 0x00 for Non-secure reads.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICC_RPR_EL1

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_RPR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b011

```

ICC_SGI0R_EL1, Interrupt Controller Software Generated Interrupt Group 0 Register

The ICC_SGI0R_EL1 characteristics are:

Purpose

Generates Secure Group 0 SGIs.

Configuration

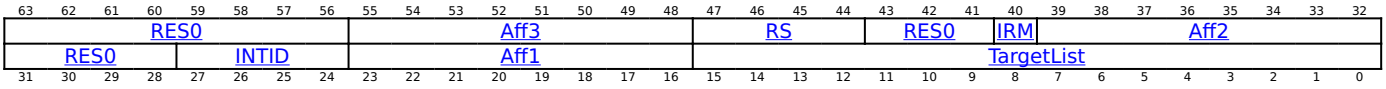
AArch64 System register ICC_SGI0R_EL1 performs the same function as AArch32 System register ICC_SGI0R.

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SGI0R_EL1 are UNDEFINED.

Attributes

ICC_SGI0R_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_SGI0R_EL1

This register allows software executing in a Secure state to generate Group 0 SGIs. It will also allow software executing in a Non-secure state to generate Group 0 SGIs, if permitted by the settings of GICR_NSACR in the Redistributor corresponding to the target PE.

When GICD_CTLR.DS==0, Non-secure writes do not generate an interrupt for a target PE if not permitted by the GICR_NSACR register associated with the target PE. For more information, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_SGI0R_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b111

ICC_SGI1R_EL1, Interrupt Controller Software Generated Interrupt Group 1 Register

The ICC_SGI1R_EL1 characteristics are:

Purpose

Generates Group 1 SGIs for the current Security state.

Configuration

AArch64 System register ICC_SGI1R_EL1 performs the same function as AArch32 System register ICC_SGI1R.

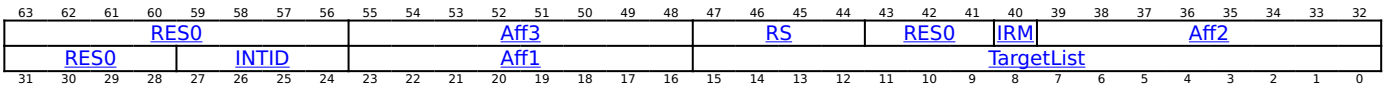
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SGI1R_EL1 are UNDEFINED.

Under certain conditions a write to ICC_SGI1R_EL1 can generate Group 0 interrupts, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICC_SGI1R_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

Aff3, bits [55:48]

The affinity 3 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

RS, bits [47:44]

RangeSelector

Controls which group of 16 values is represented by the TargetList field.

TargetList[n] represents aff0 value ((RS * 16) + n).

When ICC_CTLR_EL1.RSS==0, RS is RES0.

When ICC_CTLR_EL1.RSS==1 and GICD_TYPER.RSS==0, writing this register with RS != 0 is a CONSTRAINED UNPREDICTABLE choice of:

- The write is ignored.
- The RS field is treated as 0.

Bits [43:41]

Reserved, RES0.

IRM, bit [40]

Interrupt Routing Mode. Determines how the generated interrupts are distributed to PEs. Possible values are:

IRM	Meaning
0b0	Interrupts routed to the PEs specified by Aff3.Aff2.Aff1.<target list>.
0b1	Interrupts routed to all PEs in the system, excluding "self".

Aff2, bits [39:32]

The affinity 2 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

Bits [31:28]

Reserved, RES0.

INTID, bits [27:24]

The INTID of the SGI.

Aff1, bits [23:16]

The affinity 1 value of the affinity path of the cluster for which SGI interrupts will be generated.

If the IRM bit is 1, this field is RES0.

TargetList, bits [15:0]

Target List. The set of PEs for which SGI interrupts will be generated. Each bit corresponds to the PE within a cluster with an Affinity 0 value equal to the bit number.

Note

If SRE is set only for EL3, software executing at EL3 might use the System register interface to generate SGIs. Therefore, the Distributor must always be able to receive and acknowledge Generate SGI packets received from CPU interface regardless of the ARE settings for a Security state. However, the Distributor might discard such packets.

If the IRM bit is 1, this field is RES0.

If a bit is 1 and the bit does not correspond to a valid target PE, the bit must be ignored by the Distributor. It is IMPLEMENTATION DEFINED whether, in such cases, a Distributor can signal a system error.

Accessing ICC_SGI1R_EL1

Note

Accesses at EL3 are treated as Secure regardless of the value of SCR_EL3.NS.

Accesses to this register use the following encodings in the System register encoding space:

ICC_SRE_EL1, Interrupt Controller System Register Enable Register (EL1)

The ICC_SRE_EL1 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL1.

Configuration

This register is banked between ICC_SRE_EL1 and ICC_SRE_EL1_S and ICC_SRE_EL1_NS.

AArch64 System register ICC_SRE_EL1 bits [31:0] (ICC_SRE_EL1_S) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (ICC_SRE_S).

AArch64 System register ICC_SRE_EL1 bits [31:0] (ICC_SRE_EL1_NS) are architecturally mapped to AArch32 System register ICC_SRE[31:0] (ICC_SRE_NS).

AArch64 System register ICC_SRE_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICC_SRE.

This register is present only when (GICv3 is implemented or (FEAT_GCIE is implemented and EL2 is implemented)) and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SRE_EL1 are UNDEFINED.

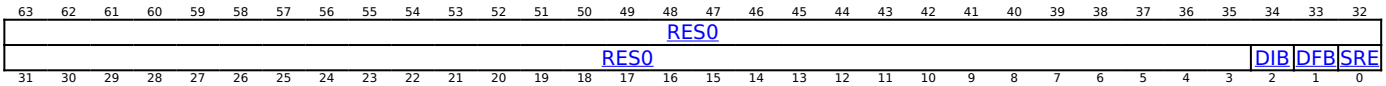
Attributes

ICC_SRE_EL1 is a 64-bit register.

This register has the following instances:

- ICC_SRE_EL1, when EL3 is not implemented.
- ICC_SRE_EL1_S, when EL3 is implemented.
- ICC_SRE_EL1_NS, when EL3 is implemented.

Field descriptions



Bits [63:3]

Reserved, RES0.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read/write alias of ICC_SRE_EL3.DIB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DIB.

In systems that do not support IRQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_GCIE is implemented, access to this field is RAO/WI.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS == 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS == 1, and EL2 is not implemented, this field is a read/write alias of ICC_SRE_EL3.DFB.

If EL3 is not implemented and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DFB.

If GICD_CTLR.DS == 1 and EL2 is implemented, this field is a read-only alias of ICC_SRE_EL2.DFB.

In systems that do not support FIQ bypass, this field is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_GCIE is implemented, access to this field is RAO/WI.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL1 to any ICC_* System register other than ICC_SRE_EL1 is trapped to EL1.
0b1	The System register interface for the current Security state is enabled.

If software changes this bit from 1 to 0 in the Secure instance of this register, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Secure copy of this bit becomes UNKNOWN.

If EL2 is implemented and ICC_SRE_EL2.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL2.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 the Non-secure copy of this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, the Non-secure copy of this bit becomes UNKNOWN.

If Realm Management Extension is implemented, this field is RAO/WI.

GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI. The following options are supported:

- The Non-secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL2.SRE is also RAO/WI. This means all Non-secure software, including VMs using only virtual interrupts, must access the GIC using System registers.
- The Secure copy of ICC_SRE_EL1.SRE can be RAO/WI if ICC_SRE_EL3.SRE and ICC_SRE_EL2.SRE are also RAO/WI. This means that all Secure software must access the GIC using System registers and all Non-secure accesses to registers for physical interrupts must use System registers.

Note

A VM using only virtual interrupts might still use memory-mapped access if the Non-secure copy of ICC_SRE_EL1.SRE is not RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_GCIE is implemented, access to this field is RAO/WI.

Accessing ICC_SRE_EL1

Execution with ICC_SRE_EL1.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_SRE_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b101

ICC_SRE_EL2, Interrupt Controller System Register Enable Register (EL2)

The ICC_SRE_EL2 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL2.

Configuration

AArch64 System register ICC_SRE_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICC_HSRE[31:0].

This register is present only when (GICv3 is implemented or (FEAT_GCIE is implemented and EL2 is implemented)), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SRE_EL2 are UNDEFINED.

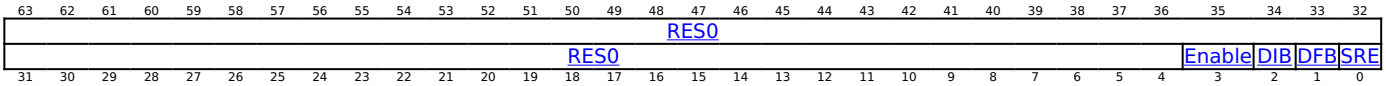
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICC_SRE_EL2 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE_EL1.

Enable	Meaning
0b0	When EL2 is implemented and enabled in the current Security state, EL1 accesses to ICC_SRE_EL1 trap to EL2.
0b1	EL1 accesses to ICC_SRE_EL1 do not trap to EL2.

If ICC_SRE_EL2.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL2.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_GCIE is implemented, access to this field is RAO/WI.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DIB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read/write alias of ICC_SRE_EL3.DIB.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_GCIE is implemented, access to this field is RAO/WI.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

If EL3 is implemented and GICD_CTLR.DS is 0, this field is a read-only alias of ICC_SRE_EL3.DFB.

If EL3 is implemented and GICD_CTLR.DS is 1, this field is a read/write alias of ICC_SRE_EL3.DFB.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_GCIE is implemented, access to this field is RAO/WI.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL2 to any ICH_* or ICC_* register other than ICC_SRE_EL1 or ICC_SRE_EL2, is trapped to EL2.
0b1	The System register interface to the ICH_* registers and the EL1 and EL2 ICC_* registers is enabled for EL2.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If an implementation supports only a System register interface to the GIC CPU interface, this bit is RAO/WI.

If EL3 is implemented and ICC_SRE_EL3.SRE==0 this bit is RAZ/WI. If ICC_SRE_EL3.SRE is changed from zero to one, this bit becomes UNKNOWN.

If Realm Management Extension is implemented, this field is RAO/WI.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI, but this is only allowed if ICC_SRE_EL3.SRE is also RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_GCIE is implemented, access to this field is RAO/WI.

Accessing ICC_SRE_EL2

Execution with ICC_SRE_EL2.SRE set to 0 might make some System registers UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_SRE_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1001	0b101

ICC_SRE_EL3, Interrupt Controller System Register Enable Register (EL3)

The ICC_SRE_EL3 characteristics are:

Purpose

Controls whether the System register interface or the memory-mapped interface to the GIC CPU interface is used for EL3.

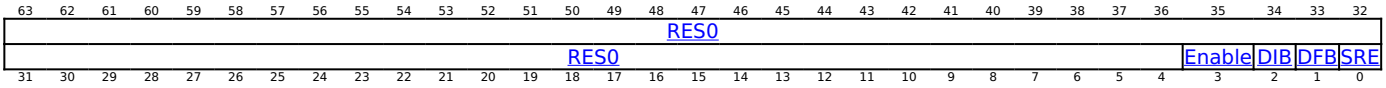
Configuration

This register is present only when GICv3 is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICC_SRE_EL3 are UNDEFINED.

Attributes

ICC_SRE_EL3 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

Enable, bit [3]

Enable. Enables lower Exception level access to ICC_SRE_EL1 and ICC_SRE_EL2.

Enable	Meaning
0b0	EL1 accesses to ICC_SRE_EL1 trap to EL3, unless these accesses are trapped to EL2 as a result of ICC_SRE_EL2.Enable == 0. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 trap to EL3.
0b1	EL1 accesses to ICC_SRE_EL1 do not trap to EL3. EL2 accesses to ICC_SRE_EL1 and ICC_SRE_EL2 do not trap to EL3.

If ICC_SRE_EL3.SRE is RAO/WI, an implementation is permitted to make the Enable bit RAO/WI.

If ICC_SRE_EL3.SRE is 0, the Enable bit behaves as 1 for all purposes other than reading the value of the bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIB, bit [2]

Disable IRQ bypass.

DIB	Meaning
0b0	IRQ bypass enabled.
0b1	IRQ bypass disabled.

In systems that do not support IRQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

DFB, bit [1]

Disable FIQ bypass.

DFB	Meaning
0b0	FIQ bypass enabled.
0b1	FIQ bypass disabled.

In systems that do not support FIQ bypass, this bit is RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SRE, bit [0]

System Register Enable.

SRE	Meaning
0b0	The memory-mapped interface must be used. Access at EL3 to any ICH_* or ICC_* register other than ICC_SRE_EL1, ICC_SRE_EL2, or ICC_SRE_EL3 is trapped to EL3
0b1	The System register interface to the ICH_* registers and the EL1, EL2, and EL3 ICC_* registers is enabled for EL3.

If software changes this bit from 1 to 0, the results are UNPREDICTABLE.

If Realm Management Extension is implemented, this field is RAO/WI.

FEAT_GICv3 implementations that do not require GICv2 compatibility might choose to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICC_SRE_EL3

This register is always System register accessible.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_SRE_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1100	0b1100	0b101

elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    ICC_SRE_EL3() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICH_AP0R<n>_EL2, Interrupt Controller Hyp Active Priorities Group 0 Registers, n = 0 - 3

The ICH_AP0R<n>_EL2 characteristics are:

Purpose

Provides information about Group 0 virtual active priorities for EL2.

Configuration

AArch64 System register ICH_AP0R<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_AP0R<n>[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_AP0R<n>_EL2 are UNDEFINED.

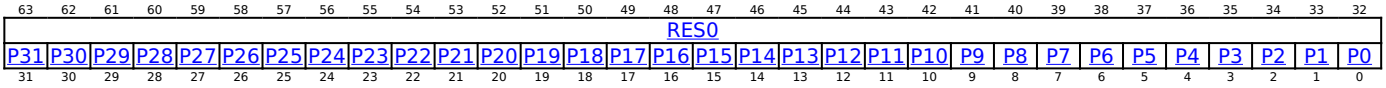
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_AP0R<n>_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Provides the access to the virtual active priorities for Group 0 interrupts. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 0 interrupt active with this priority level, or all active Group 0 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 0 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP0R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP0R0_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP0R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP0R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP0R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP0R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP0R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00000000`.

Additional information

If FEAT_GICv3 is implemented, software must ensure that ICH_AP0R<n>_EL2 is 0 for legacy VMs otherwise behavior is UNPREDICTABLE. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The active priorities for Group 0 and Group 1 interrupts for legacy VMs are held in ICH_AP1R<n>_EL2 and reads and writes to GICV_APR access ICH_AP1R<n>_EL2. This means that ICH_AP0R<n>_EL2 is inaccessible to legacy VMs.

Accessing ICH_AP0R<n>_EL2

If FEAT_GCIE_LEGACY is implemented, only 32 priority levels are supported, which means that ICH_AP0R0_EL2 is the only implemented register.

ICH_AP0R1_EL2 is implemented only in implementations that support 6 or more bits of preemption. ICH_AP0R2_EL2 and ICH_AP0R3_EL2 are implemented only in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>_EL2.
- ICH_AP1R<n>_EL2.

Having the bit corresponding to a priority set in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 can result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_AP0R<m>_EL2 ; Where m = 0-3

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1000	0b0:m[1:0]

NMI, bit [63]
When (FEAT_GICv3_NMI is implemented or FEAT_GCIE_LEGACY is implemented) and n == 0:

Indicates whether the running virtual priority is from a NMI.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
0b1	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Group 1 interrupt active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no Group 1 interrupt active with this priority level, or all active Group 1 interrupts with this priority level have undergone priority-drop.
0b1	There is a Group 1 interrupt active with this priority level which has not undergone priority drop.

The correspondence between priority levels and bits depends on the number of bits of priority that are implemented.

If 5 bits of preemption are implemented (bits [7:3] of priority), then there are 32 preemption levels, and the active state of these preemption levels are held in ICH_AP1R0_EL2 in the bits corresponding to Priority[7:3].

If 6 bits of preemption are implemented (bits [7:2] of priority), then there are 64 preemption levels, and:

- The active state of preemption levels 0 - 124 are held in ICH_AP1R0_EL2 in the bits corresponding to 0:Priority[6:2].
- The active state of preemption levels 128 - 252 are held in ICH_AP1R1_EL2 in the bits corresponding to 1:Priority[6:2].

If 7 bits of preemption are implemented (bits [7:1] of priority), then there are 128 preemption levels, and:

- The active state of preemption levels 0 - 62 are held in ICH_AP1R0_EL2 in the bits corresponding to 00:Priority[5:1].
- The active state of preemption levels 64 - 126 are held in ICH_AP1R1_EL2 in the bits corresponding to 01:Priority[5:1].
- The active state of preemption levels 128 - 190 are held in ICH_AP1R2_EL2 in the bits corresponding to 10:Priority[5:1].
- The active state of preemption levels 192 - 254 are held in ICH_AP1R3_EL2 in the bits corresponding to 11:Priority[5:1].

Note

Having the bit corresponding to a priority set to 1 in both ICH_AP0R<n>_EL2 and ICH_AP1R<n>_EL2 might result in UNPREDICTABLE behavior of the interrupt prioritization system for virtual interrupts.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00000000`.

Additional information

If FEAT_GICv3 is implemented, this register is always used for legacy VMs, regardless of the group of the virtual interrupt. Reads and writes to GICV_APR<n> access ICH_AP1R<n>_EL2. For more information about support for legacy VMs, see 'Support for legacy operation of VMs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing ICH_AP1R<n>_EL2

If FEAT_GCIE_LEGACY is implemented, only 32 priority levels are supported, which means that ICH_AP1R0_EL2 is the only implemented register.

ICH_AP1R1_EL2 is implemented only in implementations that support 6 or more bits of preemption. ICH_AP1R2_EL2 and ICH_AP1R3_EL2 are implemented only in implementations that support 7 bits of preemption. Unimplemented registers are UNDEFINED.

Note

The number of bits of preemption is indicated by ICH_VTR_EL2.PREbits

Writing to these registers with any value other than the last read value of the register (or 0x00000000 for a newly set up virtual machine) can result in UNPREDICTABLE behavior of the virtual interrupt prioritization system allowing either:

- Virtual interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution at EL1 or EL0.

Writing to the active priority registers in any order other than the following order will result in UNPREDICTABLE behavior:

- ICH_AP0R<n>_EL2.
- ICH_AP1R<n>_EL2.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_AP1R<m>_EL2 ; Where m = 0-3

ICH_APR_EL2, Interrupt Controller Active Virtual Priorities Register

The ICH_APR_EL2 characteristics are:

Purpose

Records active priorities for the Virtual Interrupt Domain.

Configuration

AArch64 System register ICH_APR_EL2 bits [63:0] are architecturally mapped to AArch64 System register ICV_APR_EL1[63:0].

This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_APR_EL2 are UNDEFINED.

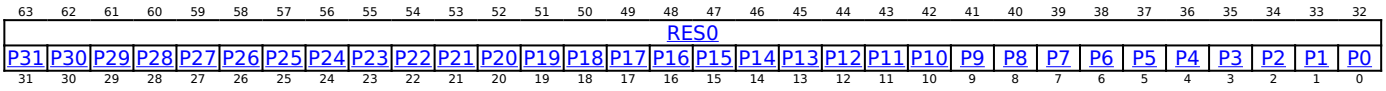
If EL2 is not implemented, this register is RES0 from EL3.

When FEAT_GCIE_LEGACY is implemented, AArch64 System register ICH_APR_EL2 bits [31:0] are architecturally mapped to AArch64 System register ICH_AP1R0_EL2[31:0].

Attributes

ICH_APR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Provides access to the active virtual priorities.

P<x>	Meaning
0b0	Priority not active
0b1	Priority active

This field is an alias of the equivalent field in ICV_APR_EL1.

Accessing ICH_APR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_APR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1000	0b100

ICH_CONTEXTR_EL2, Interrupt Controller Virtual Context Register

The ICH_CONTEXTR_EL2 characteristics are:

Purpose

Selects the current resident VPE.

Configuration

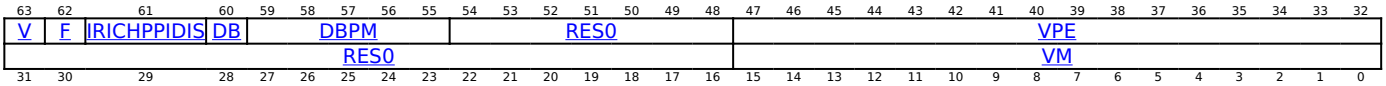
This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_CONTEXTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_CONTEXTR_EL2 is a 64-bit register.

Field descriptions



V, bit [63]

Indicates whether a VPE is currently resident.

If EL2 is not enabled in the Security state identified by SCR_EL3.{NSE,NS}, the Effective value of this field is 0.

V	Meaning
0b0	No VPE is resident.
0b1	A VPE is resident.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

F, bit [62]

Indicates whether the last write that set V to 1 succeeded in making a VPE resident.

F	Meaning
0b0	Success
0b1	Fault

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

IRICHPPIDIS, bit [61]

Specifies whether the candidate HPPI presented by the IRI for the resident VPE is considered when selecting the HPPI for the Virtual Interrupt Domain.

When V is 0, this field is IGNORED.

IRICHPPIDIS	Meaning
0b0	The CPU interface considers both the virtual PPIs and the candidate HPPI presented by the IRI when determining the HPPI for the Virtual Interrupt Domain.
0b1	The CPU interface only considers the virtual PPIs when determining the HPPI for the Virtual Interrupt Domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

DB, bit [60]

Specifies whether a doorbell interrupt is requested when making a VPE non-resident.

DB	Meaning
0b0	No doorbell requested.
0b1	Doorbell requested.

On a write that changes V from 1 to 0, this field specifies whether a doorbell interrupt is requested for the previously resident VPE.

For all other writes, this field is IGNORED.

On reads, this field is RAZ.

If the current value of SCR_EL3.{NSE,NS} is different from the value at the time the VPE was made resident, this field behaves as if set to 0.

This field has no effect if EL2 is not enabled in the Security state identified by SCR_EL3.{NSE,NS}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

DBPM, bits [59:55]

Doorbell priority mask.

On a write that changes V from 1 to 0, when DB is written as 1, this field specifies the minimum priority for a virtual interrupt to trigger the VPE's doorbell.

For all other writes, this field is IGNORED.

On reads, this field is RAZ.

This field has no effect if EL2 is not enabled in the Security state identified by SCR_EL3.{NSE,NS}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [54:48]

Reserved, RES0.

VPE, bits [47:32]

When V is 1, identifies the resident VPE.

When V is 0, this field is IGNORED.

This field has no effect if EL2 is not enabled in the Security state identified by SCR_EL3.{NSE,NS}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [31:16]

Reserved, RES0.

VM, bits [15:0]

When V is 1, identifies the resident VM.

When V is 0, this field is IGNORED.

This field has no effect if EL2 is not enabled in the Security state identified by SCR_EL3.{NSE,NS}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICH_CONTEXTR_EL2

ICH_EISR_EL2, Interrupt Controller End of Interrupt Status Register

The ICH_EISR_EL2 characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

AArch64 System register ICH_EISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_EISR[31:0].

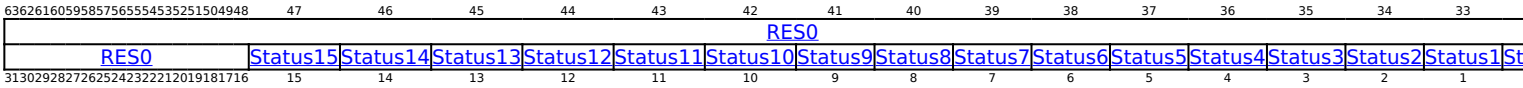
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_EISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_EISR_EL2 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status bit for List register <n>:

Status<n>	Meaning
0b0	List register <n>, ICH_LR<n>_EL2, does not have an EOI maintenance interrupt.
0b1	List register <n>, ICH_LR<n>_EL2, has an EOI maintenance interrupt that has not been handled.

For any ICH_LR<n>_EL2, the corresponding status bit is set to 1 if all of the following are true:

- ICH_LR<n>_EL2.State is 0b00.
- ICH_LR<n>_EL2.HW is 0.
- ICH_LR<n>_EL2.EOI (bit [41]) is 1, indicating that when the interrupt corresponding to that List register is deactivated, a maintenance interrupt is asserted.

Otherwise the status bit takes the value 0.

Accessing ICH_EISR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_EISR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b011

```
if !((IsFeatureImplemented(FEAT_GICv3) || IsFeatureImplemented(FEAT_GCIE_LEGACY)) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then

    end;
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICH_ELRSR_EL2, Interrupt Controller Empty List Register Status Register

The ICH_ELRSR_EL2 characteristics are:

Purpose

These registers can be used to locate a usable List register when the hypervisor is delivering an interrupt to a VM.

Configuration

AArch64 System register ICH_ELRSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_ELRSR[31:0].

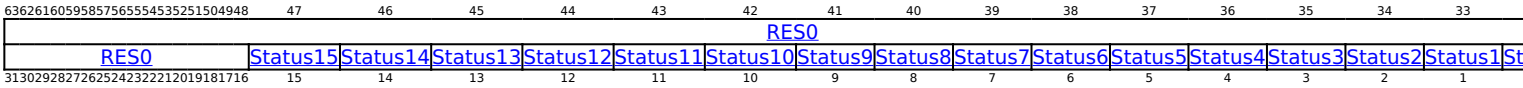
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_ELRSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_ELRSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>, ICH_LR<n>_EL2:

Status<n>	Meaning
0b0	List register ICH_LR<n>_EL2, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	List register ICH_LR<n>_EL2 does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any List register <n>, the corresponding status bit is set to 1 if ICH_LR<n>_EL2.State is 0b00 and either ICH_LR<n>_EL2.HW is 1 or ICH_LR<n>_EL2.EOI (bit [41]) is 0.

Otherwise the status bit takes the value 0.

Accessing ICH_ELRSR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_ELRSR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b101

```
if !((IsFeatureImplemented(FEAT_GICv3) || IsFeatureImplemented(FEAT_GCIE_LEGACY)) && (HaveEL(EL2) || HaveEL(EL3)) &&
IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} && (IsFeatureImplemented(FEAT_GICv3) ||
(IsFeatureImplemented(FEAT_GCIE_LEGACY) && ICH_VCTLR_EL2().V3 == '1')) then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    if ICC_SRE_EL2().SRE == '0' then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        X{64}(t) = ICH_ELRSR_EL2();
    end;
elsif PSTATE.EL == EL3 then
    if ICC_SRE_EL3().SRE == '0' then
        AArch64_SystemAccessTrap(EL3, 0x18);
    else
        X{64}(t) = ICH_ELRSR_EL2();
    end;
end;
```

ICH_HCR_EL2, Interrupt Controller Hyp Control Register

The ICH_HCR_EL2 characteristics are:

Purpose

Controls the environment for the virtual CPU interface.

Configuration

AArch64 System register ICH_HCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_HCR[31:0].

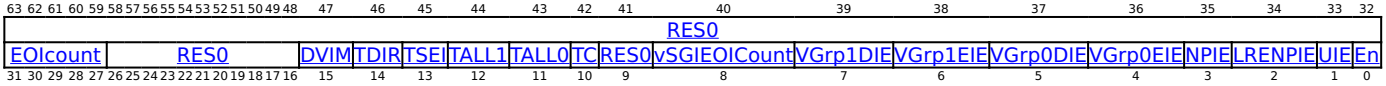
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_HCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

EOIcount, bits [31:27]

This field is incremented whenever a successful write to a virtual EOIR or DIR register would have resulted in a virtual interrupt deactivation. That is either:

- A virtual write to EOIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is zero and no List Register was found.
- A virtual write to DIR with a valid interrupt identifier that is not in the LPI range (that is < 8192) when EOI mode is one and no List Register was found.

This allows software to manage more active interrupts than there are implemented List Registers.

It is CONSTRAINED UNPREDICTABLE whether a virtual write to EOIR that does not clear a bit in the Active Priorities registers (ICH_AP0R<n>_EL2/ ICH_AP1R<n>_EL2) increments EOIcount. Permitted behaviors are:

- Increment EOIcount.
- Leave EOIcount unchanged.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00000'.

Bits [26:16]

Reserved, RES0.

DVIM, bit [15]
When GICv3 is implemented and ICH_VTR_EL2.DVIM == '1':

Directly-injected Virtual Interrupt Mask.

DVIM	Meaning
0b0	This control has no effect on the signaling of virtual interrupts.
0b1	Virtual interrupts received via direct-injection are not presented to the virtual CPU interface and not considered when determining the highest priority pending virtual interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TDIR, bit [14]
When FEAT_GICv3_TDIR is implemented:

Trap EL1 writes to ICC_DIR_EL1 and ICV_DIR_EL1.

TDIR	Meaning
0b0	EL1 writes of ICC_DIR_EL1 and ICV_DIR_EL1 are not trapped to EL2, unless trapped by other mechanisms.
0b1	EL1 writes of ICV_DIR_EL1 are trapped to EL2. It is IMPLEMENTATION DEFINED whether writes of ICC_DIR_EL1 are trapped. Not trapping ICC_DIR_EL1 writes is DEPRECATED.

Arm deprecates not including this trap bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TSEI, bit [13]
When GICv3 is implemented:

Trap all locally generated SEIs. This bit allows the hypervisor to intercept locally generated SEIs that would otherwise be taken at EL1.

TSEI	Meaning
0b0	Locally generated SEIs do not cause a trap to EL2.
0b1	Locally generated SEIs trap to EL2.

If ICH_VTR_EL2.SEIS is 0, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TALL1, bit [12]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 1 interrupts to EL2.

TALL1	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 1 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TALL0, bit [11]

Trap all EL1 accesses to ICC_* and ICV_* System registers for Group 0 interrupts to EL2.

TALL0	Meaning
0b0	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts proceed as normal.
0b1	EL1 accesses to ICC_* and ICV_* registers for Group 0 interrupts trap to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TC, bit [10]

Trap all EL1 accesses to System registers that are common to Group 0 and Group 1 to EL2.

TC	Meaning
0b0	EL1 accesses to common registers proceed as normal.
0b1	EL1 accesses to common registers trap to EL2.

This affects accesses to ICC_SGI0R_EL1, ICC_SGI1R_EL1, ICC_ASGI1R_EL1, ICC_CTLR_EL1, ICC_DIR_EL1, ICC_PMR_EL1, ICC_RPR_EL1, ICV_CTLR_EL1, ICV_DIR_EL1, ICV_PMR_EL1, and ICV_RPR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [9]

Reserved, RES0.

vSGIEOICount, bit [8]
When GICv4.1 is implemented:

Controls whether deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount

vSGIEOICount	Meaning
0b0	Deactivation of virtual SGIs can increment ICH_HCR_EL2.EOIcount.
0b1	Deactivation of virtual SGIs does not increment ICH_HCR_EL2.EOIcount.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG1 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable. Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected vPE is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when ICH_VMCR_EL2.VENG0 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

NPIE, bit [3]

No Pending Interrupt Enable. Enables the signaling of a maintenance interrupt when there are no List registers with the State field set to 0b01 (pending):

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable. Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register entry for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted while the EOIcount field is not 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

UIE, bit [1]

Underflow Interrupt Enable. Enables the signaling of a maintenance interrupt when the List registers are empty, or hold only one valid entry:

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt is asserted if none, or only one, of the List register entries is marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

En, bit [0]

Enable. Global enable bit for the virtual CPU interface:

En	Meaning
0b0	Virtual CPU interface operation disabled.
0b1	Virtual CPU interface operation enabled.

If FEAT_GCIE_LEGACY is implemented and ICH_VCTLR_EL2.V3 is 0, the Effective value of this field is 0.

When this field is set to 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of ICV_IAR0_EL1, ICV_IAR1_EL1, ICV_NMIAR1_EL1, GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

Note

This field is RES0 when SCR_EL3.{NS,EEL2}=={0,0}

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing ICH_HCR_EL2

ICH_HFGITR_EL2, Hypervisor GIC Fine-Grained Instruction Trap Register

The ICH_HFGITR_EL2 characteristics are:

Purpose

Provides instruction trap controls for GIC System instructions.

Configuration

This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_HFGITR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HFGITR_EL2 is a 64-bit register.

Field descriptions

Bits [63:11]

Reserved, RES0.

GICRCDNMIA, bit [10]

Trap execution of GICR CDNMIA at EL1 to EL2.

GICRCDNMIA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GICR CDNMIA at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GICR CDNMIA is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICRCDIA, bit [9]

Trap execution of GICR CDIA at EL1 to EL2.

GICRCDIA	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GICR CDIA at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GICR CDIA is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDDI, bit [8]

Trap execution of GIC CDDI at EL1 to EL2.

GICCDDI	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDDI at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDDI is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDEOI, bit [7]

Trap execution of GIC CDEOI at EL1 to EL2.

GICCDEOI	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDEOI at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDEOI is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDHM, bit [6]

Trap execution of GIC CDHM at EL1 to EL2.

GICCDHM	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDHM at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDHM is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDRCFG, bit [5]

Trap execution of GIC CDRCFG at EL1 to EL2.

GICCDRCFG	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDRCFG at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDRCFG is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDPEND, bit [4]

Trap execution of GIC CDPEND at EL1 to EL2.

GICCDPEND	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDPEND at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDPEND is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDAFF, bit [3]

Trap execution of GIC CDAFF at EL1 to EL2.

GICCDAFF	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDAFF at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDAFF is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDPRI, bit [2]

Trap execution of GIC CDPRI at EL1 to EL2.

GICCDPRI	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDPRI at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDPRI is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDDIS, bit [1]

Trap execution of GIC CDDIS at EL1 to EL2.

GICCDDIS	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDDIS at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDDIS is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

GICCDEN, bit [0]

Trap execution of GIC CDEN at EL1 to EL2.

GICCDEN	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then execution of GIC CDEN at EL1 is trapped to EL2 and reported with EC syndrome value 0x18, unless the instruction generates a higher priority exception.
0b1	Execution of GIC CDEN is not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICH_HFGITR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_HFGITR_EL2

ICH_HFGRTR_EL2, Hypervisor GIC Fine-Grained Read Trap Register

The ICH_HFGRTR_EL2 characteristics are:

Purpose

Provides controls for traps of MRS reads of GIC System registers.

Configuration

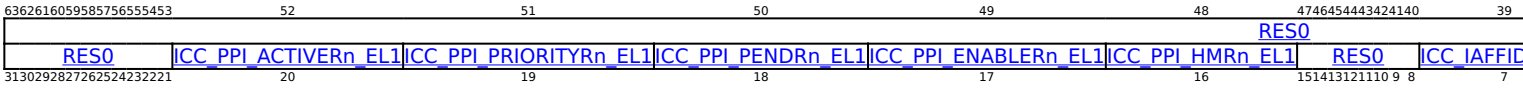
This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_HFGRTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HFGRTR_EL2 is a 64-bit register.

Field descriptions



Bits [63:21]

Reserved, RES0.

ICC_PPI_ACTIVERn_EL1, bit [20]

Trap MRS reads of ICC_PPI_CACTIVER<n>_EL1, ICC_PPI_SACTIVER<n>_EL1, ICV_PPI_CACTIVER<n>_EL1 and ICV_PPI_SACTIVER<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_ACTIVERn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PPI_PRIORITYRn_EL1, bit [19]

Trap MRS reads of ICC_PPI_PRIORITYR<n>_EL1 and ICV_PPI_PRIORITYR<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_PRIORITYRn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PPI_PENDRn_EL1, bit [18]

Trap MRS reads of ICC_PPI_CPENDR<n>_EL1, ICC_PPI_SPENDR<n>_EL1 ICV_PPI_CPENDR<n>_EL1 and ICV_PPI_SPENDR<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_PENDRn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PPI_ENABLERn_EL1, bit [17]

Trap MRS reads of ICC_PPI_ENABLER<n>_EL1 and ICV_PPI_ENABLER<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_ENABLERn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PPI_HMRn_EL1, bit [16]

Trap MRS reads of ICC_PPI_HMR<n>_EL1 and ICV_PPI_HMR<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_HMRn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [15:8]

Reserved, RES0.

ICC_IAFFIDR_EL1, bit [7]

Trap MRS reads of ICC_IAFFIDR_EL1 at EL1 using AArch64 to EL2.

ICC_IAFFIDR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_ICSR_EL1, bit [6]

Trap MRS reads of ICC_ICSR_EL1 at EL1 using AArch64 to EL2.

ICC_ICSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PCR_EL1, bit [5]

Trap MRS reads of ICC_PCR_EL1 and ICV_PCR_EL1 at EL1 using AArch64 to EL2.

ICC_PCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_HPPIR_EL1, bit [4]

Trap MRS reads of ICC_HPPIR_EL1 and ICV_HPPIR_EL1 at EL1 using AArch64 to EL2.

ICC_HPPIR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_HAPR_EL1, bit [3]

Trap MRS reads of ICC_HAPR_EL1 and ICV_HAPR_EL1 at EL1 using AArch64 to EL2.

ICC_HAPR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_CR0_EL1, bit [2]

Trap MRS reads of ICC_CR0_EL1 and ICV_CR0_EL1 at EL1 using AArch64 to EL2.

ICC_CR0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_IDRn_EL1, bit [1]

Trap MRS reads of ICC_IDR0_EL1 at EL1 using AArch64 to EL2.

ICC_IDRn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_APR_EL1, bit [0]

Trap MRS reads of ICC_APR_EL1 and ICV_APR_EL1 at EL1 using AArch64 to EL2.

ICC_APR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MRS reads of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MRS reads of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICH_HFGWTR_EL2, Hypervisor GIC Fine-Grained Write Trap Register

The ICH_HFGWTR_EL2 characteristics are:

Purpose

Provides controls for traps of MSR writes of GIC System registers.

Configuration

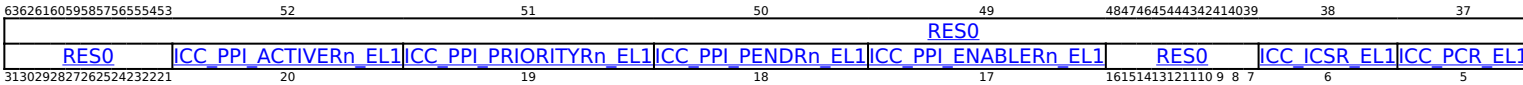
This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_HFGWTR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HFGWTR_EL2 is a 64-bit register.

Field descriptions



Bits [63:21]

Reserved, RES0.

ICC_PPI_ACTIVERn_EL1, bit [20]

Trap MSR writes of ICC_PPI_CACTIVER<n>_EL1, ICC_PPI_SACTIVER<n>_EL1, ICV_PPI_CACTIVER<n>_EL1 and ICV_PPI_SACTIVER<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_ACTIVERn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PPI_PRIORITYRn_EL1, bit [19]

Trap MSR writes of ICC_PPI_PRIORITYR<n>_EL1 and ICV_PPI_PRIORITYR<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_PRIORITYRn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PPI_PENDRn_EL1, bit [18]

Trap MSR writes of ICC_PPI_CPENDR<n>_EL1, ICC_PPI_SPENDR<n>_EL1 ICV_PPI_CPENDR<n>_EL1 and ICV_PPI_SPENDR<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_PENDRn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PPI_ENABLERn_EL1, bit [17]

Trap MSR writes of ICC_PPI_ENABLER<n>_EL1 and ICV_PPI_ENABLER<n>_EL1 at EL1 using AArch64 to EL2.

ICC_PPI_ENABLERn_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [16:7]

Reserved, RES0.

ICC_ICSR_EL1, bit [6]

Trap MSR writes of ICC_ICSR_EL1 at EL1 using AArch64 to EL2.

ICC_ICSR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

ICC_PCR_EL1, bit [5]

Trap MSR writes of ICC_PCR_EL1 and ICV_PCR_EL1 at EL1 using AArch64 to EL2.

ICC_PCR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bits [4:3]

Reserved, RES0.

ICC_CR0_EL1, bit [2]

Trap MSR writes of ICC_CR0_EL1 and ICV_CR0_EL1 at EL1 using AArch64 to EL2.

ICC_CR0_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Bit [1]

Reserved, RES0.

ICC_APR_EL1, bit [0]

Trap MSR writes of ICC_APR_EL1 and ICV_APR_EL1 at EL1 using AArch64 to EL2.

ICC_APR_EL1	Meaning
0b0	If EL2 is implemented and enabled in the current Security state, then MSR writes of the specified registers at EL1 using AArch64 are trapped to EL2 and reported with EC syndrome value 0x18, unless the read generates a higher priority exception.
0b1	MSR writes of the specified registers are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICH_HFGWTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

end;
```

2025-12-10 16:11:30, 2025-12_rel

ICH_HPPIR_EL2, Interrupt Controller Hypervisor Highest Priority Pending Interrupt Register

The ICH_HPPIR_EL2 characteristics are:

Purpose

Reports the HPPI for the Virtual Interrupt Domain.

Configuration

AArch64 System register ICH_HPPIR_EL2 bits [63:0] are architecturally mapped to AArch64 System register ICV_HPPIR_EL1[63:0].

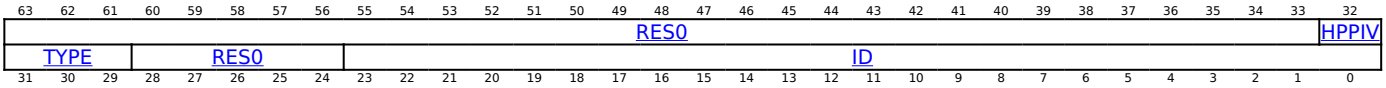
This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_HPPIR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_HPPIR_EL2 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

HPPIV, bit [32]

HPPI valid.

There is an HPPI with Sufficient priority for the Interrupt Domain.

HPPIV	Meaning
0b0	Invalid: There is no HPPI with Sufficient priority for the Interrupt Domain.
0b1	VALID: There is an HPPI with Sufficient priority for the Interrupt Domain.

If ICH_HPPIR_EL2.HPPIV is 1, ID and TYPE together form the INTID of the HPPI for the Interrupt Domain.

TYPE, bits [31:29]

The encoding of this field depends on the value of HPPIV as described below:

- If ICH_HPPIR_EL2.HPPIV is 0, TYPE is RES0.
- If ICH_HPPIR_EL2.HPPIV is 1, TYPE specifies the Type of the interrupt.

TYPE	Meaning
0b001	PPI
0b010	LPI
0b011	SPI

Values not defined above are reserved.

Bits [28:24]

Reserved, RES0.

ID, bits [23:0]

The encoding of this field depends on the value of HPPIV as described below:

- If ICH_HPPIR_EL2.HPPIV is 0, ID is RES0.
- If ICH_HPPIR_EL2.HPPIV is 1, ID specifies the interrupt ID.

Accessing ICH_HPPIR_EL2

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_HPPIR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1000	0b101

```
if !(IsFeatureImplemented(FEAT_GCIE) && (HaveEL(EL2) || HaveEL(EL3)) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} && (!IsFeatureImplemented(FEAT_GCIE_LEGACY) ||
(IsFeatureImplemented(FEAT_GCIE_LEGACY) && ICH_VCTLR_EL2().V3 == '0')) then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = ICH_HPPIR_EL2();
elsif PSTATE.EL == EL3 then
    X{64}(t) = ICH_HPPIR_EL2();
end;
```

2025-12-10 16:11:30, 2025-12_rel

ICH_LR<n>_EL2, Interrupt Controller List Registers, n = 0 - 15

The ICH_LR<n>_EL2 characteristics are:

Purpose

Provides interrupt context information for the virtual CPU interface.

Configuration

AArch64 System register ICH_LR<n>_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_LR<n>[31:0].

AArch64 System register ICH_LR<n>_EL2 bits [63:32] are architecturally mapped to AArch32 System register ICH_LRC<n>[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_LR<n>_EL2 are UNDEFINED.

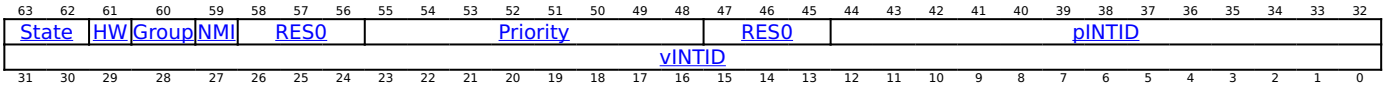
If EL2 is not implemented, this register is RES0 from EL3.

If list register n is not implemented, then accesses to this register are UNDEFINED.

Attributes

ICH_LR<n>_EL2 is a 64-bit register.

Field descriptions



State, bits [63:62]

The state of the interrupt:

State	Meaning
0b00	Invalid (Inactive).
0b01	Pending.
0b10	Active.
0b11	Pending and active.

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. When a virtual interrupt from a List register is acknowledged, the state is updated to the active state regardless of the interrupt type.

Entries in the invalid state are ignored, except for the purpose of generating virtual maintenance interrupts.

For hardware interrupts, the pending and active state is held in the physical Distributor rather than the virtual CPU interface. A hypervisor must only use the pending and active state for software originated interrupts, which are typically associated with virtual devices, or SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HW, bit [61]

Indicates whether this virtual interrupt maps directly to a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt with the ID that the pINTID field indicates.

HW	Meaning
0b0	The interrupt is triggered entirely by software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	If FEAT_GICv3 is implemented, all of the following are true: • The interrupt maps directly to a hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using the pINTID field from this register to indicate the physical interrupt ID. • If ICH_VMCR_EL2.VEOIM is 0, this request corresponds to a write to ICC_EOIR0_EL1 or ICC_EOIR1_EL1. Otherwise, it corresponds to a write to ICC_DIR_EL1. If FEAT_GCIE_LEGACY is implemented, the virtual interrupt also deactivates the physical interrupt specified in pINTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [60]

Indicates the group for this virtual interrupt.

Group	Meaning
0b0	This is a Group 0 virtual interrupt. ICH_VMCR_EL2.VFIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and ICH_VMCR_EL2.VENG0 enables signaling of this interrupt to the virtual machine.
0b1	This is a Group 1 virtual interrupt, signaled as a virtual IRQ. ICH_VMCR_EL2.VENG1 enables the signaling of this interrupt to the virtual machine. If ICH_VMCR_EL2.VCBPR is 0, then ICC_BPR1_EL1 determines if a pending Group 1 interrupt has sufficient priority to preempt current execution. Otherwise, ICH_LR<n>_EL2 determines preemption.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NMI, bit [59]
When FEAT_GICv3_NMI is implemented:

Indicates whether the virtual priority has the non-maskable property.

NMI	Meaning
0b0	vINTID does not have the non-maskable interrupt property.
0b1	vINTID has the non-maskable interrupt property.

Setting ICH_LR<n>_EL2.NMI to 1 when ICH_LR<n>_EL2.State is not Invalid is CONSTRAINTED UNPREDICTABLE if either ICH_LR<n>_EL2.vINTID indicates an LPI or ICH_LR<n>_EL2.Group is 0.

The permitted behaviors are:

- ICH_LR<n>_EL2.NMI is treated as 0 for all purposes other than a direct read of the register.
- The virtual interrupt is presented with superpriority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

Priority, bits [55:48]

The priority of this interrupt.

It is IMPLEMENTATION DEFINED how many bits of priority are implemented, though at least five bits must be implemented. Unimplemented bits are RES0 and start from bit[48] up to bit[50]. The number of implemented bits can be discovered from ICH_VTR_EL2.PRIbits.

When ICH_LR<n>_EL2.NMI is set to 1, this field is RES0 and the virtual interrupt's priority is treated as 0x00.

If FEAT_GCIE_LEGACY is implemented, 5 bits of priority are implemented meaning that bits[50:48] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:45]

Reserved, RES0.

pINTID, bits [44:32]
When FEAT_GCIE_LEGACY is implemented:

Physical PPI INTID, for hardware interrupts.

When ICH_LR<n>_EL2.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42]: RES0.
- Bit[41]: EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.
- Bits[40:32]: RES0.

When ICH_LR<n>_EL2.HW is 1 (there is a corresponding physical interrupt):

- This field specifies the ID of a physical PPI in the Current Physical Interrupt Domain.
- This field is only required to implement enough bits to hold a valid value for the implemented physical PPIs. Any unused higher order bits are RES0.
- If pINTID specifies an unreachable PPI, no physical interrupt is deactivated.

Otherwise:

Physical INTID, for hardware interrupts.

When ICH_LR<n>_EL2.HW is 0 (there is no corresponding physical interrupt), this field has the following meaning:

- Bits[44:42]: RES0.
- Bit[41]: EOI. If this bit is 1, then when the interrupt identified by vINTID is deactivated, a maintenance interrupt is asserted.
- Bits[40:32]: RES0.

When ICH_LR<n>_EL2.HW is 1 (there is a corresponding physical interrupt):

- This field indicates the physical INTID. This field is only required to implement enough bits to hold a valid value for the implemented INTID size. Any unused higher order bits are RES0.
- When ICC_CTLR_EL1.ExtRange is 0, then bits[44:42] of this field are RES0.
- If the value of pINTID is not a valid INTID, behavior is UNPREDICTABLE. If the value of pINTID indicates a PPI, this field applies to the PPI associated with this same physical PE ID as the virtual CPU interface requesting the deactivation.

A hardware physical identifier is only required in List Registers for interrupts that require deactivation. This means only 13 bits of Physical INTID are required, regardless of the number specified by ICC_CTLR_EL1.IDbits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

vINTID, bits [31:0]

Virtual INTID of the interrupt.

If the value of vINTID is 1020-1023 and ICH_LR<n>_EL2.State!=0b00 (Inactive), behavior is UNPREDICTABLE.

Behavior is UNPREDICTABLE if two or more List Registers specify the same vINTID when:

- ICH_LR<n>_EL2.State == 0b01.
- ICH_LR<n>_EL2.State == 0b10.
- ICH_LR<n>_EL2.State == 0b11.

It is IMPLEMENTATION DEFINED how many bits are implemented, though at least 16 bits must be implemented. Unimplemented bits are RES0. The number of implemented bits can be discovered from ICH_VTR_EL2.IDbits.

When ICC_SRE_EL1.SRE == 0, specifying a vINTID in the LPI range is UNPREDICTABLE

Note

When a VM is using memory-mapped access to the GIC, software must ensure that the correct source PE ID is provided in bits[12:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICH_LR<n>_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_LR<m>_EL2 ; Where m = 0-15

ICH_MISR_EL2, Interrupt Controller Maintenance Interrupt State Register

The ICH_MISR_EL2 characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

AArch64 System register ICH_MISR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_MISR[31:0].

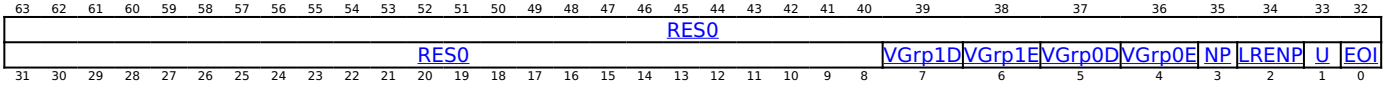
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_MISR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_MISR_EL2 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1DIE==1 and ICH_VMCR_EL2.VENG1==is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp1EIE==1 and ICH_VMCR_EL2.VENG1==is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp0DIE==1 and ICH_VMCR_EL2.VENG0==0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.VGrp0EIE==1 and ICH_VMCR_EL2.VENG0==1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.NPIE==1 and no List register is in pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

LRENP, bit [2]

List Register Entry Not Present.

LRENP	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.LRENPIE==1 and ICH_HCR_EL2.EOIcount is nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when ICH_HCR_EL2.UIE==1 and zero or one of the List register entries are marked as a valid interrupt, that is, if the corresponding ICH_LR<n>_EL2.State bits do not equal 0x0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in ICH_EISR_EL2 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Additional information

The U and NP bits do not include the status of any pending/active 'VSet (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) packets because these bits control generation of interrupts that allow software management of the contents of the List Registers (which are not affected by 'VSet (IRI)' packets).

Accessing ICH_MISR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_MISR_EL2

ICH_PPI_ACTIVER<n>_EL2, Interrupt Controller Virtual Interrupt Active Registers, n = 0 - 1

The ICH_PPI_ACTIVER<n>_EL2 characteristics are:

Purpose

Access to Active state for virtual PPIs.

Configuration

AArch64 System register ICH_PPI_ACTIVER<n>_EL2 bits [63:0] are architecturally mapped to AArch64 System register ICV_PPI_CACTIVER<n>_EL1[63:0].

AArch64 System register ICH_PPI_ACTIVER<n>_EL2 bits [63:0] are architecturally mapped to AArch64 System register ICV_PPI_SACTIVER<n>_EL1[63:0].

This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_PPI_ACTIVER<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_PPI_ACTIVER<n>_EL2 is a 64-bit register.

Field descriptions

ICH_PPI_DVIR<n>_EL2, Interrupt Controller PPI Direct-inject Virtual Interrupt Registers, n = 0 - 1

The ICH_PPI_DVIR<n>_EL2 characteristics are:

Purpose

Controls whether Pending physical PPIs are directly injected as virtual PPIs to the Virtual Interrupt Domain.

Configuration

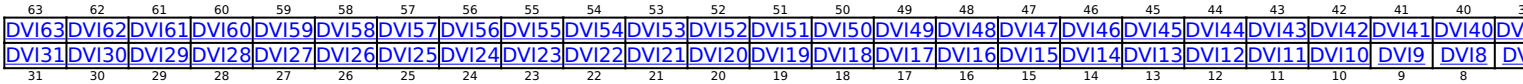
This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_PPI_DVIR<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_PPI_DVIR<n>_EL2 is a 64-bit register.

Field descriptions



DVI<x>, bit [x], for x = 63 to 0

Controls whether the physical PPI Pending state is directly injected to a virtual PPI in the Virtual Interrupt Domain.

DVI<x>	Meaning
0b0	Physical PPI <x> is not directly injected as a virtual PPI.
0b1	Physical PPI <x> is directly injected as a virtual PPI.

The Effective value of DVI<x> is 0 if any of the following are true:

- Physical PPI <x> is not assigned to Current Physical Interrupt Domain.
- Physical PPI <x> is assigned to the EL3 Interrupt Domain.
- Physical PPI <x> is assigned to the Secure Interrupt Domain and SCR_EL3.EEL2 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 64) + x), access to this field is RES0 .
- Access to this field is RAZ/WI if all the following are true:
  - !IsPPIAssignedToCurrentDomain((n * 64) + x).
  - PSTATE.EL IN {EL2, EL1}.
- Otherwise, access to this field is RW.

Accessing ICH_PPI_DVIR<n>_EL2

Accesses to this register use the following encodings in the System register encoding space:

ICH_PPI_PRIORITYR<n>_EL2, Interrupt Controller Virtual Interrupt Priority Registers, n = 0 - 15

The ICH_PPI_PRIORITYR<n>_EL2 characteristics are:

Purpose

Priority of virtual PPIs.

Configuration

AArch64 System register ICH_PPI_PRIORITYR<n>_EL2 bits [63:0] are architecturally mapped to AArch64 System register ICV_PPI_PRIORITYR<n>_EL1[63:0].

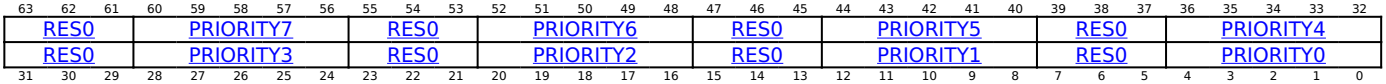
This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_PPI_PRIORITYR<n>_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_PPI_PRIORITYR<n>_EL2 is a 64-bit register.

Field descriptions



Bits [63:61, 55:53, 47:45, 39:37, 31:29, 23:21, 15:13, 7:5]

Reserved, RES0.

PRIORITY<x>, bits [60:56, 52:48, 44:40, 36:32, 28:24, 20:16, 12:8, 4:0], for x = 7 to 0, where each field is 5 bits wide

Alias of equivalent ICV_PPI_PRIORITY<n>_EL1 field.

Fields corresponding to unimplemented INTIDs are RES0.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 8) + x), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing ICH_PPI_PRIORITYR<n>_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_PPI_PRIORITYR<n>_EL2 ; Where n = 0-15

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b111:n[3]	n[2:0]

```
let n:integer = UInt(CRm[0] :: op2[2:0]);

ICH_VCTLR_EL2, Interrupt Controller Virtual CPU interface Control Register

The ICH_VCTLR_EL2 characteristics are:

Purpose

Controls behavior of the Virtual CPU interface.

Configuration

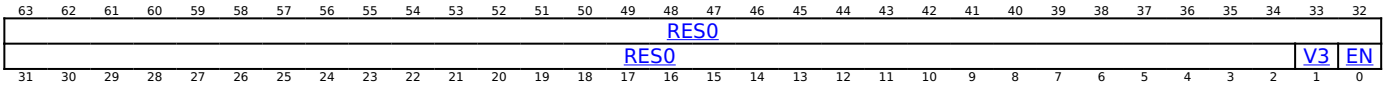
This register is present only when FEAT_GCIE is implemented, (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_VCTLR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

ICH_VCTLR_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

V3, bit [1]
When FEAT_GCIE_LEGACY is implemented:

Enable bit for Legacy operation.

If EL2 is not enabled in the Security state identified by SCR_EL3.{NSE,NS}, the Effective value of this field is 0.

When the Effective value of this field is 0, the Effective value of ICH_HCR_EL2.En is 0.

See 'Legacy virtual CPU interface' for more information.

V3	Meaning
0b0	Legacy operation disabled.
0b1	Legacy operation enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN, bit [0]
When FEAT_GCIE_LEGACY is not implemented or (FEAT_GCIE_LEGACY is implemented and ICH_VCTLR_EL2.V3 == '0'):

Enable interrupts for the Virtual Interrupt Domain.

If EL2 is not enabled in the Security state identified by SCR_EL3.{NSE,NS}, the Effective value of this field is 0.

EN	Meaning
0b0	Disabled.
0b1	Enabled.

When this field is 0, there is no HPPI of Sufficient priority for the Virtual Interrupt Domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing ICH_VCTLR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_VCTLR_EL2

op0	op1	CRn	CRm	op2

end;
```

2025-12-10 16:11:30, 2025-12_rel

ICH_VMCR_EL2, Interrupt Controller Virtual Machine Control Register

The ICH_VMCR_EL2 characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state.

Configuration

AArch64 System register ICH_VMCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VMCR[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_VMCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

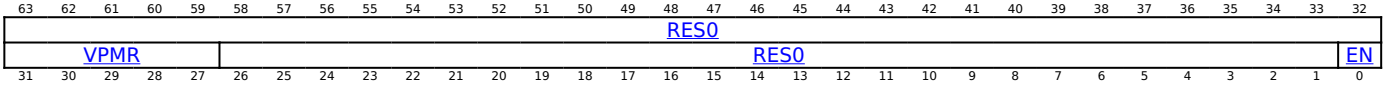
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_VMCR_EL2 is a 64-bit register.

Field descriptions

When FEAT_GCIE is implemented and (FEAT_GCIE_LEGACY is not implemented or (FEAT_GCIE_LEGACY is implemented and ICH_VCTLR_EL2.V3 == '0')):



Bits [63:32]

Reserved, RES0.

VPMR, bits [31:27]

Virtual priority mask.

This field is an alias of ICV_PCR_EL1.Priority.

Bits [26:1]

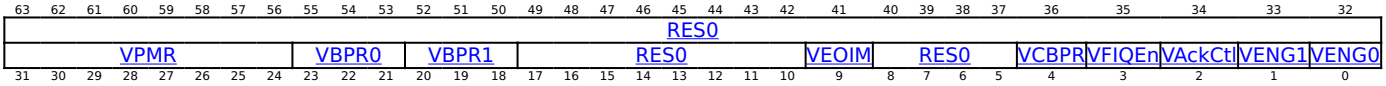
Reserved, RES0.

EN, bit [0]

Enables interrupts for the Virtual Interrupt Domain. When this field is 0, there is no HPPI of Sufficient priority for the Virtual Interrupt Domain.

This field is an alias of ICV_CR0_EL1.EN.

Otherwise:



Bits [63:32]

Reserved, RES0.

VPMR, bits [31:24]

Virtual Priority Mask. The priority mask level for the virtual CPU interface. If the priority of a pending virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

This field is an alias of ICV_PMR_EL1.Priority.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 1.

This field is an alias of ICV_BPR0_EL1.BinaryPoint.

The minimum value of this field is determined by ICH_VTR_EL2.PREbits. An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption if ICH_VMCR_EL2.VCBPR == 0.

This field is an alias of ICV_BPR1_EL1.BinaryPoint.

This field is always accessible to EL2 accesses, regardless of the setting of the ICH_VMCR_EL2.VCBPR field.

For Non-secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

VEOIM	Meaning
0b0	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.
0b1	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

This bit is an alias of ICV_CTLR_EL1.EOImode.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
0b1	ICV_BPR0_EL1 determines the preemption group for virtual Group 1 interrupts.

This field is an alias of ICV_CTLR_EL1.CBPR.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This bit is an alias of GICV_CTLR.FIQEn.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES1.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This bit is an alias of GICV_CTLR.AckCtl.

This field is supported for backward compatibility with GICv2. Arm deprecates the use of this field.

In implementations where the Non-secure copy of ICC_SRE_EL1.SRE is always 1, this bit is RES0.

VENG1, bit [1]

Virtual Group 1 interrupt enable. Possible values of this bit are:

VENG1	Meaning
0b0	Virtual Group 1 interrupts are disabled.
0b1	Virtual Group 1 interrupts are enabled.

This bit is an alias of ICV_IGRPEN1_EL1.Enable.

VENG0, bit [0]

Virtual Group 0 interrupt enable. Possible values of this bit are:

VENG0	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

This bit is an alias of ICV_IGRPEN0_EL1.Enable.

Accessing ICH_VMCR_EL2

When EL2 is using System register access, EL1 using either System register or memory-mapped access must be supported.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_VMCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b1011	0b111

ICH_VTR_EL2, Interrupt Controller VGIC Type Register

The ICH_VTR_EL2 characteristics are:

Purpose

Reports supported GIC virtualization features.

Configuration

AArch64 System register ICH_VTR_EL2 bits [31:0] are architecturally mapped to AArch32 System register ICH_VTR[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), (EL2 is implemented or EL3 is implemented), and FEAT_AA64 is implemented. Otherwise, direct accesses to ICH_VTR_EL2 are UNDEFINED.

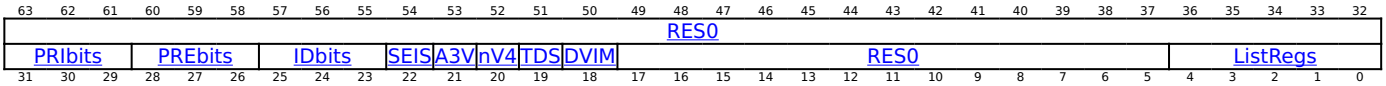
If EL2 is not implemented, this register is RES0 from EL3, except for nV4, which is RES1 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

ICH_VTR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

PRIbits, bits [31:29]

Priority bits. Indicates the number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

This field is an alias of ICV_CTLR_EL1.PRIbits.

If FEAT_GCIE_LEGACY is implemented, this field returns 4 (5 bits of priority).

The value of this field is an IMPLEMENTATION DEFINED choice of:

PRIbits	Meaning
0b100..0b110	The number of virtual priority bits implemented, minus one.

Access to this field is RO.

PREbits, bits [28:26]

Preemption bits. Indicates the number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of ICH_VTR_EL2.PRIbits.

This field determines the minimum value of ICH_VMCR_EL2.VBPR0.

If FEAT_GCIE_LEGACY is implemented, this field returns 4 (5 bits of preemption).

The value of this field is an IMPLEMENTATION DEFINED choice of:

PREbits	Meaning
0b000..0b110	The number of virtual preemption bits implemented, minus one.

Access to this field is RO.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

This field is an alias of ICV_CTLR_EL1.IDbits.

Access to this field is RO.

SEIS, bit [22]
When FEAT_GCIE_LEGACY is implemented:

SEI Support. The virtual CPU interface does not support generation of SEIs.

Reads as 0b0.

Access to this field is RO.

Otherwise:

SEI Support. Indicates whether the virtual CPU interface supports generation of SEIs:

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

This bit is an alias of ICV_CTLR_EL1.SEIS.

Access to this field is RO.

A3V, bit [21]

Affinity 3 Valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

This bit is an alias of ICV_CTLR_EL1.A3V.

Access to this field is RO.

nV4, bit [20]
When FEAT_GCIE_LEGACY is implemented:

Direct injection of virtual interrupts not supported.

Reads as 0b1.

Access to this field is RO.

Otherwise:

Direct injection of virtual interrupts not supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nV4	Meaning
0b0	The CPU interface logic supports direct injection of virtual interrupts.
0b1	The CPU interface logic does not support direct injection of virtual interrupts.

In GICv3, the only permitted value is 0b1.

Access to this field is RO.

TDS, bit [19]
When FEAT_GICv3_TDIR is implemented:

Separate trapping of EL1 writes to ICV_DIR_EL1 supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TDS	Meaning
0b0	Implementation does not support ICH_HCR_EL2.TDIR.
0b1	Implementation supports ICH_HCR_EL2.TDIR.

FEAT_GICv3_TDIR implements the functionality added by the value 0b1.

Access to this field is RO.

When FEAT_GCIE_LEGACY is implemented:

Separate trapping of EL1 writes to ICV_DIR_EL1 supported.

FEAT_GICv3_TDIR implements the functionality added by the value 0b1.

Reads as 0b1.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DVIM, bit [18]
When FEAT_GCIE_LEGACY is implemented:

Masking of directly-injected virtual interrupts.

Reads as 0b0.

Access to this field is RO.

Otherwise:

Masking of directly-injected virtual interrupts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DVIM	Meaning
0b0	Masking of Directly-injected Virtual Interrupts not supported.
0b1	Masking of Directly-injected Virtual Interrupts is supported.

When a PE implements the Realm Management Extension, this field is RAO/WI.

Access to this field is RO.

Bits [17:5]

Reserved, RES0.

ListRegs, bits [4:0]

List Registers. Indicates the number of List registers implemented, minus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ListRegs	Meaning
0b00000..0b01111	The number of List registers implemented, minus one.

Access to this field is RO.

Accessing ICH_VTR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICH_VTR_EL2

ICV_AP0R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 0 Registers, n = 0 - 3

The ICV_AP0R<n>_EL1 characteristics are:

Purpose

Provides information about virtual Group 0 active priorities.

Configuration

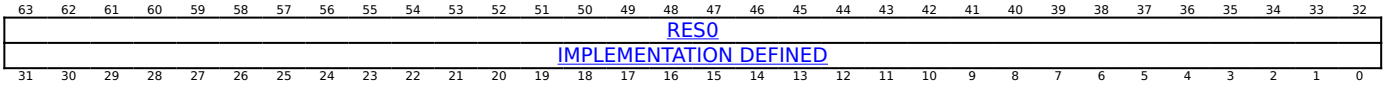
AArch64 System register ICV_AP0R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP0R<n>[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_AP0R<n>_EL1 are UNDEFINED.

Attributes

ICV_AP0R<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICV_AP0R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 0 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

If FEAT_GCIE_LEGACY is implemented, only 32 priority levels are supported, which means that ICV_AP0R0_EL1 is the only implemented register.

ICV_AP0R1_EL1 is implemented only in implementations that support 6 or more bits of priority. ICV_AP0R2_EL1 and ICV_AP0R3_EL1 are implemented only in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>_EL1.
- ICV_AP1R<n>_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_AP0R<m>_EL1 ; Where m = 0-3

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b1:m[1:0]

ICV_AP1R<n>_EL1, Interrupt Controller Virtual Active Priorities Group 1 Registers, n = 0 - 3

The ICV_AP1R<n>_EL1 characteristics are:

Purpose

Provides information about virtual Group 1 active priorities.

Configuration

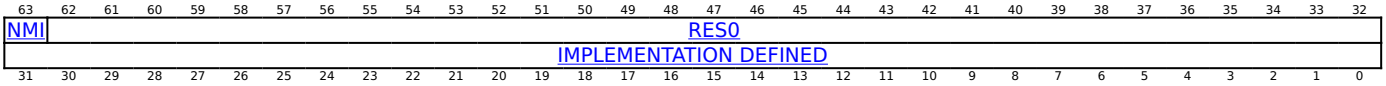
AArch64 System register ICV_AP1R<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_AP1R<n>[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_AP1R<n>_EL1 are UNDEFINED.

Attributes

ICV_AP1R<n>_EL1 is a 64-bit register.

Field descriptions



NMI, bit [63]
When FEAT_GICv3_NMI is implemented and n == 0:

Indicates whether the running priority is from a NMI.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority-drop.
0b1	There is an active Group 1 NMI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [62:32]

Reserved, RES0.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

Accessing ICV_AP1R<n>_EL1

Writing to these registers with any value other than the last read value of the register (or 0x00000000 when there are no Group 1 active priorities) might result in UNPREDICTABLE behavior of the virtual interrupt prioritization system, causing:

- Interrupts that should preempt execution to not preempt execution.
- Interrupts that should not preempt execution to preempt execution.

If FEAT_GCIE_LEGACY is implemented, only 32 priority levels are supported, which means that ICV_AP1R0_EL1 is the only implemented register.

ICV_AP1R1_EL1 is implemented only in implementations that support 6 or more bits of priority. ICV_AP1R2_EL1 and ICV_AP1R3_EL1 are implemented only in implementations that support 7 bits of priority. Unimplemented registers are UNDEFINED.

Writing to the active priority registers in any order other than the following order might result in UNPREDICTABLE behavior of the interrupt prioritization system:

- ICV_AP0R<n>_EL1.

ICV_APR_EL1, Interrupt Controller Virtual Active Priorities Register

The ICV_APR_EL1 characteristics are:

Purpose

Records active priorities for the Virtual CPU interface.

Configuration

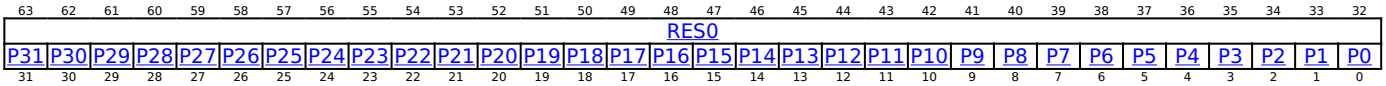
AArch64 System register ICV_APR_EL1 bits [63:0] are architecturally mapped to AArch64 System register ICH_APR_EL2[63:0].

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_APR_EL1 are UNDEFINED.

Attributes

ICV_APR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

P<x>, bit [x], for x = 31 to 0

Provides access to the active priorities.

P<x>	Meaning
0b0	Priority not active
0b1	Priority active

Fields in this register are indexed using the 5-bit priority as an unsigned integer, P[Priority].

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICV_APR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_APR_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b1100	0b0000	0b000

ICV_BPR0_EL1, Interrupt Controller Virtual Binary Point Register 0

The ICV_BPR0_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 0 interrupt preemption.

Configuration

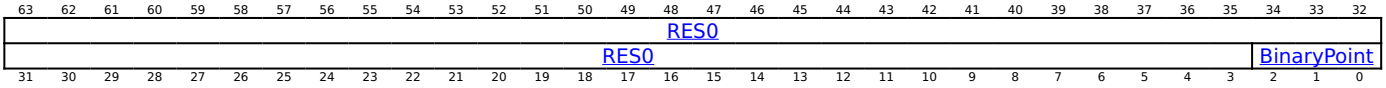
AArch64 System register ICV_BPR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR0[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_BPR0_EL1 are UNDEFINED.

Attributes

ICV_BPR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

The value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. This is done as follows:

Binary point value	Group priority field	Subpriority field	Field with binary point
0	[7:1]	[0]	ggggggg.s
1	[7:2]	[1:0]	gggggg.ss
2	[7:3]	[2:0]	ggggg.sss
3	[7:4]	[3:0]	gggg.ssss
4	[7:5]	[4:0]	ggg.sssss
5	[7:6]	[5:0]	gg.ssssss
6	[7]	[6:0]	g.sssssss
7	No preemption	[7:0]	.sssssss

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR0_EL1

The minimum binary point value is derived from the number of implemented preemption bits, as shown in the following table:

Number of implemented preemption bits	Minimum value of BPR0
7	0
6	1
5	2

The number of implemented preemption bits is indicated by ICH_VTR_EL2.PREbits.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR0_EL1

ICV_BPR1_EL1, Interrupt Controller Virtual Binary Point Register 1

The ICV_BPR1_EL1 characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines virtual Group 1 interrupt preemption.

Configuration

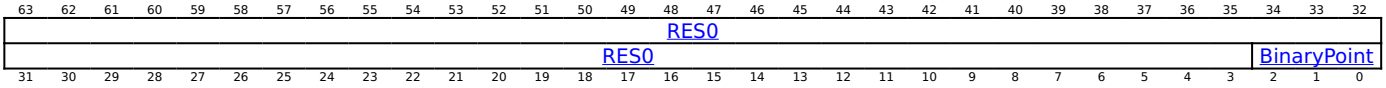
AArch64 System register ICV_BPR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_BPR1[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_BPR1_EL1 are UNDEFINED.

Attributes

ICV_BPR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

BinaryPoint, bits [2:0]

If the GIC is configured to use separate binary point fields for Group 0 and Group 1 interrupts, the value of this field controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For more information about priorities, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

An attempt to program this field to a value less than the minimum value sets the field to the minimum value.

If ICV_CTLR_EL1.CBPR is set to 1, Non-secure EL1 reads return ICV_BPR0_EL1 + 1 saturated to 0b111. Non-secure EL1 writes are ignored.

If ICV_CTLR_EL1.CBPR is set to 1, Secure EL1 reads return ICV_BPR0_EL1. Secure EL1 writes modify ICV_BPR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_BPR1_EL1

For Non-secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0 plus one.

For Secure writes, the minimum value of this field is the minimum value of ICH_VMCR_EL2.VBPR0.

An attempt to program the binary point field to a value less than the minimum value sets the field to the minimum value. On a reset, the binary point field is UNKNOWN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_BPR1_EL1

ICV_CR0_EL1, Interrupt Controller EL1 Virtual Control Register

The ICV_CR0_EL1 characteristics are:

Purpose

Controls behavior of the CPU interface in the Virtual Interrupt Domain.

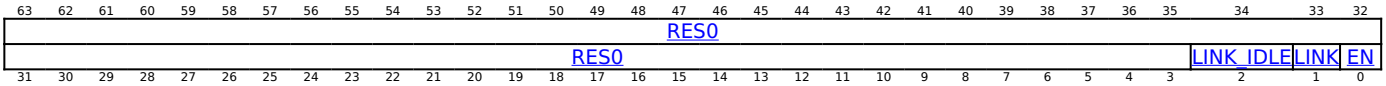
Configuration

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_CR0_EL1 are UNDEFINED.

Attributes

ICV_CR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:3]

Reserved, RES0.

LINK_IDLE, bit [2]

Whether the link between the CPU interface and the IRI is in the process of connecting or disconnecting.

LINK_IDLE	Meaning
0b0	The link between the CPU interface and the IRI is in the process of connecting or disconnecting.
0b1	The link between the CPU interface and the IRI is not in the process of connecting or disconnecting.

Access to this field is RAO/WI.

LINK, bit [1]

Whether the link between the CPU interface and the IRI is connected.

LINK	Meaning
0b0	The link between the CPU interface and the IRI is disconnected.
0b1	The link between the CPU interface and the IRI is connected.

Access to this field is RAO/WI.

EN, bit [0]

Enable interrupts for the Interrupt Domain.

When this field is 0, there is no HPPI of Sufficient priority for the Interrupt Domain.

EN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICV_CR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CR0_EL1

ICV_CTLR_EL1, Interrupt Controller Virtual Control Register

The ICV_CTLR_EL1 characteristics are:

Purpose

Controls aspects of the behavior of the GIC virtual CPU interface and provides information about the features implemented.

Configuration

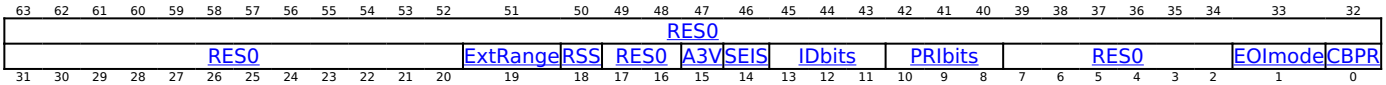
AArch64 System register ICV_CTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_CTLR[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_CTLR_EL1 are UNDEFINED.

Attributes

ICV_CTLR_EL1 is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

ExtRange, bit [19]

Extended INTID range (read-only).

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExtRange	Meaning
0b0	CPU interface does not support INTIDs in the range 1024..8191. • Behavior is UNPREDICTABLE if the IRI delivers an interrupt in the range 1024 to 8191 to the CPU interface. Note Arm strongly recommends that the IRI is not configured to deliver interrupts in this range to a PE that does not support them.
0b1	CPU interface supports INTIDs in the range 1024..8191 • All INTIDs in the range 1024..8191 are treated as requiring deactivation.

ICV_CTLR_EL1.ExtRange is an alias of ICC_CTLR_EL1.ExtRange.

Access to this field is RO.

RSS, bit [18]

Range Selector Support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RSS	Meaning
0b0	Targeted SGIs with affinity level 0 values of 0 - 15 are supported.
0b1	Targeted SGIs with affinity level 0 values of 0 - 255 are supported.

This bit is read-only.

Access to this field is RO.

Bits [17:16]

Reserved, RES0.

A3V, bit [15]

Affinity 3 Valid. Read-only and writes are ignored.

The value of this field is an IMPLEMENTATION DEFINED choice of:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of Affinity 3 in SGI generation System registers.
0b1	The virtual CPU interface logic supports nonzero values of Affinity 3 in SGI generation System registers.

Access to this field is RO.

SEIS, bit [14]

SEI Support. Read-only and writes are ignored. Indicates whether the virtual CPU interface supports local generation of SEIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support local generation of SEIs.
0b1	The virtual CPU interface logic supports local generation of SEIs.

Access to this field is RO.

IDbits, bits [13:11]

Identifier bits. Read-only and writes are ignored. Indicates the number of virtual interrupt identifier bits supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

Access to this field is RO.

PRIbits, bits [10:8]

Indicates the number of virtual priority bits implemented.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

The division between group priority and subpriority is defined in the binary point registers ICV_BPR0_EL1 and ICV_BPR1_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PRIbits	Meaning
0b100..0b110	The number of virtual priority bits implemented, minus one.

Access to this field is RO.

Bits [7:2]

Reserved, RES0.

EOImode, bit [1]

Virtual EOI mode. Controls whether a write to an End of Interrupt register also deactivates the virtual interrupt:

EOImode	Meaning
0b0	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide both priority drop and interrupt deactivation functionality. Accesses to ICV_DIR_EL1 are UNPREDICTABLE.
0b1	ICV_EOIR0_EL1 and ICV_EOIR1_EL1 provide priority drop functionality only. ICV_DIR_EL1 provides interrupt deactivation functionality.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CBPR, bit [0]

Common Binary Point Register. Controls whether the same register is used for interrupt preemption of both virtual Group 0 and virtual Group 1 interrupts:

CBPR	Meaning
0b0	ICV_BPR1_EL1 determines the preemption group for virtual Group 1 interrupts.
0b1	Non-secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1 plus one, saturated to 0b111. Non-secure writes to ICV_BPR1_EL1 are ignored. Secure reads of ICV_BPR1_EL1 return ICV_BPR0_EL1. Secure writes of ICV_BPR1_EL1 modify ICV_BPR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_CTLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_CTLR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b100

ICV_DIR_EL1, Interrupt Controller Deactivate Virtual Interrupt Register

The ICV_DIR_EL1 characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified virtual interrupt.

Configuration

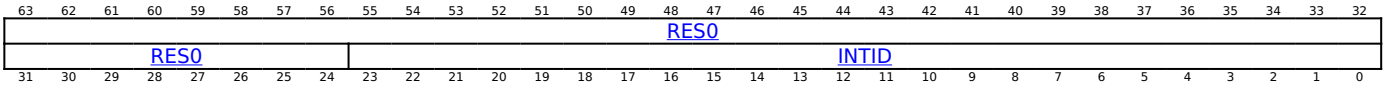
AArch64 System register ICV_DIR_EL1 bits [31:0] performs the same function as AArch32 System register ICV_DIR[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_DIR_EL1 are UNDEFINED.

Attributes

ICV_DIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the virtual interrupt to be deactivated.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_DIR_EL1

When EOImode == 0, writes are ignored. In systems supporting system error generation, an implementation might generate an SEI.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_DIR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1011	0b001

ICV_EOIR0_EL1, Interrupt Controller Virtual End Of Interrupt Register 0

The ICV_EOIR0_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 0 interrupt.

Configuration

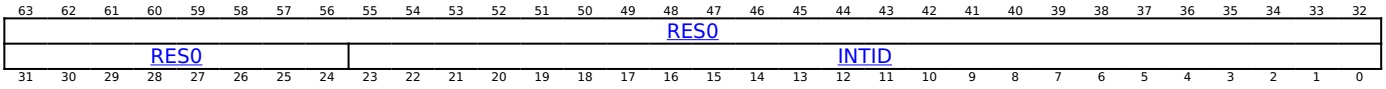
AArch64 System register ICV_EOIR0_EL1 bits [31:0] performs the same function as AArch32 System register ICV_EOIR0[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_EOIR0_EL1 are UNDEFINED.

Attributes

ICV_EOIR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR0_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR_EL1.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR_EL1.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

Accessing ICV_EOIR0_EL1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR0_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_EOIR0_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1000	0b001

ICV_EOIR1_EL1, Interrupt Controller Virtual End Of Interrupt Register 1

The ICV_EOIR1_EL1 characteristics are:

Purpose

A PE writes to this register to inform the CPU interface that it has completed the processing of the specified virtual Group 1 interrupt.

Configuration

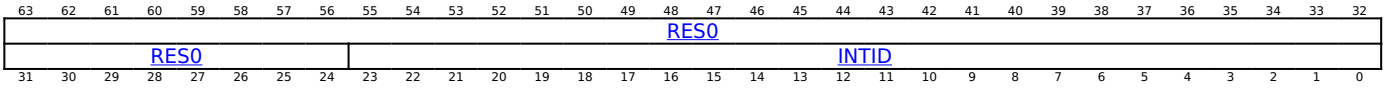
AArch64 System register ICV_EOIR1_EL1 bits [31:0] performs the same function as AArch32 System register ICV_EOIR1[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_EOIR1_EL1 are UNDEFINED.

Attributes

ICV_EOIR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID from the corresponding ICV_IAR1_EL1 access.

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

If the ICV_CTLR_EL1.EOImode bit is 0, a write to this register drops the priority for the virtual interrupt, and also deactivates the virtual interrupt.

If the ICV_CTLR_EL1.EOImode bit is 1, a write to this register only drops the priority for the virtual interrupt. Software must write to ICV_DIR_EL1 to deactivate the virtual interrupt.

Accessing ICV_EOIR1_EL1

A write to this register must correspond to the most recent valid read by this vPE from a Virtual Interrupt Acknowledge Register, and must correspond to the INTID that was read from ICV_IAR1_EL1, otherwise the system behavior is UNPREDICTABLE. A valid read is a read that returns a valid INTID that is not a special INTID.

Accesses to this register use the following encodings in the System register encoding space:

MSR ICC_EOIR1_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1100	0b001

ICV_HAPR_EL1, Interrupt Controller Virtual Highest Active Priority Register

The ICV_HAPR_EL1 characteristics are:

Purpose

Reports the running priority of the Virtual Interrupt Domain.

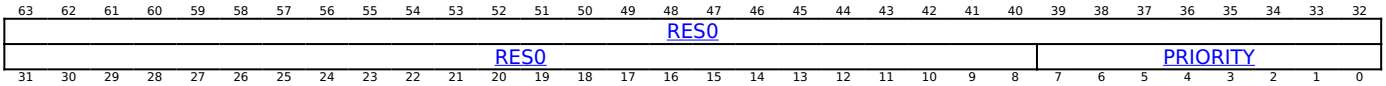
Configuration

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_HAPR_EL1 are UNDEFINED.

Attributes

ICV_HAPR_EL1 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

PRIORITY, bits [7:0]

The running priority for the Virtual Interrupt Domain.

If there are no active priorities on the CPU interface in the applicable Interrupt Domain, or all active priorities have undergone a priority drop, the value returned is the Idle priority.

Accessing ICV_HAPR_EL1

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_HAPR_EL1

op0	op1	CRn	CRm	op2

ICV_HPPIR_EL1, Interrupt Controller Virtual Highest Priority Pending Interrupt Register

The ICV_HPPIR_EL1 characteristics are:

Purpose

Reports the HPPI for the Virtual Interrupt Domain.

Configuration

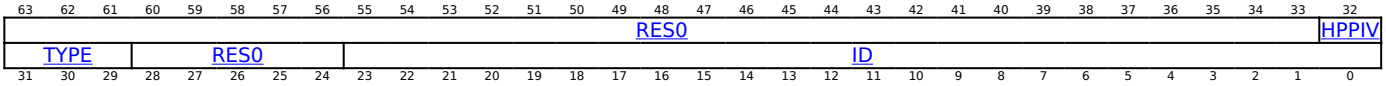
AArch64 System register ICV_HPPIR_EL1 bits [63:0] are architecturally mapped to AArch64 System register ICH_HPPIR_EL2[63:0].

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_HPPIR_EL1 are UNDEFINED.

Attributes

ICV_HPPIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

HPPIV, bit [32]

HPPI valid.

There is an HPPI with Sufficient priority for the Interrupt Domain.

HPPIV	Meaning
0b0	Invalid: There is no HPPI with Sufficient priority for the Interrupt Domain.
0b1	VALID: There is an HPPI with Sufficient priority for the Interrupt Domain.

If ICV_HPPIR_EL1.HPPIV is 1, ID and TYPE together form the INTID of the HPPI for the Interrupt Domain.

TYPE, bits [31:29]

The encoding of this field depends on the value of HPPIV as described below:

- If ICV_HPPIR_EL1.HPPIV is 0, TYPE is RES0.
- If ICV_HPPIR_EL1.HPPIV is 1, TYPE specifies the Type of the interrupt.

TYPE	Meaning
0b001	PPI
0b010	LPI
0b011	SPI

Values not defined above are reserved.

Bits [28:24]

Reserved, RES0.

ID, bits [23:0]

The encoding of this field depends on the value of HPPIV as described below:

- If ICV_HPPIR_EL1.HPPIV is 0, ID is RES0.
- If ICV_HPPIR_EL1.HPPIV is 1, ID specifies the interrupt ID.

Accessing ICV_HPPIR_EL1

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_HPPIR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1010	0b011

ICV_IAR0_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 0

The ICV_IAR0_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 0 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICV_IAR0_EL1 bits [31:0] performs the same function as AArch32 System register ICV_IAR0[31:0].

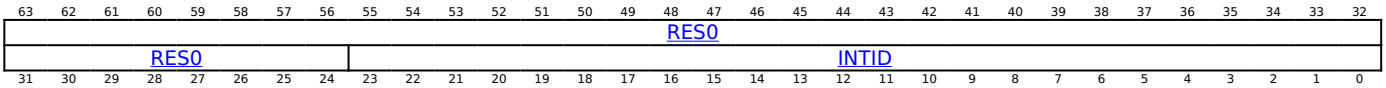
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_IAR0_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE. For information on PE interrupt masking see Arm® Architecture Reference Manual for A-profile architecture. This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_IAR0_EL1

ICV_IAR1_EL1, Interrupt Controller Virtual Interrupt Acknowledge Register 1

The ICV_IAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

AArch64 System register ICV_IAR1_EL1 bits [31:0] performs the same function as AArch32 System register ICV_IAR1[31:0].

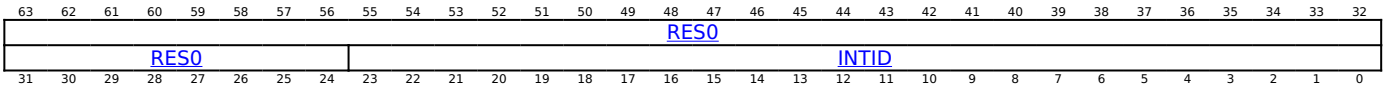
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_IAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE. For information on PE interrupt masking see Arm® Architecture Reference Manual for A-profile architecture. This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_IAR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that interrupt is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_IAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICV_IGRPEN0_EL1, Interrupt Controller Virtual Interrupt Group 0 Enable Register

The ICV_IGRPEN0_EL1 characteristics are:

Purpose

Controls whether virtual Group 0 interrupts are enabled or not.

Configuration

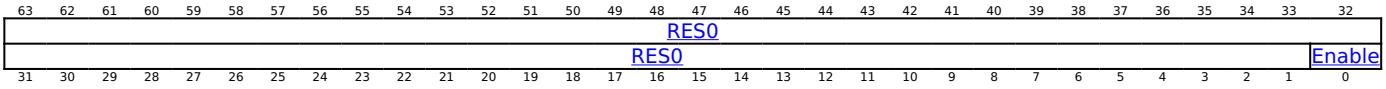
AArch64 System register ICV_IGRPEN0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_IGRPEN0[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_IGRPEN0_EL1 are UNDEFINED.

Attributes

ICV_IGRPEN0_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

Enable, bit [0]

Enables virtual Group 0 interrupts.

Enable	Meaning
0b0	Virtual Group 0 interrupts are disabled.
0b1	Virtual Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_IGRPEN0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_IGRPEN0_EL1

ICV_NMIAR1_EL1, Interrupt Controller Virtual Non-maskable Interrupt Acknowledge Register 1

The ICV_NMIAR1_EL1 characteristics are:

Purpose

The PE reads this register to obtain the INTID of the signaled virtual Group 1 interrupt. This read acts as an acknowledge for the interrupt.

Configuration

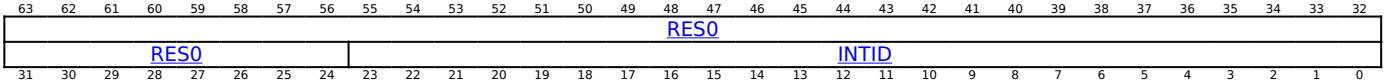
This register is present only when (FEAT_GICv3_NMI is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_NMIAR1_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that reads of this register are self-synchronizing when interrupts are masked by the PE. For information on PE interrupt masking see Arm® Architecture Reference Manual for A-profile architecture. This ensures that the effect of activating an interrupt on the signaling of interrupt exceptions is observed when a read of this register is architecturally executed so that no spurious interrupt exception occurs if interrupts are unmasked by an instruction immediately following the read. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_NMIAR1_EL1 is a 64-bit register.

Field descriptions



Bits [63:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled virtual interrupt.

This is the INTID of the highest priority pending virtual interrupt, if that virtual interrupt has the Non-maskable property and is of sufficient priority for it to be signaled to the PE, and if it can be acknowledged at the current Security state and Exception level.

If the highest priority pending interrupt is not observable, this field contains a special INTID to indicate the reason. For more information, see 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field has either 16 or 24 bits implemented. The number of implemented bits can be found in ICV_CTLR_EL1.IDbits. If only 16 bits are implemented, bits [23:16] of this register are RES0.

Accessing ICV_NMIAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_NMIAR1_EL1

ICV_PCR_EL1, Interrupt Controller Virtual Interrupt Priority Control Register

The ICV_PCR_EL1 characteristics are:

Purpose

Controls the Virtual priority mask for the Virtual Interrupt Domain.

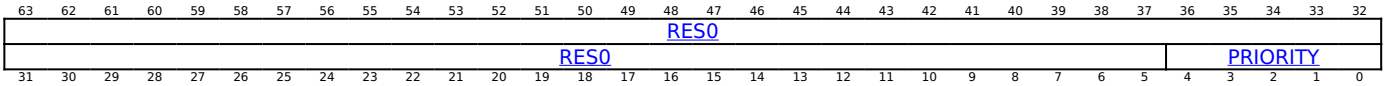
Configuration

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_PCR_EL1 are UNDEFINED.

Attributes

ICV_PCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

PRIORITY, bits [4:0]

The priority mask for the Interrupt Domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing ICV_PCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b1100	0b0000	0b010

ICV_PMR_EL1, Interrupt Controller Virtual Interrupt Priority Mask Register

The ICV_PMR_EL1 characteristics are:

Purpose

Provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Configuration

AArch64 System register ICV_PMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ICV_PMR[31:0].

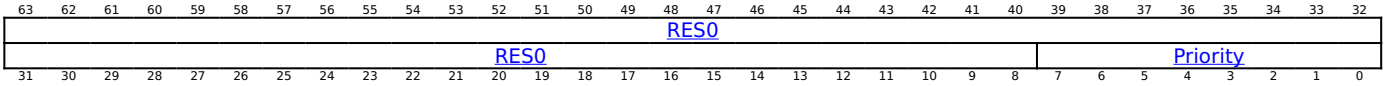
This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_PMR_EL1 are UNDEFINED.

To allow software to ensure appropriate observability of actions initiated by GIC register accesses, the PE and CPU interface logic must ensure that writes to this register are self-synchronizing. This ensures that no interrupts below the written PMR value will be taken after a write to this register is architecturally executed. For more information, see 'Observability of the effects of accesses to the GIC registers' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

ICV_PMR_EL1 is a 64-bit register.

Field descriptions



Bits [63:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of a virtual interrupt is higher than the value indicated by this field, the interface signals the virtual interrupt to the PE.

The possible priority field values are as follows:

Implemented priority bits	Possible priority field values	Number of priority levels
[7:0]	0x00-0xFF (0-255), all values	256
[7:1]	0x00-0xFE (0-254), even values only	128
[7:2]	0x00-0xFC (0-252), in steps of 4	64
[7:3]	0x00-0xF8 (0-248), in steps of 8	32
[7:4]	0x00-0xF0 (0-240), in steps of 16	16

Unimplemented priority bits are RAZ/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing ICV_PMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PMR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0110	0b000

ICV_PPI_CACTIVER<n>_EL1, Interrupt Controller Virtual PPI Clear Active Registers, n = 0 - 1

The ICV_PPI_CACTIVER<n>_EL1 characteristics are:

Purpose

Clear Active state for virtual PPIs.

Configuration

AArch64 System register ICV_PPI_CACTIVER<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register ICH_PPI_ACTIVER<n>_EL2[63:0].

AArch64 System register ICV_PPI_CACTIVER<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register ICV_PPI_SACTIVER<n>_EL1[63:0].

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_PPI_CACTIVER<n>_EL1 are UNDEFINED.

Attributes

ICV_PPI_CACTIVER<n>_EL1 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	

ACTIVE<x>, bit [x], for x = 63 to 0

Configures whether PPIs are Active.

Reads return the Active state of the INTID.

Writing 1 clears the Active state of the INTID. Writing 0 has no effect.

ACTIVE<x>	Meaning
0b0	Inactive
0b1	Active

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 64) + x), access to this field is RES0 .
- Otherwise, access to this field is W1C.

Accessing ICV_PPI_CACTIVER<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PPI_CACTIVER<n>_EL1 ; Where n = 0-1

op0	op1	CRn	CRm	op2

PEND<x>, bit [x], for x = 63 to 0

Controls the Pending state of PPIs.

Reads return the current state of the INTIDs.

Writing 1 to a field clears the Pending state of the corresponding INTID. Writing 0 has no effect.

PEND<x>	Meaning
0b0	Not pending
0b1	Pending

When the Pending state of a physical PPI is directly injected to the Pending state of virtual PPI <x>, all of the following are true:

- Reads of Pend<x> return the value of the field corresponding to the physical PPI in ICC_PPI_CPENDR<n>_EL1.
- Writes to Pend<x> have the same effect as writes to the field corresponding to the physical PPI in ICC_PPI_CPENDR<n>_EL1.

Otherwise, all of the following are true:

- Reads of Pend<x> return the value of ICH_PPI_PENDR<n>_EL2.Pend<x>.
- Writes to Pend<x> update the value of ICH_PPI_PENDR<n>_EL2.Pend<x>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 64) + x), access to this field is RES0 .
- When ICV_PPI_HMR_EL1[n].HM<x> == '1', access to this field is RO.
- Otherwise, access to this field is W1C.

Accessing ICV_PPI_CPENDR<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PPI_CPENDR<n>_EL1 ; Where n = 0-1

ICV_PPI_ENABLER<n>_EL1, Interrupt Controller Virtual PPI Clear Enable Registers, n = 0 - 1

The ICV_PPI_ENABLER<n>_EL1 characteristics are:

Purpose

Access to Enabled state for virtual PPIs.

Configuration

AArch64 System register ICV_PPI_ENABLER<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register ICH_PPI_ENABLER<n>_EL2[63:0].

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_PPI_ENABLER<n>_EL1 are UNDEFINED.

Attributes

ICV_PPI_ENABLER<n>_EL1 is a 64-bit register.

Field descriptions

ICV_PPI_HMR<n>_EL1, Interrupt Controller Virtual PPI Handling mode Registers, n = 0 - 1

The ICV_PPI_HMR<n>_EL1 characteristics are:

Purpose

Report whether virtual PPIs are Edge or Level.

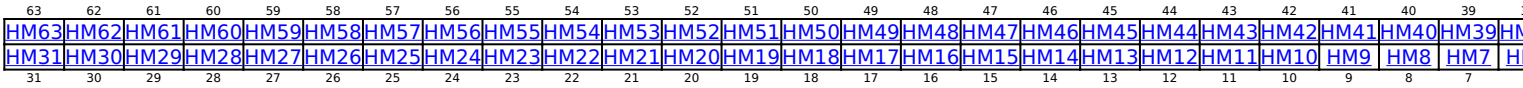
Configuration

This register is present only when FEAT_GCIE is implemented, EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_PPI_HMR<n>_EL1 are UNDEFINED.

Attributes

ICV_PPI_HMR<n>_EL1 is a 64-bit register.

Field descriptions



HM<x>, bit [x], for x = 63 to 0

The PPI Handling mode.

HM<x>	Meaning
0b0	Edge
0b1	Level

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 64) + x), access to this field is RES0 .
- Otherwise, access to this field is RO.

Accessing ICV_PPI_HMR<n>_EL1

This register is Read-only.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_PPI_HMR<n>_EL1 ; Where n = 0-1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b1010	0b00:n[0]

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	

PEND<x>, bit [x], for x = 63 to 0

Controls the Pending state of PPIs.

Reads return the current state of the INTIDs.

Writing 1 to a field sets the Pending state of the corresponding INTID. Writing 0 has no effect.

PEND<x>	Meaning
0b0	Not pending
0b1	Pending

When the Pending state of a physical PPI is directly injected to the Pending state of virtual PPI <x>, all of the following are true:

- Reads of Pend<x> return the value of the field corresponding to the physical PPI in ICC_PPI_SPENDR<n>_EL1.
- Writes to Pend<x> have the same effect as writes to the field corresponding to the physical PPI in ICC_PPI_SPENDR<n>_EL1.

Otherwise, all of the following are true:

- Reads of Pend<x> return the value of ICH_PPI_PENDR<n>_EL2.Pend<x>.
- Writes to Pend<x> update the value of ICH_PPI_PENDR<n>_EL2.Pend<x>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an UNKNOWN value.

Accessing this field has the following behavior:

- When !IsPPIImplemented((n * 64) + x), access to this field is RES0 .
- When ICV_PPI_HMR_EL1[n].HM<x> == '1', access to this field is RO.
- Otherwise, access to this field is W1S.

Accessing ICV_PPI_SPENDR<n>_EL1

Accesses to this register use the following encodings in the System register encoding space:

ICV_RPR_EL1, Interrupt Controller Virtual Running Priority Register

The ICV_RPR_EL1 characteristics are:

Purpose

Indicates the Running priority of the virtual CPU interface.

Configuration

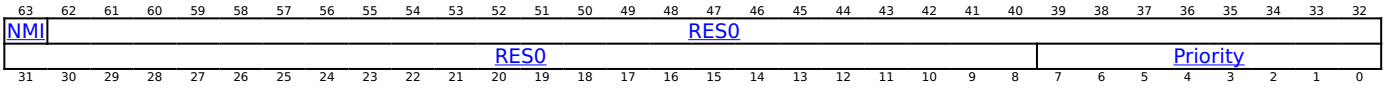
AArch64 System register ICV_RPR_EL1 bits [31:0] performs the same function as AArch32 System register ICV_RPR[31:0].

This register is present only when (GICv3 is implemented or FEAT_GCIE_LEGACY is implemented), EL2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to ICV_RPR_EL1 are UNDEFINED.

Attributes

ICV_RPR_EL1 is a 64-bit register.

Field descriptions



NMI, bit [63]
When FEAT_GICv3_NMI is implemented:

Indicates whether the running priority is from a NMI.

NMI	Meaning
0b0	There is no active Group 1 NMI, or all active Group 1 NMIs have undergone priority drop.
0b1	There is an active Group 1 NMI.

Otherwise:

Reserved, RES0.

Bits [62:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active virtual interrupt.

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR for the current Exception level and Security state was set to the minimum value of BPR for the number of implemented priority bits.

Note

If 8 bits of priority are implemented the group priority is bits[7:1] of the priority.

Accessing ICV_RPR_EL1

If there are no active interrupts on the virtual CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

Software cannot determine the number of implemented priority bits from a read of this register.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ICC_RPR_EL1

op0	op1	CRn	CRm	op2

0b11	0b000	0b1100	0b1011	0b011

```

ID_AA64DFR0_EL1, AArch64 Debug Feature Register 0

The ID_AA64DFR0_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

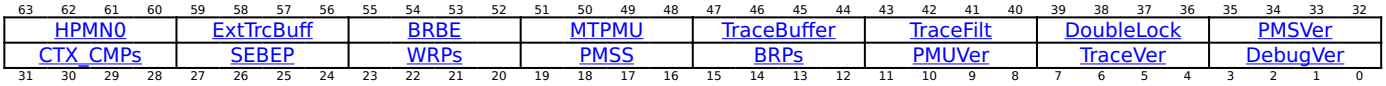
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64DFR0_EL1 are UNDEFINED.

The external register EDDFR gives information from this register.

Attributes

ID_AA64DFR0_EL1 is a 64-bit register.

Field descriptions



HPMN0, bits [63:60]

Zero PMU event counters for a Guest operating system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPMN0	Meaning
0b0000	Setting MDCR_EL2.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
0b0001	Setting MDCR_EL2.HPMN to zero has defined behavior.

All other values are reserved.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

Access to this field is RO.

ExtTrcBuff, bits [59:56]

Trace Buffer External Mode Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExtTrcBuff	Meaning
0b0000	Trace Buffer External Mode not implemented.
0b0001	Trace Buffer External Mode implemented.

All other values are reserved.

FEAT_TRBE_EXT implements the functionality identified by the value 0b0001.

Access to this field is RO.

BRBE, bits [55:52]

Branch Record Buffer Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRBE	Meaning
0b0000	Branch Record Buffer Extension not implemented.
0b0001	Branch Record Buffer Extension implemented.
0b0010	As 0b0001, and adds support for branch recording at EL3.

All other values are reserved.

FEAT_BRBE implements the functionality identified by the value 0b0001.

FEAT_BRBEv1p1 implements the functionality identified by the value 0b0010.

From Armv9.3, if FEAT_BRBE is implemented, the value 0b0001 is not permitted.

Access to this field is RO.

MTPMU, bits [51:48]

Multi-threaded PMU extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>_EL0.MT and PMEVTYPER<n>.MT are RES0.

All other values are reserved.

FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Access to this field is RO.

TraceBuffer, bits [47:44]

Trace Buffer Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceBuffer	Meaning
0b0000	Trace Buffer Extension not implemented.
0b0001	Trace Buffer Extension implemented.
0b0010	As 0b0001, and adds: • If EL2 and FEAT_FGT are implemented, a fine-grained trap on the TSB CSYNC instruction. • If EL2 is implemented, an EL2 control to override TRBLIMITR_EL1.nVM. • The TRBE Profiling exception extension, FEAT_TRBE_EXC.

All other values are reserved.

FEAT_TRBE implements the functionality identified by the value 0b0001.

FEAT_TRBEv1p1 implements the functionality identified by the value 0b0010.

In any Armv9 implementation, if FEAT_ETE is implemented, the value 0b0000 is not permitted.

From Armv9.6, if FEAT_TRBE is implemented, the value 0b0001 is not permitted.

Access to this field is RO.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_ETMv4 is implemented, the value 0b0000 is not permitted.

If FEAT_ETE is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

DoubleLock, bits [39:36]

OS Double Lock implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DoubleLock	Meaning
0b0000	OS Double Lock implemented. OSDLR_EL1 is RW.
0b1111	OS Double Lock not implemented. OSDLR_EL1 is RAZ/WI.

All other values are reserved.

FEAT_DoubleLock implements the functionality identified by the value 0b0000.

In Armv8.0, the only permitted value is 0b0000.

If FEAT_Debugv8p2 is implemented and FEAT_DoPD is not implemented, the permitted values are 0b0000 and 0b1111.

If FEAT_DoPD is implemented, the only permitted value is 0b1111.

Access to this field is RO.

PMSVer, bits [35:32]

Statistical Profiling Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSVer	Meaning
0b0000	Statistical Profiling Extension not implemented.
0b0001	Statistical Profiling Extension implemented.
0b0010	As 0b0001, and adds: • Support for the Events packet Alignment flag. • If FEAT_SVE is implemented, support for the Scalable Vector extensions to Statistical Profiling.
0b0011	As 0b0010, and adds: • Discard mode. • Extended event filtering, including the PMSNEVFR_EL1 System register. • Support for the OPTIONAL previous branch target Address packet. • If FEAT_PMUv3 is implemented, controls to freeze the PMU event counters after an SPE buffer management event occurs. • If FEAT_PMUv3 is implemented, the SAMPLE_FEED_BR, SAMPLE_FEED_EVENT, SAMPLE_FEED_LAT, SAMPLE_FEED_LD, SAMPLE_FEED_OP, and SAMPLE_FEED_ST PMU events.
0b0100	As 0b0011, and adds: • If FEAT_MOPS is implemented, Operation Type packet encodings for Memory Copy and Set operations. • If FEAT_MTE is implemented, Operation Type packet encodings for loads and stores of Allocation Tags.
0b0101	As 0b0100, and adds: • Support for the Events packet Level 2 Data cache access, Level 2 Data cache miss, Cached data modified, Recently fetched cache line, and Cache snoop flags. • Support for Data Source filtering.
0b0110	As 0b0101, and adds: • If EL2 and FEAT_FGT are implemented, a fine-grained trap on the PSB CSYNC instruction. • The SPE Profiling exception extension, FEAT_SPE_EXC. • The Statistical Profiling physical addressing mode extension, FEAT_SPE_nVM.

All other values are reserved.

FEAT_SPE implements the functionality identified by the value 0b0001.

FEAT_SPEv1p1 implements the functionality identified by the value 0b0010.

FEAT_SPEv1p2 implements the functionality identified by the value 0b0011.

FEAT_SPEv1p3 implements the functionality identified by the value 0b0100.

FEAT_SPEv1p4 implements the functionality identified by the value 0b0101.

FEAT_SPEv1p5 implements the functionality identified by the value 0b0110.

From Armv8.5, if FEAT_SPE is implemented, the value 0b0001 is not permitted.

From Armv8.7, if FEAT_SPE is implemented, the value 0b0010 is not permitted.

From Armv8.8, if FEAT_SPE is implemented, the value 0b0011 is not permitted.

From Armv8.9, if FEAT_SPE is implemented, the value 0b0100 is not permitted.

From Armv9.6, if FEAT_SPE is implemented, the value 0b0101 is not permitted.

Access to this field is RO.

CTX_CMPs, bits [31:28]

Number of context-aware breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0b0000..0b1110	The number of context-aware breakpoints, minus 1.
0b1111	If ID_AA64DFR1_EL1.CTX_CMPs is zero, then 16 context-aware breakpoints are implemented. Otherwise, 16 or more context-aware breakpoints are implemented and ID_AA64DFR1_EL1.CTX_CMPs indicates how many.

Values greater than ID_AA64DFR0_EL1.BRPs are not permitted.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

Access to this field is RO.

SEBEP, bits [27:24]

Synchronous-exception-based event profiling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEBEP	Meaning
0b0000	Synchronous-exception-based event profiling not implemented.
0b0001	Synchronous-exception-based event profiling implemented.

All other values are reserved.

FEAT_SEBEP implements the functionality identified by the value 0b0001.

Access to this field is RO.

WRPs, bits [23:20]

Number of watchpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0b0001..0b1111	The number of watchpoints, minus 1.

If FEAT_Debugv8p9 is implemented and 16 or more watchpoints are implemented, then this field reads as 0b1111 and ID_AA64DFR1_EL1.WRPs indicates the number of watchpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 watchpoints.

The value 0b0000 is reserved.

Access to this field is RO.

PMSS, bits [19:16]

PMU Snapshot extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSS	Meaning
0b0000	PMU snapshot extension not implemented.
0b0001	PMU snapshot extension implemented.

All other values are reserved.

FEAT_PMUv3_SS implements the functionality identified by the value 0b0001.

Access to this field is RO.

BRPs, bits [15:12]

Index of the highest numbered context-aware breakpoint. Identifies which of the implemented breakpoints are context-aware breakpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0b0001..0b1110	Index of the highest numbered context-aware breakpoint.
0b1111	If ID_AA64DFR0_EL1.CTX_CMPs and ID_AA64DFR1_EL1.CTX_CMPs indicate that 16 or fewer breakpoints are context-aware, then the index of the highest context-aware breakpoint is 15. Otherwise, the context-aware breakpoints are the lowest numbered breakpoints.

If ID_AA64DFR1_EL1.BRPs is zero, then this is also the number of implemented breakpoints, minus 1, meaning the context-aware breakpoints are the highest numbered breakpoints.

The value of this field is always less than the number of implemented breakpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

The value 0b0000 is reserved.

Access to this field is RO.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: • Updates the definitions of existing PMU events. • Adds support for the PMUSERENR_EL0.UEN control and the PMUACR_EL1 register. • Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

Access to this field is RO.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace unit is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceVer	Meaning
0b0000	Trace unit System registers not implemented.
0b0001	Trace unit System registers implemented.

All other values are reserved.

When trace unit System registers are implemented, see TRCIDR1 for tracing capabilities of the trace unit.

Access to this field is RO.

DebugVer, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DebugVer	Meaning
0b0110	Armv8.0 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Access to this field is RO.

Accessing ID_AA64DFR0_EL1

ID_AA64DFR1_EL1, AArch64 Debug Feature Register 1

The ID_AA64DFR1_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

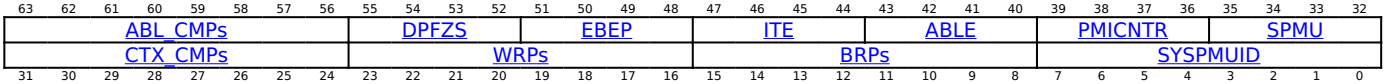
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64DFR1_EL1 are UNDEFINED.

Attributes

ID_AA64DFR1_EL1 is a 64-bit register.

Field descriptions



ABL_CMPs, bits [63:56]
When FEAT_ABLE is implemented:

Number of breakpoints that support address linking, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABL_CMPs	Meaning
0x00..0x3F	Number of breakpoints that support address linking minus 1.

All other values are reserved.

The number of breakpoints that support address linking is never more than either the number of breakpoints or the number of watchpoints.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DPFZS, bits [55:52]

Behavior of the cycle counter when event counting is frozen by a Statistical Profiling management event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DPFZS	Meaning
0b0000	The cycle counter PMCCNTR_EL0 is never affected by PMCR_EL0.FZS.
0b0001	The cycle counter PMCCNTR_EL0 does not count when PMCR_EL0.DP is 1 and counting by event counters accessible to EL1 is frozen by the PMCR_EL0.FZS mechanism.

FEAT_SPE_DPFZS implements the functionality identified by the value 0b0001.

Access to this field is RO.

EBEP, bits [51:48]

Exception-based event profiling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EBEP	Meaning
0b0000	Exception-based event profiling not implemented.
0b0001	Exception-based event profiling implemented.

All other values are reserved.

FEAT_EBEP implements the functionality identified by the value 0b0001.

Access to this field is RO.

ITE, bits [47:44]

Instrumentation Trace Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ITE	Meaning
0b0000	Instrumentation Trace Extension not implemented.
0b0001	Instrumentation Trace Extension implemented.

All other values are reserved.

FEAT_ITE implements the functionality identified by the value 0b0001.

Access to this field is RO.

ABLE, bits [43:40]

Address Breakpoint Linking Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABLE	Meaning
0b0000	Address Breakpoint Linking Extension not implemented.
0b0001	Address Breakpoint Linking Extension implemented.

All other values are reserved.

FEAT_BWE implements the address range breakpoints and mismatch breakpoints part of the functionality identified by the value 0b0001.

FEAT_ABLE implements the functionality identified by the value 0b0001.

Access to this field is RO.

PMICNTR, bits [39:36]

PMU fixed-function instruction counter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMICNTR	Meaning
0b0000	PMU fixed-function instruction counter not implemented.
0b0001	PMU fixed-function instruction counter implemented.

All other values are reserved.

FEAT_PMUv3_ICNTR implements the functionality identified by the value 0b0001.

If FEAT_PMUv3 is not implemented, then the only permitted value is 0b0000.

Access to this field is RO.

SPMU, bits [35:32]

System PMU extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPMU	Meaning
0b0000	System PMU extension not implemented.
0b0001	System PMU extension implemented.
0b0010	As 0b0001, and adds support for SPMZR_EL0.

All other values are reserved.

FEAT_SPMU implements the functionality identified by the value 0b0001.

FEAT_SPMU2 implements the functionality identified by the value 0b0010.

From Armv9.5, the value 0b0001 is not permitted.

Access to this field is RO.

CTX_CMPs, bits [31:24]

Context-aware breakpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0x00	ID_AA64DFR0_EL1.CTX_CMPs is the number of context-aware breakpoints, minus 1.
0x01..0x3F	Number of context-aware breakpoints minus 1.

All other values are reserved.

If 16 or fewer context-aware breakpoints are implemented, then the value of this field is either 0x00 or the same as ID_AA64DFR0_EL1.CTX_CMPs. If more than 16 context-aware breakpoints are implemented, then the value 0x00 is not permitted.

Values greater than ID_AA64DFR1_EL1.BRPs are not permitted.

Access to this field is RO.

WRPs, bits [23:16]

Watchpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0x00	ID_AA64DFR0_EL1.WRPs is the number of watchpoints, minus 1.
0x01..0x3F	Number of watchpoints minus 1.

All other values are reserved.

Access to this field is RO.

BRPs, bits [15:8]

Breakpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0x00	ID_AA64DFR0_EL1.BRPs is the number of breakpoints, minus 1.
0x01..0x3F	Number of breakpoints minus 1.

All other values are reserved.

If more than 16 breakpoints are implemented, or the index of the highest numbered context-aware breakpoint is not the number of breakpoints minus 1, then the value 0x00 is not permitted.

Nonzero values less than ID_AA64DFR0_EL1.BRPs are not permitted.

Access to this field is RO.

SYSPMUID, bits [7:0]
When FEAT_SPMU is implemented:

System PMU ID. Indicates the largest value that can be written to SPMSELR_EL0.SYSPMUSEL.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSPMUID	Meaning
0x00..0x1F	The largest supported value that can be written to SPMSELR_EL0.SYSPMUSEL.

All other values are reserved.

Since System PMUs might not be contiguously accessible, this field does not necessarily indicate the total number of accessible System PMUs.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing ID_AA64DFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64DFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0101	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then

        X{64}(t) = ID_AA64DFR1_EL1();
    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = ID_AA64DFR1_EL1();
end;
```

2025-12-10 16:11:30, 2025-12_rel

ID_AA64DFR2_EL1, AArch64 Debug Feature Register 2

The ID_AA64DFR2_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64DFR2_EL1 are UNDEFINED.

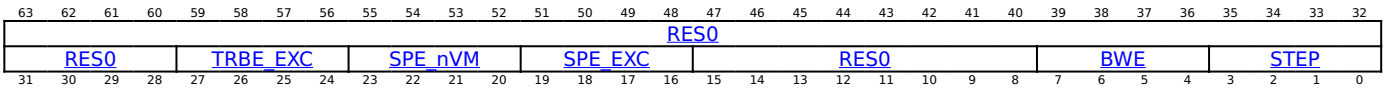
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64DFR2_EL1 is a 64-bit register.

Field descriptions



Bits [63:28]

Reserved, RES0.

TRBE_EXC, bits [27:24]

TRBE Profiling exception extension. Describes support for reporting trace buffer management events as TRBE Profiling exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TRBE_EXC	Meaning
0b0000	TRBE Profiling exception not implemented.
0b0001	TRBE Profiling exception implemented.

All other values are reserved.

FEAT_TRBE_EXC implements the functionality identified by the value 0b0001.

Access to this field is RO.

SPE_nVM, bits [23:20]

Profiling Buffer physical address mode supported. Describes support for defining the Profiling Buffer using physical addresses or intermediate physical addresses.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPE_nVM	Meaning
0b0000	Profiling Buffer physical address mode not implemented.
0b0001	Profiling Buffer physical address mode implemented.

All other values are reserved.

FEAT_SPE_nVM implements the functionality identified by the value 0b0001.

Access to this field is RO.

SPE_EXC, bits [19:16]

SPE Profiling exception extension. Describes support for reporting Profiling Buffer management events as SPE Profiling exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPE_EXC	Meaning
0b0000	SPE Profiling exception not implemented.
0b0001	SPE Profiling exception implemented.

All other values are reserved.

FEAT_SPE_EXC implements the functionality identified by the value 0b0001.

Access to this field is RO.

Bits [15:8]

Reserved, RES0.

BWE, bits [7:4]

Breakpoints and watchpoint enhancements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BWE	Meaning
0b0000	This field does not indicate whether DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0001	DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0010	As 0b0001, and address mismatch watchpoints are implemented.

All other values are reserved.

FEAT_BWE implements the functionality identified by the value 0b0001.

FEAT_BWE2 implements the functionality identified by the value 0b0010.

When this field is 0b0000, ID_AA64DFR1_EL1.ABLE might indicate the presence of support for DBGBCR<n>_EL1.MASK and address mismatch breakpoints.

From Armv9.5, the value 0b0001 is not permitted.

Access to this field is RO.

STEP, bits [3:0]

Enhanced Software Step Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

STEP	Meaning
0b0000	Execution from MDSTEPOP_EL1 is not supported for Software Step.
0b0001	Execution from MDSTEPOP_EL1 is supported for Software Step.

All other values are reserved.

FEAT_STEP2 implements the functionality identified by the value 0b0001.

Access to this field is RO.

Accessing ID_AA64DFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_AA64FPFR0_EL1, AArch64 Floating-point Feature Register 0

The ID_AA64FPFR0_EL1 characteristics are:

Purpose

Provides information about floating-point formats and instructions implemented in AArch64 state.

The fields in this register do not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64SMFR0_EL1 and ID_AA64FPFR0_EL1.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64FPFR0_EL1 are UNDEFINED.

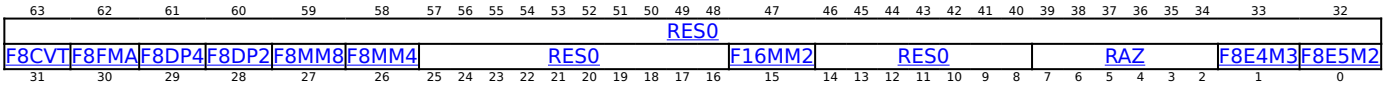
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64FPFR0_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

F8CVT, bit [31]

Indicates support for the following instructions:

- The Advanced SIMD floating-point scaling instruction FSCALE.
- The Advanced SIMD FP8 convert instructions BF1CVTL, BF1CVTL2, BF2CVTL, BF2CVTL2, F1CVTL, F1CVTL2, F2CVTL, F2CVTL2, FCVTN, and FCVTN2.
- When FEAT_SVE2 or FEAT_SME2 is implemented, the SVE2 FP8 convert instructions BF1CVT, BF1CVTLT, BF2CVT, BF2CVTLT, F1CVT, F1CVTLT, F2CVT, F2CVTLT, BFCVTN, FCVTN, FCVTNB, and FCVTNT.
- When FEAT_SME2 is implemented, the SME2 multi-vector floating-point scaling instruction FSCALE and the SME2 FP8 convert instructions BF1CVT, BF1CVTL, BF2CVT, BF2CVTL, F1CVT, F1CVTL, F2CVT, F2CVTL, BFCVT, FCVT, and FCVTN.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8CVT	Meaning
0b0	The specified instructions are not implemented.
0b1	The specified instructions are implemented.

FEAT_FP8 implements the functionality identified by the value 1.

Access to this field is RO.

F8FMA, bit [30]

Indicates support for the following instructions:

- The Advanced SIMD FP8 to single-precision and half-precision multiply-accumulate instructions FMLALB, FMLALT, FMLALLBB, FMLALLBT, FMLALLTB, and FMLALLTT.
- When FEAT_SVE2 is implemented and the PE is not in Streaming SVE mode, the SVE2 FP8 to single-precision and half-precision multiply-accumulate instructions FMLALB, FMLALT, FMLALLBB, FMLALLBT, FMLALLTB, and FMLALLTT.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8FMA	Meaning
0b0	The specified instructions are not implemented.
0b1	The specified instructions are implemented.

FEAT_FP8FMA implements the functionality identified by the value 1.

Access to this field is RO.

F8DP4, bit [29]

Indicates support for the following instructions:

- Advanced SIMD FP8 to single-precision 4-way dot product FDOT (4-way) instructions.
- When FEAT_SVE2 is implemented and the PE is not in Streaming SVE mode, SVE FP8 to single-precision 4-way dot product FDOT (4-way) instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8DP4	Meaning
0b0	The specified instructions are not implemented by this feature.
0b1	The specified instructions are implemented.

Note

Other features may implement some of the specified instructions.

All other values are reserved.

FEAT_FP8DOT4 implements the functionality identified by the value 1.

Access to this field is RO.

F8DP2, bit [28]

Indicates support for the following instructions:

- Advanced SIMD FP8 to half-precision 2-way dot product FDOT (2-way) instructions.
- When FEAT_SVE2 is implemented and the PE is not in Streaming SVE mode, SVE FP8 to half-precision 2-way dot product FDOT (2-way) instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8DP2	Meaning
0b0	The specified instructions are not implemented by this feature.
0b1	The specified instructions are implemented.

Note

Other features may implement some of the specified instructions.

FEAT_FP8DOT2 implements the functionality identified by the value 1.

Access to this field is RO.

F8MM8, bit [27]

Indicates support for the following instructions:

- Advanced SIMD FP8 to single-precision matrix multiply FMMLA (8-way, FP8 to FP32) instruction.
- If FEAT_SVE2 is implemented, SVE FP8 to single-precision matrix multiply FMMLA (widening, FP8 to FP32) instruction is implemented when the PE is not in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8MM8	Meaning
0b0	Advanced SIMD and SVE FP8 to single-precision matrix multiply instructions are not implemented by this feature.
0b1	The specified Advanced SIMD and SVE FP8 to single-precision matrix multiply instructions are implemented.

FEAT_F8F32MM implements the functionality identified by the value 0b0001

Access to this field is RO.

F8MM4, bit [26]

Indicates support for the following instructions:

- Advanced SIMD FP8 to half-precision matrix multiply FMMLA (4-way, FP8 to FP16) instruction.
- If FEAT_SVE2 is implemented, SVE FP8 to half-precision matrix multiply FMMLA (widening, FP8 to FP16) instruction is implemented when the PE is not in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8MM4	Meaning
0b0	Advanced SIMD and SVE FP8 to half-precision matrix multiply instructions are not implemented by this feature.
0b1	The specified Advanced SIMD and SVE FP8 to half-precision matrix multiply instructions are implemented.

FEAT_F8F16MM implements the functionality identified by the value 0b0001

Access to this field is RO.

Bits [25:16]

Reserved, RES0.

F16MM2, bit [15]

Indicates support for the following instructions:

- Advanced SIMD half-precision matrix multiply-accumulate instruction FMMLA.
- If FEAT_SVE2p2 is implemented, the SVE half-precision matrix multiply-accumulate instruction FMMLA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F16MM2	Meaning
0b0	The specified instructions are not implemented.
0b1	The specified instructions are implemented.

FEAT_F16MM implements the functionality identified by the value 0b1.

SVE FMMLA instructions might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

Bits [14:8]

Reserved, RES0.

Bits [7:2]

Reserved for data formats 2 to 7.

Reserved, RAZ.

F8E4M3, bit [1]

Indicates support for OFP8 E4M3 format and behavior for FP8 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8E4M3	Meaning
0b0	OFP8 E4M3 format is not supported.
0b1	OFP8 E4M3 format is supported.

If FEAT_FP8 is implemented, the only permitted value is 1.

Otherwise, the only permitted value is 0.

For more information on OFP8 formats, see the Open Compute Project, OCP 8-bit Floating Point Specification (OFP8).

Access to this field is RO.

F8E5M2, bit [0]

Indicates support for OFP8 E5M2 format and behavior for FP8 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8E5M2	Meaning
0b0	OFP8 E5M2 format is not supported.
0b1	OFP8 E5M2 format is supported.

If FEAT_FP8 is implemented, the only permitted value is 1.

Otherwise, the only permitted value is 0.

For more information on OFP8 formats, see the Open Compute Project, OCP 8-bit Floating Point Specification (OFP8).

Access to this field is RO.

ID_AA64ISAR0_EL1, AArch64 Instruction Set Attribute Register 0

The ID_AA64ISAR0_EL1 characteristics are:

Purpose

Provides information about the instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

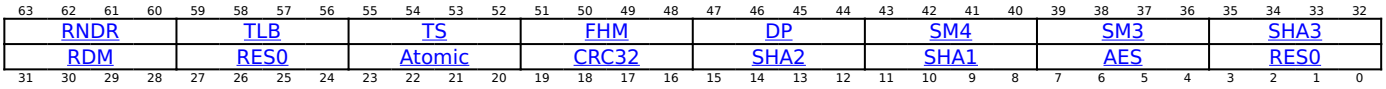
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR0_EL1 are UNDEFINED.

Attributes

ID_AA64ISAR0_EL1 is a 64-bit register.

Field descriptions



RNDR, bits [63:60]

Indicates support for Random Number instructions in AArch64 state.

When FEAT_RNG_TRAP is implemented, the value returned by a direct read of ID_AA64ISAR0_EL1.RNDR is further controlled by the value of SCR_EL3.TRNDR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RNDR	Meaning
0b0000	No Random Number instructions are implemented.
0b0001	RNDR and RNDRRS registers are implemented.

All other values are reserved.

FEAT_RNG implements the functionality identified by the value 0b0001.

Access to this field is RO.

TLB, bits [59:56]

Indicates support for Outer Shareable and TLB range maintenance instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TLB	Meaning
0b0000	Outer Shareable and TLB range maintenance instructions are not implemented.
0b0001	Outer Shareable TLB maintenance instructions are implemented.
0b0010	Outer Shareable and TLB range maintenance instructions are implemented.

All other values are reserved.

FEAT_TLBIOS implements the functionality identified by the values 0b0001 and 0b0010.

FEAT_TLBIRANGE implements the functionality identified by the value 0b0010.

From Armv8.4, the values 0b0000 and 0b0001 are not permitted.

Access to this field is RO.

TS, bits [55:52]

Indicates support for flag manipulation instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TS	Meaning
0b0000	No flag manipulation instructions are implemented.
0b0001	CFINV, RMIF, SETF16, and SETF8 instructions are implemented.
0b0010	CFINV, RMIF, SETF16, SETF8, AXFLAG, and XAFLAG instructions are implemented.

All other values are reserved.

FEAT_FlagM implements the functionality identified by the value 0b0001.

FEAT_FlagM2 implements the functionality identified by the value 0b0010.

In Armv8.4, the value 0b0000 is not permitted.

From Armv8.5, the value 0b0001 is not permitted.

Access to this field is RO.

FHM, bits [51:48]

Indicates support for the Advanced SIMD half-precision to single-precision multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FHM	Meaning
0b0000	The Advanced SIMD half-precision to single-precision multiply instructions are not implemented.
0b0001	FMLAL and FMLSL instructions are implemented.
0b0010	As 0b0001, and adds half-precision to single-precision dot product FDOT instructions.
0b0011	As 0b0010, and adds half-precision to single-precision matrix multiply-accumulate FMMLA instruction.

All other values are reserved.

FEAT_FHM implements the functionality identified by the value 0b0001.

FEAT_F16F32DOT implements the functionality identified by the value 0b0010.

FEAT_F16F32MM implements the functionality identified by the value 0b0011.

From Armv8.4, if FEAT_FP16 is implemented, the value 0b0000 is not permitted.

From Armv9.7, if FEAT_AdvSIMD is implemented, the value 0b0001 is not permitted.

From Armv9.7, if FEAT_AdvSIMD and FEAT_SVE_F16F32MM are both implemented, the value 0b0010 is not permitted.

Access to this field is RO.

DP, bits [47:44]

Indicates support for Dot Product instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DP	Meaning
0b0000	No Dot Product instructions implemented.
0b0001	UDOT and SDOT instructions implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_AdvSIMD is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

SM4, bits [43:40]

Indicates support for SM4 instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SM4	Meaning
0b0000	No SM4 instructions implemented.
0b0001	SM4E and SM4EKEY instructions implemented.

All other values are reserved.

If FEAT_SM4 is not implemented, the value 0b0001 is reserved.

FEAT_SM4 implements the functionality identified by the value 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM3.

Access to this field is RO.

SM3, bits [39:36]

Indicates support for the following SM3 instructions SM3SS1, SM3TT1A, SM3TT1B, SM3TT2A, SM3TT2B, SM3PARTW1, and SM3PARTW2 in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SM3	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

If FEAT_SM3 is not implemented, the value 0b0001 is reserved.

FEAT_SM3 implements the functionality identified by the value 0b0001.

This field must have the same value as ID_AA64ISAR0_EL1.SM4.

Access to this field is RO.

SHA3, bits [35:32]

Indicates support for the following SHA3 instructions EOR3, RAX1, XAR, and BCAX in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA3	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

If FEAT_SHA3 is not implemented, the value 0b0001 is reserved.

FEAT_SHA3 implements the functionality identified by the value 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0001, ID_AA64ISAR0_EL1.SHA2 must have the value 0b0010.

Access to this field is RO.

RDM, bits [31:28]

Indicates support for SQRDMLAH and SQRDMLSH instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RDM	Meaning
0b0000	No RDMA instructions implemented.
0b0001	SQRDMLAH and SQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

Bits [27:24]

Reserved, RES0.

Atomic, bits [23:20]

Indicates support for Atomic instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Atomic	Meaning
0b0000	No Atomic instructions implemented.
0b0010	LDADD, LDCLR, LDEOR, LDSET, LDSMAX, LDSMIN, LDUMAX, LDUMIN, CAS, CASP, and SWP instructions implemented.
0b0011	As for 0b0010, plus 128-bit instructions LDCLRP, LDSETP, and SWPP.

All other values are reserved.

FEAT_LSE implements the functionality identified by the value 0b0010.

FEAT_LSE128 implements the functionality identified by the value 0b0011.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

CRC32, bits [19:16]

Indicates support for the following CRC32 instructions CRC32B, CRC32H, CRC32W, CRC32X, CRC32CB, CRC32CH, CRC32CW, and CRC32CX in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRC32	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_CRC32 implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

SHA2, bits [15:12]

Indicates support for SHA2 instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	Implements instructions: SHA256H, SHA256H2, SHA256SU0, and SHA256SU1.
0b0010	Implements instructions: • SHA256H, SHA256H2, SHA256SU0, and SHA256SU1. • SHA512H, SHA512H2, SHA512SU0, and SHA512SU1.

All other values are reserved.

FEAT_SHA256 implements the functionality identified by the value 0b0001.

FEAT_SHA512 implements the functionality identified by the value 0b0010.

If the value of ID_AA64ISAR0_EL1.SHA1 is 0b0000, this field must have the value 0b0000.

If the value of this field is 0b0010, ID_AA64ISAR0_EL1.SHA3 must have the value 0b0001.

Access to this field is RO.

SHA1, bits [11:8]

Indicates support for the following SHA1 instructions SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA1	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_SHA1 implements the functionality identified by the value 0b0001.

If the value of ID_AA64ISAR0_EL1.SHA2 is 0b0000, this field must have the value 0b0000.

Access to this field is RO.

AES, bits [7:4]

Indicates support for AES instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC instructions implemented.
0b0010	As for 0b0001, plus PMULL and PMULL2 instructions operating on 64-bit source elements.

FEAT_AES implements the functionality identified by the value 0b0001.

FEAT_PMULL implements the functionality identified by the value 0b0010.

All other values are reserved.

Access to this field is RO.

Bits [3:0]

Reserved, RES0.

ID_AA64ISAR1_EL1, AArch64 Instruction Set Attribute Register 1

The ID_AA64ISAR1_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

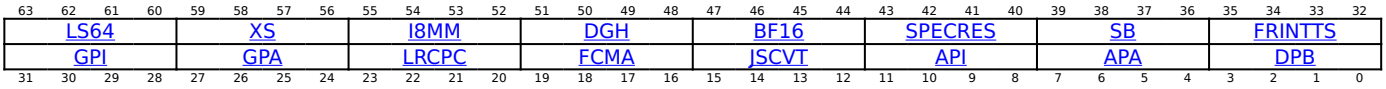
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR1_EL1 are UNDEFINED.

Attributes

ID_AA64ISAR1_EL1 is a 64-bit register.

Field descriptions



LS64, bits [63:60]

Indicates support for LD64B and ST64B* instructions, and the ACCDATA_EL1 register.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LS64	Meaning
0b0000	No LD64B or ST64B instructions are supported.
0b0001	The LD64B and ST64B instructions are supported.
0b0010	As 0b0001, and adds the ST64BV instruction and traps.
0b0011	As 0b0010, and adds the ST64BV0 instruction, ACCDATA_EL1 register, and traps.
0b0100	As 0b0011, and adds support for atomic accesses to Write-back Cacheable, Shareable memory using one of the following: • LD64B and ST64B instructions. • SIMD&FP instructions that load or store a pair of 128-bit registers by generating 32-byte single-copy atomic accesses.

All other values are reserved.

FEAT_LS64 implements the functionality identified by 0b0001.

FEAT_LS64_V implements the functionality identified by 0b0010.

FEAT_LS64_ACCDATA implements the functionality identified by 0b0011.

FEAT_LS64WB implements the functionality identified by 0b0100.

Access to this field is RO.

XS, bits [59:56]

Indicates support for the XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

XS	Meaning
0b0000	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are not supported.
0b0001	The XS attribute, the TLBI and DSB instructions with the nXS qualifier, and the HCRX_EL2.{FGTnXS, FnXS} fields are supported.

All other values are reserved.

FEAT_XS implements the functionality identified by 0b0001.

From Armv8.7, the value 0b0000 is not permitted.

Access to this field is RO.

I8MM, bits [55:52]

Indicates support for the following Advanced SIMD Int8 matrix multiplication instructions SMMLA, SUDOT, UMMLA, USMMLA, and USDOT in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8MM	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ZFR0_EL1.I8MM.

From Armv8.6, the value 0b0000 is not permitted.

Access to this field is RO.

DGH, bits [51:48]

Indicates support for the Data Gathering Hint instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DGH	Meaning
0b0000	Data Gathering Hint is not implemented.
0b0001	Data Gathering Hint is implemented.

All other values are reserved.

FEAT_DGH implements the functionality identified by 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

If the DGH instruction has no effect in preventing the merging of memory accesses, the value of this field is 0b0000.

Access to this field is RO.

BF16, bits [47:44]

Indicates support for Advanced SIMD and floating-point BFloat16 instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	BFCVT, BFCVTN, BFCVTN2, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.
0b0010	As 0b0001, but the FPCR.EBF field is also supported.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

When FEAT_SVE or FEAT_SME is implemented, this field must return the same value as ID_AA64ZFR0_EL1.BF16.

From Armv8.6 and Armv9.1, the value 0b0000 is not permitted.

Access to this field is RO.

SPECRES, bits [43:40]

Indicates support for prediction invalidation instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFP RCTX, DVP RCTX and CPP RCTX instructions are implemented.
0b0010	As 0b0001, and COSP RCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

FEAT_SPECRES2 implements the functionality identified by 0b0010.

From Armv8.5, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Access to this field is RO.

SB, bits [39:36]

Indicates support for SB instruction in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is RO.

FRINTTS, bits [35:32]

Indicates support for FRINT32Z, FRINT32X, FRINT64Z, and FRINT64X instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FRINTTS	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_FRINTTS implements the functionality identified by 0b0001.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is RO.

GPI, bits [31:28]

Indicates support for an IMPLEMENTATION DEFINED algorithm is implemented in the PE for generic code authentication in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GPI	Meaning
0b0000	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Generic Authentication using an IMPLEMENTATION DEFINED algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

When this field is nonzero, FEAT_PACIMP is implemented.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPA is nonzero, or the value of ID_AA64ISAR2_EL1.GPA3 is nonzero, this field must have the value 0b0000.

Access to this field is RO.

GPA, bits [27:24]

Indicates whether the QARMA5 algorithm is implemented in the PE for generic code authentication in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GPA	Meaning
0b0000	Generic Authentication using the QARMA5 algorithm is not implemented.
0b0001	Generic Authentication using the QARMA5 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACQARMA5 implements the functionality identified by 0b0001.

When this field is nonzero, FEAT_PACQARMA5 is implemented.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is nonzero, or the value of ID_AA64ISAR2_EL1.GPA3 is nonzero, this field must have the value 0b0000.

Access to this field is RO.

LRCPC, bits [23:20]

Indicates support for weaker release consistency, RCpc, based model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LRCPC	Meaning
0b0000	RCpc instructions are not implemented.
0b0001	The no offset LDAPR, LDAPRB, and LDAPRH instructions are implemented.
0b0010	As 0b0001, and the LDAPUR (unscaled), LDAPURB (unscaled), LDAPURSB (unscaled), LDAPURH (unscaled), LDAPURSH (unscaled), LDAPURSW (unscaled), STLUR (unscaled), STLURB (unscaled) and STLURH (unscaled) instructions are implemented.
0b0011	As 0b0010, and the post-index LDAPR, LDIAPP, STILP, and pre-index STLR instructions are implemented. If Advanced SIMD and floating-point is implemented, then the LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP) instructions are implemented in Advanced SIMD and floating-point.

All other values are reserved.

FEAT_LRCPC implements the functionality identified by the value 0b0001.

FEAT_LRCPC2 implements the functionality identified by the value 0b0010.

FEAT_LRCPC3 implements the functionality identified by the value 0b0011.

From Armv8.3, the value 0b0000 is not permitted.

From Armv8.4, the value 0b0001 is not permitted.

Access to this field is RO.

FCMA, bits [19:16]

Indicates support for complex number addition and multiplication, where numbers are stored in vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FCMA	Meaning
0b0000	The FCMLA and FCADD instructions are not implemented.
0b0001	The FCMLA and FCADD instructions are implemented.

All other values are reserved.

FEAT_FCMA implements the functionality identified by the value 0b0001.

From Armv8.3, if Advanced SIMD or floating-point is implemented, the value 0b0000 is not permitted.

From Armv8.3, if Advanced SIMD or floating-point is not implemented, the only permitted value is 0b0000.

Access to this field is RO.

JSCVT, bits [15:12]

Indicates support for JavaScript conversion from double-precision floating-point values to integers in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

JSCVT	Meaning
0b0000	The FJCVTZS instruction is not implemented.
0b0001	The FJCVTZS instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

From Armv8.3, if Advanced SIMD or floating-point is implemented, the value 0b0000 is not permitted.

From Armv8.3, if Advanced SIMD or floating-point is not implemented, the only permitted value is 0b0000.

Access to this field is RO.

API, bits [11:8]

Indicates whether an IMPLEMENTATION DEFINED algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

API	Meaning
0b0000	Address Authentication using an IMPLEMENTATION DEFINED algorithm is not implemented.
0b0001	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC and FEAT_PAuth2 are not implemented.
0b0010	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is implemented, and FEAT_PAuth2 is not implemented.
0b0011	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is not implemented, and FEAT_PAuth2 is implemented.
0b0100	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2 and FEAT_FPAC are implemented.
0b0101	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, and FEAT_FPACCOMBINE are implemented.
0b0110	Address Authentication using an IMPLEMENTATION DEFINED algorithm is implemented, including instructions that allow signing of LR using SP and PC as diversifiers, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, FEAT_FPACCOMBINE, and FEAT_PAuth_LR are implemented.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

FEAT_PAuth_LR implements the functionality identified by 0b0110.

When this field is nonzero, FEAT_PACIMP is implemented.

In Armv8.3, the permitted values are 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0000, 0b0011, 0b0100, and 0b0101.

From Armv9.5, the permitted values are 0b0000, 0b0011, 0b0100, 0b0101, and 0b0110.

If the value of ID_AA64ISAR1_EL1.APA is nonzero, or the value of ID_AA64ISAR2_EL1.APA3 is nonzero, this field must have the value 0b0000.

Access to this field is RO.

APA, bits [7:4]

Indicates whether the QARMA5 algorithm is implemented in the PE for address authentication, in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

APA	Meaning
0b0000	Address Authentication using the QARMA5 algorithm is not implemented.
0b0001	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC and FEAT_PAuth2 are not implemented.
0b0010	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is implemented, and FEAT_PAuth2 is not implemented.
0b0011	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is not implemented, and FEAT_PAuth2 is implemented.
0b0100	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2 and FEAT_FPAC are implemented.
0b0101	Address Authentication using the QARMA5 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, and FEAT_FPACCOMBINE are implemented.
0b0110	Address Authentication using the QARMA5 algorithm is implemented, including instructions that allow signing of LR using SP and PC as diversifiers, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, FEAT_FPACCOMBINE, and FEAT_PAuth_LR are implemented.

All other values are reserved.

FEAT_PAuth implements the functionality identified by 0b0001.

FEAT_EPAC implements the functionality identified by 0b0010.

FEAT_PAuth2 implements the functionality identified by 0b0011.

FEAT_FPAC implements the functionality identified by 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by 0b0101.

FEAT_PAuth_LR implements the functionality identified by 0b0110.

When this field is nonzero, FEAT_PACQARMA5 is implemented.

In Armv8.3, the permitted values are 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0000, 0b0011, 0b0100, and 0b0101.

From Armv9.5, the permitted values are 0b0000, 0b0011, 0b0100, 0b0101, and 0b0110.

If the value of ID_AA64ISAR1_EL1.API is nonzero, or the value of ID_AA64ISAR2_EL1.APA3 is nonzero, this field must have the value 0b0000.

Access to this field is RO.

DPB, bits [3:0]

Data Persistence writeback. Indicates support for the DC CVAP and DC CVADP instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DPB	Meaning
0b0000	DC CVAP not supported.
0b0001	DC CVAP supported.
0b0010	DC CVAP and DC CVADP supported.

All other values are reserved.

FEAT_DPB implements the functionality identified by the value 0b0001.

FEAT_DPB2 implements the functionality identified by the value 0b0010.

From Armv8.2, the value 0b0000 is not permitted.

From Armv8.5, the value 0b0001 is not permitted.

Access to this field is RO.

Accessing ID_AA64ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b001

```

ID_AA64ISAR2_EL1, AArch64 Instruction Set Attribute Register 2

The ID_AA64ISAR2_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR2_EL1 are UNDEFINED.

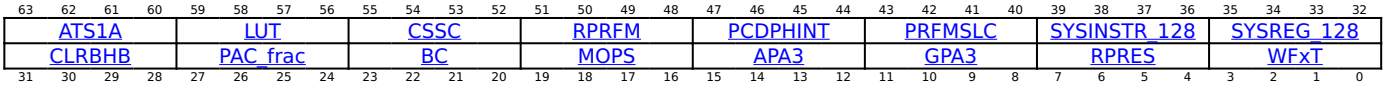
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR2_EL1 is a 64-bit register.

Field descriptions



ATS1A, bits [63:60]

Indicates support for address translation instructions, which perform stage 1 address translation for the given virtual address without checking for stage 1 permissions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ATS1A	Meaning
0b0000	Address Translate Stage 1 instructions without Permissions Checks are not implemented
0b0001	Address Translate Stage 1 instructions without Permissions Checks are implemented.

All other values are reserved.

Access to this field is RO.

LUT, bits [59:56]

Indicates support for:

- Advanced SIMD lookup table instructions with 2-bit and 4-bit indices.
- If FEAT_SVE2 or FEAT_SME2 is implemented, SVE lookup table instructions with 2-bit and 4-bit indices.
- If FEAT_SVE2p3 or FEAT_SME2p3 is implemented, SVE lookup table instructions with 6-bit indices.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LUT	Meaning
0b0000	The specified instructions are not implemented.
0b0001	Lookup table instructions with 2-bit indices LUTI2 and 4-bit indices LUTI4 are implemented.
0b0010	As 0b0001, and adds SVE lookup table instruction with 6-bit indices LUTI6.

All other values are reserved.

FEAT_LUT implements the functionality identified by the value 0b0001.

From Armv9.5, if FEAT_AdvSIMD is implemented, the value 0b0000 is not permitted.

If FEAT_SVE2p3 or FEAT_SME2p3 is implemented, the value 0b0001 is not permitted. Otherwise, the value 0b0010 is not permitted.

Access to this field is RO.

CSSC, bits [55:52]

Indicates support for common short sequence compression instructions.

If FEAT_CMPBR is implemented, indicates support for compare and branch instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSSC	Meaning
0b0000	Common short sequence compression instructions are not implemented.
0b0001	The following common short sequence compression instructions are implemented: • 32-bit and 64-bit ABS, CNT, CTZ • 32-bit SMAX, UMAX, SMIN, UMIN (immediate). • 64-bit SMAX, UMAX, SMIN, UMIN (immediate). • 32-bit SMAX, UMAX, SMIN, UMIN (register). • 64-bit SMAX, UMAX, SMIN, UMIN (register).
0b0010	As 0b0001, and adds compare and branch instructions: • CBB<cc>. • CB<cc> (immediate), CB<cc> (register). • CBH<cc>.

All other values are reserved.

FEAT_CSSC implements the functionality identified by the value 0b0001.

FEAT_CMPBR implements the functionality identified by the value 0b0010.

From Armv9.4, the value 0b0000 is not permitted.

From Armv9.6, the value 0b0001 is not permitted.

Access to this field is RO.

RPRFM, bits [51:48]

RPRFM hint instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RPRFM	Meaning
0b0000	RPRFM hint instruction is not implemented and is treated as a NOP.
0b0001	RPRFM hint instruction is implemented.

All other values are reserved.

FEAT_RPRFM implements the functionality identified by the value 0b0001.

Access to this field is RO.

PCDPHINT, bits [47:44]

Indicates support for producer-consumer data placement hints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCDPHINT	Meaning
0b0000	The STSHH and PRFM IR hint instructions are not implemented.
0b0001	The STSHH and PRFM IR hint instructions are implemented.

FEAT_PCDPHINT implements the functionality identified by the value 0b0001.

Access to this field is RO.

PRFMSLC, bits [43:40]

Indicates whether the PRFM and PRFUM instructions support a system level cache option.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PRFMSLC	Meaning
0b0000	The PRFM and PRFUM instructions do not support the SLC target.
0b0001	The PRFM and PRFUM instructions support the SLC target.

All other values are reserved.

FEAT_PRFMSLC implements the functionality identified by the value 0b0001.

Access to this field is RO.

SYSINSTR_128, bits [39:36]

SYSINSTR_128. Indicates support for System instructions that can take 128-bit inputs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSINSTR_128	Meaning
0b0000	System instructions that can take 128-bit inputs are not supported.
0b0001	System instructions that can take 128-bit inputs are supported.

All other values are reserved.

FEAT_SYSINSTR128 implements the functionality identified by the value 0b0001.

Access to this field is RO.

SYSREG_128, bits [35:32]

SYSREG_128. Indicates support for instructions to access 128-bit System Registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYSREG_128	Meaning
0b0000	Instructions to access 128-bit System Registers are not supported.
0b0001	Instructions to access 128-bit System Registers are supported.

All other values are reserved.

FEAT_SYSREG128 implements the functionality identified by the value 0b0001.

Access to this field is RO.

CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by the value 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

Access to this field is RO.

PAC_frac, bits [27:24]

Indicates which address bit is used to determine the size of the PAC field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAC_frac	Meaning
0b0000	The address bit which is used to define the size of the PAC field is dependent on whether address tagging is used.
0b0001	The address bit which is used to define the size of the PAC field is fixed.

All other values are reserved.

FEAT_CONSTPACFIELD implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

BC, bits [23:20]

Indicates support for the BC instruction in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BC	Meaning
0b0000	BC instruction is not implemented.
0b0001	BC instruction is implemented.

All other values are reserved.

FEAT_HBC implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is RO.

MOPS, bits [19:16]

Indicates support for the Memory Copy and Memory Set instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MOPS	Meaning
0b0000	The Memory Copy and Memory Set instructions are not implemented in AArch64 state.
0b0001	The Memory Copy and Memory Set instructions are implemented in AArch64 state with the following exception. If FEAT_MTE is implemented, then SETGP*, SETGM* and SETGE* instructions are also supported.
0b0010	As 0b0001 and if FEAT_MTE is implemented, support for SETGO* instructions.

All other values are reserved.

FEAT_MOPS implements the functionality identified by the value 0b0001.

FEAT_MOPS_GO implements the functionality identified by the value 0b0010.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is RO.

APA3, bits [15:12]

Indicates whether the QARMA3 algorithm is implemented in the PE for address authentication in AArch64 state. This applies to all Pointer Authentication instructions other than the PACGA instruction.

The value of this field is an IMPLEMENTATION DEFINED choice of:

APA3	Meaning
0b0000	Address Authentication using the QARMA3 algorithm is not implemented.
0b0001	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC and FEAT_PAuth2 are not implemented.
0b0010	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is implemented, and FEAT_PAuth2 is not implemented.
0b0011	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is not implemented, and FEAT_PAuth2 is implemented.
0b0100	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2 and FEAT_FPAC are implemented.
0b0101	Address Authentication using the QARMA3 algorithm is implemented, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, and FEAT_FPACCOMBINE are implemented.
0b0110	Address Authentication using the QARMA3 algorithm is implemented, including instructions that allow signing of LR using SP and PC as diversifiers, FEAT_EPAC is not implemented, FEAT_PAuth2, FEAT_FPAC, FEAT_FPACCOMBINE, and FEAT_PAuth_LR are implemented.

All other values are reserved.

FEAT_PAuth implements the functionality identified by the value 0b0001.

FEAT_EPAC implements the functionality identified by the value 0b0010.

FEAT_PAuth2 implements the functionality identified by the value 0b0011.

FEAT_FPAC implements the functionality identified by the value 0b0100.

FEAT_FPACCOMBINE implements the functionality identified by the value 0b0101.

FEAT_PAuth_LR implements the functionality identified by the value 0b0110.

When this field is nonzero, FEAT_PACQARMA3 is implemented.

In Armv8.3, the permitted values are 0b0000, 0b0001, 0b0010, 0b0011, 0b0100, and 0b0101.

From Armv8.6, the permitted values are 0b0000, 0b0011, 0b0100, and 0b0101.

From Armv9.5, the permitted values are 0b0000, 0b0011, 0b0100, 0b0101, and 0b0110.

If the value of ID_AA64ISAR1_EL1.API is nonzero, or the value of ID_AA64ISAR1_EL1.APA is nonzero, this field must have the value 0b0000.

Access to this field is RO.

GPA3, bits [11:8]

Indicates whether the QARMA3 algorithm is implemented in the PE for generic code authentication in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GPA3	Meaning
0b0000	Generic Authentication using the QARMA3 algorithm is not implemented.
0b0001	Generic Authentication using the QARMA3 algorithm is implemented. This includes the PACGA instruction.

All other values are reserved.

FEAT_PACQARMA3 implements the functionality identified by the value 0b0001.

When this field is nonzero, FEAT_PACQARMA3 is implemented.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

If the value of ID_AA64ISAR1_EL1.GPI is nonzero, or the value of ID_AA64ISAR1_EL1.GPA is nonzero, this field must have the value 0b0000.

Access to this field is RO.

RPRES, bits [7:4]

Indicates support for 12 bits of mantissa in single-precision reciprocal and reciprocal square root instructions in AArch64 state, when FPCR.AH is 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RPRES	Meaning
0b0000	Single-precision reciprocal and reciprocal square root estimates give 8 bits of mantissa, when FPCR.AH is 1.
0b0001	Single-precision reciprocal and reciprocal square root estimates give 12 bits of mantissa, when FPCR.AH is 1.

All other values are reserved.

FEAT_RPRES implements the functionality identified by the value 0b0001.

When FPCR.AH is 0, the floating-point reciprocal estimate and reciprocal square root estimate instructions give 8 bits of mantissa.

Access to this field is RO.

WFxT, bits [3:0]

Indicates support for the WFET and WFIT instructions in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFxT	Meaning
0b0000	WFET and WFIT are not supported.
0b0010	WFET and WFIT are supported, and the register number is reported in the ESR_ELx on exceptions.

All other values are reserved.

FEAT_WFxT implements the functionality identified by the value 0b0010.

From Armv8.7, the only permitted value is 0b0010.

Access to this field is RO.

Accessing ID_AA64ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then

ID_AA64ISAR3_EL1, AArch64 Instruction Set Attribute Register 3

The ID_AA64ISAR3_EL1 characteristics are:

Purpose

Provides information about the features and instructions implemented in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64ISAR3_EL1 are UNDEFINED.

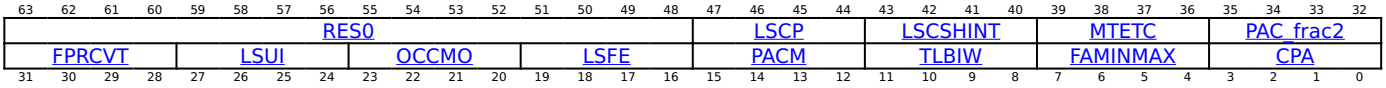
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64ISAR3_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

LSCP, bits [47:44]

Indicates support for the following Load and Store Consistency Pair instructions:

- LDAP.
- LDAPP.
- STLP

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSCP	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_LSCP implements the functionality identified by the value 0b0001.

Access to this field is RO.

LSCSHINT, bits [43:40]

Indicates support for the following hint instructions:

- SHUH.
- STCPH.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSCSHINT	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_CMH implements the functionality identified by the value 0b0001.

Access to this field is RO.

MTETC, bits [39:36]

Indicates support for the following store instructions:

- DC ZGBVA.
- DC GBVA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTETC	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_MTETC implements the functionality identified by the value 0b0001.

Access to this field is RO.

PAC_frac2, bits [35:32]

Indicates support for the following pointer authentication controls:

- To independently control pointer authentication at EL0.
- To disable BTI landing pad behavior on pointer authentication instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAC_frac2	Meaning
0b0000	The enhanced pointer authentication controls are not implemented.
0b0001	The enhanced pointer authentication controls are implemented.

FEAT_PAuth_EnhCtl implements the functionality identified by the value 0b0001.

From Armv9.7, the value 0b0000 is not permitted.

Access to this field is RO.

FPRCVT, bits [31:28]

Indicates support for the following conversion between floating-point and integer instructions with only scalar SIMD&FP register operands and results, and with different input and output register sizes, when the PE is not in Streaming SVE mode:

- FCVTAS (scalar SIMD&FP), FCVTAU (scalar SIMD&FP).
- FCVTMS (scalar SIMD&FP), FCVTMU (scalar SIMD&FP).
- FCVTNS (scalar SIMD&FP), FCVTNU (scalar SIMD&FP).
- FCVTPS (scalar SIMD&FP), FCVTPU (scalar SIMD&FP).
- FCVTZS (scalar SIMD&FP), FCVTZU (scalar SIMD&FP).
- SCVTF (scalar SIMD&FP), UCVTF (scalar SIMD&FP).

If FEAT_SME is implemented, indicates support for the above instructions, as well as the following conversion between floating-point and integer instructions with only scalar SIMD&FP register operands and results, and with the same input and output register sizes, when the PE is in Streaming SVE mode:

- FCVTAS (vector), FCVTAU (vector).
- FCVTMS (vector), FCVTMU (vector).
- FCVTNS (vector), FCVTNU (vector).
- FCVTPS (vector), FCVTPU (vector).
- FCVTZS (vector), FCVTZU (vector).
- SCVTF (vector), UCVTF (vector).

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPRCVT	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_FPRCVT implements the functionality identified by the value 0b0001.

From Armv9.6, if FEAT_FP is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

LSUI, bits [27:24]

Support for the following load and store unprivileged instructions:

- LDTXR, STTXR.
- LDATXR, STLTXR.
- CAST, CASAT, CASALT, CASLT.
- CASPT, CASPAT, CASPALT, CASPLT.
- LDTP, STTP.
- LDTP (SIMD&FP), STTP (SIMD&FP).
- LDTNP, STTNP.
- LDTNP (SIMD&FP), STTNP (SIMD&FP).
- SWPT, SWPTA, SWPTL, SWPTAL.
- LDTADD, LDTADDA, LDTADDAL, LDTADDL.
- LDTSET, LDTSETA, LDTSETAL, LDTSETL.
- LDTCLR, LDTCLRA, LDTCLRAL, LDTCLRL.
- STTADD, STTADDL.
- STTSET, STTSETL.
- STTCLR, STTCLRL.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSUI	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_LSUI implements the functionality identified by the value 0b0001.

Access to this field is RO.

OCCMO, bits [23:20]

Indicates support for the following cache maintenance operation to the Outer cache level instructions:

- DC CIVAOC.
- DC CVAOC.

If FEAT_MTE is implemented:

- DC CIGDVAOC.
- DC CGDVAOC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OCCMO	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

FEAT_OCCMO implements the functionality identified by the value 0b0001.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is RO.

LSFE, bits [19:16]

Indicates support for the following A64 Base atomic floating-point in-memory instructions:

- Floating-point atomic add in memory: LDFADD, LDFADDA, LDFADDAL, and LDFADDL.
- BFloat16 atomic add in memory: LDBFADD, LDBFADDA, LDBFADDAL, and LDBFADDL.
- Floating-point atomic maximum in memory: LDFMAX, LDFMAXA, LDFMAXAL, and LDFMAXL.
- BFloat16 atomic maximum in memory: LDBFMAX, LDBFMAXA, LDBFMAXAL, and LDBFMAXL.
- Floating-point atomic maximum number in memory: LDFMAXNM, LDFMAXNMA, LDFMAXNMAL, and LDFMAXNML.

- BFloat16 atomic maximum number in memory: LDBFMAXNM, LDBFMAXNMA, LDBFMAXNMAL, and LDBFMAXNML.
- Floating-point atomic minimum in memory: LDFMIN, LDFMINA, LDFMINAL, and LDFMINL.
- BFloat16 atomic minimum in memory: LDBFMIN, LDBFMINA, LDBFMINAL, and LDBFMINL.
- Floating-point atomic minimum number in memory: LDFMINNM, LDFMINNMA, LDFMINNMAL, and LDFMINNML.
- BFloat16 atomic minimum number in memory: LDBFMINNM, LDBFMINNMA, LDBFMINNMAL, and LDBFMINNML.
- Floating-point atomic add in memory, without return: STFADD and STFADDL.
- BFloat16 atomic add in memory, without return: STBFADD and STBFADDL.
- Floating-point atomic maximum in memory, without return: STFMAX and STFMAXL.
- BFloat16 atomic maximum in memory, without return: STBFMAX and STBFMAXL.
- Floating-point atomic maximum number in memory, without return: STFMAXNM and STFMAXNML.
- BFloat16 atomic maximum number in memory, without return: STBFMAXNM and STBFMAXNML.
- Floating-point atomic minimum in memory, without return: STFMIN and STFMINL.
- BFloat16 atomic minimum in memory, without return: STBFMIN and STBFMINL.
- Floating-point atomic minimum number in memory, without return: STFMINNM and STFMINNML.
- BFloat16 atomic minimum number in memory, without return: STBFMINNM and STBFMINNML.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSFE	Meaning
0b0000	Atomic floating-point in-memory instructions are not implemented.
0b0001	The specified Atomic floating-point in-memory instructions are implemented.

FEAT_LSFE implements the functionality identified by the value 0b0001

Access to this field is RO.

PACM, bits [15:12]

Indicates the implementation of PSTATE.PACM.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PACM	Meaning
0b0000	PSTATE.PACM is not implemented.
0b0001	Trivial implementation of PSTATE.PACM.
0b0010	Full implementation of PSTATE.PACM.

All other values are reserved.

FEAT_PAuth_LR implements the functionality identified by the values 0b0001 and 0b0010.

If FEAT_PAuth_LR is implemented, the value 0b0000 is not permitted.

If ID_AA64ISAR1_EL1.API is 0b0000, the value 0b0001 is not permitted.

If one of FEAT_PACQARMA3 or FEAT_PACQARMA5 are implemented, the value 0b0001 is not permitted.

Access to this field is RO.

TLBIW, bits [11:8]

Support for TLBI VMALL for Dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TLBIW	Meaning
0b0000	TLBI VMALL for Dirty state is not supported.
0b0001	TLBI VMALL for Dirty state is supported.

All other values are reserved.

FEAT_TLBIW implements the functionality identified by the value 0b0001.

Access to this field is RO.

FAMINMAX, bits [7:4]

Indicates support for the following Advanced SIMD, SVE2, and SME2 instructions that compute maximum and minimum absolute value:

- When Advanced SIMD is implemented, the Advanced SIMD instructions FAMAX and FAMIN.
- When FEAT_SVE2 or FEAT_SME2 is implemented, the SVE2 instructions FAMAX and FAMIN.
- When FEAT_SME2 is implemented, the SME2 instructions FAMAX (multiple and single vectors), FAMIN (multiple and single vectors), FAMAX (multiple vectors), and FAMIN (multiple vectors).

The value of this field is an IMPLEMENTATION DEFINED choice of:

FAMINMAX	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_FAMINMAX implements the functionality identified by the value 0b0001.

Access to this field is RO.

CPA, bits [3:0]

Indicates support for Checked Pointer Arithmetic instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CPA	Meaning
0b0000	Checked Pointer Arithmetic instructions are not implemented.
0b0001	Checked Pointer Arithmetic instructions are implemented.
0b0010	Checked Pointer Arithmetic instructions are implemented, and Checked Pointer Arithmetic can be enabled.

All other values are reserved.

FEAT_CPA implements the functionality identified by the value 0b0001.

FEAT_CPA2 implements the functionality identified by the value 0b0010.

From Armv9.5, the value 0b0000 is not permitted.

Access to this field is RO.

Accessing ID_AA64ISAR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ISAR3_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0110	0b011

end;
```

2025-12-10 16:11:30, 2025-12_rel

ID_AA64MMFR0_EL1, AArch64 Memory Model Feature Register 0

The ID_AA64MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

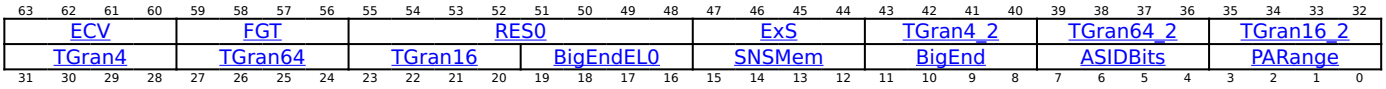
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR0_EL1 are UNDEFINED.

Attributes

ID_AA64MMFR0_EL1 is a 64-bit register.

Field descriptions



ECV, bits [63:60]

Indicates presence of Enhanced Counter Virtualization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ECV	Meaning
0b0000	Enhanced Counter Virtualization is not implemented.
0b0001	Enhanced Counter Virtualization is implemented. Supports CNTHCTL_EL2.{EL1TVT, EL1TVCT, EL1NVPCT, EL1NVVCT, EVNTIS}, CNTKCTL_EL1.EVNTIS, CNTPCTSS_EL0 counter views, and CNTVCTSS_EL0 counter views. Extends the PMSCR_EL1.PCT, PMSCR_EL2.PCT, TRFCR_EL1.TS, and TRFCR_EL2.TS fields.
0b0010	As 0b0001, and the CNTPOFF_EL2 register and the CNTHCTL_EL2.ECV and SCR_EL3.ECVEn fields are implemented.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0001.

FEAT_ECV_POFF implements the functionality identified by the value 0b0010.

From Armv8.6, the value 0b0000 is not permitted.

Access to this field is RO.

FGT, bits [59:56]

Indicates presence of the Fine-Grained Trap controls.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FGT	Meaning
0b0000	Fine-grained trap controls are not implemented.
0b0001	Fine-grained trap controls are implemented. Supports: • If EL2 is implemented, the HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers, and their associated traps. • If EL2 is implemented, MDCR_EL2.TDCC. • If EL3 is implemented, MDCR_EL3.TDCC. • If both EL2 and EL3 are implemented, SCR_EL3.FGTEn.
0b0010	As 0b0001, and also includes support for: • If EL2 is implemented, the HDFGRTR2_EL2, HDFGWTR2_EL2, HFGITR2_EL2, HFGRTR2_EL2, and HFGWTR2_EL2 registers, and their associated traps. • If both EL2 and EL3 are implemented, SCR_EL3.FGTEn2.

All other values are reserved.

FEAT_FGT implements the functionality identified by the value 0b0001.

FEAT_FGT2 implements the functionality identified by the value 0b0010.

From Armv8.6, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Access to this field is RO.

Bits [55:48]

Reserved, RES0.

ExS, bits [47:44]

Indicates support for disabling context synchronizing exception entry and exit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExS	Meaning
0b0000	All exception entries and exits are context synchronization events.
0b0001	Non-context synchronizing exception entry and exit are supported.

All other values are reserved.

FEAT_ExS implements the functionality identified by the value 0b0001.

Access to this field is RO.

TGran4_2, bits [43:40]

Indicates support for 4KB memory granule size at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran4_2	Meaning	Applies when
0b0000	Support for 4KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran4 field.	
0b0001	4KB granule not supported at stage 2.	
0b0010	4KB granule supported at stage 2.	
0b0011	4KB granule at stage 2 supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

If EL2 is not implemented, this field is 0b0000. Otherwise, the value 0b0000 is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

Access to this field is RO.

TGran64_2, bits [39:36]

Indicates support for 64KB memory granule size at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran64_2	Meaning
0b0000	Support for 64KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran64 field.
0b0001	64KB granule not supported at stage 2.
0b0010	64KB granule supported at stage 2.

All other values are reserved.

If EL2 is not implemented, this field is 0b0000. Otherwise, the value 0b0000 is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

Access to this field is RO.

TGran16_2, bits [35:32]

Indicates support for 16KB memory granule size at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran16_2	Meaning	Applies when
0b0000	Support for 16KB granule at stage 2 is identified in the ID_AA64MMFR0_EL1.TGran16 field.	
0b0001	16KB granule not supported at stage 2.	
0b0010	16KB granule supported at stage 2.	
0b0011	16KB granule at stage 2 supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

If EL2 is not implemented, this field is 0b0000. Otherwise, the value 0b0000 is deprecated.

Note

This field does not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64MMFR0_EL1 stage 2 granule sizes for more information.

Access to this field is RO.

TGran4, bits [31:28]

Indicates support for 4KB memory translation granule size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran4	Meaning	Applies when
0b0000	4KB granule supported.	
0b0001	4KB granule supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented
0b1111	4KB granule not supported.	

All other values are reserved.

Access to this field is RO.

TGran64, bits [27:24]

Indicates support for 64KB memory translation granule size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran64	Meaning
0b0000	64KB granule supported.
0b1111	64KB granule not supported.

All other values are reserved.

Access to this field is RO.

TGran16, bits [23:20]

Indicates support for 16KB memory translation granule size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TGran16	Meaning	Applies when
0b0000	16KB granule not supported.	
0b0001	16KB granule supported.	
0b0010	16KB granule supports 52-bit input addresses and can describe 52-bit output addresses.	When FEAT_LPA2 is implemented

All other values are reserved.

Access to this field is RO.

BigEndEL0, bits [19:16]

Indicates support for mixed-endian at EL0 only.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BigEndEL0	Meaning
0b0000	No mixed-endian support at EL0. The SCTLR_EL1.E0E bit has a fixed value.
0b0001	Mixed-endian support at EL0. The SCTLR_EL1.E0E bit can be configured.

FEAT_MixedEndEL0 implements the functionality identified by the value 0b0001.

All other values are reserved.

This field is invalid and is RES0 if ID_AA64MMFR0_EL1.BigEnd is not 0b0000.

Access to this field is RO.

SNSMem, bits [15:12]

Indicates support for a distinction between Secure and Non-secure Memory.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SNSMem	Meaning
0b0000	Does not support a distinction between Secure and Non-secure Memory.
0b0001	Does support a distinction between Secure and Non-secure Memory.

Note

If EL3 is implemented, the value 0b0000 is not permitted.

All other values are reserved.

Access to this field is RO.

BigEnd, bits [11:8]

Indicates support for mixed-endian configuration.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BigEnd	Meaning
0b0000	No mixed-endian support. The SCTLR_ELx.EE bits have a fixed value. See the BigEndEL0 field, bits[19:16], for whether EL0 supports mixed-endian.
0b0001	Mixed-endian support. The SCTLR_ELx.EE and SCTLR_EL1.E0E bits can be configured.

FEAT_MixedEnd implements the functionality identified by the value 0b0001.

If this field is 0b0001, FEAT_MixedEndEL0 is also implemented.

All other values are reserved.

Access to this field is RO.

ASIDBits, bits [7:4]

Number of ASID bits.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ASIDBits	Meaning
0b0000	8 bits.
0b0010	16 bits.

All other values are reserved.

Access to this field is RO.

PARange, bits [3:0]

Physical Address range supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PARange	Meaning	Applies when
0b0000	32 bits, 4GB.	
0b0001	36 bits, 64GB.	
0b0010	40 bits, 1TB.	
0b0011	42 bits, 4TB.	
0b0100	44 bits, 16TB.	
0b0101	48 bits, 256TB.	
0b0110	52 bits, 4PB.	When FEAT_LPA is implemented
0b0111	56 bits, 64PB.	When FEAT_D128 is implemented

All other values are reserved.

Access to this field is RO.

Accessing ID_AA64MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR0_EL1

op0	op1	CRn	CRm	op2

ID_AA64MMFR1_EL1, AArch64 Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

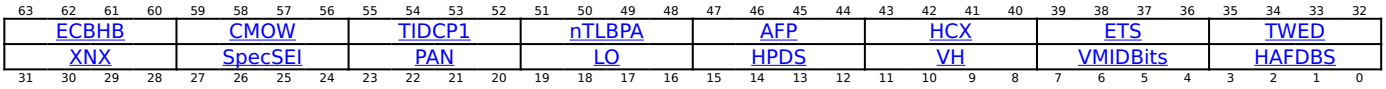
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR1_EL1 are UNDEFINED.

Attributes

ID_AA64MMFR1_EL1 is a 64-bit register.

Field descriptions



ECBHB, bits [63:60]

Indicates support for restrictions on branch history speculation around exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ECBHB	Meaning
0b0000	The implementation does not disclose whether restrictions are imposed on branch history speculation around exceptions.
0b0001	The implementation imposes restrictions on branch history speculation around exceptions.

All other values are reserved.

FEAT_ECBHB implements the functionality identified by the value 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

Access to this field is RO.

CMOW, bits [59:56]

Indicates support for cache maintenance instruction permission.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMOW	Meaning
0b0000	SCTLR_EL1.CMOW, SCTLR_EL2.CMOW, and HCRX_EL2.CMOW bits are not implemented.
0b0001	SCTLR_EL1.CMOW is implemented. If EL2 is implemented, SCTLR_EL2.CMOW and HCRX_EL2.CMOW bits are implemented.

All other values are reserved.

FEAT_CMOW implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is RO.

TIDCP1, bits [55:52]

Indicates whether SCTLR_EL1.TIDCP and SCTLR_EL2.TIDCP are implemented in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TIDCP1	Meaning
0b0000	SCTLR_EL1.TIDCP and SCTLR_EL2.TIDCP bits are not implemented and are RES0.
0b0001	SCTLR_EL1.TIDCP bit is implemented. If EL2 is implemented, SCTLR_EL2.TIDCP bit is implemented.

All other values are reserved.

FEAT_TIDCP1 implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is RO.

nTLBPA, bits [51:48]

Indicates support for intermediate caching of translation table walks.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent physical translation caches.
0b0001	The intermediate caching of translation table walks does not include non-coherent physical translation caches.

Non-coherent physical translation caches are non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE, where either:

- The caching is indexed by the physical address of the location holding the translation table entry.
- The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

Access to this field is RO.

AFP, bits [47:44]

Indicates support for FPCR.{AH, FIZ, NEP}.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AFP	Meaning
0b0000	The FPCR.{AH, FIZ, NEP} fields are not supported.
0b0001	The FPCR.{AH, FIZ, NEP} fields are supported.

All other values are reserved.

FEAT_AFP implements the functionality identified by the value 0b0001.

From Armv8.7, if Advanced SIMD and floating-point is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

HCX, bits [43:40]

Indicates support for HCRX_EL2 and its associated EL3 trap.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HCX	Meaning
0b0000	HCRX_EL2 and its associated EL3 trap are not supported.
0b0001	HCRX_EL2 and its associated EL3 trap are supported.

All other values are reserved.

FEAT_HCX implements the functionality identified by the value 0b0001.

From Armv8.7, if EL2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

ETS, bits [39:36]

Indicates support for Enhanced Translation Synchronization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is not supported.
0b0010	FEAT_ETS2 is implemented.
0b0011	FEAT_ETS3 is implemented.

All other values are reserved.

FEAT_ETS2 implements the functionality identified by the value 0b0010.

FEAT_ETS3 implements the functionality identified by the value 0b0011.

From Armv8.8, the values 0b0000 and 0b0001 are not permitted.

From Armv9.5, the value 0b0010 is not permitted.

Access to this field is RO.

TWED, bits [35:32]

Indicates support for the configurable delayed trapping of WFE and WFET.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TWED	Meaning
0b0000	Configurable delayed trapping of WFE and WFET are not supported.
0b0001	Configurable delayed trapping of WFE and WFET are supported.

All other values are reserved.

FEAT_TWED implements the functionality identified by the value 0b0001.

Access to this field is RO.

XNX, bits [31:28]

Indicates support for execute-never control distinction by Exception level at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

Access to this field is RO.

SpecSEI, bits [27:24]
When FEAT_RAS is implemented:

Describes whether the PE can generate SError exceptions from speculative reads of memory, including speculative instruction fetches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SpecSEI	Meaning
0b0000	The PE never generates an SError exception due to an External abort on a speculative read.
0b0001	The PE might generate an SError exception due to an External abort on a speculative read.

All other values are reserved.

FEAT_SpecSEI implements the functionality identified by the value 0b0001.

Access to this field is RO.

Otherwise:

Reserved, RES0.

PAN, bits [23:20]

Privileged Access Never. Indicates support for the PAN bit in PSTATE, SPSR_EL1, SPSR_EL2, SPSR_EL3, and DSPSR_EL0.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and AT S1E1RP and AT S1E1WP instructions supported.
0b0011	PAN supported, AT S1E1RP and AT S1E1WP instructions supported, and SCTLR_EL1.EPAN and SCTLR_EL2.EPAN bits supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

FEAT_PAN3 implements the functionality added by the value 0b0011.

From Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the value 0b0001 is not permitted.

From Armv8.7, the value 0b0010 is not permitted.

Access to this field is RO.

LO, bits [19:16]

LORegions. Indicates support for LORegions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LO	Meaning
0b0000	LORegions not supported.
0b0001	LORegions supported.

All other values are reserved.

FEAT_LOR implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

HPDS, bits [15:12]

Hierarchical Permission Disables. Indicates support for disabling hierarchical controls in translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Disabling of hierarchical controls supported with the TCR_EL1.{HPD1, HPD0}, TCR_EL2.HPD or TCR_EL2.{HPD1, HPD0}, and TCR_EL3.HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_HPDS implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality identified by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

VH, bits [11:8]

Virtualization Host Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VH	Meaning
0b0000	Virtualization Host Extensions not supported.
0b0001	Virtualization Host Extensions supported.

All other values are reserved.

FEAT_VHE implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

VMIDBits, bits [7:4]

Number of VMID bits.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMIDBits	Meaning
0b0000	8 bits
0b0010	16 bits

All other values are reserved.

FEAT_VMID16 implements the functionality identified by the value 0b0010.

Access to this field is RO.

HAFDBS, bits [3:0]

Hardware updates to Access flag and Dirty state in translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAFDBS	Meaning
0b0000	Hardware update of the Access flag and dirty state are not supported.
0b0001	Support for hardware update of the Access flag for Block and Page descriptors.
0b0010	As 0b0001, and adds support for hardware update of dirty state.
0b0011	As 0b0010, and adds support for hardware update of the Access flag for Table descriptors.
0b0100	As 0b0011, and adds support for hardware tracking of Dirty state Structure.

All other values are reserved.

FEAT_HAF implementes the functionality identified by the value 0b0001.

FEAT_HAFDBS implements the functionality identified by the value 0b0010.

FEAT_HAFT implements the functionality identified by the value 0b0011.

FEAT_HDBSS implements the functionality identified by the value 0b0100.

Access to this field is RO.

Accessing ID_AA64MMFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

end;
```

2025-12-10 16:11:30, 2025-12_rel

ID_AA64MMFR2_EL1, AArch64 Memory Model Feature Register 2

The ID_AA64MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR2_EL1 are UNDEFINED.

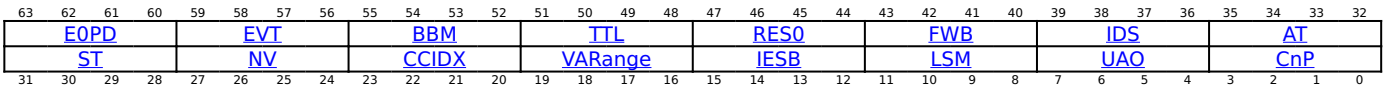
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR2_EL1 is a 64-bit register.

Field descriptions



E0PD, bits [63:60]

Indicates support for the E0PD mechanism.

The value of this field is an IMPLEMENTATION DEFINED choice of:

E0PD	Meaning
0b0000	E0PDx mechanism is not implemented.
0b0001	E0PDx mechanism is implemented.

All other values are reserved.

FEAT_E0PD implements the functionality identified by the value 0b0001.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Access to this field is RO.

EVT, bits [59:56]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EVT	Meaning
0b0000	HCR_EL2.{TTLBOS, TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR_EL2.{TOCU, TICAB, TID4} traps are supported.
0b0010	As 0b0001, and HCR_EL2.{TTLBOS, TTLBIS} traps are supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the value 0b0001.

FEAT_EVT2 implements the functionality identified by the value 0b0010.

If EL2 is not implemented, the only permitted value is 0b0000.

From Armv8.5, if EL2 is implemented, the value 0b0001 is not permitted.

Access to this field is RO.

BBM, bits [55:52]

Allows identification of the requirements of the hardware to have break-before-make sequences when changing block or table size for a translation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BBM	Meaning
0b0000	Break-before-make sequence must be used.
0b0001	Level 1 support for changing block size is supported.
0b0010	Level 2 support for changing block size is supported.
0b0011	Level 3 support for changing block size is supported.

All other values are reserved.

FEAT_BBML1 implements the functionality identified by the value 0b0001.

FEAT_BBML2 implements the functionality identified by the value 0b0010.

FEAT_BBML3 implements the functionality identified by the value 0b0011.

Access to this field is RO.

TTL, bits [51:48]

Indicates support for TTL field in address operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TTL	Meaning
0b0000	TLB maintenance instructions by address have bits[47:44] as RES0.
0b0001	TLB maintenance instructions by address have bits[47:44] holding the TTL field.

All other values are reserved.

FEAT_TTL implements the functionality identified by the value 0b0001.

This field affects TLBI IPAS2E1, TLBI IPAS2E1IS, TLBI IPAS2E1OS, TLBI IPAS2LE1, TLBI IPAS2LE1IS, TLBI IPAS2LE1OS, TLBI VAAE1, TLBI VAAE1IS, TLBI VAAE1OS, TLBI VAALE1, TLBI VAALE1IS, TLBI VAALE1OS, TLBI VAE1, TLBI VAE1IS, TLBI VAE1OS, TLBI VAE2, TLBI VAE2IS, TLBI VAE2OS, TLBI VAE3, TLBI VAE3IS, TLBI VAE3OS,TLBI VALE1, TLBI VALE1IS, TLBI VALE1OS, TLBI VALE2, TLBI VALE2IS, TLBI VALE2OS, TLBI VALE3, TLBI VALE3IS, TLBI VALE3OS.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is RO.

Bits [47:44]

Reserved, RES0.

FWB, bits [43:40]

Indicates support for HCR_EL2.FWB.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FWB	Meaning
0b0000	HCR_EL2.FWB bit is not supported.
0b0001	HCR_EL2.FWB is supported.

All other values reserved.

FEAT_S2FWB implements the functionality identified by the value 0b0001.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is RO.

IDS, bits [39:36]

Indicates the EC syndrome value in ESR_ELx.EC that is reported if an exception is generated by a read access to the feature ID space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IDS	Meaning
0b0000	An exception which is generated by a read access to the feature ID space, other than a trap caused by HCR_EL2.TIDx, SCTLR_EL1.UCT, or SCTLR_EL2.UCT is reported by ESR_ELx.EC == 0x0.
0b0001	All exceptions generated by an AArch64 read access to the feature ID space are reported by ESR_ELx.EC == 0x18.
0b0010	As 0b0001 and introduces support for trapping ID register accesses to EL3.

All other values are reserved.

The Feature ID space is defined as the System register space in AArch64 with op0==3, op1=={0, 1, 3}, CRn==0, CRm=={0-7}, op2=={0-7}.

FEAT_IDST implements the functionality identified by the value 0b0001.

FEAT_IDTE3 implements the functionality identified by 0b0010.

From Armv8.4, the value 0b0000 is not permitted.

From Armv9.6, if EL3 is implemented, the value 0b0001 is not permitted.

Access to this field is RO.

AT, bits [35:32]

Identifies support for unaligned single-copy atomicity and atomic functions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AT	Meaning
0b0000	Unaligned single-copy atomicity and atomic functions are not supported.
0b0001	Unaligned single-copy atomicity and atomic functions with a 16-byte address range aligned to 16-bytes are supported.

All other values are reserved.

FEAT_LSE2 implements the functionality identified by the value 0b0001.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is RO.

ST, bits [31:28]

Identifies support for small translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ST	Meaning
0b0000	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 39.
0b0001	The maximum value of the TCR_ELx.{T0SZ,T1SZ} and VTCR_EL2.T0SZ fields is 48 for 4KB and 16KB granules, and 47 for 64KB granules.

All other values are reserved.

FEAT_TTST implements the functionality identified by the value 0b0001.

When FEAT_SEL2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

NV, bits [27:24]

Nested Virtualization. If EL2 is implemented, indicates support for the use of nested virtualization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NV	Meaning
0b0000	If ID_AA64MMFR4_EL1.NV_frac != 0b0000, support for nested virtualization is described in ID_AA64MMFR4_EL1.NV_frac. Otherwise, nested virtualization is not supported.
0b0001	The HCR_EL2.{AT, NV1, NV} bits are implemented.
0b0010	The VNCR_EL2 register and the HCR_EL2.{NV2, AT, NV1, NV} bits are implemented.

All other values are reserved.

If EL2 is not implemented, the only permitted value is 0b0000.

FEAT_NV implements the functionality identified by the value 0b0001.

FEAT_NV2 implements the functionality identified by the value 0b0010.

In Armv8.3, if EL2 is implemented, the permitted values are 0b0000 and 0b0001.

From Armv8.4, if EL2 is implemented, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is RO.

CCIDX, bits [23:20]

Support for the use of revised CCSIDR_EL1 register format.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR_EL1.
0b0001	64-bit format implemented for all levels of the CCSIDR_EL1.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by the value 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

VARange, bits [19:16]

Indicates support for a larger virtual address.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VARange	Meaning	Applies when
0b0000	VMSAv8-64 supports 48-bit VAs.	
0b0001	VMSAv8-64 supports 52-bit VAs when using the 64KB translation granule. The size for other translation granules is not defined by this field.	
0b0010	VMSAv9-128 supports 56-bit VAs.	When FEAT_D128 is implemented

All other values are reserved.

FEAT_LVA implements the functionality identified by the value 0b0001.

FEAT_LVA3 implements the functionality identified by the value 0b0010.

Access to this field is RO.

IESB, bits [15:12]

Indicates support for the IESB bit in the SCTLR_ELx registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IESB	Meaning
0b0000	IESB bit in the SCTLR_ELx registers is not supported.
0b0001	IESB bit in the SCTLR_ELx registers is supported.

All other values are reserved.

FEAT_IESB implements the functionality identified by the value 0b0001.

Access to this field is RO.

LSM, bits [11:8]

Indicates support for LSMAOE and nTLSMD bits in SCTLR_EL1 and SCTLR_EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

Access to this field is RO.

UAO, bits [7:4]

User Access Override.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UAO	Meaning
0b0000	UAO not supported.
0b0001	UAO supported.

All other values are reserved.

FEAT_UAO implements the functionality identified by the value 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

Access to this field is RO.

CnP, bits [3:0]

Indicates support for Common not Private translations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

Access to this field is RO.

Accessing ID_AA64MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b010

ID_AA64MMFR3_EL1, AArch64 Memory Model Feature Register 3

The ID_AA64MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch64 state.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR3_EL1 are UNDEFINED.

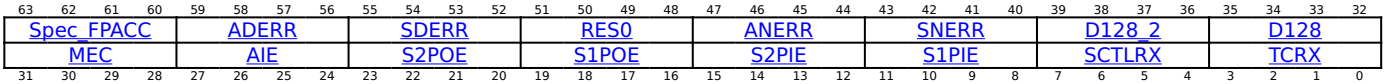
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR3_EL1 is a 64-bit register.

Field descriptions



Spec_FPACC, bits [63:60]
When FEAT_FPACCOMBINE is implemented:

Speculative behavior in the event of a PAC authentication failure in an implementation that includes FEAT_FPACCOMBINE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Spec_FPACC	Meaning
0b0000	The implementation does not disclose whether the speculative use of pointers processed by a PAC Authentication is materially different in terms of the impact on cached microarchitectural state between passing and failing of the PAC Authentication.
0b0001	The speculative use of pointers processed by a PAC Authentication is not materially different in terms of the impact on cached microarchitectural state between passing and failing of the PAC Authentication.

All other values are reserved.

For the purpose of this definition, cached microarchitecture state is the state of caching agents such as instruction caches, data caches and TLBs which can be altered as a result of speculation caused by a mispredicted execution, but is not restored to the state prior to the speculation when the misprediction is corrected.

Access to this field is RO.

Otherwise:

Reserved, RES0.

ADERR, bits [59:56]

Asynchronous Device error exceptions. With ID_AA64MMFR3_EL1.SDERR, describes the PE behavior for External aborts signaled on Device memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ADERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.SDERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.SDERR.
0b0001	All External aborts on Device memory loads are handled asynchronously.
0b0010	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnADERR is set to the value of SCTLR2_ELx.EnANERR. • HCRX_EL2.EnSDERR is set to the value of HCRX_EL2.EnSNERR.
0b0011	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR operate independently of SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.SDERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.SDERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.SDERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.SDERR is 0b0011, the value of this field is 0b0011.

FEAT_ADERR implements the functionality described by the value 0b0010.

Access to this field is RO.

SDERR, bits [55:52]

Synchronous Device error exceptions. With ID_AA64MMFR3_EL1.ADERR, describes the PE behavior for External aborts signaled on Device memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SDERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.ADERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.ADERR.
0b0001	All External aborts on Device memory loads are handled synchronously.
0b0010	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnADERR is set to the value of SCTLR2_ELx.EnANERR. • HCRX_EL2.EnSDERR is set to the value of HCRX_EL2.EnSNERR.
0b0011	FEAT_ADERR is implemented. SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR are implemented. If FEAT_ANERR is also implemented, then SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR operate independently of SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.ADERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.ADERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.ADERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.ADERR is 0b0011, the value of this field is 0b0011.

FEAT_ADERR implements the functionality described by the value 0b0010.

Access to this field is RO.

Bits [51:48]

Reserved, RES0.

ANERR, bits [47:44]

Asynchronous Normal error exceptions. With ID_AA64MMFR3_EL1.SNERR, describes the PE behavior for External aborts signaled on Normal memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ANERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.SNERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.SNERR.
0b0001	All External aborts on Normal memory loads are handled asynchronously.
0b0010	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnANERR is set to the value of SCTLR2_ELx.EnADERR. • HCRX_EL2.EnSNERR is set to the value of HCRX_EL2.EnSDERR.
0b0011	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR operate independently of SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.SNERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.SNERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.SNERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.SNERR is 0b0011, the value of this field is 0b0011.

FEAT_ANERR implements the functionality described by the value 0b0010.

Access to this field is RO.

SNERR, bits [43:40]

Synchronous Normal error exceptions. With ID_AA64MMFR3_EL1.ANERR, describes the PE behavior for External aborts signaled on Normal memory loads.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SNERR	Meaning
0b0000	If FEAT_RASv2 is not implemented and ID_AA64MMFR3_EL1.ANERR is 0b0000, then the behavior is not described. Otherwise, the behavior is described by ID_AA64MMFR3_EL1.ANERR.
0b0001	All External aborts on Normal memory loads are handled synchronously.
0b0010	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then software should ensure that all the following apply: • SCTLR2_ELx.EnANERR is set to the value of SCTLR2_ELx.EnADERR. • HCRX_EL2.EnSNERR is set to the value of HCRX_EL2.EnSDERR.
0b0011	FEAT_ANERR is implemented. SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR are implemented. If FEAT_ADERR is also implemented, then SCTLR2_ELx.EnANERR and HCRX_EL2.EnSNERR operate independently of SCTLR2_ELx.EnADERR and HCRX_EL2.EnSDERR.

All other values are reserved.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

When FEAT_RASv2 is implemented and ID_AA64MMFR3_EL1.ANERR is 0b0000, the value of this field is 0b0001.

When ID_AA64MMFR3_EL1.ANERR is 0b0001, the value of this field is 0b0000.

When ID_AA64MMFR3_EL1.ANERR is 0b0010, the value of this field is 0b0010.

When ID_AA64MMFR3_EL1.ANERR is 0b0011, the value of this field is 0b0011.

FEAT_ANERR implements the functionality described by the value 0b0010.

Access to this field is RO.

D128_2, bits [39:36]

128-bit translation table descriptor at stage 2. Indicates support for 128-bit translation table descriptor at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

D128_2	Meaning
0b0000	128-bit translation table descriptor Extension at stage 2 is not supported.
0b0001	128-bit translation table descriptor Extension at stage 2 is supported.

All other values are reserved.

Access to this field is RO.

D128, bits [35:32]

128-bit translation table descriptor. Indicates support for 128-bit translation table descriptor.

The value of this field is an IMPLEMENTATION DEFINED choice of:

D128	Meaning
0b0000	128-bit translation table descriptor Extension is not supported.
0b0001	128-bit translation table descriptor Extension is supported.

All other values are reserved.

Access to this field is RO.

MEC, bits [31:28]

Indicates support for Memory Encryption Contexts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MEC	Meaning
0b0000	Memory Encryption Contexts is not supported.
0b0001	Memory Encryption Contexts is supported, with multiple contexts in the Realm physical address space.

All other values are reserved.

FEAT_MEC implements the functionality identified by the value 0b0001.

Access to this field is RO.

AIE, bits [27:24]

Attribute Indexing. Indicates support for the Attribute Index Enhancement.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AIE	Meaning
0b0000	The Attribute Index Enhancement is not supported.
0b0001	The Attribute Index Enhancement at stage 1 is supported.

All other values are reserved.

FEAT_AIE implements the functionality identified by the value 0b0001.

Access to this field is RO.

S2POE, bits [23:20]

Stage 2 Permission Overlay. Indicates support for Permission Overlay at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S2POE	Meaning
0b0000	Permission Overlay at stage 2 is not supported.
0b0001	Permission Overlay at stage 2 is supported.

All other values are reserved.

FEAT_S2POE implements the functionality identified by the value 0b0001.

Access to this field is RO.

S1POE, bits [19:16]

Stage 1 Permission Overlay. Indicates support for Permission Overlay at stage 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S1POE	Meaning
0b0000	Permission Overlay at stage 1 is not supported.
0b0001	Permission Overlay at stage 1 is supported.
0b0010	As 0b0001, and Enhanced Permission Overlays at stage 1 are supported.

All other values are reserved.

FEAT_S1POE implements the functionality identified by the value 0b0001.

FEAT_S1POE2 implements the functionality identified by the value 0b0010.

Access to this field is RO.

S2PIE, bits [15:12]

Stage 2 Permission Indirection. Indicates support for Permission Indirection at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S2PIE	Meaning
0b0000	Permission Indirection at stage 2 is not supported.
0b0001	Permission Indirection at stage 2 is supported.

All other values are reserved.

FEAT_S2PIE implements the functionality identified by the value 0b0001.

Access to this field is RO.

S1PIE, bits [11:8]

Stage 1 Permission Indirection. Indicates support for Permission Indirection at stage 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

S1PIE	Meaning
0b0000	Permission Indirection at stage 1 is not supported.
0b0001	Permission Indirection at stage 1 is supported.

All other values are reserved.

FEAT_S1PIE implements the functionality identified by the value 0b0001.

Access to this field is RO.

SCTLRX, bits [7:4]

SCTLR Extension. Indicates support for extension of SCTLR_ELx.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SCTLRX	Meaning
0b0000	SCTLR2_EL1, SCTLR2_EL2, SCTLR2_EL3 registers, and their associated trap controls are not implemented.
0b0001	SCTLR2_EL1, SCTLR2_EL2, SCTLR2_EL3 resisters, and their associated trap controls are implemented.

All other values are reserved.

From Armv8.9, the value 0b0000 is not permitted.

FEAT_SCTLR2 implements the functionality described by the value 0b0001.

Access to this field is RO.

TCRX, bits [3:0]

TCR Extension. Indicates support for extension of TCR_ELx.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TCRX	Meaning
0b0000	TCR2_EL1, TCR2_EL2, and their associated trap controls are not implemented.
0b0001	TCR2_EL1, TCR2_EL2, and their associated trap controls are implemented.

All other values are reserved.

From Armv8.9, the value 0b0000 is not permitted.

FEAT_TCR2 implements the functionality described by the value 0b0001.

Access to this field is RO.

ID_AA64MMFR4_EL1, AArch64 Memory Model Feature Register 4

The ID_AA64MMFR4_EL1 characteristics are:

Purpose

Provides additional information about implemented memory model and memory management support in AArch64.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64MMFR4_EL1 are UNDEFINED.

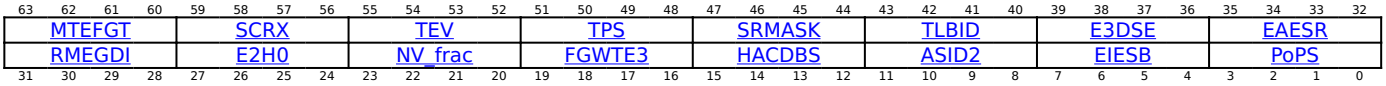
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64MMFR4_EL1 is a 64-bit register.

Field descriptions



MTEFGT, bits [63:60]

If FEAT_MTE2 or FEAT_VMTE is implemented, indicates support for fine grained traps on RGSR_EL1 and GCR_EL1.

If FEAT_MTE_ASYNC is implemented, indicates support for fine grained traps on TFSR_EL1 and TFSRE0_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEFGT	Meaning
0b0000	Fine grained traps on RGSR_EL1, GCR_EL1, TFSR_EL1, and TFSRE0_EL1 are not supported.
0b0001	Fine grained traps on RGSR_EL1, GCR_EL1, TFSR_EL1, and TFSRE0_EL1 are supported.

All other values are reserved.

FEAT_MTEFGT implements the functionality identified by the value 0b0001.

Access to this field is RO.

SCRX, bits [59:56]

Indicates support for SCR2_EL3.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SCRX	Meaning
0b0000	SCR2_EL3 is not supported.
0b0001	SCR2_EL3 is supported.

All other values are reserved.

FEAT_SCR2 implements the functionality identified by the value 0b0001.

Access to this field is RO.

TEV, bits [55:52]

TIndex Exception-like Vector. Indicates support for exception-like changes to TIndex and the associated changes to interpretation of exception vectors and VBAR_ELx.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TEV	Meaning
0b0000	FEAT_TEV is not supported.
0b0001	FEAT_TEV is supported.

All other values are reserved.

Access to this field is RO.

TPS, bits [51:48]

Thread Private State. Indicates support for thread-private region permissions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TPS	Meaning
0b0000	Thread Private State checks are not supported.
0b0001	Thread Private State are supported at EL0 only.
0b0010	Thread Private State checks are supported at EL0, EL1, and EL2.

All other values are reserved.

FEAT_TPS implements the functionality identified by the value 0b0001.

FEAT_TPSP implements the functionality identified by the value 0b0010.

Access to this field is RO.

SRMASK, bits [47:44]

Indicates support for bitwise write masks for the following registers:

- ACTLR_EL1.
- CPACR_EL1.
- SCTLR_EL1.
- SCTLR2_EL1.
- TCR_EL1.
- TCR2_EL1.
- ACTLR_EL2.
- CPTR_EL2.
- SCTLR_EL2.
- SCTLR2_EL2.
- TCR_EL2.
- TCR2_EL2.

When FEAT_SRMASK2 is implemented, indicates support for bitwise write masks for the following registers:

- HCR_EL2 and HCRX_EL2.
- If FEAT_NV3 is implemented, indicates support for the following:
  - The NVHCRX_EL2 register.
  - Bitwise masks for NVHCRX_EL2 and NVHCR_EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SRMASK	Meaning
0b0000	Bitwise write masks for the specified registers are not supported.
0b0001	Bitwise write masks for the specified registers are supported.
0b0010	As 0b0001, and FEAT_SRMASK2 is implemented.

FEAT_SRMASK implements the functionality identified by the value 0b0001.

FEAT_SRMASK2 implements the functionality identified by the value 0b0010.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is RO.

TLBID, bits [43:40]

Support for TLBI Domains.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TLBID	Meaning
0b0000	FEAT_TLBID is not implemented.
0b0001	FEAT_TLBID is implemented.

FEAT_TLBID implements the functionality identified by the value 0b0001.

The number of bits of TLBI Domains supported is described in TLBIDIDR_El1.

Access to this field is RO.

E3DSE, bits [39:36]

Delegated SError exceptions from EL3. Describes support for delegated SError injection from EL3.

The value of this field is an IMPLEMENTATION DEFINED choice of:

E3DSE	Meaning
0b0000	FEAT_E3DSE is not implemented.
0b0001	FEAT_E3DSE is implemented. The following are implemented: • Register fields SCR_EL3.DSE and SCR_EL3.EnDSE. • Registers VSESR_EL3 and VDISR_EL3.

All other values are reserved.

FEAT_E3DSE implements the functionality described by the value 0b0001.

Access to this field is RO.

EAESR, bits [35:32]

Indicates support for Enhanced Abort Syndrome.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EAESR	Meaning
0b0000	FEAT_EAESR is not implemented.
0b0001	FEAT_EAESR is implemented.

All other values are reserved.

FEAT_EAESR implements the functionality identified by the value 0b0001.

Access to this field is RO.

RMEGDI, bits [31:28]

RME Granular Data Isolation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RMEGDI	Meaning
0b0000	The Granular Data isolation GPI encodings are reserved.
0b0001	The Granular Data Isolation GPI encodings can be configured to be either reserved or No Access from this PE.

All other values are reserved.

FEAT_RME_GDI implements the functionality described by the value 0b0001.

Access to this field is RO.

E2H0, bits [27:24]

Indicates support for programming HCR_EL2.E2H.

The value of this field is an IMPLEMENTATION DEFINED choice of:

E2H0	Meaning
0b0000	FEAT_E2H0 is implemented.
0b1110	FEAT_E2H0 is not implemented. HCR_EL2.NV1 is RES0.
0b1111	FEAT_E2H0 is not implemented.

All other values are reserved.

If FEAT_NV is not implemented, then the value 0b1110 is not permitted.

If FEAT_E2H0 is implemented and FEAT_VHE is not implemented, then HCR_EL2.E2H is RES0.

If FEAT_E2H0 is implemented and FEAT_VHE is implemented, then HCR_EL2.E2H can be programmed to 0 or 1.

If FEAT_E2H0 is not implemented then:

- FEAT_VHE is implemented.
- HCR_EL2.E2H is RES1 and behaves as though it is 1.

Access to this field is RO.

NV_frac, bits [23:20]

Indicates support for a subset of FEAT_NV and FEAT_NV2 behaviors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NV_frac	Meaning
0b0000	Support for FEAT_NV and FEAT_NV2 is described in ID_AA64MMFR2_EL1.NV.
0b0001	FEAT_NV and FEAT_NV2 are implemented, but all of the following apply: • ID_AA64MMFR2_EL1.NV is 0b0000. • Programming HCR_EL2.{NV, NV2} to {1, 0} behaves as {1, 1}.
0b0010	As 0b0001 and adds stateful bits in specified _EL1 registers for software usage under nested virtualization.
0b0011	As 0b0010 and adds support for FEAT_NV3.

FEAT_NV2p1 implements the functionality indicated by the value 0b0010.

FEAT_NV3 implements the functionality indicated by the value 0b0011.

Access to this field is RO.

FGWTE3, bits [19:16]

Indicates support for Fine Grained Write Trap EL3 feature.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FGWTE3	Meaning
0b0000	Fine Grained Write Trap EL3 is not supported.
0b0001	Fine Grained Write Trap EL3 is supported.

All other values are reserved.

FEAT_FGWTE3 implements the functionality identified by the value 0b0001.

Access to this field is RO.

HACDBS, bits [15:12]

Support for Hardware accelerator for cleaning Dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HACDBS	Meaning
0b0000	Hardware accelerator for cleaning Dirty state is not supported.
0b0001	Hardware accelerator for cleaning Dirty state is supported.

All other values are reserved.

FEAT_HACDBS implements the functionality identified by the value 0b0001.

Access to this field is RO.

ASID2, bits [11:8]

Indicates support for concurrent use of two ASIDs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ASID2	Meaning
0b0000	FEAT_ASID2 is not implemented.
0b0001	FEAT_ASID2 is implemented.

All other values are reserved.

From Armv9.5, the value 0b0000 is not permitted.

Access to this field is RO.

EIESB, bits [7:4]
When FEAT_IESB is implemented:

Early Implicit Error Synchronization event. Indicates whether the implicit Error synchronization event inserted on taking an exception to ELx when SCTLR_ELx.IESB is 1 is inserted before or after the exception is taken.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EIESB	Meaning
0b1111	FEAT_IESB is implemented. When SError exceptions are routed to EL3, and either FEAT_DoubleFault is not implemented or the Effective value of SCR_EL3.NMEA is 1, an implicit Error synchronization event might be inserted after an exception is taken to EL3.
0b0000	FEAT_IESB is not implemented, or behavior is not described.
0b0001	FEAT_IESB is implemented. When SError exceptions are routed to EL3, and either FEAT_DoubleFault is not implemented or the Effective value of SCR_EL3.NMEA is 1, an implicit Error synchronization event is inserted before an exception taken to EL3.
0b0010	As 0b0001, and also: • When SError exceptions are routed to EL1, and either FEAT_DoubleFault2 is not implemented or the Effective value of SCTLR2_EL1.NMEA is 1, an implicit Error synchronization event is inserted before an exception taken to EL1. • When SError exceptions are routed to EL2, and either FEAT_DoubleFault2 is not implemented or the Effective value of SCTLR2_EL2.NMEA is 1, an implicit Error synchronization event is inserted before an exception taken to EL2.

All other values are reserved.

This field describes the PE behavior on taking an exception to ELx when SCTLR_ELx.IESB is 1. This field does not describe the behavior when SCTLR_ELx.IESB is 0.

The behavior described by this field only applies for the conditions described above. For example, if ID_AA64MMFR4_EL1.EIESB reads as 0b0001, then it does not describe the behavior when SError exceptions are not routed to EL3, or when FEAT_DoubleFault is implemented and the Effective value of SCR_EL3.NMEA is 0.

Inserting the event before the exception is taken means that if the Error synchronization event causes an SError exception to become pending, and SError exceptions are not masked and not disabled, then the SError exception is taken in place of the original exception.

When FEAT_IESB is not implemented, the only permitted value of this field is 0b0000.

Access to this field is RO.

Otherwise:

Reserved, RES0.

PoPS, bits [3:0]

Support for the clean and invalidate to the Point of Physical Storage instructions:

- DC CIVAPS.
- If FEAT_MTE2 is implemented, DC CIGDVAPS.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PoPS	Meaning
0b0000	The System instructions to clean and invalidate to the Point of Physical Storage are not implemented.
0b0001	The specified System instructions to clean and invalidate to the Point of Physical Storage are implemented.

FEAT_PoPS implements the functionality described by the value 0b0001.

All other values are reserved.

Access to this field is RO.

Accessing ID_AA64MMFR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64MMFR4_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0111	0b100

```
if !IsFeatureImplemented(FEAT_AA64) then
    UnimplementedIDRegister();

    else
        X{64}(t) = ID_AA64MMFR4_EL1();
    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = ID_AA64MMFR4_EL1();
end;
```

2025-12-10 16:11:30, 2025-12_rel

ID_AA64PFR0_EL1, AArch64 Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

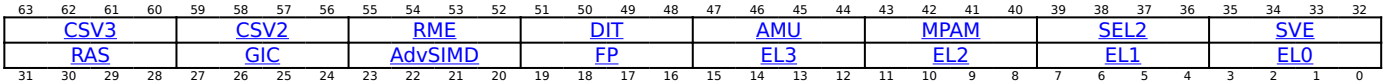
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64PFR0_EL1 are UNDEFINED.

The external register EDPFR gives information from this register.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

Field descriptions



CSV3, bits [63:60]

Speculative use of faulting data.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded or read from a register under speculation where the data load or register read would not be permitted architecturally, can be used by instructions newer than the load or register read in a manner that allows the value of the inaccessible data to be recovered by code architecturally executed.
0b0001	Data loaded or read from a register under speculation where the data load or register read would not be permitted architecturally, cannot be used by instructions newer than the load or register read in a manner that allows the value of the inaccessible data to be recovered by code architecturally executed.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is RO.

CSV2, bits [59:56]

Speculative use of out of context prediction resources.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_2 and FEAT_CSV2_3 are not implemented. ID_AA64PFR1_EL1.CSV2_frac determines whether either or both of FEAT_CSV2_1p1 or FEAT_CSV2_1p2 are implemented.
0b0010	FEAT_CSV2_2 is implemented, but FEAT_CSV2_3 is not implemented.
0b0011	FEAT_CSV2_3 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_2 implements the functionality identified by the value 0b0010.

FEAT_CSV2_3 implements the functionality identified by the feature 0b0011.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is RO.

RME, bits [55:52]

Realm Management Extension (RME).

The value of this field is an IMPLEMENTATION DEFINED choice of:

RME	Meaning
0b0000	Realm Management Extension not implemented.
0b0001	RMEv1 is implemented.
0b0010	As 0b0001, and adds support for the GPC2 Extension.
0b0011	As 0b0010, and adds support for the GPC3 Extension.

All other values are reserved.

FEAT_RME implements the functionality identified by the value 0b0001.

FEAT_RME_GPC2 implements the functionality identified by the value 0b0010.

FEAT_RME_GPC3 implements the functionality identified by the value 0b0011.

Access to this field is RO.

DIT, bits [51:48]

Data Independent Timing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIT	Meaning
0b0000	AArch64 does not guarantee constant execution time of any instructions.
0b0001	AArch64 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.
0b0010	As 0b0001 and adds support for FEAT_FDIT.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

FEAT_FDIT implements the functionality identified by the value 0b0010.

From Armv8.4, the value 0b0000 is not permitted.

Access to this field is RO.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is RO.

MPAM, bits [43:40]

Indicates the major version number of support for the MPAM Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM	Meaning
0b0000	The major version number of the MPAM extension is 0.
0b0001	The major version number of the MPAM extension is 1.

All other values are reserved.

When combined with the minor version number from ID_AA64PFR1_EL1.MPAM_frac, the "major.minor" version is:

MPAM Extension version	MPAM	MPAM_frac
Not implemented.	0b0000	0b0000
v0.1 is implemented.	0b0000	0b0001
v1.0 is implemented.	0b0001	0b0000
v1.1 is implemented.	0b0001	0b0001

If ID_AA64PFR2_EL1.MPAM2 is not 0b0000, then this field is 0b0000.

For more information, see 'The Memory Partitioning and Monitoring (MPAM) Extension'.

Access to this field is RO.

SEL2, bits [39:36]

Secure EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

All other values are reserved.

FEAT_SEL2 implements the functionality identified by the value 0b0001.

From Armv8.4, if Secure state and EL2 are implemented, the value 0b0000 is not permitted.

From Armv8.4, if Secure state is not implemented, or if EL2 is not implemented, the only permitted value is 0b0000.

Access to this field is RO.

SVE, bits [35:32]

Scalable Vector Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVE	Meaning
0b0000	SVE architectural state and programmers' model are not implemented.
0b0001	SVE architectural state and programmers' model are implemented.

All other values are reserved.

FEAT_SVE implements the functionality identified by the value 0b0001.

If implemented, refer to ID_AA64ZFR0_EL1 for information about which SVE instructions are available.

Access to this field is RO.

RAS, bits [31:28]

RAS Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	Support for the Reliability, Availability, and Serviceability Extension is implemented. The ESB instruction and the Error synchronization event are supported.
0b0010	As 0b0001, and adds support for: • If EL3 is implemented, FEAT_DoubleFault. • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.
0b0011	As 0b0010 and adds support for: • The error group status register, ERXGSR_EL1. • The SCR_EL3.TWERR write trap control for error record System registers. • Additional fields in ESR_ELx.ISS for error exceptions. Error records accessed through System registers conform to either RAS System Architecture v1.1 or RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 and FEAT_DoubleFault implement the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0001 is not permitted.

Note

When the value of this field is 0b0001, ID_AA64PFR1_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

From Armv8.9, if ERRIDR_EL1.NUM is nonzero, the value 0b0010 is not permitted.

Access to this field is RO.

GIC, bits [27:24]

System register GIC CPU interface.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Access to this field is RO.

AdvSIMD, bits [23:20]

Advanced SIMD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

Access to this field is RO.

FP, bits [19:16]

Floating-point.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

Access to this field is RO.

EL3, bits [15:12]

EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
0b0000	EL3 is not implemented.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

The value 0b0010 is not permitted in Armv9-A implementations.

Access to this field is RO.

EL2, bits [11:8]

EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
0b0000	EL2 is not implemented.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

The value 0b0010 is not permitted in Armv9-A implementations.

Access to this field is RO.

EL1, bits [7:4]

EL1 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL1	Meaning
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

The value 0b0010 is not permitted in Armv9-A implementations.

Access to this field is RO.

EL0, bits [3:0]

EL0 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL0	Meaning
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in either AArch64 or AArch32 state.

All other values are reserved.

Access to this field is RO.

Accessing ID_AA64PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b000

```

```

2025-12-10 16:11:30, 2025-12_rel

ID_AA64PFR1_EL1, AArch64 Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

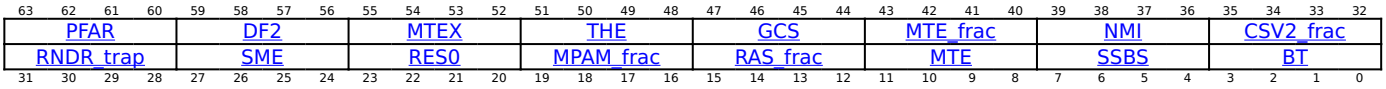
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64PFR1_EL1 are UNDEFINED.

Attributes

ID_AA64PFR1_EL1 is a 64-bit register.

Field descriptions



PFAR, bits [63:60]

Support for physical fault address registers, FEAT_PFAR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PFAR	Meaning
0b0000	FEAT_PFAR is not implemented.
0b0001	FEAT_PFAR is implemented. Includes support for the PFAR_ELx and, if EL3 is implemented, MFAR_EL3 registers.

All other values are reserved.

FEAT_PFAR implements the functionality identified by the value 0b0001.

Access to this field is RO.

DF2, bits [59:56]

Support for error exception routing extensions, FEAT_DoubleFault2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DF2	Meaning
0b0000	FEAT_DoubleFault2 is not implemented. Note This does not mean that FEAT_DoubleFault, as identified by ID_AA64PFR0_EL1.RAS >= 0b0010, is not implemented.
0b0001	FEAT_DoubleFault2 is implemented. As ID_AA64PFR0_EL1.RAS == 0b0010, and also includes support for routing error exceptions: • Traps for masked error exceptions, HCRX_EL2.TMEA and SCR_EL3.TMEA. • Additional controls for masking SError exceptions, SCTLR2_EL1.NMEA, and SCTLR2_EL2.NMEA. • Additional controls for taking external aborts to the SError exception vector, SCTLR2_EL1.EASE and SCTLR2_EL2.EASE.

All other values are reserved.

FEAT_DoubleFault2 implements the functionality identified by the value 0b0001.

Access to this field is RO.

MTEX, bits [55:52]

Support for additional MTE tag checking modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEX	Meaning
0b0000	Canonical Tag checking and Memory tagging with Address tagging disabled are not supported.
0b0001	The following additional tag checking modes for MTE are supported: • Canonical Tag checking. • Memory tagging with Address tagging disabled.

All other values are reserved.

This field is valid if any of the following are true:

- ID_AA64PFR1_EL1.MTE >= 0b0010
- ID_AA64PFR2_EL1.VMTE >= 0b0001

FEAT_MTE_NO_ADDRESS_TAGS and FEAT_MTE_CANONICAL_TAGS implement the functionality identified by the value 0b0001.

If neither FEAT_MTE2 nor FEAT_VMTE are implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

THE, bits [51:48]

Support for Translation Hardening Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THE	Meaning
0b0000	Translation Hardening Extension is not implemented.
0b0001	The RCW and RCWS instructions, their associated registers and traps are supported. If EL2 is implemented, the AssuredOnly check, TopLevel check, and their associated controls are implemented. If EL2 and FEAT_GCS are implemented, VTCR_EL2.GCSH is implemented.

All other values are reserved.

FEAT_THE implements the functionality identified by the value 0b0001.

Access to this field is RO.

GCS, bits [47:44]

Support for Guarded Control Stack.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GCS	Meaning
0b0000	Guarded Control Stack is not implemented.
0b0001	Guarded Control Stack is implemented.

All other values are reserved.

FEAT_GCS implements the functionality identified by the value 0b0001.

Access to this field is RO.

MTE_frac, bits [43:40]

Support for Asynchronous reporting of a Tag Check Fault.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTE_frac	Meaning
0b0000	Asynchronous reporting of a Tag Check Fault is supported. If FEAT_VMTETC is implemented, Asymmetric Tag Check Fault handling is supported.
0b1111	Asynchronous reporting of a Tag Check Fault is not supported. Asymmetric Tag Check Fault handling is not supported.

All other values are reserved.

This field is valid if any of the following are true:

- ID_AA64PFR1_EL1.MTE >= 0b0010
- ID_AA64PFR2_EL1.VMTETC >= 0b0001

FEAT_MTE_ASYNC implements the functionality identified by the value 0b0000.

If FEAT_MTE_ASYM_FAULT is implemented this field must be 0b0000.

If FEAT_VMTETC is implemented, FEAT_MTE_ASYM_FAULT implements the functionality identified by the value 0b0000.

Access to this field is RO.

NMI, bits [39:36]

Non-maskable Interrupt. Indicates support for Non-maskable interrupts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NMI	Meaning
0b0000	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are not supported.
0b0001	SCTLR_ELx.{SPINTMASK, NMI} and PSTATE.ALLINT with its associated instructions are supported.

All other values are reserved.

FEAT_NMI implements the functionality identified by the value 0b0001.

From Armv8.8, the value 0b0000 is not permitted.

Access to this field is RO.

CSV2_frac, bits [35:32]

CSV2 fractional field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV2_frac	Meaning
0b0000	Either ID_AA64PFR0_EL1.CSV2 is not 0b0001, or the implementation does not disclose whether FEAT_CSV2_1p1 is implemented. FEAT_CSV2_1p2 is not implemented.
0b0001	FEAT_CSV2_1p1 is implemented, but FEAT_CSV2_1p2 is not implemented.
0b0010	FEAT_CSV2_1p2 is implemented.

All other values are reserved.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p2 implements the functionality identified by the value 0b0010.

From Armv8.0, the permitted values are 0b0000, 0b0001, and 0b0010.

The values 0b0001 and 0b0010 are permitted only when ID_AA64PFR0_EL1.CSV2 is 0b0001.

Access to this field is RO.

RNDR_trap, bits [31:28]

Random Number trap to EL3 field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RNDR_trap	Meaning
0b0000	Trapping of RNDR and RNDRRS to EL3 is not supported.
0b0001	Trapping of RNDR and RNDRRS to EL3 is supported. SCR_EL3.TRNDR is present.

All other values are reserved.

FEAT_RNG_TRAP implements the functionality identified by the value 0b0001.

Access to this field is RO.

SME, bits [27:24]

Scalable Matrix Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0000	SME architectural state and programmers' model are not implemented.
0b0001	SME architectural state and programmers' model are implemented.
0b0010	As 0b0001, plus the SME2 ZT0 register.

All other values are reserved.

FEAT_SME implements the functionality identified by the value 0b0001.

FEAT_SME2 implements the functionality identified by the value 0b0010.

From Armv9.2, the permitted values are 0b0000, 0b0001, and 0b0010.

If implemented, refer to ID_AA64SMFR0_EL1 and ID_AA64ZFR0_EL1 for information about which SME and SVE instructions are available.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

MPAM_frac, bits [19:16]

Indicates the minor version number of support for the MPAM Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM_frac	Meaning
0b0000	The minor version number of the MPAM extension is 0.
0b0001	The minor version number of the MPAM extension is 1.

All other values are reserved.

When combined with the major version number from ID_AA64PFR0_EL1.MPAM, The combined "major.minor" version is:

MPAM Extension version	MPAM	MPAM_frac
Not implemented.	0b0000	0b0000
v0.1 is implemented.	0b0000	0b0001
v1.0 is implemented.	0b0001	0b0000
v1.1 is implemented.	0b0001	0b0001

If ID_AA64PFR2_EL1.MPAM2 is not 0b0000, then this field is 0b0000.

For more information, see 'The Memory Partitioning and Monitoring (MPAM) Extension'.

Access to this field is RO.

RAS_frac, bits [15:12]

RAS Extension fractional field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS_frac	Meaning
0b0000	If ID_AA64PFR0_EL1.RAS == 0b0001, support for the Reliability, Availability, and Serviceability Extension is implemented.
0b0001	If ID_AA64PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for: • Additional ERXMISC<m>_EL1 System registers. • Additional System registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1, and the SCR_EL3.FIEN and HCR_EL2.FIEN trap controls, to support the optional RAS Common Fault Injection Model Extension. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS, and support for the optional RAS Timestamp and RAS Common Fault Injection Model Extensions.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0000.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if ID_AA64PFR0_EL1.RAS == 0b0001.

Access to this field is RO.

MTE, bits [11:8]

Support for the Memory Tagging Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTE	Meaning
0b0000	Memory Tagging Extension is not implemented.
0b0001	Instruction-only Memory Tagging Extension is implemented.
0b0010	As 0b0001, and adds: • Support for in-memory Allocation tags. • Support for synchronous tag checking. • Optional support for Asynchronous reporting of a Tag Check Fault, identified as FEAT_MTE_ASYNC. Support for FEAT_MTE_ASYNC is indicated by ID_AA64PFR1_EL1.MTE_frac.
0b0011	As 0b0010, except that support for FEAT_MTE_ASYNC is mandatory, and adds support for Asymmetric Tag Check Fault handling, identified as FEAT_MTE_ASYM_FAULT.

All other values are reserved.

FEAT_MTE implements the functionality identified by the value 0b0001.

FEAT_MTE2 implements the functionality identified by the value 0b0010.

FEAT_MTE3 implements the functionality identified by the value 0b0011.

From Armv8.7, when the value of this field is >= 0b0010, ID_AA64PFR2_EL1.MTEPERM indicates support for FEAT_MTE_PERM.

From Armv8.7, when the value of this field is >= 0b0010, the following fields indicate support for FEAT_MTE4:

- ID_AA64PFR1_EL1.MTEX
- ID_AA64PFR2_EL1.MTEFAR
- ID_AA64PFR2_EL1.MTESTOREONLY

Access to this field is RO.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SSBS	Meaning
0b0000	AArch64 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch64 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.
0b0010	As 0b0001, and adds the MSR and MRS instructions to directly read and write the PSTATE.SSBS field.

All other values are reserved.

FEAT_SSBS implements the functionality identified by the value 0b0001.

FEAT_SSBS2 implements the functionality identified by the value 0b0010.

Access to this field is RO.

BT, bits [3:0]

Branch Target Identification mechanism support in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BT	Meaning
0b0000	The Branch Target Identification mechanism is not implemented.
0b0001	The Branch Target Identification mechanism is implemented.
0b0010	As 0b0001, and the Enhanced Branch Target Identification mechanism is implemented.

All other values are reserved.

FEAT_BTI implements the functionality identified by the value 0b0001.

FEAT_BTIE implements the functionality identified by the value 0b0010.

From Armv8.5, the value 0b0000 is not permitted.

Access to this field is RO.

Accessing ID_AA64PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b001

end;
```

2025-12-10 16:11:30, 2025-12_rel

ID_AA64PFR2_EL1, AArch64 Processor Feature Register 2

The ID_AA64PFR2_EL1 characteristics are:

Purpose

Provides additional information about implemented PE features in AArch64 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AA64PFR2_EL1 are UNDEFINED.

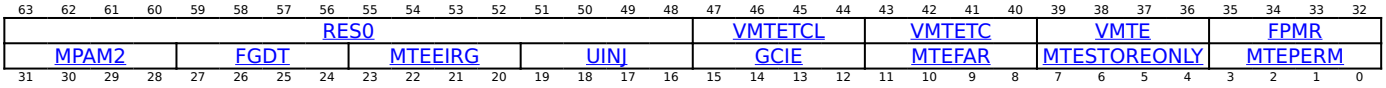
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64PFR2_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

VMTETCL, bits [47:44]

Support for tag checking of data loads when Virtual tagging is implemented and enabled.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMTETCL	Meaning
0b0000	Virtual tagging tag checking of loads is not supported.
0b0001	Virtual tagging tag check of loads is supported.

FEAT_VMTETCL implements the functionality identified by the value 0b0001.

All other values are reserved.

Access to this field is RO.

VMTETC, bits [43:40]

Support for tag checking when Virtual tagging is implemented and enabled.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMTETC	Meaning
0b0000	Virtual tagging tag checking controls are not implemented.
0b0001	Virtual tagging tag check controls are implemented but tag checking cannot be enabled.
0b0010	Reserved.
0b0011	Virtual tagging tag check controls are implemented and tag checking can be enabled.

FEAT_VMTETC implements the functionality identified by the value 0b0001.

FEAT_VMTETCE implements the functionality identified by the value 0b0011.

All other values are reserved.

Access to this field is RO.

VMTE, bits [39:36]

Support for Virtual tagging.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMTE	Meaning
0b0000	Virtual tagging is not implemented.
0b0001	Virtual tagging is implemented but cannot be enabled.
0b0010	Virtual tagging is implemented and can be enabled.

All other values are reserved.

FEAT_VMTE implements the functionality identified by the value 0b0001.

FEAT_VMTEE implements the functionality identified by the value 0b0010.

Access to this field is RO.

FPMR, bits [35:32]

Indicates support for FPMR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPMR	Meaning
0b0000	FPMR is not implemented.
0b0001	FPMR is implemented.

All other values are reserved.

FEAT_FPMR implements the functionality identified by the value 0b0001.

Access to this field is RO.

MPAM2, bits [31:28]

Support for MPAM 2 Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM2	Meaning
0b0000	MPAM 2 extension is not implemented.
0b0001	MPAM 2 extension is implemented.

All other values are reserved.

FEAT_MPAMv2 implements the functionality identified by the value 0b0001.

If this field is not 0b0000, then ID_AA64PFR0_EL1.MPAM and ID_AA64PFR1_EL1.MPAM_frac must both be 0b0000.

For more information, see 'The Memory Partitioning and Monitoring (MPAM) Extension'.

Access to this field is RO.

FGDT, bits [27:24]

Indicates the how many bits of FGDTIndex are implemented, and how many (A)FGDTp<n>_ELx registers are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FGDT	Meaning
0b0000	FGDTIndex is 3 bits wide and (A)FGDTp<n>_ELx registers are implemented for m = 4.
0b0001	FGDTIndex is 4 bits wide and (A)FGDTp<n>_ELx registers are implemented for m = 8.
0b0010	FGDTIndex is 5 bits wide and (A)FGDTp<n>_ELx registers are implemented for m = 16.

All other values are reserved.

Access to this field is RO.

MTEEIRG, bits [23:20]

Support for the Enhanced Insert Random taG algorithm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEEIRG	Meaning
0b0000	The Enhanced Insert Random taG algorithm is not implemented.
0b0001	The Enhanced Insert Random taG algorithm is implemented.

FEAT_MTE_EIRG implements the functionality identified by the value 0b0001.

From Armv9.7, the value 0b0000 is not permitted.

Access to this field is RO.

UINJ, bits [19:16]

Support for software injection of Undefined Instruction exceptions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UINJ	Meaning
0b0000	Software injection of Undefined Instruction exceptions is not implemented.
0b0001	Software injection of Undefined Instruction exceptions is implemented.

FEAT_UINJ implements the functionality identified by the value 0b0001.

From Armv9.6, the value 0b0000 is not permitted.

Access to this field is RO.

GCIE, bits [15:12]

Support for the GICv5 CPU interface extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GCIE	Meaning
0b0000	FEAT_GCIE is not supported.
0b0001	FEAT_GCIE is supported.

Access to this field is RO.

MTEFAR, bits [11:8]

Indicates whether FAR_ELx[63:60] are UNKNOWN on a synchronous exception due to a Tag Check Fault.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEFAR	Meaning
0b0000	On a synchronous exception due to a Tag Check Fault, FAR_ELx[63:60] are UNKNOWN.
0b0001	On a synchronous exception due to a Tag Check Fault, FAR_ELx[63:60] are not UNKNOWN.

All other values are reserved.

FEAT_MTE_TAGGED_FAR implements the functionality identified by the value 0b0001.

If neither FEAT_MTE2 nor FEAT_VMTETC are implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

MTESTOREONLY, bits [7:4]

Support for Store-only Tag checking.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTESTOREONLY	Meaning
0b0000	Store-only Tag checking is not supported.
0b0001	Store-only Tag checking is supported.

All other values are reserved.

FEAT_MTE_STORE_ONLY implements the functionality identified by the value 0b0001.

If neither FEAT_MTE2 nor FEAT_VMTETC are implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

MTEPERM, bits [3:0]

Support for Allocation tag access permissions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTEPERM	Meaning
0b0000	Allocation tag access permissions are not supported.
0b0001	Allocation tag access permissions are supported. Note NoTagAccess is supported at stage 2 of translation only.

All other values are reserved.

FEAT_MTE_PERM implements the functionality identified by the value 0b0001

If FEAT_MTE2 is not implemented, the value 0b0001 is not permitted.

From Armv8.9, if FEAT_MTE2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

Accessing ID_AA64PFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64PFR2_EL1

ID_AA64SMFR0_EL1, SME Feature ID Register 0

The ID_AA64SMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented features of the AArch64 Scalable Matrix Extension.

The fields in this register do not follow the standard ID scheme. See Alternative ID scheme used for ID_AA64SMFR0_EL1 and ID_AA64FPFR0_EL1.

Configuration

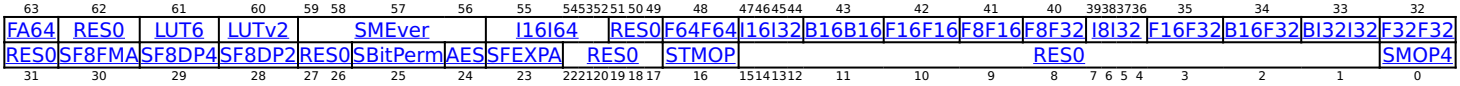
Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_AA64SMFR0_EL1 is a 64-bit register.

Field descriptions



FA64, bit [63]

Indicates support at each Exception Level for execution of the full AArch64 Advanced SIMD and SVE instruction sets when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FA64	Meaning
0b0	Only those AArch64 instructions defined as being legal can be executed in streaming SVE mode.
0b1	All implemented AArch64 instructions are legal for execution in Streaming SVE mode, when enabled by SMCR_EL1.FA64, SMCR_EL2.FA64, and SMCR_EL3.FA64.

FEAT_SME_FA64 implements the functionality identified by the value 0b1.

Access to this field is RO.

Bit [62]

Reserved, RES0.

LUT6, bit [61]
When FEAT_SME2p3 is implemented:

Indicates support for SME lookup table instructions with 6-bit indices.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LUT6	Meaning
0b0	SME LUTI6 instructions with 6-bit indices are not implemented.
0b1	SME LUTI6 instructions with 6-bit indices are implemented.

If FEAT_SME2p3 is implemented, the value 0b0 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

LUTv2, bit [60]

Indicates support for the following additional variants of SME2 lookup table LUTI4 and MOVT instructions:

- A LUTI4 instruction with 8-bit result elements, two consecutively numbered source vectors, and four consecutively numbered destination vectors.
- If FEAT_SME2p1 is implemented, a LUTI4 instruction with 8-bit result elements, two consecutively numbered source vectors, and four destination vectors with strided register numbering.
- A MOVT instruction that copies a single Z source vector to ZT0.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LUTv2	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

All other values are reserved.

FEAT_SME_LUTv2 implements the functionality identified by the value 0b1.

Access to this field is RO.

SMEver, bits [59:56]
When FEAT_SME is implemented:

Indicates support for SME instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMEver	Meaning
0b0000	The mandatory SME instructions are implemented.
0b0001	As 0b0000, and adds the mandatory SME2 instructions.
0b0010	As 0b0001, and adds the mandatory SME2.1 instructions.
0b0011	As 0b0010, and adds the mandatory SME2.2 instructions.
0b0100	As 0b0011, and adds the mandatory SME2.3 instructions.

All other values are reserved.

FEAT_SME2 implements the functionality identified by the value 0b0001.

FEAT_SME2p1 implements the functionality identified by the value 0b0010.

From Armv9.4, the value 0b0001 is not permitted.

FEAT_SME2p2 implements the functionality identified by 0b0011.

From Armv9.6, the values 0b0000 and 0b0010 are not permitted.

FEAT_SME2p3 implements the functionality identified by 0b0100.

From Armv9.7, the value 0b0011 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

I16I64, bits [55:52]

Indicates support for the following SME instructions that accumulate into 64-bit integer elements in the ZA array:

- The variants of the ADDHA, ADDVA, SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate into 64-bit integer tiles.
- When FEAT_SME2 is implemented, the variants of the ADD, ADDA, SDOT, SMLALL, SMLSLL, SUB, SUBA, SVDOT, UDOT, UMLALL, UMLSLL, and UVDOT instructions that accumulate into 64-bit integer elements in ZA array vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I16I64	Meaning
0b0000	The specified instructions are not implemented by this control.
0b1111	The specified instructions are implemented.

All other values are reserved.

FEAT_SME_I16I64 implements the functionality identified by the value 0b1111.

Access to this field is RO.

Bits [51:49]

Reserved, RES0.

F64F64, bit [48]

Indicates support for the following SME instructions that accumulate into double-precision floating-point elements in the ZA array:

- The variants of the FMOPA and FMOPS instructions that accumulate into double-precision tiles.
- When FEAT_SME2 is implemented, the variants of the FADD, FMLA, FMLS, and FSUB instructions that accumulate into double-precision elements in ZA array vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F64F64	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented .

FEAT_SME_F64F64 implements the functionality identified by the value 0b1.

Access to this field is RO.

I16I32, bits [47:44]
When FEAT_SME2 is implemented:

Indicates support for SME2 SMOPA (2-way), SMOPS (2-way), UMOPA (2-way), and UMOPS (2-way) instructions that accumulate 16-bit outer products into 32-bit integer tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I16I32	Meaning
0b0000	The specified instructions are not implemented by this control.
0b0101	The specified instructions are implemented.

All other values are reserved.

If FEAT_SME2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

B16B16, bit [43]

Indicates support for the SME ZA-targeting non-widening BFloat16 BFADD, BFMLA, BFMLS, BFMOPA, BFMOPS, and BFSUB instructions with BFloat16 operands and results.

The value of this field is an IMPLEMENTATION DEFINED choice of:

B16B16	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_B16B16 implements the functionality identified by the value 0b1.

Access to this field is RO.

F16F16, bit [42]

Indicates support for the following SME2 half-precision floating-point instructions:

- FMOPA and FMOPS instructions that accumulate half-precision outer-products into half-precision tiles.
- Multi-vector FADD, FMLA, FMLS, and FSUB instructions with half-precision operands and results.
- Multi-vector FCVT and FCVTL instructions that convert half-precision inputs to single-precision results.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F16F16	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_F16F16 implements the functionality identified by the value 0b1.

Access to this field is RO.

F8F16, bit [41]

Indicates support for the following SME2 instructions:

- The ZA-targeting FP8 instructions FDOT (2-way), FMLAL, FMOPA (2-way), and FVDOT that accumulate into half-precision floating-point elements.
- ZA-targeting non-widening half-precision FADD and FSUB instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8F16	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_F8F16 implements the functionality identified by the value 0b1.

Access to this field is RO.

F8F32, bit [40]

Indicates support for the SME2 ZA-targeting FP8 FDOT (4-way), FMLALL, FMOPA (4-way), FVDOTB, and FVDOTT instructions that accumulate into single-precision floating-point elements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F8F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_F8F32 implements the functionality identified by the value 0b1.

Access to this field is RO.

I8I32, bits [39:36]
When FEAT_SME is implemented:

Indicates support for SME SMOPA, SMOPS, SUMOPA, SUMOPS, UMOPA, UMOPS, USMOPA, and USMOPS instructions that accumulate 8-bit outer products into 32-bit tiles

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8I32	Meaning
0b0000	The specified instructions are not implemented by this control.
0b1111	The specified instructions are implemented.

All other values are reserved.

If FEAT_SME is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

F16F32, bit [35]
When FEAT_SME is implemented:

Indicates support for SME FMOPA and FMOPS instructions that accumulate half-precision floating-point outer products into single-precision floating-point tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F16F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME is implemented, the value 0b0 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

B16F32, bit [34]
When FEAT_SME is implemented:

Indicates support for SME BFMOPA and BFMOPS instructions that accumulate BFloat16 outer products into single-precision floating-point tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

B16F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME is implemented, the value 0b0 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

BI32I32, bit [33]
When FEAT_SME2 is implemented:

Indicates support for SME BMOPA and BMOPS instructions that accumulate thirty-two 1-bit binary outer products into 32-bit integer tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BI32I32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME2 is implemented, the value 0b0 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

F32F32, bit [32]
When FEAT_SME is implemented:

Indicates support for SME FMOPA and FMOPS instructions that accumulate single-precision floating-point outer products into single-precision floating-point tiles.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F32F32	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

If FEAT_SME is implemented, the value 0b0 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bit [31]

Reserved, RES0.

SF8FMA, bit [30]

Indicates support for the SVE2 FP8 to single-precision and half-precision multiply-accumulate FMLALB, FMLALT, FMLALLBB, FMLALLBT, FMLALLTB, and FMLALLTT instructions when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SF8FMA	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instructions are supported in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

If FEAT_SME2 and FEAT_FP8FMA are implemented, the value 0b0 is not permitted.

FEAT_SSVE_FP8FMA implements the functionality identified by the value 0b1.

Access to this field is RO.

SF8DP4, bit [29]

Indicates support for the SVE2 FP8 to single-precision 4-way dot product FDOT (4-way) instructions when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SF8DP4	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instructions are supported in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

If FEAT_SME2 and FEAT_FP8DOT4 are implemented, the value 0b0 is not permitted.

FEAT_SSVE_FP8DOT4 implements the functionality identified by the value 0b1.

Access to this field is RO.

SF8DP2, bit [28]

Indicates support for the SVE2 FP8 to half-precision 2-way dot product FDOT (2-way) instructions when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SF8DP2	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instructions are supported in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

If FEAT_SME2 and FEAT_FP8DOT2 are implemented, the value 0b0 is not permitted.

FEAT_SSVE_FP8DOT2 implements the functionality identified by the value 0b1.

Access to this field is RO.

Bits [27:26]

Reserved, RES0.

SBitPerm, bit [25]

Indicates support for the SVE bit permute instructions identified as implemented by ID_AA64ZFR0_EL1.BitPerm, when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SBitPerm	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instructions are implemented when the PE is in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

FEAT_SSVE_BitPerm implements the functionality identified by the value 0b1.

Access to this field is RO.

AES, bit [24]

Indicates support for the SVE AES and 128-bit polynomial multiply long instructions identified as implemented by ID_AA64ZFR0_EL1.AES, when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instructions are supported when the PE is in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

FEAT_SSVE_AES implements the functionality identified by the value 0b1.

Access to this field is RO.

SFEXPA, bit [23]

Indicates support for the SVE FEXPA instruction when the PE is in Streaming SVE mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SFEXPA	Meaning
0b0	This control has no effect on Streaming SVE mode behavior.
0b1	The specified instruction is supported when the PE is in Streaming SVE mode.

Note

Other features may support some of the specified instructions in Non-streaming SVE mode.

FEAT_SSVE_FEXPA implements the functionality identified by the value 0b1.

Access to this field is RO.

Bits [22:17]

Reserved, RES0.

STMOP, bit [16]

Indicates support for the following SME Structured sparsity outer product instructions:

- BFTMOPA (non-widening), if FEAT_SME_B16B16 is implemented.
- BFTMOPA (widening, BF16 to FP32).
- FTMOPA (non-widening, FP16), if FEAT_SME_F16F16 is implemented.
- FTMOPA (non-widening, FP32).
- FTMOPA (widening, 2-way, FP16 to FP32).
- FTMOPA (widening, 2-way, FP8 to FP16), if FEAT_SME_F8F16 is implemented.
- FTMOPA (widening, 4-way, FP8 to FP32) if FEAT_SME_F8F32 is implemented.
- STMOPA, SUTMOPA, USTMOPA, UTMOPA (4-way, Int8 to Int32). STMOPA, UTMOPA (2-way, Int16 to Int32).

The value of this field is an IMPLEMENTATION DEFINED choice of:

STMOP	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_TMOP implements the functionality identified by the value 0b1.

Access to this field is RO.

Bits [15:1]

Reserved, RES0.

SMOP4, bit [0]

Indicates support for the following SME Quarter-tile outer product instructions:

- BFMOP4A, BFMOP4S (non-widening, BF16), if FEAT_SME_B16B16 is implemented.
- BFMOP4A, BFMOP4S (widening, 2-way, BF16 to FP32).
- FMOP4A, FMOP4S (non-widening, FP16), if FEAT_SME_F16F16 is implemented.
- FMOP4A, FMOP4S (non-widening, FP32).
- FMOP4A, FMOP4S (non-widening, FP64), if FEAT_SME_F64F64 is implemented.
- FMOP4A, FMOP4S (widening, 2-way, FP16 to FP32).
- FMOP4A(widening, 2-way, FP8 to FP16), if FEAT_SME_F8F16 is implemented.
- FMOP4A(widening, 4-way, FP8 to FP32) instruction, if FEAT_SME_F8F32 is implemented.
- SMOP4A, SMOP4S, SUMOP4A, SUMOP4S, UMOP4A, UMOP4S, USMOP4A, USMOP4S (4-way, Int8 to Int32).
- SMOP4A, SMOP4S, SUMOP4A, SUMOP4S, UMOP4A, UMOP4S, USMOP4A, USMOP4S (4-way, Int16 to Int64), if FEAT_SME_I16I64 is implemented.
- SMOP4A, SMOP4S, UMOP4A, UMOP4S (2-way, Int16 to Int32).

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMOP4	Meaning
0b0	The specified instructions are not implemented by this control.
0b1	The specified instructions are implemented.

FEAT_SME_MOP4 implements the functionality identified by the value 0b1.

Access to this field is RO.

Accessing ID_AA64SMFR0_EL1

This register is read-only and can be accessed from EL1 and higher.

This register is only accessible from the AArch64 state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64SMFR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0100	0b101

```
if PSTATE.EL == EL0 then

```

2025-12-10 16:11:30, 2025-12_rel

ID_AA64ZFR0_EL1, SVE Feature ID Register 0

The ID_AA64ZFR0_EL1 characteristics are:

Purpose

Provides additional information about the implemented features of the AArch64 Scalable Vector Extension instruction set, when FEAT_SVE or FEAT_SME is implemented.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

Note

Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

If FEAT_SME is implemented and FEAT_SVE is not implemented, then SVE instructions can only be executed when the PE is in Streaming SVE mode and the instructions are legal for execution in Streaming SVE mode.

Attributes

ID_AA64ZFR0_EL1 is a 64-bit register.

Bits [63:60]

Reserved, RES0.

F64MM, bits [59:56]

Indicates support for the SVE double-precision floating-point matrix multiply-accumulate instruction FMMLA, the LD1RO* instructions, the 128-bit element variants of the SVE TRN1, TRN2, UZP1, UZP2, ZIP1, and ZIP2 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F64MM	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_F64MM implements the functionality identified by 0b0001.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

F32MM, bits [55:52]

Indicates support for the SVE single-precision floating-point matrix multiply-accumulate instruction FMMLA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F32MM	Meaning
0b0000	This field does not indicate support for the specified instruction.
0b0001	The specified instruction is implemented.

All other values are reserved.

FEAT_F32MM implements the functionality identified by 0b0001.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

F16MM, bits [51:48]

Indicates support for the SVE half-precision floating-point matrix multiply-accumulate to single-precision instruction FMMLA (widening, FP16 to FP32).

The value of this field is an IMPLEMENTATION DEFINED choice of:

F16MM	Meaning
0b0000	This field does not indicate support for the specified instruction.
0b0001	The specified instruction is implemented.

FEAT_SVE_F16F32MM implements the functionality identified by 0b0001.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

I8MM, bits [47:44]

Indicates support for the following SVE 8-bit integer sum-of-products and accumulate to 32-bit integer instructions SMMLA, SUDOT, UMMLA, USMMLA, and USDOT.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8MM	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_I8MM implements the functionality identified by 0b0001.

When Advanced SIMD and SVE are both implemented, this field must return the same value as ID_AA64ISAR1_EL1.I8MM.

From Armv8.6, if SVE is implemented, the value 0b0000 is not permitted.

SVE SMMLA, UMMLA, and USMMLA instructions might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

SM4, bits [43:40]

Indicates support for SVE SM4 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SM4	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	SVE SM4E and SM4EKEY instructions are implemented.

All other values are reserved.

FEAT_SVE_SM4 implements the functionality identified by 0b0001.

The instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

Bits [39:36]

Reserved, RES0.

SHA3, bits [35:32]

Indicates support for the SVE SHA3 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA3	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	SVE RAX1 instruction is implemented.

All other values are reserved.

FEAT_SVE_SHA3 implements the functionality identified by 0b0001.

If FEAT_SME2p1 is not implemented, then the instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

Bits [31:28]

Reserved, RES0.

B16B16, bits [27:24]

Indicates support for SVE non-widening BFloat16 instructions and SME multi-vector Z-targeting non-widening BFloat16 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

B16B16	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The following non-widening BFloat16 instructions are implemented: • SVE instructions: BFADD, BFCLAMP, BFMAX, BFMAXNM, BFMIN, BFMINNM, BFMLA, BFMLS, BFMUL, and BFSUB. • If FEAT_SME2 is implemented, SME multi-vector Z-targeting instructions: BFCLAMP, BFMAX, BFMAXNM, BFMIN, and BFMINNM.
0b0010	As 0b0001, and adds the following non-widening BFloat16 instructions: • SVE instruction BFSCALE. • If FEAT_SME2 is implemented, SME multi-vector Z-targeting instructions BFMUL and BFSCALE.
0b0011	As 0b0010, and adds the SVE BFloat16 matrix multiply-accumulate instruction BFMMLA.

FEAT_SVE_B16B16 implements the functionality identified by 0b0001.

FEAT_SVE_BFSCALE implements the functionality identified by 0b0010.

FEAT_SVE_B16MM implements the functionality identified by value 0b0011.

SVE BFMMLA instructions might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

BF16, bits [23:20]

Indicates support for SVE BFloat16 instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BF16	Meaning
0b0000	SVE BFloat16 instructions are not implemented.
0b0001	SVE BFCVT, BFCVTNT, BFDOT, BFMLALB, BFMLALT, and BFMMLA instructions are implemented.
0b0010	As 0b0001, but the FPCR.EBF field is also supported.

All other values are reserved.

FEAT_BF16 implements the functionality identified by 0b0001.

FEAT_EBF16 implements the functionality identified by 0b0010.

This field must return the same value as ID_AA64ISAR1_EL1.BF16.

SVE BFMMLA instructions might not be legal when the PE is in Streaming SVE mode.

From Armv8.6 and Armv9.1, the value 0b0000 is not permitted.

Access to this field is RO.

BitPerm, bits [19:16]

Indicates support for the SVE bit permute instructions BDEP, BEXT, and BGRP.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitPerm	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_SVE_BitPerm implements the functionality identified by 0b0001 when the PE is not in Streaming SVE mode.

FEAT_SSVE_BitPerm which is identified in ID_AA64SMFR0_EL1.SBitPerm, indicates whether the FEAT_SVE_BitPerm functionality is implemented when the PE is in Streaming SVE mode.

Access to this field is RO.

EltPerm, bits [15:12]
When FEAT_SVE2p2 is implemented or FEAT_SME2p2 is implemented:

If FEAT_SVE2p2 is implemented, the following SVE instructions are implemented when the PE is not in Streaming SVE mode:

- 8-bit and 16-bit element COMPACT.
- 8-bit, 16-bit, 32-bit, and 64-bit element EXPAND.

If FEAT_SME2p2 is implemented, the following SVE instructions are implemented when the PE is in Streaming SVE mode:

- 8-bit, 16-bit, 32-bit, and 64-bit element COMPACT and EXPAND.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EltPerm	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The specified instructions are implemented.

If FEAT_SVE2p2 or FEAT_SME2p2 is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [11:8]

Reserved, RES0.

AES, bits [7:4]

Indicates support for SVE Advanced Encryption Standard instructions and 128-bit polynomial multiply long instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0000	This field does not indicate support for the specified instructions.
0b0001	The following instructions are implemented: • SVE single-vector AESD, AESE, AESIMC, and AESMC instructions. • The 128-bit destination element variant of the SVE single-vector PMULLB and PMULLT instructions.
0b0010	As 0b0001.
0b0011	As 0b0010, and adds the following SVE instructions: • Multi-vector AESD, AESDIMC, AESE and AESEMC instructions. • Multi-vector 128-bit destination element PMULL and PMLAL instructions.

All other values are reserved.

FEAT_SVE_AES implements the functionality identified by the value 0b0001.

FEAT_SVE_PMULL128 implements the functionality identified by the value 0b0010.

FEAT_SVE_AES2 implements the functionality identified by 0b0011.

If FEAT_SSVE_AES is not implemented, then the instructions described by nonzero values of this field might not be legal when the PE is in Streaming SVE mode.

Access to this field is RO.

SVEver, bits [3:0]
When FEAT_SVE is implemented or FEAT_SME is implemented:

Indicates support for SVE instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVEver	Meaning
0b0000	The SVE instructions are implemented.
0b0001	As 0b0000, and adds the mandatory SVE2 instructions.
0b0010	As 0b0001, and adds the mandatory SVE2.1 instructions.
0b0011	As 0b0010, and adds the mandatory SVE2.2 instructions.
0b0100	As 0b0011, and adds the mandatory SVE2.3 instructions.

All other values are reserved.

FEAT_SVE2 implements the functionality identified by 0b0001 when the PE is not in Streaming SVE mode.

FEAT_SME implements the functionality identified by 0b0001 when the PE is in Streaming SVE mode.

FEAT_SME2p1 implements the functionality identified by 0b0010 when the PE is in Streaming SVE mode.

FEAT_SVE2p1 implements the functionality identified by 0b0010 when the PE is not in Streaming SVE mode.

FEAT_SVE2p2 implements the functionality identified by 0b0011 when the PE is not in Streaming SVE mode.

FEAT_SME2p2 implements the functionality identified by 0b0011 when the PE is in Streaming SVE mode.

FEAT_SVE2p3 implements the functionality identified by 0b0100 when the PE is not in Streaming SVE mode.

FEAT_SME2p3 implements the functionality identified by 0b0100 when the PE is in Streaming SVE mode.

From Armv9, the value 0b0000 is not permitted.

From Armv9.4, the value 0b0001 is not permitted.

From Armv9.6, the value 0b0010 is not permitted.

From Armv9.7, the value 0b0011 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing ID_AA64ZFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_AA64ZFR0_EL1

ID_AFR0_EL1, AArch32 Auxiliary Feature Register 0

The ID_AFR0_EL1 characteristics are:

Purpose

Provides information about the IMPLEMENTATION DEFINED features of the PE in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_AFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_AFR0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_AFR0_EL1 are UNDEFINED.

Attributes

ID_AFR0_EL1 is a 64-bit register.

ID_DFR0_EL1, AArch32 Debug Feature Register 0

The ID_DFR0_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch32 state.

Must be interpreted with the Main ID Register, MIDR_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR0[31:0].

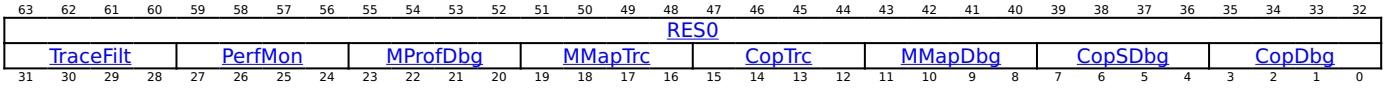
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_DFR0_EL1 are UNDEFINED.

Attributes

ID_DFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

TraceFilt, bits [31:28]

Armv8.4 Self-hosted Trace Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_ETMv4 is implemented, the value 0b0000 is not permitted.

If FEAT_ETE is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

PerfMon, bits [27:24]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

The value of this field is an IMPLEMENTATION DEFINED choice of:

PerfMon	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv1 implemented.
0b0010	Performance Monitors Extension, PMUv2 implemented.
0b0011	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0011, and adds support for: • Extended 16-bit PMEVTYPER<n>.evtCount field. • If EL2 is implemented, the HDCR.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the HDCR.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR.FZO and, if EL2 is implemented, HDCR.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: • Updates the definitions of existing PMU events. • Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0011.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

In any Armv8 implementation, the values 0b0001 and 0b0010 are not permitted.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0011 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

Access to this field is RO.

MProfDbg, bits [23:20]

M-profile Debug. Support for memory-mapped debug model for M-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProfDbg	Meaning
0b0000	Not supported.
0b0001	Support for M-profile Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

MMapTrc, bits [19:16]

Memory-mapped Trace. Support for memory-mapped trace model.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is RO.

CopTrc, bits [15:12]

Support for System registers-based trace model, using registers in the coproc == 0b1110 encoding space.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CopTrc	Meaning
0b0000	Not supported.
0b0001	Support for Arm trace architecture, with System registers access.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

For more information, see the Arm® Embedded Trace Macrocell Architecture Specification, ETMv4 (ARM IHI 0064).

Access to this field is RO.

MMapDbg, bits [11:8]

Memory-mapped Debug. Support for Armv7 memory-mapped debug model for A and R-profile processors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MMapDbg	Meaning
0b0000	Not supported.
0b0100	Support for Armv7, v7 Debug architecture, with memory-mapped access.
0b0101	Support for Armv7, v7.1 Debug architecture, with memory-mapped access.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

The optional memory map defined by Armv8 is not compatible with Armv7.

Access to this field is RO.

CopSDbg, bits [7:4]

Support for a System registers-based Secure debug model, using registers in the coproc = 0b1110 encoding space, for an A-profile processor that includes EL3.

If EL3 is not implemented and the implemented Security state is Non-secure state, this field is RES0. Otherwise, this field reads the same as bits [3:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CopDbg, bits [3:0]

Debug architecture version. Indicates presence of Armv8 debug architecture.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CopDbg	Meaning
0b0000	Not supported.
0b0010	Armv6, v6 Debug architecture, with System registers access.
0b0011	Armv6, v6.1 Debug architecture, with System registers access.
0b0100	Armv7, v7 Debug architecture, with System registers access.
0b0101	Armv7, v7.1 Debug architecture, with System registers access.
0b0110	Armv8 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

All other values are reserved.

The values 0b0000, 0b0010, 0b0011, 0b0100, and 0b0101 are not permitted in Armv8.

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

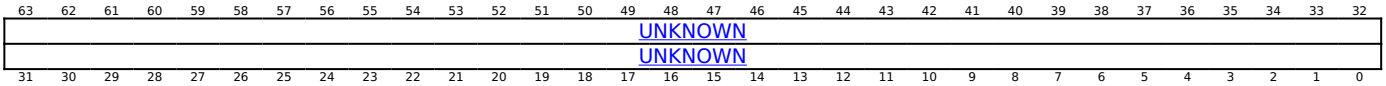
From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_DFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

ID_DFR1_EL1, AArch32 Debug Feature Register 1

The ID_DFR1_EL1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch32.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_DFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_DFR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_DFR1_EL1 are UNDEFINED.

Note

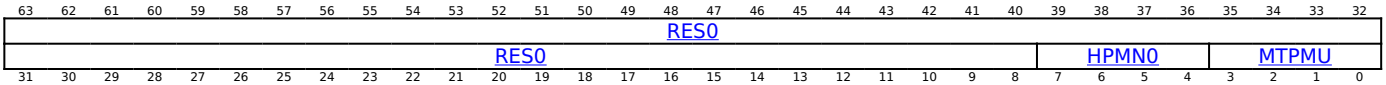
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_DFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:8]

Reserved, RES0.

HPMN0, bits [7:4]

Zero PMU event counters for a Guest operating system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPMN0	Meaning
0b0000	Setting HDCR.HPMN to zero has CONSTRAINED UNPREDICTABLE behavior.
0b0001	Setting HDCR.HPMN to zero has defined behavior.

All other values are reserved.

If FEAT_PMUv3 is not implemented, FEAT_FGT is not implemented, or EL2 is not implemented, the only permitted value is 0b0000.

FEAT_HPMN0 implements the functionality identified by the value 0b0001.

From Armv8.8, in an implementation that includes FEAT_PMUv3, FEAT_FGT, and EL2, the value 0b0000 is not permitted.

Access to this field is RO.

MTPMU, bits [3:0]

Multi-threaded PMU extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MTPMU	Meaning
0b0000	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, it is IMPLEMENTATION DEFINED whether PMEVTYPER<n>.MT are read/write or RES0.
0b0001	FEAT_MTPMU and FEAT_PMUv3 implemented. PMEVTYPER<n>.MT are read/write. When FEAT_MTPMU is disabled, the Effective values of PMEVTYPER<n>.MT are 0.
0b1111	FEAT_MTPMU not implemented. If FEAT_PMUv3 is implemented, PMEVTYPER<n>.MT are RES0.

All other values are reserved.

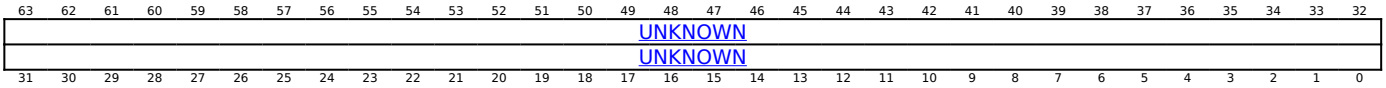
FEAT_MTPMU implements the functionality identified by the value 0b0001.

From Armv8.6, in an implementation that includes FEAT_PMUv3, the value 0b0000 is not permitted.

In an implementation that does not include FEAT_PMUv3, the value 0b0001 is not permitted.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_DFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_DFR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b101

```
if !IsFeatureImplemented(FEAT_AA64) then

ID_ISAR0_EL1, AArch32 Instruction Set Attribute Register 0

The ID_ISAR0_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR0[31:0].

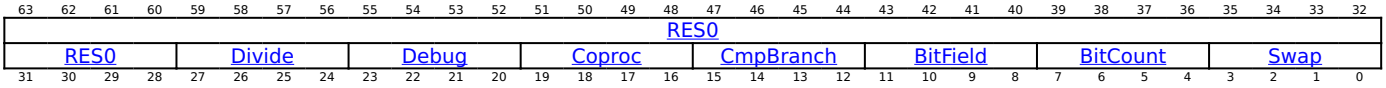
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR0_EL1 are UNDEFINED.

Attributes

ID_ISAR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:28]

Reserved, RES0.

Divide, bits [27:24]

Indicates the implemented Divide instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Divide	Meaning
0b0000	None implemented.
0b0001	Adds SDIV and UDIV in the T32 instruction set.
0b0010	As for 0b0001, and adds SDIV and UDIVin the A32 instruction set.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

Debug, bits [23:20]

Indicates the implemented Debug instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Debug	Meaning
0b0000	None implemented.
0b0001	Adds BKPT.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Coproc, bits [19:16]

Indicates the implemented System register access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Coproc	Meaning
0b0000	None implemented, except for instructions separately attributed by the architecture to provide access to AArch32 System registers and System instructions.
0b0001	Adds generic CDP, LDC, MCR, MRC, and STC.
0b0010	As for 0b0001, and adds generic CDP2, LDC2, MCR2, MRC2, and STC2.
0b0011	As for 0b0010, and adds generic MCRR and MRRC.
0b0100	As for 0b0011, and adds generic MCRR2 and MRRC2.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

CmpBranch, bits [15:12]

Indicates the implemented combined Compare and Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CmpBranch	Meaning
0b0000	None implemented.
0b0001	Adds CBNZ and CBZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

BitField, bits [11:8]

Indicates support for the following BitField instructions BFC, BFI, SBFX, and UBFX.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitField	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

BitCount, bits [7:4]

Indicates the implemented Bit Counting instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BitCount	Meaning
0b0000	None implemented.
0b0001	Adds CLZ.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Swap, bits [3:0]

Indicates the implemented Swap instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

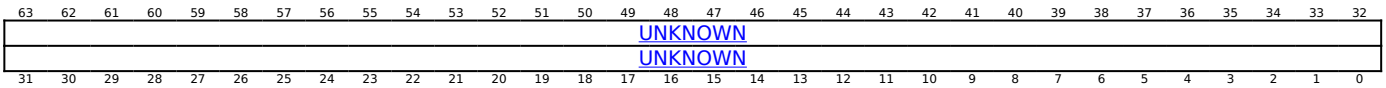
Swap	Meaning
0b0000	None implemented.
0b0001	Adds SWP and SWPB.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR0_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b000

ID_ISAR1_EL1, AArch32 Instruction Set Attribute Register 1

The ID_ISAR1_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR1[31:0].

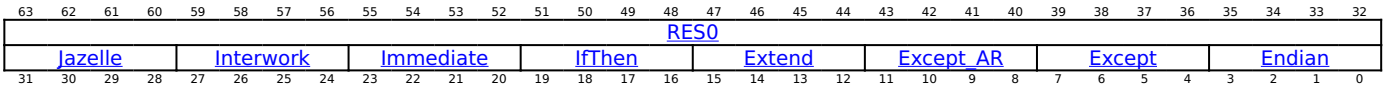
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR1_EL1 are UNDEFINED.

Attributes

ID_ISAR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

Jazelle, bits [31:28]

Indicates the implemented Jazelle extension instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Jazelle	Meaning
0b0000	No support for Jazelle.
0b0001	Adds the BXJ instruction and the J bit in the PSR. This setting might indicate a trivial implementation of the Jazelle extension.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Interwork, bits [27:24]

Indicates the implemented Interworking instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Interwork	Meaning
0b0000	None implemented.
0b0001	Adds the BX instruction, and the T bit in the PSR.
0b0010	As for 0b0001, and adds the BLX instruction. PC loads have BX-like behavior.
0b0011	As for 0b0010, and guarantees that data-processing instructions in the A32 instruction set with the PC as the destination and the S bit clear have BX-like behavior.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is RO.

Immediate, bits [23:20]

Indicates support for the following data-processing instructions with long immediates:

- The MOVT instruction.
- The MOV instruction encodings with zero-extended 16-bit immediates.
- The T32 ADD and SUB instruction encodings with zero-extended 12-bit immediates, and the other ADD, ADR, and SUB encodings cross-referenced by the pseudocode for those encodings.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Immediate	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

IfThen, bits [19:16]

Indicates the implemented If-Then instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IfThen	Meaning
0b0000	None implemented.
0b0001	Adds the IT instructions, and the IT bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Extend, bits [15:12]

Indicates the implemented Extend instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Extend	Meaning
0b0000	No scalar sign-extend or zero-extend instructions are implemented, where scalar instructions means non-Advanced SIMD instructions.
0b0001	Adds the SXTB, SXTH, UXTB, and UXTH instructions.
0b0010	As for 0b0001, and adds the SXTB16, SXTAB, SXTAB16, SXTAH, UXTB16, UXTAB, UXTAB16, and UXTAH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

Except_AR, bits [11:8]

Indicates the implemented A and R-profile exception-handling instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except_AR	Meaning
0b0000	None implemented.
0b0001	Adds the SRS and RFE instructions, and the A and R-profile forms of the CPS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Except, bits [7:4]

Indicates the implemented exception-handling instructions in the A32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Except	Meaning
0b0000	Not implemented. This indicates that the User bank and Exception return forms of the LDM and STM instructions are not implemented.
0b0001	Adds the LDM (exception return), LDM (user registers), and STM (user registers) instruction versions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Endian, bits [3:0]

Indicates the implemented Endian instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

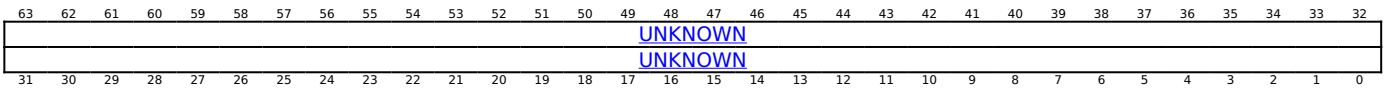
Endian	Meaning
0b0000	None implemented.
0b0001	Adds the SETEND instruction, and the E bit in the PSRs.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR1_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b001

ID_ISAR2_EL1, AArch32 Instruction Set Attribute Register 2

The ID_ISAR2_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR2[31:0].

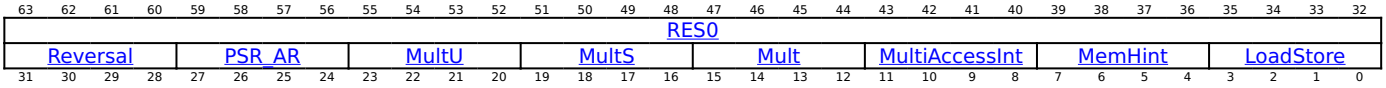
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR2_EL1 are UNDEFINED.

Attributes

ID_ISAR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

Reversal, bits [31:28]

Indicates the implemented Reversal instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Reversal	Meaning
0b0000	None implemented.
0b0001	Adds the REV, REV16, and REVSH instructions.
0b0010	As for 0b0001, and adds the RBIT instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

PSR_AR, bits [27:24]

Indicates the implemented A and R-profile instructions to manipulate the PSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_AR	Meaning
0b0000	None implemented.
0b0001	Adds the MRS and MSR instructions, and the exception return forms of data-processing instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

The exception return forms of the data-processing instructions are:

- In the A32 instruction set, data-processing instructions with the PC as the destination and the S bit set. These instructions might be affected by the WithShifts attribute.
- In the T32 instruction set, the SUBS PC,LR,#N instruction.

Access to this field is RO.

MultU, bits [23:20]

Indicates the implemented advanced unsigned Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultU	Meaning
0b0000	None implemented.
0b0001	Adds the UMULL and UMLAL instructions.
0b0010	As for 0b0001, and adds the UMAAL instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

MultS, bits [19:16]

Indicates the implemented advanced signed Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultS	Meaning
0b0000	None implemented.
0b0001	Adds the SMULL and SMLAL instructions.
0b0010	As for 0b0001, and adds the SMLABB, SMLABT, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, and SMULWT instructions. Also adds the Q bit in the PSRs.
0b0011	As for 0b0010, and adds the SMLAD, SMLADX, SMLALD, SMLALDX, SMLSD, SMLSDX, SMLSLD, SMLSLDX, SMMLA, SMMLAR, SMMLS, SMMLSR, SMMUL, SMMULR, SMUAD, SMUADX, SMUSD, and SMUSDX instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is RO.

Mult, bits [15:12]

Indicates the implemented additional Multiply instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Mult	Meaning
0b0000	No additional instructions implemented. This means only MUL is implemented.
0b0001	Adds the MLA instruction.
0b0010	As for 0b0001, and adds the MLS instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

MultiAccessInt, bits [11:8]

Indicates the support for interruptible multi-access instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MultiAccessInt	Meaning
0b0000	No support. This means the LDM and STM instructions are not interruptible.
0b0001	LDM and STM instructions are restartable.
0b0010	LDM and STM instructions are continuable.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

MemHint, bits [7:4]

Indicates the implemented Memory Hint instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemHint	Meaning
0b0000	None implemented.
0b0001	Adds the PLD instruction.
0b0010	Adds the PLD instruction. (0b0001 and 0b0010 have identical effects.)
0b0011	As for 0b0001 (or 0b0010), and adds the PLI instruction.
0b0100	As for 0b0011, and adds the PLDW instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Access to this field is RO.

LoadStore, bits [3:0]

Indicates the implemented additional load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

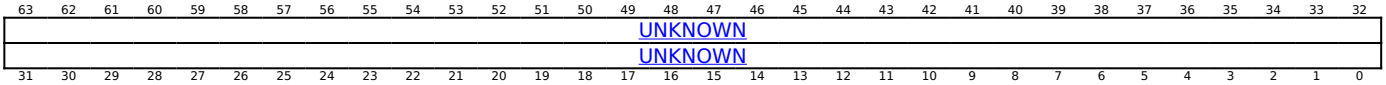
LoadStore	Meaning
0b0000	No additional load/store instructions implemented.
0b0001	Adds the LDRD and STRD instructions.
0b0010	As for 0b0001, and adds the Load Acquire (LDAB, LDAH, LDA, LDAEXB, LDAEXH, LDAEX, LDAEXD) and Store Release (STLB, STLH, STL, STLEXB, STLEXH, STLEX, STLEXD) instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR2_EL1

ID_ISAR3_EL1, AArch32 Instruction Set Attribute Register 3

The ID_ISAR3_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR4_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR3[31:0].

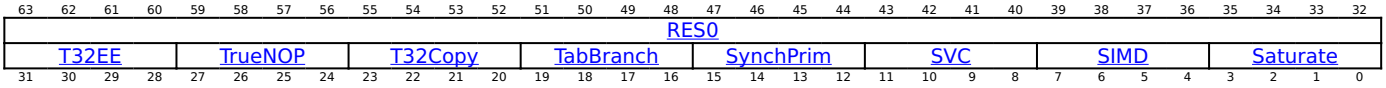
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR3_EL1 are UNDEFINED.

Attributes

ID_ISAR3_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

T32EE, bits [31:28]

Indicates the implemented T32EE instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32EE	Meaning
0b0000	None implemented.
0b0001	Adds the ENTERX and LEAVEX instructions, and modifies the load behavior to include null checking.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

TrueNOP, bits [27:24]

Indicates the implemented true NOP instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TrueNOP	Meaning
0b0000	None implemented. This means there are no NOP instructions that do not have any register dependencies.
0b0001	Adds true NOP instructions in both the T32 and A32 instruction sets. This also permits additional NOP-compatible hints.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

T32Copy, bits [23:20]

Indicates the support for T32 non flag-setting MOV instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

T32Copy	Meaning
0b0000	Not supported. This means that in the T32 instruction set, encoding T1 of the MOV (register) instruction does not support a copy from a low register to a low register.
0b0001	Adds support for T32 instruction set encoding T1 of the MOV (register) instruction, copying from a low register to a low register.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

TabBranch, bits [19:16]

Indicates the implemented Table Branch instructions in the T32 instruction set.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TabBranch	Meaning
0b0000	None implemented.
0b0001	Adds the TBB and TBH instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

SynchPrim, bits [15:12]

Used in conjunction with ID_ISAR4.SynchPrim_frac to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim	Meaning
0b0000	If SynchPrim_frac == 0b0000, no Synchronization Primitives implemented.
0b0001	If SynchPrim_frac == 0b0000, adds the LDREX and STREX instructions. If SynchPrim_frac == 0b0011, also adds the CLREX, LDREXB, STREXB, and STREXH instructions.
0b0010	If SynchPrim_frac == 0b0000, as for [0b0001, 0b0011] and also adds the LDREXD and STREXD instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

SVC, bits [11:8]

Indicates the implemented SVC instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVC	Meaning
0b0000	Not implemented.
0b0001	Adds the SVC instruction.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

SIMD, bits [7:4]

Indicates the implemented SIMD instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMD	Meaning
0b0000	None implemented.
0b0001	Adds the SSAT and USAT instructions, and the Q bit in the PSRs.
0b0011	As for 0b0001, and adds the PKHBT, PKHTB, QADD16, QADD8, QASX, QSUB16, QSUB8, QSAX, SADD16, SADD8, SASX, SEL, SHADD16, SHADD8, SHASX, SHSUB16, SHSUB8, SHSAX, SSAT16, SSUB16, SSUB8, SSAX, SXTAB16, SXTB16, UADD16, UADD8, UASX, UHADD16, UHADD8, UHASX, UHSUB16, UHSUB8, UHSAX, UQADD16, UQADD8, UQASX, UQSUB16, UQSUB8, UQSAX, USAD8, USADA8, USAT16, USUB16, USUB8, USAX, UXTAB16, and UXTB16 instructions. Also adds support for the GE[3:0] bits in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

The SIMD field relates only to implemented instructions that perform SIMD operations on the general-purpose registers. In an implementation that supports Advanced SIMD and floating-point instructions, MVFR0, MVFR1, and MVFR2 give information about the implemented Advanced SIMD instructions.

Access to this field is RO.

Saturate, bits [3:0]

Indicates the implemented Saturate instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Saturate	Meaning
0b0000	None implemented. This means no non-Advanced SIMD saturate instructions are implemented.
0b0001	Adds the QADD, QDADD, QDSUB, and QSUB instructions, and the Q bit in the PSRs.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Otherwise:

ID_ISAR4_EL1, AArch32 Instruction Set Attribute Register 4

The ID_ISAR4_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR4[31:0].

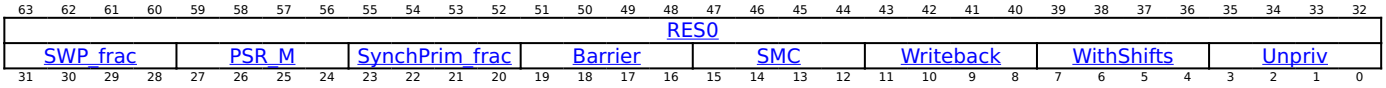
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR4_EL1 are UNDEFINED.

Attributes

ID_ISAR4_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

SWP_frac, bits [31:28]

Indicates support for the memory system locking the bus for SWP or SWPB instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SWP_frac	Meaning
0b0000	SWP or SWPB instructions not implemented.
0b0001	SWP or SWPB implemented but only in a uniprocessor context. SWP and SWPB do not guarantee whether memory accesses from other Requesters can come between the load memory access and the store memory access of the SWP or SWPB.

All other values are reserved. This field is valid only if ID_ISAR0.Swap is 0b0000.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

PSR_M, bits [27:24]

Indicates the implemented M-profile instructions to modify the PSRs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PSR_M	Meaning
0b0000	None implemented.
0b0001	Adds the M-profile forms of the CPS, MRS, and MSR instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

SynchPrim_frac, bits [23:20]

Used in conjunction with ID_ISAR3.SynchPrim to indicate the implemented Synchronization Primitive instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SynchPrim_frac	Meaning
0b0000	If SynchPrim == 0b0000, no Synchronization Primitives implemented. If SynchPrim == 0b0001, adds the LDREX and STREX instructions. If SynchPrim == 0b0010, also adds the CLREX, LDREXB, LDREXH, STREXB, STREXH, LDREXD, and STREXD instructions.
0b0011	If SynchPrim == 0b0001, adds the LDREX, STREX, CLREX, LDREXB, LDREXH, STREXB, and STREXH instructions.

All other combinations of SynchPrim and SynchPrim_frac are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

Barrier, bits [19:16]

Indicates the implemented Barrier instructions in the T32 and A32 instruction sets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Barrier	Meaning
0b0000	None implemented. Barrier operations are provided only as System instructions in the (coproc==0b1111) encoding space.
0b0001	Adds the DMB, DSB, and ISB barrier instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

SMC, bits [15:12]

Indicates the implemented SMC instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMC	Meaning
0b0000	None implemented.
0b0001	Adds the SMC instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- If EL3 is implemented and EL1 can use AArch32, the only permitted value is 0b0001.
- If neither EL3 nor EL2 is implemented, the only permitted value is 0b0000.

If EL1 cannot use AArch32, this field has the value 0b0000.

Access to this field is RO.

Writeback, bits [11:8]

Indicates the support for Writeback addressing modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Writeback	Meaning
0b0000	Basic support. Only the LDM, STM, PUSH, POP, SRS, and RFE instructions support writeback addressing modes. These instructions support all of their writeback addressing modes.
0b0001	Adds support for all of the writeback addressing modes.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

WithShifts, bits [7:4]

Indicates the support for instructions with shifts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WithShifts	Meaning
0b0000	Nonzero shifts supported only in MOV and shift instructions.
0b0001	Adds support for shifts of loads and stores over the range LSL 0-3.
0b0011	As for 0b0001, and adds support for other constant shift options, both on load/store and other instructions.
0b0100	As for 0b0011, and adds support for register-controlled shift options.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0100.

Access to this field is RO.

Unpriv, bits [3:0]

Indicates the implemented unprivileged instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

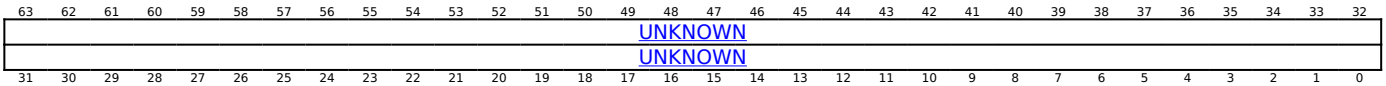
Unpriv	Meaning
0b0000	None implemented. No T variant instructions are implemented.
0b0001	Adds the LDRBT, LDRT, STRBT, and STRT instructions.
0b0010	As for 0b0001, and adds the LDRHT, LDRSBT, LDRSHT, and STRHT instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_ISAR4_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b100

ID_ISAR5_EL1, AArch32 Instruction Set Attribute Register 5

The ID_ISAR5_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, and ID_ISAR4_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR5[31:0].

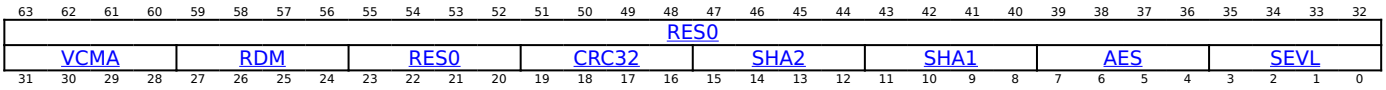
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR5_EL1 are UNDEFINED.

Attributes

ID_ISAR5_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

VCMA, bits [31:28]

Indicates AArch32 support for complex number addition and multiplication where numbers are stored in vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VCMA	Meaning
0b0000	The VCMLA and VCADD instructions are not implemented in AArch32.
0b0001	The VCMLA and VCADD instructions are implemented in AArch32.

All other values are reserved.

FEAT_FCMA implements the functionality identified by 0b0001.

From Armv8.3, the value 0b0000 is not permitted.

Access to this field is RO.

RDM, bits [27:24]

Indicates whether the VQRDMLAH and VQRDMLSH instructions are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RDM	Meaning
0b0000	No VQRDMLAH and VQRDMLSH instructions implemented.
0b0001	VQRDMLAH and VQRDMLSH instructions implemented.

All other values are reserved.

FEAT_RDM implements the functionality identified by the value 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

CRC32, bits [19:16]

Indicates whether the CRC32 instructions CRC32B, CRC32H, CRC32W, CRC32CB, CRC32CH, and CRC32CW are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRC32	Meaning
0b0000	CRC32 instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_CRC32 implements the functionality identified by the value 0b0001.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.1, the value 0b0000 is not permitted.

Access to this field is RO.

SHA2, bits [15:12]

Indicates whether the SHA2 instructions SHA256H, SHA256H2, SHA256SU0, and SHA256SU1 are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA2	Meaning
0b0000	No SHA2 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

SHA1, bits [11:8]

Indicates whether the SHA1 instructions SHA1C, SHA1P, SHA1M, SHA1H, SHA1SU0, and SHA1SU1 are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SHA1	Meaning
0b0000	No SHA1 instructions implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

AES, bits [7:4]

Indicates whether the AES instructions are implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AES	Meaning
0b0000	No AES instructions implemented.
0b0001	AESE, AESD, AESMC, and AESIMC implemented.
0b0010	As for 0b0001, plus VMULL (polynomial) instructions operating on 64-bit data quantities.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0010.

Access to this field is RO.

SEVL, bits [3:0]

Indicates whether the SEVL instruction is implemented in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

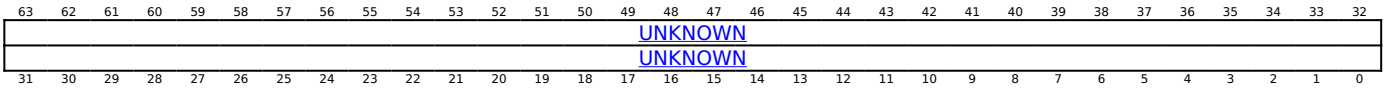
SEVL	Meaning
0b0000	SEVL is implemented as a NOP.
0b0001	SEVL is implemented as Send Event Local.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_ISAR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_ISAR6_EL1, AArch32 Instruction Set Attribute Register 6

The ID_ISAR6_EL1 characteristics are:

Purpose

Provides information about the instruction sets implemented by the PE in AArch32 state.

Must be interpreted with ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1 and ID_ISAR5_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_ISAR6_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_ISAR6[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_ISAR6_EL1 are UNDEFINED.

Note

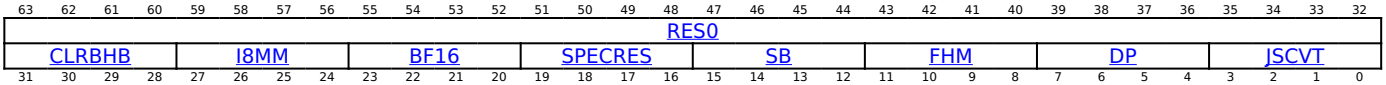
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_ISAR6_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

CLRBHB, bits [31:28]

Indicates support for the CLRBHB instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CLRBHB	Meaning
0b0000	CLRBHB instruction is not implemented.
0b0001	CLRBHB instruction is implemented.

All other values are reserved.

FEAT_CLRBHB implements the functionality identified by 0b0001.

From Armv8.9, the value 0b0000 is not permitted.

Access to this field is RO.

I8MM, bits [27:24]

Indicates support for the following Advanced SIMD Int8 matrix multiplication instructions VSMMLA, VSUDOT, VUMMLA, VUSMMLA, and VUSDOT in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

I8MM	Meaning
0b0000	Int8 matrix multiplication instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_AA32I8MM implements the functionality identified by 0b0001.

Access to this field is RO.

BF16, bits [23:20]

Indicates support for the following Advanced SIMD and floating-point BFloat16 instructions VCVT, VCVTB, VCVTT, VDOT, VFMAB, VFMAT, and VMMLA instructions with BF16 operand or result types in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BF16	Meaning
0b0000	BFloat16 instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_AA32BF16 implements the functionality identified by 0b0001.

Access to this field is RO.

SPECRES, bits [19:16]

Indicates support for prediction invalidation instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SPECRES	Meaning
0b0000	Prediction invalidation instructions are not implemented.
0b0001	CFPRCTX, DVPRCTX, and CPPRCTX instructions are implemented.
0b0010	As 0b0001, and COSPRCTX instruction is implemented.

All other values are reserved.

FEAT_SPECRES implements the functionality identified by 0b0001.

FEAT_SPECRES2 implements the functionality identified by 0b0010.

From Armv8.5, the value 0b0000 is not permitted.

From Armv8.9, the value 0b0001 is not permitted.

Access to this field is RO.

SB, bits [15:12]

Indicates support for the SB instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SB	Meaning
0b0000	SB instruction is not implemented.
0b0001	SB instruction is implemented.

All other values are reserved.

FEAT_SB implements the functionality identified by 0b0001.

From Armv8.5, value 0b0000 is not permitted.

Access to this field is RO.

FHM, bits [11:8]

Indicates support for the following Advanced SIMD and floating-point VFMAL and VFMSL instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FHM	Meaning
0b0000	The specified instructions are not implemented.
0b0001	The specified instructions are implemented.

All other values are reserved.

FEAT_FHM implements the functionality identified by 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

DP, bits [7:4]

Indicates support for dot product instructions in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DP	Meaning
0b0000	Dot product instructions are not implemented.
0b0001	VUDOT and VSDOT instructions are implemented.

All other values are reserved.

FEAT_DotProd implements the functionality identified by 0b0001.

In Armv8.2, the permitted values are 0b0000 and 0b0001.

From Armv8.4, the only permitted value is 0b0001.

Access to this field is RO.

JSCVT, bits [3:0]

Indicates support for the VJCVT instruction in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

JSCVT	Meaning
0b0000	The VJCVT instruction is not implemented.
0b0001	The VJCVT instruction is implemented.

All other values are reserved.

FEAT_JSCVT implements the functionality identified by 0b0001.

In Armv8.0, Armv8.1, and Armv8.2, the only permitted value is 0b0000.

From Armv8.3, if Advanced SIMD or Floating-point is implemented, the value 0b0000 is not implemented.

From Armv8.3, if Advanced SIMD or Floating-point is not implemented, the only permitted value is 0b0000.

Access to this field is RO.

ID_MMFR0_EL1, AArch32 Memory Model Feature Register 0

The ID_MMFR0_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR0[31:0].

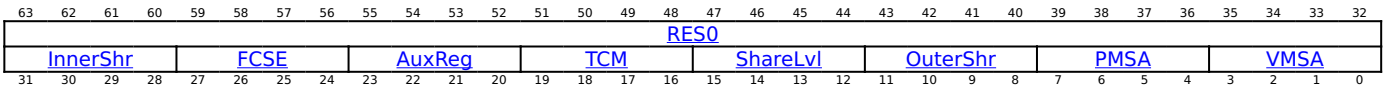
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR0_EL1 are UNDEFINED.

Attributes

ID_MMFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

InnerShr, bits [31:28]

Innermost Shareability. Indicates the innermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

InnerShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

This field is valid only if the implementation supports two levels of shareability, as indicated by ID_MMFR0_EL1.ShareLvl having the value 0b0001.

When ID_MMFR0_EL1.ShareLvl is zero, this field is UNKNOWN.

Access to this field is RO.

FCSE, bits [27:24]

Indicates whether the implementation includes the FCSE.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FCSE	Meaning
0b0000	Not supported.
0b0001	Support for FCSE.

All other values are reserved.

From Armv8 the only permitted value is 0b0000.

Access to this field is RO.

AuxReg, bits [23:20]

Auxiliary Registers. Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxReg	Meaning
0b0000	None supported.
0b0001	Support for Auxiliary Control Register only.
0b0010	Support for Auxiliary Fault Status Registers (AIFSR and ADFSR) and Auxiliary Control Register.

All other values are reserved.

From Armv8 the only permitted value is 0b0010.

Note

Accesses to unimplemented Auxiliary registers are UNDEFINED.

Access to this field is RO.

TCM, bits [19:16]

Indicates support for TCMs and associated DMAs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TCM	Meaning
0b0000	Not supported.
0b0001	Support is IMPLEMENTATION DEFINED.
0b0010	Support for TCM only, Armv6 implementation.
0b0011	Support for TCM and DMA, Armv6 implementation.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is RO.

ShareLvl, bits [15:12]

Shareability Levels. Indicates the number of shareability levels implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ShareLvl	Meaning
0b0000	One level of shareability implemented.
0b0001	Two levels of shareability implemented.

All other values are reserved.

From Armv8 the only permitted value is 0b0001.

Access to this field is RO.

OuterShr, bits [11:8]

Outermost Shareability. Indicates the outermost shareability domain implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OuterShr	Meaning
0b0000	Implemented as Non-cacheable.
0b0001	Implemented with hardware coherency support.
0b1111	Shareability ignored.

All other values are reserved.

From Armv8 the permitted values are 0b0000, 0b0001, and 0b1111.

Access to this field is RO.

PMSA, bits [7:4]

Indicates support for a PMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED PMSA.
0b0010	Support for PMSAv6, with a Cache Type Register implemented.
0b0011	Support for PMSAv7, with support for memory subsections. Armv7-R profile.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is RO.

VMSA, bits [3:0]

Indicates support for a VMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

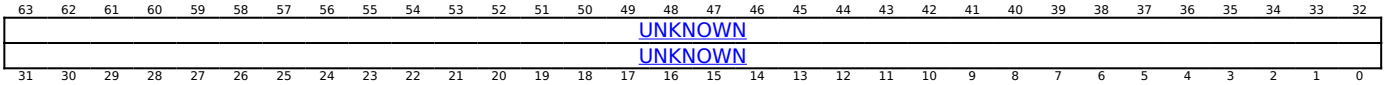
VMSA	Meaning
0b0000	Not supported.
0b0001	Support for IMPLEMENTATION DEFINED VMSA.
0b0010	Support for VMSAv6, with Cache and TLB Type Registers implemented.
0b0011	Support for VMSAv7, with support for remapping and the Access flag. Armv7-A profile.
0b0100	As for 0b0011, and adds support for the PXN bit in the Short-descriptor translation table format descriptors.
0b0101	As for 0b0100, and adds support for the Long-descriptor translation table format.

All other values are reserved.

In Armv8-A the only permitted value is 0b0101.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_MMFR1_EL1, AArch32 Memory Model Feature Register 1

The ID_MMFR1_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR1[31:0].

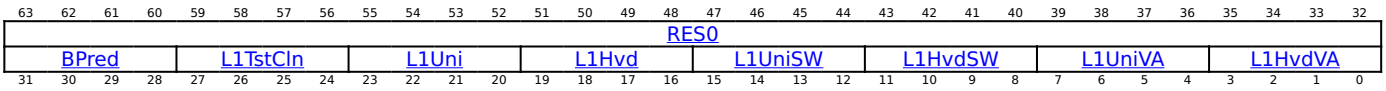
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR1_EL1 are UNDEFINED.

Attributes

ID_MMFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

BPred, bits [31:28]

Branch Predictor. Indicates branch predictor management requirements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPred	Meaning
0b0000	No branch predictor, or no MMU present. Implies a fixed MPU configuration.
0b0001	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Changes to the TTBR0, TTBR1, or TTBCR registers. • Changes to the ContextID or ASID, or to the FCSE ProcessID if this is supported.
0b0010	Branch predictor requires flushing on: • Enabling or disabling a stage of address translation. • Writing new data to instruction locations. • Writing new mappings to the translation tables. • Any change to the TTBR0, TTBR1, or TTBCR registers without a change to the corresponding ContextID or ASID, or FCSE ProcessID if this is supported.
0b0011	Branch predictor requires flushing only on writing new data to instruction locations.
0b0100	For execution correctness, branch predictor requires no flushing at any time.

All other values are reserved.

In Armv8-A, the permitted values are 0b0010, 0b0011, and 0b0100. For values other than 0b0000 and 0b0100 the Arm Architecture Reference Manual, or the product documentation, might give more information about the required maintenance.

Access to this field is RO.

L1TstCln, bits [27:24]

Level 1 cache Test and Clean. Indicates the supported Level 1 data cache test and clean operations, for Harvard or unified cache implementations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1TstCln	Meaning
0b0000	None supported.
0b0001	Supported Level 1 data cache test and clean operations are: • Test and clean data cache.
0b0010	As for 0b0001, and adds: • Test, clean, and invalidate data cache.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

L1Uni, bits [23:20]

Level 1 Unified cache. Indicates the supported entire Level 1 cache maintenance operations for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Uni	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Clean cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

L1Hvd, bits [19:16]

Level 1 Harvard cache. Indicates the supported entire Level 1 cache maintenance operations for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1Hvd	Meaning
0b0000	None supported.
0b0001	Supported entire Level 1 cache operations are: • Invalidate instruction cache, including branch predictor if appropriate. • Invalidate branch predictor, if appropriate.
0b0010	As for 0b0001, and adds: • Invalidate data cache. • Invalidate data cache and instruction cache, including branch predictor if appropriate.
0b0011	As for 0b0010, and adds: • Clean data cache, using a recursive model that uses the cache dirty status bit. • Clean and invalidate data cache, using a recursive model that uses the cache dirty status bit.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

L1UniSW, bits [15:12]

Level 1 Unified cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by set/way are: • Clean cache line by set/way.
0b0010	As for 0b0001, and adds: • Clean and invalidate cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

L1HvdSW, bits [11:8]

Level 1 Harvard cache by Set/Way. Indicates the supported Level 1 cache line maintenance operations by set/way, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdSW	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by set/way are: • Clean data cache line by set/way. • Clean and invalidate data cache line by set/way.
0b0010	As for 0b0001, and adds: • Invalidate data cache line by set/way.
0b0011	As for 0b0010, and adds: • Invalidate instruction cache line by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

L1UniVA, bits [7:4]

Level 1 Unified cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a unified cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1UniVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 unified cache line maintenance operations by VA are: • Clean cache line by VA. • Invalidate cache line by VA. • Clean and invalidate cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

L1HvdVA, bits [3:0]

Level 1 Harvard cache by Virtual Address. Indicates the supported Level 1 cache line maintenance operations by VA, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

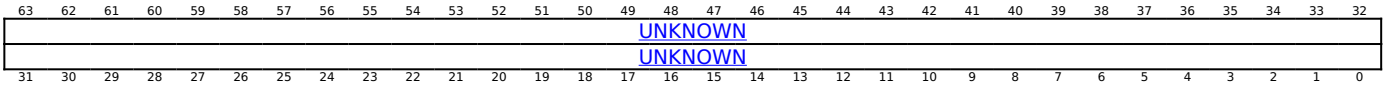
L1HvdVA	Meaning
0b0000	None supported.
0b0001	Supported Level 1 Harvard cache line maintenance operations by VA are: • Clean data cache line by VA. • Invalidate data cache line by VA. • Clean and invalidate data cache line by VA. • Clean instruction cache line by VA.
0b0010	As for 0b0001, and adds: • Invalidate branch predictor by VA, if branch predictor is implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

ID_MMFR2_EL1, AArch32 Memory Model Feature Register 2

The ID_MMFR2_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR2[31:0].

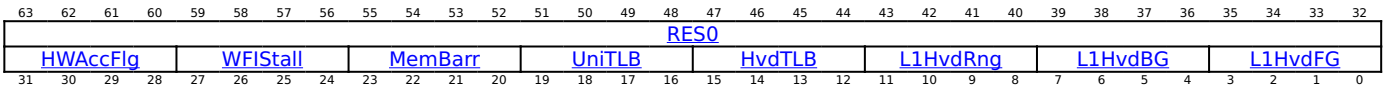
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR2_EL1 are UNDEFINED.

Attributes

ID_MMFR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

HWAccFlg, bits [31:28]

Hardware Access Flag. In earlier versions of the Arm Architecture, this field indicates support for a Hardware Access flag, as part of the VMSAv7 implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HWAccFlg	Meaning
0b0000	Not supported.
0b0001	Support for VMSAv7 Access flag, updated in hardware.

All other values are reserved.

From Armv8.0, 0b0001 is not permitted.

Access to this field is RO.

WFIStall, bits [27:24]

Wait For Interrupt Stall. Indicates the support for Wait For Interrupt (WFI) stalling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WFIStall	Meaning
0b0000	Not supported.
0b0001	Support for WFI stalling.

All other values are reserved.

Access to this field is RO.

MemBarr, bits [23:20]

Memory Barrier. Indicates the supported memory barrier System instructions in the (coproc==0b1111) encoding space:

The value of this field is an IMPLEMENTATION DEFINED choice of:

MemBarr	Meaning
0b0000	None supported.
0b0001	Supported memory barrier System instructions are: • Data Synchronization Barrier (DSB).
0b0010	As for 0b0001, and adds: • Instruction Synchronization Barrier (ISB). • Data Memory Barrier (DMB).

All other values are reserved.

From Armv8.0, the values 0b000 and 0b0001 are not permitted.

Arm deprecates the use of these operations. ID_ISAR4.Barrier_instrs indicates the level of support for the preferred barrier instructions.

Access to this field is RO.

UniTLB, bits [19:16]

Unified TLB. Indicates the supported TLB maintenance operations, for a unified TLB implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UniTLB	Meaning
0b0000	Not supported.
0b0001	Supported unified TLB maintenance operations are: • Invalidate all entries in the TLB. • Invalidate TLB entry by VA.
0b0010	As for 0b0001, and adds: • Invalidate TLB entries by ASID match.
0b0011	As for 0b0010, and adds: • Invalidate instruction TLB and data TLB entries by VA All ASID. This is a shared unified TLB operation.
0b0100	As for 0b0011, and adds: • Invalidate Hyp mode unified TLB entry by VA. • Invalidate entire Non-secure PL1&0 unified TLB. • Invalidate entire Hyp mode unified TLB.
0b0101	As for 0b0100, and adds the following operations: TLBIMVALIS, TLBIMVAALIS, TLBIMVALHIS, TLBIMVAL, TLBIMVAAL, TLBIMVALH.
0b0110	As for 0b0101, and adds the following operations: TLBIIPAS2IS, TLBIIPAS2LIS, TLBIIPAS2, TLBIIPAS2L.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0110.

Access to this field is RO.

HvdTLB, bits [15:12]

If the Unified TLB field (UniTLB, bits [19:16]) is not 0000, then the meaning of this field is IMPLEMENTATION DEFINED. Arm deprecates the use of this field by software.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

L1HvdRng, bits [11:8]

Level 1 Harvard cache Range. Indicates the supported Level 1 cache maintenance range operations, for a Harvard cache implementation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdRng	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache maintenance range operations are: • Invalidate data cache range by VA. • Invalidate instruction cache range by VA. • Clean data cache range by VA. • Clean and invalidate data cache range by VA.

All other values are reserved.

From Armv8.0, the value 0b0001 is not permitted.

Access to this field is RO.

L1HvdBG, bits [7:4]

Level 1 Harvard cache Background fetch. Indicates the supported Level 1 cache background fetch operations, for a Harvard cache implementation. When supported, background fetch operations are non-blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

L1HvdBG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache background fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8.0, the value 0b0001 is not permitted.

Access to this field is RO.

L1HvdFG, bits [3:0]

Level 1 Harvard cache Foreground fetch. Indicates the supported Level 1 cache foreground fetch operations, for a Harvard cache implementation. When supported, foreground fetch operations are blocking operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

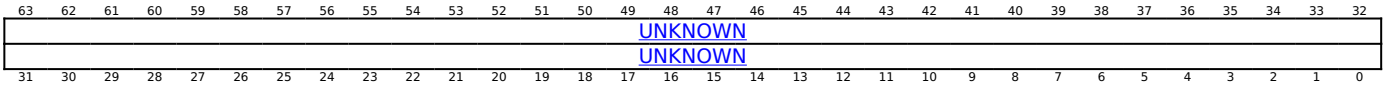
L1HvdFG	Meaning
0b0000	Not supported.
0b0001	Supported Level 1 Harvard cache foreground fetch operations are: • Fetch instruction cache range by VA. • Fetch data cache range by VA.

All other values are reserved.

From Armv8.0, the value 0b0001 is not permitted.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0001	0b110

ID_MMFR3_EL1, AArch32 Memory Model Feature Register 3

The ID_MMFR3_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR3_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR3[31:0].

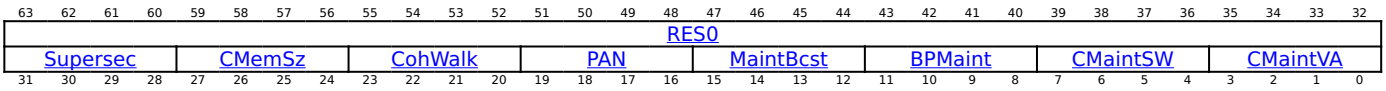
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR3_EL1 are UNDEFINED.

Attributes

ID_MMFR3_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

Supersec, bits [31:28]

Supersections. On a VMSA implementation, indicates whether Supersections are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Supersec	Meaning
0b0000	Supersections supported.
0b1111	Supersections not supported.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b1111.

Access to this field is RO.

CMemSz, bits [27:24]

Cached Memory Size. Indicates the physical memory size supported by the caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMemSz	Meaning
0b0000	4GB, corresponding to a 32-bit physical address range.
0b0001	64GB, corresponding to a 36-bit physical address range.
0b0010	1TB or more, corresponding to a 40-bit or larger physical address range.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is RO.

CohWalk, bits [23:20]

Coherent Walk. Indicates whether Translation table updates require a clean to the Point of Unification.:

The value of this field is an IMPLEMENTATION DEFINED choice of:

CohWalk	Meaning
0b0000	Updates to the translation tables require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.
0b0001	Updates to the translation tables do not require a clean to the Point of Unification to ensure visibility by subsequent translation table walks.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

PAN, bits [19:16]

Privileged Access Never. Indicates support for the PAN bit in CPSR, SPSR, and DSPSR in AArch32 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PAN	Meaning
0b0000	PAN not supported.
0b0001	PAN supported.
0b0010	PAN supported and ATS1CPRP and ATS1CPWP instructions supported.

All other values are reserved.

FEAT_PAN implements the functionality identified by the value 0b0001.

FEAT_PAN2 implements the functionality added by the value 0b0010.

From Armv8.1, the value 0b0000 is not permitted.

From Armv8.2, the value 0b0001 is not permitted.

Access to this field is RO.

MaintBcst, bits [15:12]

Maintenance Broadcast. Indicates whether Cache, TLB, and branch predictor operations are broadcast.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MaintBcst	Meaning
0b0000	Cache, TLB, and branch predictor operations only affect local structures.
0b0001	Cache and branch predictor operations affect structures according to shareability and defined behavior of instructions. TLB operations only affect local structures.
0b0010	Cache, TLB, and branch predictor operations affect structures according to shareability and defined behavior of instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

BPMaint, bits [11:8]

Branch Predictor Maintenance. Indicates the supported branch predictor maintenance operations in an implementation with hierarchical cache maintenance operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BPMaint	Meaning
0b0000	None supported.
0b0001	Supported branch predictor maintenance operations are: • Invalidate all branch predictors.
0b0010	As for 0b0001, and adds: • Invalidate branch predictors by VA.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0010.

Access to this field is RO.

CMaintSW, bits [7:4]

Cache Maintenance by Set/Way. Indicates the supported cache maintenance operations by set/way, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintSW	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance instructions by set/way are: • Invalidate data cache by set/way. • Clean data cache by set/way. • Clean and invalidate data cache by set/way.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, the data cache maintenance operations apply to the unified caches.

Access to this field is RO.

CMaintVA, bits [3:0]

Cache Maintenance by Virtual Address. Indicates the supported cache maintenance operations by VA, in an implementation with hierarchical caches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CMaintVA	Meaning
0b0000	None supported.
0b0001	Supported hierarchical cache maintenance operations by VA are: • Invalidate data cache by VA. • Clean data cache by VA. • Clean and invalidate data cache by VA. • Invalidate instruction cache by VA. • Invalidate all instruction cache entries.

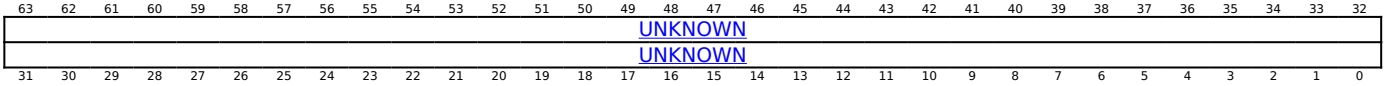
All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

In a unified cache implementation, data cache maintenance operations apply to the unified caches, and the instruction cache maintenance instructions are not implemented.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR3_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR3_EL1

op0	op1	CRn	CRm	op2

ID_MMFR4_EL1, AArch32 Memory Model Feature Register 4

The ID_MMFR4_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR4_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR4[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR4_EL1 are UNDEFINED.

Note

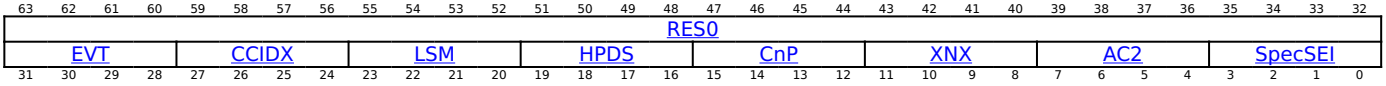
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_MMFR4_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

EVT, bits [31:28]

Enhanced Virtualization Traps. If EL2 is implemented, indicates support for the HCR2.{TTLBIS, TOCU, TICAB, TID4} traps.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EVT	Meaning
0b0000	HCR2.{TTLBIS, TOCU, TICAB, TID4} traps are not supported.
0b0001	HCR2.{TOCU, TICAB, TID4} traps are supported.
0b0010	As 0b0001, and HCR2.TTLBIS trap is supported.

All other values are reserved.

FEAT_EVT implements the functionality identified by the value 0b0001.

FEAT_EVT2 implements the functionality identified by the value 0b0010.

If EL2 is not implemented or does not support AArch32, the only permitted value is 0b0000.

From Armv8.5, if EL2 is supported and supports AArch32, the value 0b0001 is not permitted.

Access to this field is RO.

CCIDX, bits [27:24]

Support for use of the revised CCSIDR format and the presence of the CCSIDR2 is indicated.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCIDX	Meaning
0b0000	32-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is not implemented.
0b0001	64-bit format implemented for all levels of the CCSIDR, and the CCSIDR2 register is implemented.

All other values are reserved.

FEAT_CCIDX implements the functionality identified by 0b0001.

From Armv8.3, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

LSM, bits [23:20]

Indicates support for LSMAOE and nTLSMD bits in HSCTLR and SCTLR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LSM	Meaning
0b0000	LSMAOE and nTLSMD bits not supported.
0b0001	LSMAOE and nTLSMD bits supported.

All other values are reserved.

FEAT_LSMAOC implements the functionality identified by the value 0b0001.

From Armv8.2, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

HPDS, bits [19:16]

Hierarchical permission disables bits in translation tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HPDS	Meaning
0b0000	Disabling of hierarchical controls not supported.
0b0001	Supports disabling of hierarchical controls using the TTBCR2.HPD0, TTBCR2.HPD1, and HTCR.HPD bits.
0b0010	As for value 0b0001, and adds possible hardware allocation of bits[62:59] of the Translation table descriptors from the final lookup level for IMPLEMENTATION DEFINED use.

All other values are reserved.

FEAT_AA32HPD implements the functionality identified by the value 0b0001.

FEAT_HPDS2 implements the functionality added by the value 0b0010.

Note

The value 0b0000 implies that the encoding for TTBCR2 is UNDEFINED.

Access to this field is RO.

CnP, bits [15:12]

Common not Private translations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CnP	Meaning
0b0000	Common not Private translations not supported.
0b0001	Common not Private translations supported.

All other values are reserved.

FEAT_TTCNP implements the functionality identified by the value 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

Access to this field is RO.

XNX, bits [11:8]

Support for execute-never control distinction by Exception level at stage 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

XNX	Meaning
0b0000	Distinction between EL0 and EL1 execute-never control at stage 2 not supported.
0b0001	Distinction between EL0 and EL1 execute-never control at stage 2 supported.

All other values are reserved.

FEAT_XNX implements the functionality identified by the value 0b0001.

When FEAT_XNX is implemented:

- If all of the following conditions are true, it is IMPLEMENTATION DEFINED whether the value of ID_MMFR4_EL1.XNX is 0b0000 or 0b0001:
  - ID_AA64MMFR1_EL1.XNX ==1.
  - EL2 cannot use AArch32.
  - EL1 can use AArch32.
- If EL2 can use AArch32 then the value 0b0000 is not permitted.

Access to this field is RO.

AC2, bits [7:4]

Indicates the extension of the ACTLR and HACTLR registers using ACTLR2 and HACTLR2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AC2	Meaning
0b0000	ACTLR2 and HACTLR2 are not implemented.
0b0001	ACTLR2 and HACTLR2 are implemented.

All other values are reserved.

In Armv8.0 and Armv8.1 the permitted values are 0b0000 and 0b0001.

From Armv8.2, the only permitted value is 0b0001.

Access to this field is RO.

SpecSEI, bits [3:0]
When FEAT_RAS is implemented:

Describes whether the PE can generate SError exceptions from speculative reads of memory, including speculative instruction fetches.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SpecSEI	Meaning
0b0000	The PE never generates an SError exception due to an External abort on a speculative read.
0b0001	The PE might generate an SError exception due to an External abort on a speculative read.

All other values are reserved.

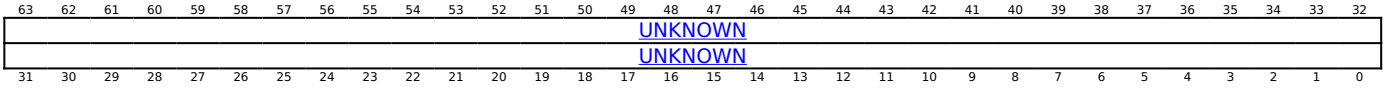
FEAT_SpecSEI implements the functionality identified by the value 0b0001.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR4_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR4_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0010	0b110

```
if !IsFeatureImplemented(FEAT_AA64) then

            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    else
        X{64}(t) = ID_MMFR4_EL1();
    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = ID_MMFR4_EL1();
end;
```

ID_MMFR5_EL1, AArch32 Memory Model Feature Register 5

The ID_MMFR5_EL1 characteristics are:

Purpose

Provides information about the implemented memory model and memory management support in AArch32 state.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_MMFR5_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_MMFR5[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_MMFR5_EL1 are UNDEFINED.

Note

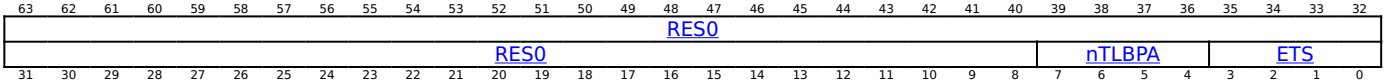
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_MMFR5_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:8]

Reserved, RES0.

nTLBPA, bits [7:4]

Indicates support for intermediate caching of translation table walks.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nTLBPA	Meaning
0b0000	The intermediate caching of translation table walks might include non-coherent physical translation caches.
0b0001	The intermediate caching of translation table walks does not include non-coherent physical translation caches.

Non-coherent physical translation caches are non-coherent caches of previous valid translation table entries since the last completed relevant TLBI applicable to the PE, where either:

- The caching is indexed by the physical address of the location holding the translation table entry.
- The caching is used for stage 1 translations and is indexed by the intermediate physical address of the location holding the translation table entry.

All other values are reserved.

FEAT_nTLBPA implements the functionality identified by the value 0b0001.

From Armv8.0, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

ETS, bits [3:0]

Indicates support for Enhanced Translation Synchronization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ETS	Meaning
0b0000	Enhanced Translation Synchronization is not supported.
0b0001	Enhanced Translation Synchronization is not supported.
0b0010	FEAT_ETS2 is implemented.
0b0011	FEAT_ETS3 is implemented.

All other values are reserved.

FEAT_ETS2 implements the functionality identified by the value 0b0010.

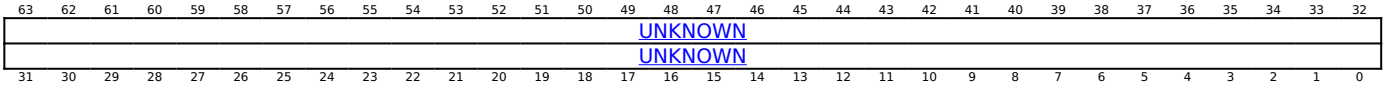
FEAT_ETS3 implements the functionality identified by the value 0b0011.

From Armv8.8, the values 0b0000 and 0b0001 are not permitted.

From Armv9.5, the value 0b0010 is not permitted.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_MMFR5_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_MMFR5_EL1

op0	op1	CRn	CRm	op2

ID_PFR0_EL1, AArch32 Processor Feature Register 0

The ID_PFR0_EL1 characteristics are:

Purpose

Gives top-level information about the instruction sets supported by the PE in AArch32 state.

Must be interpreted with ID_PFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR0[31:0].

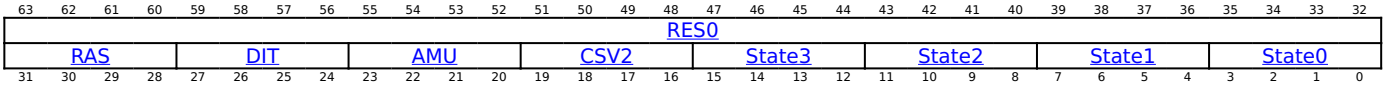
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_PFR0_EL1 are UNDEFINED.

Attributes

ID_PFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

RAS, bits [31:28]

RAS Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS	Meaning
0b0000	No RAS Extension.
0b0001	Support for the Reliability, Availability, and Serviceability Extension is implemented. The ESB instruction and the Error synchronization event are supported.
0b0010	As 0b0001, and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.
0b0011	As 0b0010, and requires that error records accessed through System registers conform to either RAS System Architecture v1.1 or RAS System Architecture v2.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0001.

FEAT_RASv1p1 implements the functionality identified by the value 0b0010.

FEAT_RASv2 implements the functionality identified by the value 0b0011.

In Armv8.0 and Armv8.1, the permitted values are 0b0000 and 0b0001.

From Armv8.2, the value 0b0000 is not permitted.

From Armv8.4, if FEAT_DoubleFault is implemented or ERRIDR_EL1.NUM is nonzero, the value 0b0001 is not permitted.

Note

When the value of this field is 0b0001, ID_PFR2_EL1.RAS_frac indicates whether FEAT_RASv1p1 is implemented.

From Armv8.9, if ERRIDR_EL1.NUM is nonzero, the value 0b0010 is not permitted.

Access to this field is RO.

DIT, bits [27:24]

Data Independent Timing.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DIT	Meaning
0b0000	AArch32 does not guarantee constant execution time of any instructions.
0b0001	AArch32 provides the PSTATE.DIT mechanism to guarantee constant execution time of certain instructions.

All other values are reserved.

FEAT_DIT implements the functionality identified by the value 0b0001.

From Armv8.4, the only permitted value is 0b0001.

Access to this field is RO.

AMU, bits [23:20]

Indicates support for Activity Monitors Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is RO.

CSV2, bits [19:16]

Speculative use of out of context branch targets.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV2	Meaning
0b0000	The implementation does not disclose whether FEAT_CSV2 is implemented.
0b0001	FEAT_CSV2 is implemented, but FEAT_CSV2_1p1 is not implemented.
0b0010	FEAT_CSV2_1p1 is implemented.

All other values are reserved.

FEAT_CSV2 implements the functionality identified by the value 0b0001.

FEAT_CSV2_1p1 implements the functionality identified by the value 0b0010.

From Armv8.5, the permitted values are 0b0001 and 0b0010.

Access to this field is RO.

State3, bits [15:12]

T32EE instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State3	Meaning
0b0000	Not implemented.
0b0001	T32EE instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

State2, bits [11:8]

Jazelle extension support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State2	Meaning
0b0000	Not implemented.
0b0001	Jazelle extension implemented, without clearing of JOSCR.CV on exception entry.
0b0010	Jazelle extension implemented, with clearing of JOSCR.CV on exception entry.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

State1, bits [7:4]

T32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

State1	Meaning
0b0000	T32 instruction set not implemented.
0b0001	T32 encodings before the introduction of Thumb-2 technology implemented: • All instructions are 16-bit. • A BL or BLX is a pair of 16-bit instructions. • 32-bit instructions other than BL and BLX cannot be encoded.
0b0011	T32 encodings after the introduction of Thumb-2 technology implemented, for all 16-bit and 32-bit T32 basic instructions.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0011.

Access to this field is RO.

State0, bits [3:0]

A32 instruction set support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

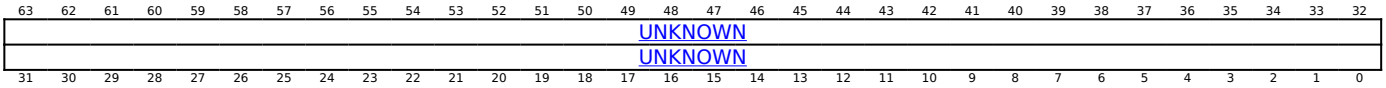
State0	Meaning
0b0000	A32 instruction set not implemented.
0b0001	A32 instruction set implemented.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0001.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ID_PFR0_EL1

op0	op1	CRn	CRm	op2

        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    else
        X{64}(t) = ID_PFR0_EL1();
    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = ID_PFR0_EL1();
end;
```

ID_PFR1_EL1, AArch32 Processor Feature Register 1

The ID_PFR1_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR1[31:0].

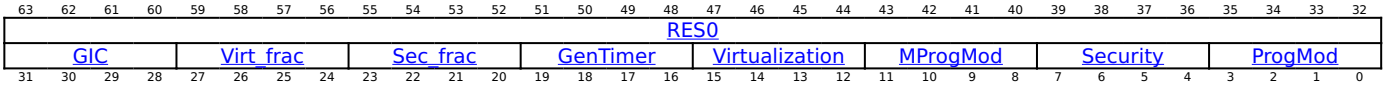
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_PFR1_EL1 are UNDEFINED.

Attributes

ID_PFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

GIC, bits [31:28]

System register GIC CPU interface.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

Access to this field is RO.

Virt_frac, bits [27:24]

Virtualization fractional field. When the Virtualization field is 0b0000, determines the support for Virtualization Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virt_frac	Meaning
0b0000	No Virtualization Extensions are implemented.
0b0001	The following Virtualization Extensions are implemented: • The SCR.SIF bit, if EL3 is implemented. • The modifications to the SCR.AW and SCR.FW bits described in the Virtualization Extensions, if EL3 is implemented. • The MSR (banked register) and MRS (banked register) instructions. • The ERET instruction.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is implemented.
- 0b0001 when EL2 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Virtualization is 0, otherwise it holds the value 0b0000.

Note

The ID_ISAR registers do not identify whether the instructions added by the Virtualization Extensions are implemented.

Access to this field is RO.

Sec_frac, bits [23:20]

Security fractional field. When the Security field is 0b0000, determines the support for Security Extensions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Sec_frac	Meaning
0b0000	No Security Extensions are implemented.
0b0001	The following Security Extensions are implemented: • The VBAR register. • The TTBCR.PD0 and TTBCR.PD1 bits.
0b0010	As for 0b0001, plus the ability to access Secure or Non-secure physical memory is supported.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is implemented.
- 0b0001 or 0b0010 when EL3 is not implemented.

This field is valid only when the value of ID_PFR1_EL1.Security is 0, otherwise it holds the value 0b0000.

Access to this field is RO.

GenTimer, bits [19:16]

Generic Timer support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GenTimer	Meaning
0b0000	Generic Timer is not implemented.
0b0001	Generic Timer is implemented.
0b0010	Generic Timer is implemented, and also includes support for CNTHCTL.EVNTIS and CNTKCTL.EVNTIS fields, and CNTPCTSS and CNTVCTSS counter views.

All other values are reserved.

FEAT_ECV implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0001.

From Armv8.6, the only permitted value is 0b0010.

Access to this field is RO.

Virtualization, bits [15:12]

Virtualization support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virtualization	Meaning
0b0000	EL2, Hyp mode, and the HVC instruction not implemented.
0b0001	EL2, Hyp mode, the HVC instruction, and all the features described by Virt_frac == 0b0001 implemented.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL2 is not implemented.
- 0b0001 when EL2 is implemented.

In an implementation that includes EL2, if EL2 cannot use AArch32 but EL1 can use AArch32, then this field has the value 0b0001.

If EL1 cannot use AArch32, then this field has the value 0b0000.

Note

The ID_ISARs do not identify whether the HVC instruction is implemented.

Access to this field is RO.

MProgMod, bits [11:8]

M-profile programmers' model support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MProgMod	Meaning
0b0000	Not supported.
0b0010	Support for two-stack programmers' model.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is RO.

Security, bits [7:4]

Security support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Security	Meaning
0b0000	EL3, Monitor mode, and the SMC instruction not implemented.
0b0001	EL3, Monitor mode, the SMC instruction, and all the features described by Sec_frac == 0b0001 implemented.
0b0010	As for 0b0001, and adds the ability to set the NSACR.RFR bit. Not permitted in Armv8 as the NSACR.RFR bit is RES0.

All other values are reserved.

In Armv8-A, the permitted values are:

- 0b0000 when EL3 is not implemented.
- 0b0001 when EL3 is implemented.

In an implementation that includes EL3, if EL3 cannot use AArch32 but EL1 can use AArch32, then this field has the value 0b0001.

If EL1 cannot use AArch32, then this field has the value 0b0000.

Access to this field is RO.

ProgMod, bits [3:0]

Support for the standard programmers' model for Armv4 and later. Model must support User, FIQ, IRQ, Supervisor, Abort, Undefined, and System modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ProgMod	Meaning
0b0000	Not supported.
0b0001	Supported.

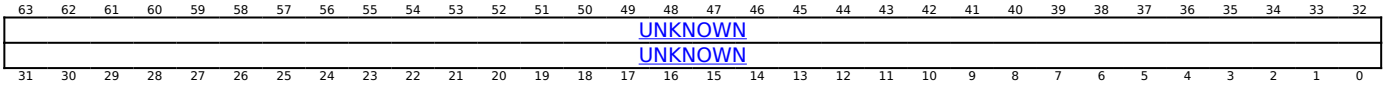
All other values are reserved.

In Armv8-A, the permitted values are 0b0001 and 0b0000.

If EL1 cannot use AArch32, then this field has the value 0b0000.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

            Undefined();
        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    else
        X{64}(t) = ID_PFR1_EL1();
    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = ID_PFR1_EL1();
end;
```

2025-12-10 16:11:30, 2025-12_rel

ID_PFR2_EL1, AArch32 Processor Feature Register 2

The ID_PFR2_EL1 characteristics are:

Purpose

Gives information about the AArch32 programmers' model.

Must be interpreted with ID_PFR0_EL1 and ID_PFR1_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register ID_PFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register ID_PFR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ID_PFR2_EL1 are UNDEFINED.

Note

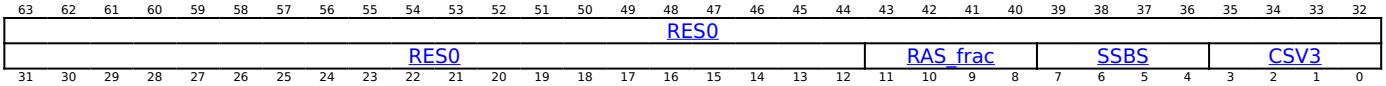
Prior to the introduction of the features described by this register, this register was unnamed and reserved, RES0 from EL1, EL2, and EL3.

Attributes

ID_PFR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:12]

Reserved, RES0.

RAS_frac, bits [11:8]

RAS Extension fractional field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RAS_frac	Meaning
0b0000	If ID_PFR0_EL1.RAS == 0b0001, Support for the Reliability, Availability, and Serviceability Extension is implemented.
0b0001	If ID_PFR0_EL1.RAS == 0b0001, as 0b0000 and adds support for additional ERXMISC<m> System registers. Error records accessed through System registers conform to RAS System Architecture v1.1, which includes simplifications to ERR<n>STATUS and support for the optional RAS Timestamp Extension.

All other values are reserved.

FEAT_RAS implements the functionality identified by the value 0b0000.

FEAT_RASv1p1 implements the functionality identified by the value 0b0001.

This field is valid only if ID_PFR0_EL1.RAS == 0b0001.

Access to this field is RO.

SSBS, bits [7:4]

Speculative Store Bypassing controls in AArch64 state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SSBS	Meaning
0b0000	AArch32 provides no mechanism to control the use of Speculative Store Bypassing.
0b0001	AArch32 provides the PSTATE.SSBS mechanism to mark regions that are Speculative Store Bypass Safe.

In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

All other values are reserved.

Access to this field is RO.

CSV3, bits [3:0]

Speculative use of faulting data.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CSV3	Meaning
0b0000	This PE does not disclose whether data loaded under speculation with a permission or domain fault can be used to form an address or generate condition codes or SVE predicate values to be used by other instructions in the speculative sequence.
0b0001	Data loaded under speculation with a permission or domain fault cannot be used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence. The execution timing of any other instructions in the speculative sequence is not a function of the data loaded under speculation.

All other values are reserved.

FEAT_CSV3 implements the functionality identified by the value 0b0001.

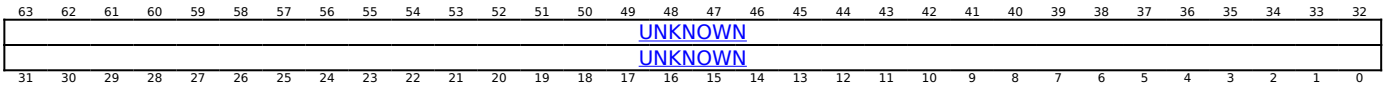
In Armv8.0, the permitted values are 0b0000 and 0b0001.

From Armv8.5, the only permitted value is 0b0001.

If FEAT_E0PD is implemented, FEAT_CSV3 must be implemented.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing ID_PFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

IFSR32_EL2, Instruction Fault Status Register (EL2)

The IFSR32_EL2 characteristics are:

Purpose

Allows access to the AArch32 IFSR register from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register IFSR32_EL2 bits [31:0] are architecturally mapped to AArch32 System register IFSR[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to IFSR32_EL2 are UNDEFINED.

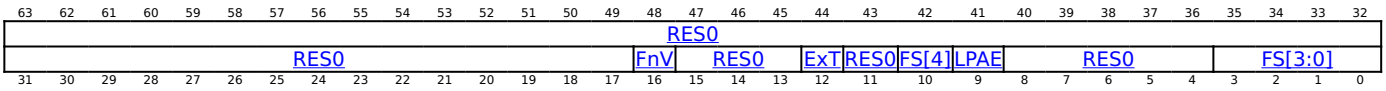
If EL2 is not implemented but EL3 is implemented, and EL1 is capable of using AArch32, then this register is not RES0.

Attributes

IFSR32_EL2 is a 64-bit register.

Field descriptions

When TTBCR.EAE == '0':



Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault Status bits. Bits [10] and [3:0] are interpreted together.

FS	Meaning	Applies when
0b00001	PC alignment fault.	
0b00010	Debug exception.	
0b00011	Access flag fault, level 1.	
0b00101	Translation fault, level 1.	
0b00110	Access flag fault, level 2.	
0b00111	Translation fault, level 2.	
0b01000	Synchronous External abort, not on translation table walk.	
0b01001	Domain fault, level 1.	
0b01011	Domain fault, level 2.	
0b01100	Synchronous External abort, on translation table walk, level 1.	
0b01101	Permission fault, level 1.	
0b01110	Synchronous External abort, on translation table walk, level 2.	
0b01111	Permission fault, level 2.	
0b10000	TLB conflict abort.	
0b10100	IMPLEMENTATION DEFINED fault (Lockdown fault).	
0b11001	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b11100	Synchronous parity or ECC error on translation table walk, level 1.	When FEAT_RAS is not implemented
0b11110	Synchronous parity or ECC error on translation table walk, level 2.	When FEAT_RAS is not implemented

All other values are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Short-descriptor translation table lookup'.

The FS field is split as follows:

- FS[4] is IFSR32_EL2[10].
- FS[3:0] is IFSR32_EL2[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

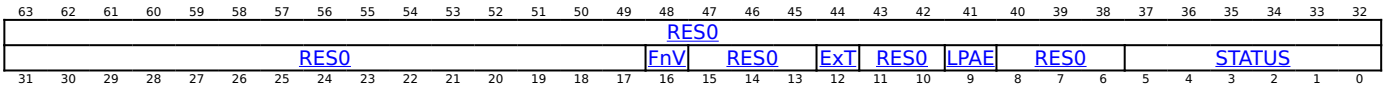
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == '1':



Bits [63:17]

Reserved, RES0.

FnV, bit [16]

FAR not Valid, for a synchronous External abort other than a synchronous External abort on a translation table walk.

FnV	Meaning
0b0	IFAR is valid.
0b1	IFAR is not valid, and holds an UNKNOWN value.

This field is valid only for a synchronous External abort other than a synchronous External abort on a translation table walk. It is RES0 for all other Prefetch Abort exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:13]

Reserved, RES0.

ExT, bit [12]

External abort type. This bit can be used to provide an IMPLEMENTATION DEFINED classification of External aborts.

In an implementation that does not provide any classification of External aborts, this bit is RES0.

For aborts other than External aborts this bit always returns 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

On taking a Data Abort exception, this bit is set as follows:

LPAE	Meaning
0b0	Using the Short-descriptor translation table formats.
0b1	Using the Long-descriptor translation table formats.

Hardware does not interpret this bit to determine the behavior of the memory system, and therefore software can set this bit to 0 or 1 without affecting operation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status bits. Possible values of this field are:

STATUS	Meaning	Applies when
0b000000	Address size fault in translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk.	
0b010101	Synchronous External abort on translation table walk, level 1.	
0b010110	Synchronous External abort on translation table walk, level 2.	
0b010111	Synchronous External abort on translation table walk, level 3.	
0b011000	Synchronous parity or ECC error on memory access, not on translation table walk.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk, level 3.	When FEAT_RAS is not implemented
0b100001	PC alignment fault.	
0b100010	Debug exception.	
0b110000	TLB conflict abort.	

All other values are reserved.

When FEAT_RAS is implemented, 0b011000, 0b011101, 0b011110, and 0b011111 are reserved.

For more information about the lookup level associated with a fault, see 'The level associated with MMU faults on a Long-descriptor translation table lookup'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IFSR32_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, IFSR32_EL2

op0	op1	CRn	CRm	op2

IRTBRP_EL1, Instruction Region Table Base Register, Privileged (EL1)

The IRTBRP_EL1 characteristics are:

Purpose

Configuration of the base address for the region of memory that contains the IRT for execution at EL1.

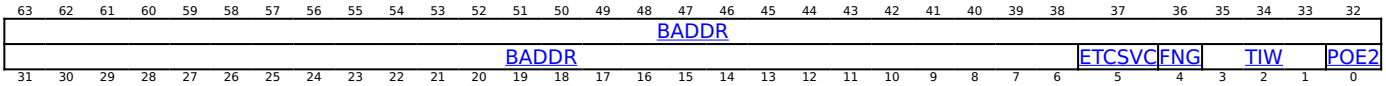
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to IRTBRP_EL1 are UNDEFINED.

Attributes

IRTBRP_EL1 is a 64-bit register.

Field descriptions



BADDR, bits [63:6]

Base address of Instruction Region Table.

Bits [63:6] of the address are the value of this field.

Bits [5:0] of the address are zero.

The least significant bits of this field are RES0, so that the base address of the table is aligned to the size of the table. If the table is smaller than 64B, then the address is aligned to 64B.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ETCSVC, bit [5]

Exclude TIndex from the hardware-defined context for CSV2.

ETCSVC	Meaning
0b0	TIndex is included in the FEAT_CSV2 hardware-defined context.
0b1	TIndex is not included in the FEAT_CSV2 hardware-defined context.

This field applies to execution at EL1.

An implementation is permitted to treat this bit as 0, regardless of the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FNG, bit [4]

Force non-global.

FNG	Meaning
0b0	No effect on the interpretation of the IRT nG bit.
0b1	For IRT entries reached via this register, the nG bit is treated as 1, regardless of the programmed value.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIW, bits [3:1]

TIndex width. The effective width of the TIndex field.

Bits of TINDEX_EL1.TIndex above the configured width are treated as zero.

The values 0 through 7 are valid.

The value 0 means that TIndex is treated as 0.

This field is permitted to be cached in a TLB.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POE2, bit [0]

Enable POE2 checks for the Exception level EL1.

POE2	Meaning
0b0	POE2 checks are disabled. The instructions TCHANGEF and TCHANGEB are UNDEFINED.
0b1	POE2 checks are enabled.

If the Effective value of TCR2_EL1.POE2F is 0, the Effective value of this field is 0.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRTBRP_EL2, Instruction Region Table Base Register, Privileged (EL2)

The IRTBRP_EL2 characteristics are:

Purpose

Configuration of the base address for the region of memory that contains the IRT for execution at EL2.

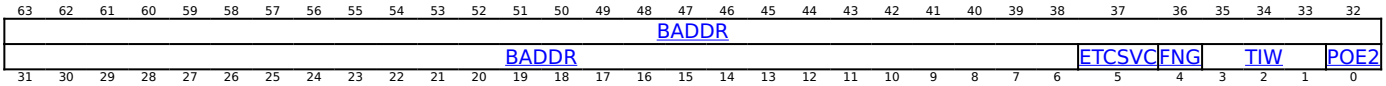
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to IRTBRP_EL2 are UNDEFINED.

Attributes

IRTBRP_EL2 is a 64-bit register.

Field descriptions



BADDR, bits [63:6]

Base address of Instruction Region Table.

Bits [63:6] of the address are the value of this field.

Bits [5:0] of the address are zero.

The least significant bits of this field are RES0, so that the base address of the table is aligned to the size of the table. If the table is smaller than 64B, then the address is aligned to 64B.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ETCSVC, bit [5]

Exclude TIndex from the hardware-defined context for CSV2.

ETCSVC	Meaning
0b0	TIndex is included in the FEAT_CSV2 hardware-defined context.
0b1	TIndex is not included in the FEAT_CSV2 hardware-defined context.

This field applies to execution at EL2.

An implementation is permitted to treat this bit as 0, regardless of the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FNG, bit [4]

Force non-global.

FNG	Meaning
0b0	No effect on the interpretation of the IRT nG bit.
0b1	For IRT entries reached via this register, the nG bit is treated as 1, regardless of the programmed value.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIW, bits [3:1]

TIndex width. The effective width of the TIndex field.

Bits of TINDEX_EL2.TIndex above the configured width are treated as zero.

The values 0 through 7 are valid.

The value 0 means that TIndex is treated as 0.

This field is permitted to be cached in a TLB.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POE2, bit [0]

Enable POE2 checks for the Exception level EL2.

POE2	Meaning
0b0	POE2 checks are disabled. The instructions TCHANGEF and TCHANGEB are UNDEFINED.
0b1	POE2 checks are enabled.

If the Effective value of TCR2_EL2.POE2F is 0, the Effective value of this field is 0.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRTBRP_EL3, Instruction Region Table Base Register, Privileged (EL3)

The IRTBRP_EL3 characteristics are:

Purpose

Configuration of the base address for the region of memory that contains the IRT for execution at EL3.

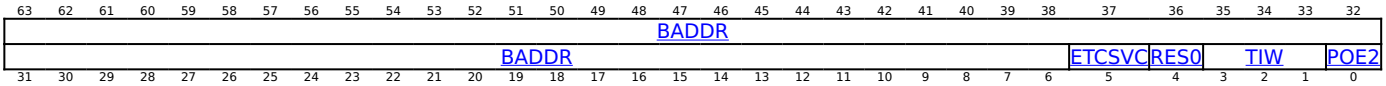
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to IRTBRP_EL3 are UNDEFINED.

Attributes

IRTBRP_EL3 is a 64-bit register.

Field descriptions



BADDR, bits [63:6]

Base address of Instruction Region Table.

Bits [63:6] of the address are the value of this field.

Bits [5:0] of the address are zero.

The least significant bits of this field are RES0, so that the base address of the table is aligned to the size of the table. If the table is smaller than 64B, then the address is aligned to 64B.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ETCSVC, bit [5]

Exclude TIndex from the hardware-defined context for CSV2.

ETCSVC	Meaning
0b0	TIndex is included in the FEAT_CSV2 hardware-defined context.
0b1	TIndex is not included in the FEAT_CSV2 hardware-defined context.

This field applies to execution at EL3.

An implementation is permitted to treat this bit as 0, regardless of the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [4]

Reserved, RES0.

TIW, bits [3:1]

TIndex width. The effective width of the TIndex field.

Bits of TINDEX_EL3.TIndex above the configured width are treated as zero.

The values 0 through 7 are valid.

The value 0 means that TIndex is treated as 0.

This field is permitted to be cached in a TLB.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POE2, bit [0]

Enable POE2 checks for the Exception level EL3.

POE2	Meaning
0b0	POE2 checks are disabled. The instructions TCHANGEF and TCHANGEB are UNDEFINED.
0b1	POE2 checks are enabled.

If the Effective value of TCR_EL3.POE2F is 0, the Effective value of this field is 0.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing IRTBRP_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, IRTBRP_EL3

IRTBRU_EL1, Instruction Region Table Base Register, Unprivileged (EL1)

The IRTBRU_EL1 characteristics are:

Purpose

Configuration of the base address for the region of memory that contains the IRT for exection at EL0 when the Effective value of HCR_EL2.{E2H, TGE} != {1, 1}.

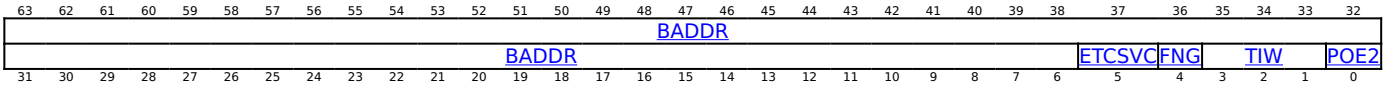
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to IRTBRU_EL1 are UNDEFINED.

Attributes

IRTBRU_EL1 is a 64-bit register.

Field descriptions



BADDR, bits [63:6]

Base address of Instruction Region Table.

Bits [63:6] of the address are the value of this field.

Bits [5:0] of the address are zero.

The least significant bits of this field are RES0, so that the base address of the table is aligned to the size of the table. If the table is smaller than 64B, then the address is aligned to 64B.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ETCSVC, bit [5]

Exclude TIndex from the hardware-defined context for CSV2.

ETCSVC	Meaning
0b0	TIndex is included in the FEAT_CSV2 hardware-defined context.
0b1	TIndex is not included in the FEAT_CSV2 hardware-defined context.

This field applies to execution at EL0 when the Effective value of HCR_EL2.{E2H, TGE} != {1, 1}.

An implementation is permitted to treat this bit as 0, regardless of the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FNG, bit [4]

Force non-global.

FNG	Meaning
0b0	No effect on the interpretation of the IRT nG bit.
0b1	For IRT entries reached via this register, the nG bit is treated as 1, regardless of the programmed value.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIW, bits [3:1]

TIndex width. The effective width of the TIndex field.

Bits of TINDEX_EL0.TIndex above the configured width are treated as zero.

The values 0 through 7 are valid.

The value 0 means that TIndex is treated as 0.

This field is permitted to be cached in a TLB.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POE2, bit [0]

Enable POE2 checks for the Exception level EL0.

POE2	Meaning
0b0	POE2 checks are disabled. The instructions TCHANGEF and TCHANGEB are UNDEFINED.
0b1	POE2 checks are enabled.

If the Effective value of TCR2_EL1.POE2F is 0, the Effective value of this field is 0.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRTBRU_EL2, Instruction Region Table Base Register, Unprivileged (EL2)

The IRTBRU_EL2 characteristics are:

Purpose

Configuration of the base address for the region of memory that contains the IRT for execution at EL0 when the Effective value of HCR_EL2.{E2H, TGE} == {1, 1}.

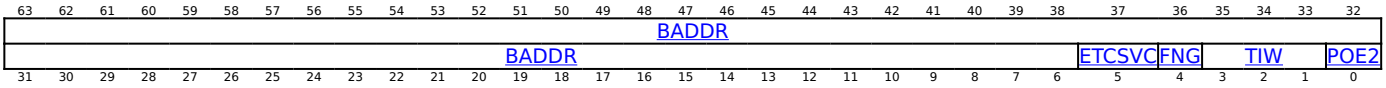
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to IRTBRU_EL2 are UNDEFINED.

Attributes

IRTBRU_EL2 is a 64-bit register.

Field descriptions



BADDR, bits [63:6]

Base address of Instruction Region Table.

Bits [63:6] of the address are the value of this field.

Bits [5:0] of the address are zero.

The least significant bits of this field are RES0, so that the base address of the table is aligned to the size of the table. If the table is smaller than 64B, then the address is aligned to 64B.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ETCSVC, bit [5]

Exclude TIndex from the hardware-defined context for CSV2.

ETCSVC	Meaning
0b0	TIndex is included in the FEAT_CSV2 hardware-defined context.
0b1	TIndex is not included in the FEAT_CSV2 hardware-defined context.

This field applies to execution at EL0 when the Effective value of HCR_EL2.{E2H, TGE} == {1, 1}.

An implementation is permitted to treat this bit as 0, regardless of the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FNG, bit [4]

Force non-global.

FNG	Meaning
0b0	No effect on the interpretation of the IRT nG bit.
0b1	For IRT entries reached via this register, the nG bit is treated as 1, regardless of the programmed value.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIW, bits [3:1]

TIndex width. The effective width of the TIndex field.

Bits of TINDEX_EL0.TIndex above the configured width are treated as zero.

The values 0 through 7 are valid.

The value 0 means that TIndex is treated as 0.

This field is permitted to be cached in a TLB.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POE2, bit [0]

Enable POE2 checks for the Exception level EL0 when the Effective value of HCR_EL2.{E2H, TGE} == {1, 1}.

POE2	Meaning
0b0	POE2 checks are disabled. The instructions TCHANGEF and TCHANGEB are UNDEFINED.
0b1	POE2 checks are enabled.

If the Effective value of TCR2_EL2.POE2F is 0, the Effective value of this field is 0.

This field is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ISR_EL1, Interrupt Status Register

The ISR_EL1 characteristics are:

Purpose

Shows the pending status of IRQ and FIQ interrupts and SError exceptions.

When FEAT_NMI is implemented, also shows whether a pending IRQ or FIQ interrupt has Superpriority.

Configuration

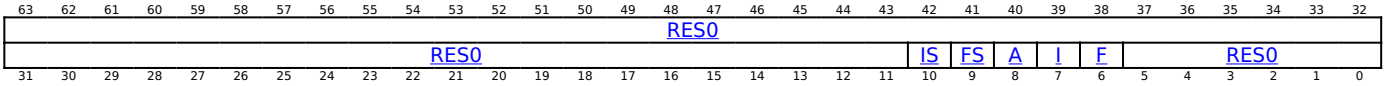
AArch64 System register ISR_EL1 bits [31:0] are architecturally mapped to AArch32 System register ISR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to ISR_EL1 are UNDEFINED.

Attributes

ISR_EL1 is a 64-bit register.

Field descriptions



Bits [63:11]

Reserved, RES0.

IS, bit [10]
When FEAT_NMI is implemented:

IRQ with Superpriority pending bit. Indicates whether an IRQ interrupt with Superpriority is pending.

IS	Meaning
0b0	No pending IRQ with Superpriority.
0b1	An IRQ interrupt with Superpriority is pending.

If all of the following apply, then this field shows the pending status of virtual IRQ interrupts with Superpriority:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.IMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical IRQ interrupts with Superpriority.

Otherwise:

Reserved, RES0.

FS, bit [9]
When FEAT_NMI is implemented:

FIQ with Superpriority pending bit. Indicates whether an FIQ interrupt with Superpriority is pending.

FS	Meaning
0b0	No pending FIQ with Superpriority.
0b1	An FIQ interrupt with Superpriority is pending.

If all of the following apply, then this field shows the pending status of virtual FIQ interrupts with Superpriority:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.FMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical FIQ interrupts with Superpriority.

Otherwise:

Reserved, RES0.

A, bit [8]

SError exception pending bit. Indicates whether an SError exception is pending.

A	Meaning
0b0	No pending SError.
0b1	An SError exception is pending.

If all of the following apply, then this field shows the pending status of virtual SError exceptions:

- EL2 is implemented and enabled in the current Security state.
- Any of the following apply:
  - HCR_EL2.AMO is 1.
  - FEAT_DoubleFault2 is implemented and the Effective value of HCRX_EL2.TMEA is 1.
- The PE is executing at EL1.

Otherwise, if all of the following apply, then this field shows the pending status of delegated SError exceptions:

- FEAT_E3DSE is implemented.
- SCR_EL3.EnDSE is 1.
- The PE is executing at EL2 or EL1.

Otherwise, this field shows the pending status of physical SError exceptions.

If the physical SError exception is edge-triggered, this field is cleared to zero when the physical SError exception is taken.

I, bit [7]

IRQ pending bit. Indicates whether an IRQ interrupt is pending.

I	Meaning
0b0	No pending IRQ.
0b1	An IRQ interrupt is pending.

If all of the following apply, then this field shows the pending status of virtual IRQ interrupts:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.IMO is 1.
- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical IRQ interrupts.

Note

This bit indicates the presence of a pending IRQ interrupt regardless of whether the interrupt has Superpriority.

F, bit [6]

FIQ pending bit. Indicates whether an FIQ interrupt is pending.

F	Meaning
0b0	No pending FIQ.
0b1	An FIQ interrupt is pending.

If all of the following apply, then this field shows the pending status of virtual FIQ interrupts:

- EL2 is implemented and enabled in the current Security state.
- HCR_EL2.FMO is 1.

- The PE is executing at EL1.

Otherwise, this field shows the pending status of physical FIQ interrupts.

Note

This bit indicates the presence of a pending FIQ interrupt regardless of whether the interrupt has Superpriority.

Bits [5:0]

Reserved, RES0.

Accessing ISR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, ISR_EL1

op0	op1	CRn	CRm	op2

LDSTT_EL1, Load and Store Unprivileged Context register (EL1)

The LDSTT_EL1 characteristics are:

Purpose

Holds the POE2 context information for EL1 execution of unprivileged memory access instructions.

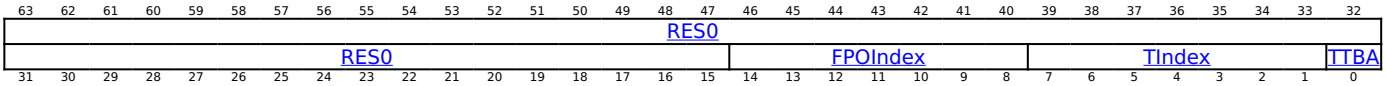
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LDSTT_EL1 are UNDEFINED.

Attributes

LDSTT_EL1 is a 64-bit register.

Field descriptions



Bits [63:15]

Reserved, RES0.

FPOIndex, bits [14:8]

Value of FPOIndex to be used for unprivileged accesses generated by unprivileged memory access instructions.

Bits of this field above the configured POIndex size in TCR2_EL1.POIW are RES0.

If IRTBRU_EL1.POE2 is 0, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIndex, bits [7:1]

Value of TIndex to be used for unprivileged accesses generated by unprivileged memory access instructions.

Bits of this field above the configured TIndex size in IRTBRU_EL1.TIW are RES0.

If IRTBRU_EL1.POE2 is 0, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTBA, bit [0]

Selects which ASID to use for IRT PLB lookups for checking unprivileged accesses generated by unprivileged memory access instructions, if TCR2_EL1.A2 is 1.

TTBA	Meaning
0b0	TTBR0_EL1.ASID is used.
0b1	TTBR1_EL1.ASID is used.

If TCR2_EL1.A2 is 0, this field is RES0 and has no effect on the selection of ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LDSTT_EL2, Load and Store Unprivileged Context register (EL2)

The LDSTT_EL2 characteristics are:

Purpose

Holds the POE2 context information for EL2 execution of unprivileged memory access instructions.

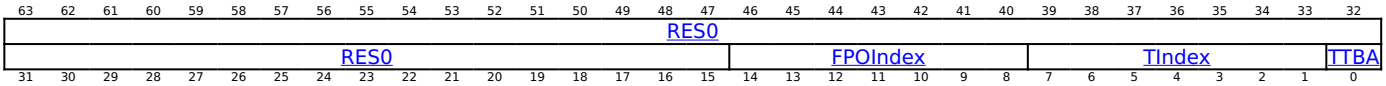
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LDSTT_EL2 are UNDEFINED.

Attributes

LDSTT_EL2 is a 64-bit register.

Field descriptions



Bits [63:15]

Reserved, RES0.

FPOIndex, bits [14:8]

Value of FPOIndex to be used for unprivileged accesses generated by unprivileged memory access instructions.

Bits of this field above the configured POIndex size in TCR2_EL2.POIW are RES0.

If IRTBRU_EL2.POE2 is 0, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIndex, bits [7:1]

Value of TIndex to be used for unprivileged accesses generated by unprivileged memory access instructions.

Bits of this field above the configured TIndex size in IRTBRU_EL2.TIW are RES0.

If IRTBRU_EL2.POE2 is 0, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTBA, bit [0]

Selects which ASID to use for IRT PLB lookups for checking unprivileged accesses generated by unprivileged memory access instructions, if TCR2_EL2.A2 is 1.

TTBA	Meaning
0b0	TTBR0_EL2.ASID is used.
0b1	TTBR1_EL2.ASID is used.

If TCR2_EL2.A2 is 0, this field is RES0 and has no effect on the selection of ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing LDSTT_EL2

```

LORC_EL1, LORegion Control (EL1)

The LORC_EL1 characteristics are:

Purpose

Enables and disables LORegions, and selects the current LORegion descriptor.

Configuration

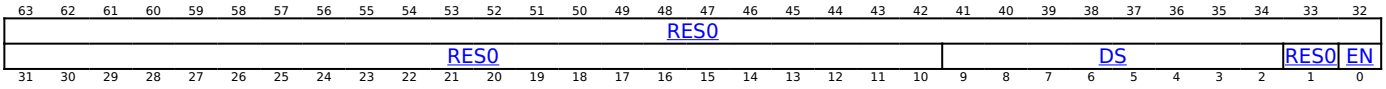
This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORC_EL1 are UNDEFINED.

If no LORegion descriptors are supported by the PE, then this register is RES0.

Attributes

LORC_EL1 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

DS, bits [9:2]

Descriptor Select. Selects the current LORegion descriptor accessed by LORSA_EL1, LOREA_EL1, and LORN_EL1.

If this field points to an LORegion descriptor that is not supported by an implementation, then the registers LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

The number of LORegion descriptors in IMPLEMENTATION DEFINED. The maximum number of LORegion descriptors supported is 256. If the number is less than 256, then bits[63:M+2] are RES0, where M is Log_2(Number of LORegion descriptors supported by the implementation).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [1]

Reserved, RES0.

EN, bit [0]

Enable. Indicates whether LORegions are enabled.

EN	Meaning
0b0	Disabled. Memory accesses do not match any LORegions.
0b1	Enabled. Memory accesses may match a LORegion.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing LORC_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORC_EL1

LOREA_EL1, LORegion End Address (EL1)

The LOREA_EL1 characteristics are:

Purpose

Holds the physical address of the end of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Configuration

This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LOREA_EL1 are UNDEFINED.

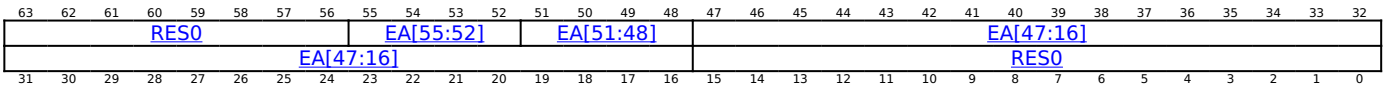
This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LOREA_EL1 is a 64-bit register.

Field descriptions



Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:56]

Reserved, RES0.

EA[55:52], bits [55:52]
When FEAT_D128 is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[51:48], bits [51:48]
When FEAT_LPA is implemented:

Extension to EA[47:16]. For more information, see EA[47:16].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EA[47:16], bits [47:16]

Bits [47:16] of the end physical address of an LORegion described in the current LORegion descriptor selected by LORC_EL1.DS. Bits[15:0] of this address are 0xFFFF. For implementations with fewer than 48 bits, the upper bits of this field are RES0.

When FEAT_LPA is implemented and 52-bit addresses are in use, EA[51:48] form bits [51:48] of the end physical address of the LORegion. Otherwise, when 52-bit addresses are not in use, EA[51:48] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

LORID_EL1, LORegionID (EL1)

The LORID_EL1 characteristics are:

Purpose

Indicates the number of LORegions and LORegion descriptors supported by the PE.

Configuration

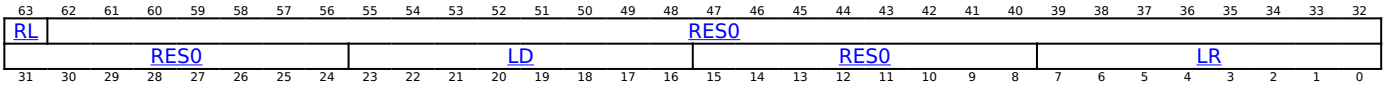
This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORID_EL1 are UNDEFINED.

If no LORegion descriptors are implemented, then the registers LORC_EL1, LORN_EL1, LOREA_EL1, and LORSA_EL1 are RES0.

Attributes

LORID_EL1 is a 64-bit register.

Field descriptions



RL, bit [63]

Indicates support for matching Realm PA space addresses to LORegions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RL	Meaning
0b0	LORegions do not match Realm PA space addresses.
0b1	LORegions can be configured to match Realm and Non-secure PA space addresses.

All other values are reserved.

FEAT_LORRL implements the functionality identified by the value 0b1.

Access to this field is RO.

Bits [62:24]

Reserved, RES0.

LD, bits [23:16]

Number of LORegion descriptors supported by the PE. This is an 8-bit binary number.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LD	Meaning
0x00..0xFF	The number of LORegions descriptors supported.

Access to this field is RO.

Bits [15:8]

Reserved, RES0.

LR, bits [7:0]

Number of LORegions supported by the PE. This is an 8-bit binary number.

Note

If LORID_EL1 indicates that no LORegions are implemented, then LoadLOAcquire and StoreLORelease will behave as LoadAcquire and StoreRelease.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LR	Meaning
0x00..0xFF	The number of LORegions supported.

Access to this field is RO.

Accessing LORID_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORID_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1010	0b0100	0b111

```

2025-12-10 16:11:30, 2025-12_rel

LORN_EL1, LORegion Number (EL1)

The LORN_EL1 characteristics are:

Purpose

Holds the number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Configuration

This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORN_EL1 are UNDEFINED.

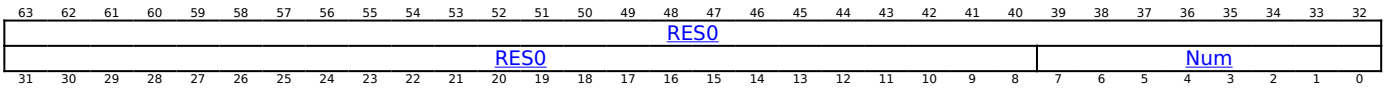
This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LORN_EL1 is a 64-bit register.

Field descriptions



Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:8]

Reserved, RES0.

Num, bits [7:0]

Number of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

The maximum number of LORegions supported by the PE is 256. If the maximum number is less than 256, then bits[8:N] are RES0, where N is (Log_2(Number of LORegions supported by the PE)).

If this field points to a LORegion that is not supported by the PE, then the current LORegion descriptor does not match any LORegion.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing LORN_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, LORN_EL1

LORSA_EL1, LORegion Start Address (EL1)

The LORSA_EL1 characteristics are:

Purpose

Indicates whether the current LORegion descriptor selected by LORC_EL1.DS is enabled, and holds the physical address of the start of the LORegion.

Configuration

This register is present only when FEAT_LOR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to LORSA_EL1 are UNDEFINED.

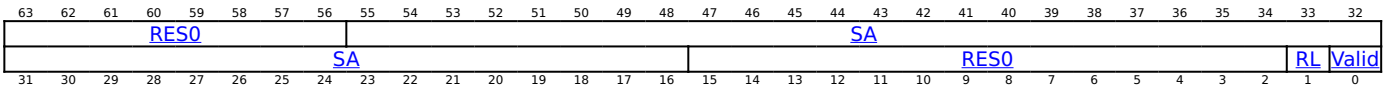
This register is RES0 if any of the following apply:

- No LORegion descriptors are supported by the PE.
- LORC_EL1.DS points to a LORegion that is not supported by the PE.

Attributes

LORSA_EL1 is a 64-bit register.

Field descriptions



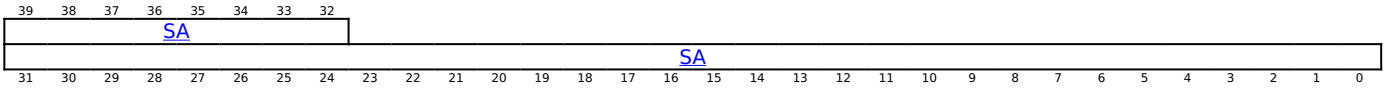
Any of the fields in this register are permitted to be cached in a TLB.

Bits [63:56]

Reserved, RES0.

SA, bits [55:16]

SA encoding when FEAT_D128 is implemented



SA, bits [39:0]

Bits [55:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

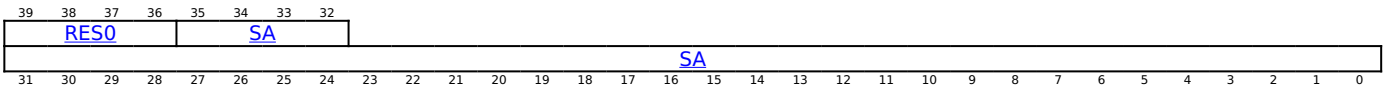
Bits[15:0] of this address are 0x0000.

For implementations with fewer than 56 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is implemented and FEAT_D128 is not implemented



Bits [39:36]

Reserved, RES0.

SA, bits [35:0]

Bits [51:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

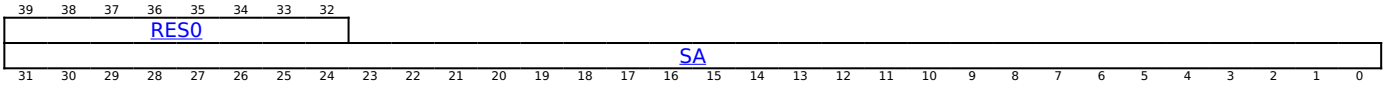
Bits[15:0] of this address are 0x0000.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SA encoding when FEAT_LPA is not implemented



Bits [39:32]

Reserved, RES0.

SA, bits [31:0]

Bits [47:16] of the start physical address of the LORegion described in the current LORegion descriptor selected by LORC_EL1.DS.

Bits[15:0] of this address are 0x0000.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:2]

Reserved, RES0.

RL, bit [1]
When FEAT_LORRL is implemented:

Configures the PA space that can match the LORegion.

RL	Meaning
0b0	Only Non-secure PA space addresses can match this region.
0b1	Non-secure and Realm PA space addresses can match this region.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Valid, bit [0]

Indicates whether the current LORegion descriptor is enabled.

Valid	Meaning
0b0	LORegion descriptor is disabled.
0b1	LORegion descriptor is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing LORSA_EL1

Accesses to this register use the following encodings in the System register encoding space:

MAIR2_EL1, Extended Memory Attribute Indirection Register (EL1)

The MAIR2_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

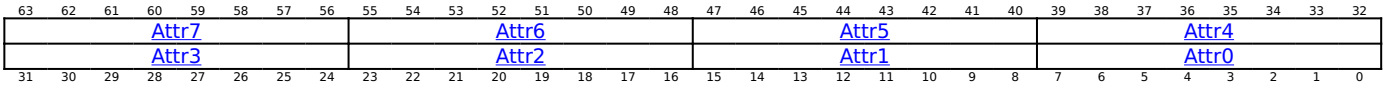
Configuration

This register is present only when FEAT_AIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR2_EL1 are UNDEFINED.

Attributes

MAIR2_EL1 is a 64-bit register.

Field descriptions



Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_EL1.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MAIR2_EL1 or MAIR2_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MAIR2_EL2, Extended Memory Attribute Indirection Register (EL2)

The MAIR2_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

Configuration

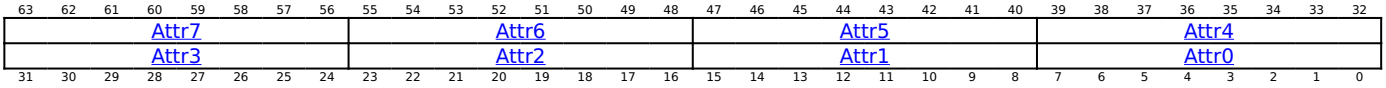
This register is present only when FEAT_AIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR2_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

MAIR2_EL2 is a 64-bit register.

Field descriptions



Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_EL2.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL2

MAIR2_EL3, Extended Memory Attribute Indirection Register (EL3)

The MAIR2_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a VMSAv8-64 or VMSAv9-128 translation table entry for stage 1 translations at EL1.

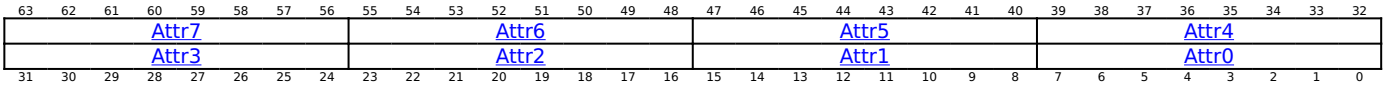
Configuration

This register is present only when FEAT_AIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR2_EL3 are UNDEFINED.

Attributes

MAIR2_EL3 is a 64-bit register.

Field descriptions



Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 1, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a VMSAv8-64 or VMSAv9-128 translation table entry is 0, see MAIR_EL3.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR2_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MAIR2_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0001	0b001

    elsif IsFeatureImplemented(FEAT_S1POE2) && FGDTState.nTT == '1' then
        AArch64_FGDTSystemAccessTrap(EL3, 0x18);
    else
        MAIR2_EL3() = X{64}(t);
    end;
end;
```

2025-12-10 16:11:30, 2025-12_rel

MAIR_EL1, Memory Attribute Indirection Register (EL1)

The MAIR_EL1 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL1.

Configuration

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PRRR[31:0] when TTBCR.EAE == '0'.

AArch64 System register MAIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when TTBCR.EAE == '1'.

AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register NMRR[31:0] when TTBCR.EAE == '0'.

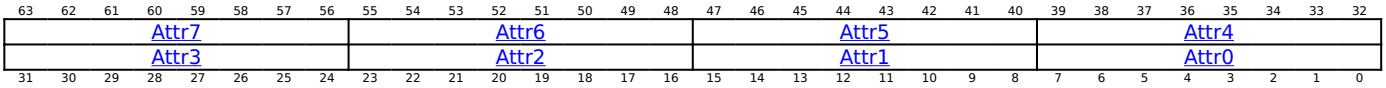
AArch64 System register MAIR_EL1 bits [63:32] are architecturally mapped to AArch32 System register MAIR1[31:0] when TTBCR.EAE == '1'.

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR_EL1 are UNDEFINED.

Attributes

MAIR_EL1 is a 64-bit register.

Field descriptions



MAIR_EL1 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 0, or when FEAT_AIE is not implemented, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 1, see MAIR2_EL1.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MAIR_EL1 or MAIR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MAIR_EL2, Memory Attribute Indirection Register (EL2)

The MAIR_EL2 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL2.

Configuration

AArch64 System register MAIR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HMAIR0[31:0].

AArch64 System register MAIR_EL2 bits [63:32] are architecturally mapped to AArch32 System register HMAIR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR_EL2 are UNDEFINED.

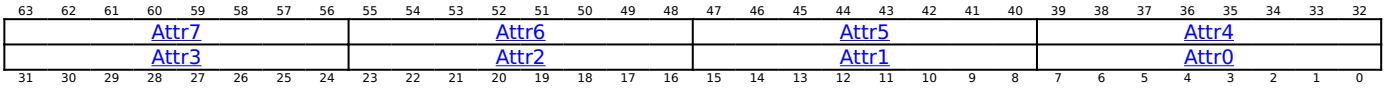
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MAIR_EL2 is a 64-bit register.

Field descriptions



MAIR_EL2 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 0, or when FEAT_AIE is not implemented, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 1, see MAIR2_EL2.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MAIR_EL2 or MAIR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MAIR_EL3, Memory Attribute Indirection Register (EL3)

The MAIR_EL3 characteristics are:

Purpose

Provides the memory attribute encodings corresponding to the possible AttrIndx values in a Long-descriptor format translation table entry for stage 1 translations at EL3.

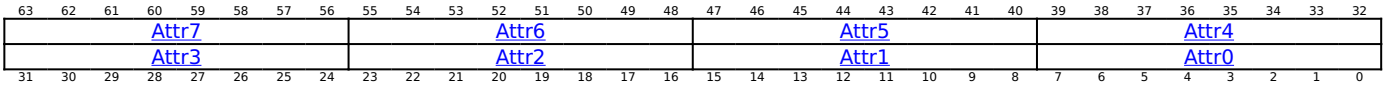
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MAIR_EL3 are UNDEFINED.

Attributes

MAIR_EL3 is a 64-bit register.

Field descriptions



MAIR_EL3 is permitted to be cached in a TLB.

Attr<n>, bits [8n+7:8n], for n = 7 to 0

Memory Attribute encoding.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 0, or when FEAT_AIE is not implemented, AttrIndx[2:0] gives the value of <n> in Attr<n>.

When FEAT_AIE is implemented and stage 1 Attributes Index Extension is enabled and AttrIndx[3] in a Long descriptor format translation table entry is 1, see MAIR2_EL3.Attr

Attr is encoded as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MAIR_EL3

MDCCINT_EL1, Monitor DCC Interrupt Enable Register

The MDCCINT_EL1 characteristics are:

Purpose

Enables interrupt requests to be signaled based on the DCC status flags.

Configuration

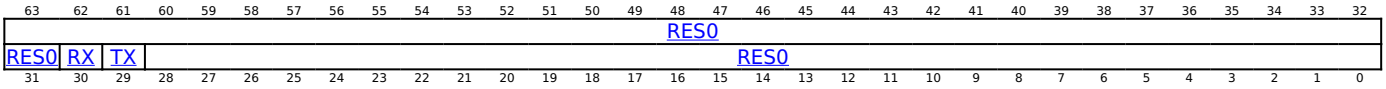
AArch64 System register MDCCINT_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDCCINT[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDCCINT_EL1 are UNDEFINED.

Attributes

MDCCINT_EL1 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

RX, bit [30]

DCC interrupt request enable control for DTRRX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

RX	Meaning
0b0	No interrupt request generated by DTRRX.
0b1	Interrupt request will be generated on RXfull == 1.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TX, bit [29]

DCC interrupt request enable control for DTRTX. Enables a common COMMIRQ interrupt request to be signaled based on the DCC status flags.

TX	Meaning
0b0	No interrupt request generated by DTRTX.
0b1	Interrupt request will be generated on TXfull == 0.

If legacy COMMRX and COMMTX signals are implemented, then these are not affected by the value of this bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [28:0]

Reserved, RES0.

Accessing MDCCINT_EL1

MDCCSR_EL0, Monitor DCC Status Register

The MDCCSR_EL0 characteristics are:

Purpose

Read-only register containing control status flags for the DCC.

Configuration

AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to External register EDSCR[30:29].

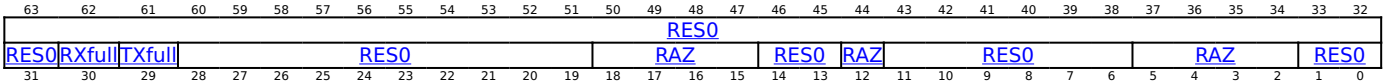
AArch64 System register MDCCSR_EL0 bits [30:29] are architecturally mapped to AArch32 System register DBGDSCRint[30:29].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDCCSR_EL0 are UNDEFINED.

Attributes

MDCCSR_EL0 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

RXfull, bit [30]

DTRRX full. Read-only view of the equivalent bit in the EDSCR.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

TXfull, bit [29]

DTRTX full. Read-only view of the equivalent bit in the EDSCR.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Bits [28:19]

Reserved, RES0.

Bits [18:15]

Reserved, RAZ.

Bits [14:13]

Reserved, RES0.

Bit [12]

Reserved, RAZ.

Bits [11:6]

MDCR_EL2, Monitor Debug Configuration Register (EL2)

The MDCR_EL2 characteristics are:

Purpose

Provides EL2 configuration options for self-hosted debug and the Performance Monitors Extension.

Configuration

AArch64 System register MDCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HDCR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDCR_EL2 are UNDEFINED.

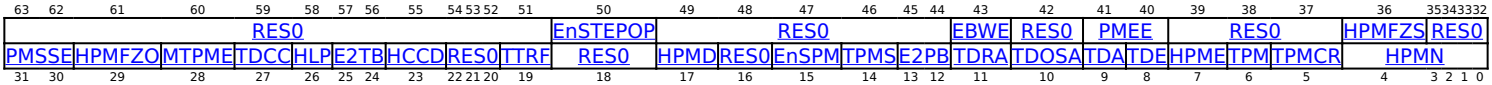
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MDCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:51]

Reserved, RES0.

EnSTEPOP, bit [50]
When FEAT_STEP2 is implemented:

EnSTEPOP	Meaning
0b0	Execution from MDSTEPOP_EL1 is disabled.
0b1	Execution from MDSTEPOP_EL1 is not disabled by this control.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b1, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [49:44]

Reserved, RES0.

EBWE, bit [43]
When FEAT_Debugv8p9 is implemented:

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EBWE	Meaning
0b0	The Effective value of MDSCR_EL1.EMBWE is 0. The Effective value of MDSELR_EL1.BANK is zero at EL2.
0b1	The Effective values of MDSCR_EL1.EMBWE and MDSELR_EL1.BANK are not affected by this field.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 1, other than for a direct read of the register.

This field is ignored by the PE and treated as 0 when EL3 is implemented and MDCR_EL3.EBWE is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

PMEE, bits [41:40]
When FEAT_EBEP is implemented:

Performance Monitors Exception Enable. Controls the generation of the PMUIRQ signal and the PMU Profiling exception at EL0, EL1, and EL2.

PMEE	Meaning
0b00	The PMUIRQ signal is asserted on a PMU overflow, and the PMU Profiling exception is disabled.
0b01	The PMUIRQ signal and the PMU Profiling exception are both controlled by PMECR_EL1.PMEE.
0b11	The PMUIRQ signal is deasserted, and the PMU Profiling exception is enabled.

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

This field is ignored by the PE when all of the following are true:

- EL3 is implemented.
- MDCR_EL3.PMEE != 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:37]

Reserved, RES0.

HPMFZS, bit [36]
When FEAT_SPEv1p2 is implemented:

Hyp Performance Monitors Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ,E} is {1,1} and profiling is stopped.

HPMFZS	Meaning
0b0	Do not freeze on a Statistical Profiling Buffer Management event.
0b1	Affected counters do not count following a Statistical Profiling Buffer Management event.

The pseudocode function SPEProfilingStopped describes when profiling is stopped.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

If MDCR_EL2.HPMN is equal to GetNumEventCountersSelfHosted(), then this field has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

PMSSE, bits [31:30]
When FEAT_PMUv3_SS is implemented:

Performance Monitors Snapshot Enable. Controls the generation of Capture events.

PMSSE	Meaning
0b00	Capture events are disabled.
0b01	Capture events are controlled by PMECR_EL1.SSE.
0b10	Capture events are enabled and prohibited.
0b11	Capture events are enabled and allowed.

If EL2 is not implemented, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Cold reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMFZO, bit [29]
When FEAT_PMUv3p7 is implemented:

Hyp Performance Monitors Freeze-on-overflow. Stop event counters on overflow.

HPMFZO	Meaning
0b0	Do not freeze on overflow.
0b1	Affected counters do not count when all of the following are true for any event counter PMEVCNTR<m>_EL0 in the second range: • PMOVSCLR_EL0[m] is 1. • Either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

If MDCR_EL2.HPMN is equal to GetNumEventCountersSelfHosted(), then this field has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented and EL3 is not implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is 0.
0b1	PMEVTYPER<n>_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Otherwise:

Reserved, RES0.

TDCC, bit [27]
When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL1 and EL0 to EL2.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	If EL2 is implemented and enabled in the current Security state, accesses to the DCC registers at EL1 and EL0 generate a Trap exception to EL2, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL2.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HLP, bit [26]
When FEAT_PMUv3p5 is implemented:

Hypervisor Long Event Counter Enable. Determines which event counter bit generates an overflow recorded by PMOVSR[n].

HLP	Meaning
0b0	Affected counters overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Affected counters overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

The following are not affected by this field:

- Other event counters.
- PMCCNTR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0.

If MDCR_EL2.HPMN is equal to GetNumEventCountersSelfHosted(), then this field has no effect.

For more information see the description of MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2TB, bits [25:24]
When FEAT_TRBE is implemented:

EL2 Trace Buffer.

If EL2 is implemented and enabled in the trace buffer owning Security state, then this field controls the trace buffer owning translation regime.

If EL2 is implemented and enabled in the current Security state, then this field controls access to trace buffer System registers from EL1.

E2TB	Meaning
0b00	If EL2 is implemented and enabled in the trace buffer owning Security state, then the trace buffer owning Exception level is EL2. Otherwise, the trace buffer owning Exception level is EL1 and, if TraceBufferEnabled() == TRUE, tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to trace buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b10	Trace buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, then tracing is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to trace buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b11	Trace buffer owning Exception level is EL1. If TraceBufferEnabled() == TRUE, then tracing is prohibited at EL2. Accesses to trace buffer System registers at EL1 are not trapped by this mechanism.

All other values are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.
- If FEAT_TRBE_MPAM is implemented, MRS and MSR accesses to TRBMPAM_EL1.
- If FEAT_TRBE_EXC is implemented, MRS and MSR accesses to TRBSR_EL2 and TRBSR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL2, reported using EC syndrome value 0x18.

When TraceBufferEnabled()==FALSE, this field has no effect on whether tracing is prohibited.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL2.
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.

Otherwise:

Reserved, RES0.

HCCD, bit [23]
When FEAT_PMUv3p5 is implemented:

Hypervisor Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting at EL2.

HCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL2.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [22:20]

Reserved, RES0.

TTRF, bit [19]
When FEAT_TRF is implemented:

Traps use of the Trace Filter Control registers at EL1 to EL2, as follows:

- Access to TRFCR_EL1 is trapped to EL2, reported using EC syndrome value 0x18.
- Access to TRFCR is trapped to EL2, reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to the specified registers at EL1 are not affected by this control.
0b1	Accesses to the specified registers at EL1 generate a trap exception to EL2 when EL2 is enabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

HPMD, bit [17]
When FEAT_PMUv3p1 is implemented and FEAT_Debugv8p2 is implemented:

Guest Performance Monitors Disable. Controls PMU operation at EL2.

HPMD	Meaning
0b0	Counters are not affected by this mechanism.
0b1	Affected counters are prohibited from counting at EL2. If PMCR_EL0.DP is 1, then PMCCNTR_EL0 is disabled at EL2. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

The counters affected by this field are:

- Event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3p1 is implemented:

Guest Performance Monitors Disable. Controls PMU operation at EL2 when ExternalSecureNoninvasiveDebugEnabled() is FALSE.

HPMD	Meaning
0b0	Counters are not affected by this mechanism.
0b1	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, then all the following apply: • Affected event counters are prohibited from counting at EL2. • If PMCR_EL0.DP is 1, then PMCCNTR_EL0 is disabled at EL2. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, then the event counters and PMCCNTR_EL0 are not affected by this field.

Otherwise, the counters affected by this field are:

- Event counters in the first range.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

Other event counters are not affected by this field. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

EnSPM, bit [15]
When FEAT_SPMU is implemented:

Enable access to System PMU registers. When disabled, accesses to System PMU registers generate a trap to EL2.

EnSPM	Meaning
0b0	Accesses of the specified System PMU registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified System PMU registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to SPMACCESSR_EL1, SPMCFGR_EL1, SPMCGCR<n>_EL1, SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMDEVAFF_EL1, SPMDEVARCH_EL1, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMIIDR_EL1, SPMINTENCLR_EL1, SPMINTENSET_EL1, SPMOVSCLR_EL0, SPMOVSSET_EL0, SPMSCR_EL1, and SPMSELR_EL0.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMS, bit [14]
When FEAT_SPE is implemented:

Trap Performance Monitor Sampling. Enables a trap to EL2 on accesses of SPE registers.

TPMS	Meaning
0b0	Accesses of the specified SPE registers are not trapped by this mechanism.
0b1	Accesses of the specified SPE registers at EL1 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMSCR_EL1, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- MRS accesses to PMSIDR_EL1.
- If FEAT_SPE_FnE is implemented, MRS and MSR accesses to PMSNEVFR_EL1.
- If FEAT_SPE_FDS is implemented, MRS and MSR accesses to PMSDSFR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2PB, bits [13:12]
When FEAT_SPE is implemented:

EL2 Profiling Buffer.

If EL2 is implemented and enabled in the Profiling Buffer owning Security state, then this field controls the Profiling Buffer owning translation regime.

If EL2 is implemented and enabled in the current Security state, then this field controls access to Profiling Buffer System registers from EL1.

E2PB	Meaning
0b00	If EL2 is implemented and enabled in the Profiling Buffer owning Security state, then the Profiling Buffer owning Exception level is EL2. Otherwise, the Profiling Buffer owning Exception level is EL1 and, Profiling is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to Profiling Buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b10	Profiling Buffer owning Exception level is EL1. Profiling is prohibited at EL2. If EL2 is implemented and enabled in the current Security state, then accesses to Profiling Buffer System registers at EL1 are trapped to EL2, unless the access generates a higher priority exception.
0b11	Profiling Buffer owning Exception level is EL1. Profiling is prohibited at EL2. Accesses to Profiling Buffer System registers at EL1 are not trapped by this mechanism.

All other values are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMBLIMITR_EL1, PMBPTR_EL1, and PMBSR_EL1.
- If FEAT_SPE_nVM is implemented, MRS and MSR accesses to PMBMAR_EL1.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL2, reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL2.
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.

Otherwise:

Reserved, RES0.

TDRA, bit [11]

Trap Debug ROM Address register access. Traps System register accesses to the Debug ROM registers to EL2 when EL2 is enabled in the current Security state as follows:

- If EL1 is using AArch64, accesses to MDRAR_EL1 are trapped to EL2, reported using EC syndrome value 0x18.
- If EL0 or EL1 is using AArch32 state, MRC or MCR accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05 and MRRC or MCRR accesses are trapped to EL2, reported using EC syndrome value 0x0C:
  - DBGDRAR, DBGDSAR.

TDRA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 System register accesses to the Debug ROM registers are trapped to EL2 when EL2 is enabled in the current Security state, unless it is trapped by the following: • DBGDSCRext.UDCCdis. • MDSCR_EL1.TDCC.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- The Effective value of MDCR_EL2.TDE is 1.
- The Effective value of HCR_EL2.TGE is 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDOSA, bit [10]
When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGOSLSR, DBGOSLAR, DBGOSDLR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- The Effective value of MDCR_EL2.TDE is 1.
- The Effective value of HCR_EL2.TGE is 1.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL1 System register accesses to the powerdown debug registers to EL2, from both Execution states as follows:

- In AArch64 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x18:
  - OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.
- In AArch32 state, accesses to the following registers are trapped to EL2, reported using EC syndrome value 0x05:
  - DBGOSLSR, DBGOSLAR, and DBGPRCR.
  - Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this bit.

It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 are trapped.

It is IMPLEMENTATION DEFINED whether accesses to DBGOSDLR are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL1 System register accesses to the powerdown debug registers are trapped to EL2 when EL2 is enabled in the current Security state.

Note

These registers are not accessible at EL0.

This field is treated as being 1 for all purposes other than a direct read when one or more of the following are true:

- The Effective value of MDCR_EL2.TDE is 1.
- The Effective value of HCR_EL2.TGE is 1.

Note

EL2 does not provide traps on debug register accesses through the optional memory-mapped external debug interfaces.

System register accesses to the debug registers might have side-effects. When a System register access is trapped to EL2, no side-effects occur before the exception is taken to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap accesses of debug System registers. Enables a trap to EL2 on accesses of debug System registers.

TDA	Meaning
0b0	Accesses of the specified debug System registers are not trapped by this mechanism.
0b1	Accesses of the specified debug System registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to DBGAUTHSTATUS_EL1, DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGCLAIMCLR_EL1, DBGCLAIMSET_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, MDCCINT_EL1, MDCCSR_EL0, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, and OSECCR_EL1.
- If FEAT_Debugv8p9 is implemented, MRS and MSR accesses to MDSELR_EL1.
- If FEAT_STEP2 is implemented, MRS and MSR accesses to MDSTEPOP_EL1.
- In Non-debug state, MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to DBGAUTHSTATUS, DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGCLAIMCLR, DBGCLAIMSET, DBGDCCINT, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGDIDR, DBGDSCRext, DBGDSCRint, DBGDTRRXext, DBGDTRTXext, DBGOSECCR, DBGVCR, DBGWCR<n>, DBGWFAR, and DBGWVR<n>.
- STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint.
- In Non-debug state, MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x05 for MRC and MCR accesses, and 0x06 for LDC and STC accesses.

The following instructions are not trapped in Debug state:

- AArch64 MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.
- AArch32 MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

If 16 or fewer breakpoints and 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI, then it is IMPLEMENTATION DEFINED whether AArch64 accesses to MDSELR_EL1 are trapped to EL2 when MDCR_EL2.TDA is 1.

This field is ignored by the PE and treated as one when any of the following are true:

- The Effective value of MDCR_EL2.TDE is 1.
- The Effective value of HCR_EL2.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDE, bit [8]

Trap Debug Exceptions. Controls routing of Debug exceptions, and defines the debug target Exception level, EL_D.

TDE	Meaning
0b0	The debug target Exception level is EL1.
0b1	If EL2 is enabled for the current Effective value of SCR_EL3.NS, the debug target Exception level is EL2, otherwise the debug target Exception level is EL1. The MDCR_EL2.{TDRA, TDOSA, TDA} fields are treated as being 1 for all purposes other than returning the result of a direct read of the register.

For more information, see 'Routing debug exceptions'.

This field is treated as being 1 for all purposes other than a direct read when the Effective value of HCR_EL2.TGE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPME, bit [7]
When FEAT_PMUv3 is implemented:

Hyp Enable.

HPME	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are the event counters in the second range. This applies even when EL2 is disabled in the current Security state.

The following counters are not affected by this field:

- Other event counters.
- PMCCNTR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0.

If MDCR_EL2.HPMN is equal to GetNumEventCountersSelfHosted(), then this field has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]
When FEAT_PMUv3 is implemented:

Trap accesses of PMU registers. Enables a trap to EL2 on accesses of PMU registers.

TPM	Meaning
0b0	Accesses of the specified PMU registers are not trapped by this mechanism.
0b1	Accesses of the specified PMU registers at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMSWINC_EL0, PMUSERENR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
- MRS accesses to PMCEID0_EL0 and PMCEID1_EL0.
- If FEAT_PMUv3p4 is implemented, MRS accesses to PMMIR_EL1.
- If FEAT_PMUv3p9 is implemented, MSR accesses to PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, MRS accesses to PMICFILTR_EL0 and PMICNTR_EL0.
- If FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented, MRS and MSR accesses to PMECR_EL1.
- If FEAT_SEBEP is implemented, MRS and MSR accesses to PMIAR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMINTENCLR, PMINTENSET, PMOVSR, PMOVSSET, PMSELR, PMSWINC, PMUSERENR, PMXEVCNTR, and PMXEVTYPER.
- MRC accesses to PMCEID0 and PMCEID1.
- MRRC and MCRR accesses to PMCCNTR.
- If FEAT_PMUv3p1 is implemented, MRC accesses to PMCEID2 and PMCEID3.
- If FEAT_PMUv3p4 is implemented, MRC accesses to PMMIR.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03 for MRC and MCR accesses, and 0x04 for MRRC and MCRR accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPMCR, bit [5]
When FEAT_PMUv3 is implemented:

Trap PMCR_EL0 or PMCR accesses. Traps EL0 and EL1 accesses to EL2, when EL2 is enabled in the current Security state, as follows:

- In AArch64 state, accesses to PMCR_EL0 are trapped to EL2, reported using EC syndrome value 0x18.
- In AArch32 state, accesses to PMCR are trapped to EL2, reported using EC syndrome value 0x03.

TPMCR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 and EL1 accesses to the specified registers are trapped to EL2 when EL2 is enabled in the current Security state, unless they are trapped by the following: • PMUSERENR.EN. • PMUSERENR_EL0.EN.

Note

EL2 does not provide traps on Performance Monitor register accesses through the optional memory-mapped external debug interface.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPMN, bits [4:0]
When FEAT_PMUv3 is implemented:

Defines the number of event counters PMEVCNTR<n>_EL0 and, if FEAT_PMUv3_SS is implemented, event counter snapshot registers PMEVCNTSVR<n>_EL1, that are accessible from EL1 and, if permitted, from EL0.

MDCR_EL2.HPMN divides the event counters accessible from self-hosted software into a first range and a second range.

When FEAT_PMUv3_EXTPMN is implemented, all of the following apply:

- PMCCR.EPMN divides the NUM_PMU_COUNTERS event counters implemented by the PE into the event counters that MDCR_EL2.HPMN divides into the first and second ranges, and a third range that is inaccessible from self-hosted software.
- If MDCR_EL2.HPMN is not 0 and is less than the Effective value of PMCCR.EPMN, then event counters [0..(MDCR_EL2.HPMN-1)] are in the first range, and the remaining event counters [MDCR_EL2.HPMN..(PMCCR.EPMN-1)] are in the second range.
- The pseudocode function GetNumEventCountersSelfHosted() returns the Effective value of PMCCR.EPMN.

When FEAT_PMUv3_EXTPMN is not implemented, all of the following apply:

- All of the NUM_PMU_COUNTERS event counters are accessible to self-hosted software and no counters are in the third range.
- If MDCR_EL2.HPMN is not 0 and is less than NUM_PMU_COUNTERS, then event counters [0..(MDCR_EL2.HPMN-1)] are in the first range, and the remaining event counters [MDCR_EL2.HPMN..(NUM_PMU_COUNTERS-1)] are in the second range.
- The pseudocode function GetNumEventCountersSelfHosted() returns NUM_PMU_COUNTERS.

If FEAT_HPMN0 is implemented and MDCR_EL2.HPMN is 0, then all of the following apply:

- No event counters are in the first range.
- If FEAT_PMUv3_EXTPMN is implemented, then event counters [0..(PMCCR.EPMN-1)] are in the second range.
- If FEAT_PMUv3_EXTPMN is not implemented, then all event counters are in the second range.

If MDCR_EL2.HPMN is equal to GetNumEventCountersSelfHosted(), or EL2 is not implemented, then all of the following apply:

- If FEAT_PMUv3_EXTPMN is implemented, then event counters [0..(PMCCR.EPMN-1)] are in the first range.
- If FEAT_PMUv3_EXTPMN is not implemented, then all event counters are in the first range.
- No event counters are in the second range.

All of the following apply for an event counter PMEVCNTR<n>_EL0 in the first range:

- The counter is accessible from EL1, EL2, and EL3.
- The counter is accessible from EL0 if permitted by PMUSERENR_EL0 and PMUACR_EL1, or by PMUSERENR.

- If FEAT_PMUv3p5 is implemented, then PMCR_EL0.LP or PMCR.LP determines whether the counter overflow flag PMOVSSET_EL0[n] is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- PMCR_EL0.E and PMCNTENSET_EL0[n] enable the operation of the event counter.

All of the following apply for an event counter PMEVCNTR<n>_EL0 in the second range:

- The counter is accessible from EL2 and EL3.
- If EL2 is disabled in the current Security state, then the event counter is accessible from EL1, and from EL0 if permitted by PMUSERENR_EL0 and PMUACR_EL1, or by PMUSERENR.
- If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP determines whether the counter overflow flag PMOVSSET_EL0[n] is set on unsigned overflow of PMEVCNTR<n>_EL0[31:0] or PMEVCNTR<n>_EL0[63:0].
- MDCR_EL2.HPME and PMCNTENSET_EL0[n] enable the operation of the event counter.

If FEAT_PMUv3_SS is implemented, then all of the following apply:

- For an event counter snapshot register PMEVCNTSVR<n>_EL1 in the first range, the register is accessible from EL1, EL2, and EL3.
- For an event counter snapshot register PMEVCNTSVR<n>_EL1 in the second range, the register is accessible from EL2 and EL3. If EL2 is disabled in the current Security state, the event counter is also accessible from EL1.

For information about counters in the third range, see the description of PMCCR.EPMN.

Values greater than GetNumEventCountersSelfHosted() are reserved. If FEAT_HPMN0 is not implemented, then the value 0 is reserved.

When FEAT_PMUv3_EXTPMN is not implemented and this field is set to a reserved value, the following CONSTRAINED UNPREDICTABLE behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is UNKNOWN.
- The number of event counters in each of the first and second ranges is UNKNOWN. That is, either:
  - The PE behaves as if MDCR_EL2.HPMN is set to an UNKNOWN nonzero value less than or equal to NUM_PMU_COUNTERS.
  - All counters are in the second range and none are in the first range.

When FEAT_PMUv3_EXTPMN is implemented and this field is set to a reserved value, the following behaviors apply:

- The value returned by a direct read of MDCR_EL2.HPMN is the Effective value of PMCCR.EPMN.
- No event counters are in the second range.
- The value returned by an indirect read of MDCR_EL2.HPMN as a result of direct reads of PMCR_EL0.N or PMCR.N is the Effective value of PMCCR.EPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `NUM_PMU_COUNTERS`.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0001	0b001

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then

        end;
    else
        MDCR_EL2() = X{64}(t);
    end;
elsif PSTATE.EL == EL3 then
    MDCR_EL2() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

MDCR_EL3, Monitor Debug Configuration Register (EL3)

The MDCR_EL3 characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug and the Performance Monitors Extension.

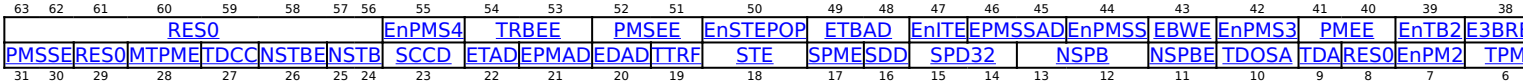
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MDCR_EL3 are UNDEFINED.

Attributes

MDCR_EL3 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

EnPMS4, bit [55]
When FEAT_SPE_nVM is implemented:

Enable access to SPE registers. When disabled, accesses to SPE registers generate a trap to EL3.

EnPMS4	Meaning
0b0	Accesses of the specified SPE registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified SPE registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to PMBMAR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRBEE, bits [54:53]
When FEAT_TRBE_EXC is implemented:

Trace buffer management event Exception Enable.

TRBEE	Meaning
0b00	Disabled. TRBE Profiling exceptions for all Exception levels are disabled. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL3. • TRBE Profiling exceptions are not generated. • TRBSR_EL1.IRQ drives the interrupt request signal TRBIRQ. • Accesses to TRBSR_EL2 at EL2 are trapped to EL3. • Accesses to TRBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to TRBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. TRBE Profiling exceptions for EL3 are disabled, but might be enabled for EL2 or EL1 by TRFCR_EL2.EE or TRFCR_EL1.EE. All of the following apply: • No trace buffer management events are recorded in TRBSR_EL3. • TRBSR_EL3.IRQ is ignored and TRBE Profiling exceptions are not taken to EL3.
0b10	Enabled. TRBE Profiling exceptions for EL3 are enabled for trace buffer management events targeting EL3, as follows: • Trace buffer management events due to a fault on a write to the trace buffer that would generate a Data Abort exception taken to EL3 if generated by a store instruction executed at the owning Exception level are recorded in TRBSR_EL3. That is, any of the following faults: ◦ Granule Protection Check faults other than Granule Protection Faults (GPFs). ◦ If SCR_EL3.GPF is 1, GPFs. ◦ If SCR_EL3.EA is 1, External aborts. • TRBE Profiling exceptions are generated and taken to EL3 when unmasked and TRBSR_EL3.IRQ is 1.
0b11	Trap all. TRBE Profiling exceptions for EL3 are enabled for all trace buffer management events, as follows: • All trace buffer management events are recorded in TRBSR_EL3. • TRBE Profiling exceptions are generated and taken to EL3 when unmasked and TRBSR_EL3.IRQ is 1.

If EL3 is not implemented, then the Effective value of MDCR_EL3.TRBEE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSEE, bits [52:51]
When FEAT_SPE_EXC is implemented:

Profiling Buffer management event Exception Enable.

PMSEE	Meaning
0b00	Disabled. SPE Profiling exceptions for all Exception levels are disabled. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL3. • SPE Profiling exceptions are not generated. • PMBSR_EL1.S drives the interrupt request signal PMBIRQ. • Accesses to PMBSR_EL2 at EL2 are trapped to EL3. • Accesses to PMBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to PMBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. SPE Profiling exceptions for EL3 are disabled, but might be enabled for EL2 or EL1 by PMSCR_EL2.EE or PMSCR_EL1.EE. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL3. • PMBSR_EL3.S is ignored and SPE Profiling exceptions are not taken to EL3.
0b10	Enabled. SPE Profiling exceptions for EL3 are enabled for Profiling Buffer management events targeting EL3, as follows: • Profiling Buffer management events due to a fault on a write to the Profiling Buffer that would generate a Data Abort exception taken to EL3 if generated by a store instruction executed at the owning Exception level are recorded in PMBSR_EL3. That is, any of the following faults: ◦ Granule Protection Check faults other than Granule Protection Faults (GPFs). ◦ If SCR_EL3.GPF is 1, GPFs. ◦ If SCR_EL3.EA is 1, External aborts. • SPE Profiling exceptions are generated and taken to EL3 when unmasked and PMBSR_EL3.S is 1.
0b11	Trap all. SPE Profiling exceptions for EL3 are enabled for all Profiling Buffer management events, as follows: • All Profiling Buffer management events are recorded in PMBSR_EL3. • SPE Profiling exceptions are generated and taken to EL3 when unmasked and PMBSR_EL3.S is 1.

If EL3 is not implemented, then the Effective value of MDCR_EL3.PMSEE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSTEPOP, bit [50]
When FEAT_STEP2 is implemented:

EnSTEPOP	Meaning
0b0	Execution from MDSTEPOP_EL1 is disabled. EL2, EL1 and EL0 System register accesses to MDSTEPOP_EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b1	Execution from MDSTEPOP_EL1 is not disabled by this control. System register accesses to MDSTEPOP_EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ETBAD, bits [49:48]
When FEAT_TRBE_EXT is implemented:

External Trace Buffer Access Disable. Controls access to the Trace Buffer registers from an external debugger.

ETBAD	Meaning	Applies when
0b00	Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. If FEAT_RME is implemented, Secure and Realm accesses from an external debugger to Trace Buffer registers are prohibited and Root accesses to Trace Buffer registers are allowed. If FEAT_RME is not implemented, Secure accesses to Trace Buffer registers are allowed.	
0b01	Secure and Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. Root and Realm accesses to Trace Buffer registers are allowed.	When FEAT_RME is implemented
0b10	Realm and Non-secure accesses from an external debugger to Trace Buffer registers are prohibited. Root and Secure accesses to Trace Buffer registers are allowed.	When FEAT_RME is implemented
0b11	All accesses from an external debugger to Trace Buffer registers are allowed.	

If EL3 is not implemented, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Otherwise:

Reserved, RES0.

EnITE, bit [47]
When FEAT_ITE is implemented:

Enable access to Instrumentation trace registers. When disabled, accesses to Instrumentation trace registers generate a trap to EL3.

EnITE	Meaning
0b0	Accesses of the specified Instrumentation trace registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified Instrumentation trace registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to TRCITECR_EL1, TRCITECR_EL2, and TRCITECR_EL12.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPMSSAD, bits [46:45]
When FEAT_PMUv3_SS is implemented:

External PMU Snapshot Access Disable. Controls access to the PMU Snapshot registers from an external debugger.

External accesses of the following registers are affected by this control:

- PMCCNTSVR_EL1, PMEVCNTSVR<n>_EL1, and PMSSCR_EL1.
- If FEAT_PMUv3_ICNTR is implemented, PMICNTSVR_EL1.

EPMSSAD	Meaning	Applies when
0b00	Non-secure accesses from an external debugger to the affected PMU Snapshot registers are prohibited. If FEAT_RME is implemented, Secure and Realm accesses from an external debugger to the affected PMU Snapshot registers are prohibited. Other accesses from an external debugger to the specified registers are not affected by this control.	
0b01	Secure and Non-secure accesses from an external debugger to the affected PMU Snapshot registers are prohibited. Other accesses from an external debugger to the specified registers are not affected by this control.	When FEAT_RME is implemented
0b10	Realm and Non-secure accesses from an external debugger to the affected PMU Snapshot registers are prohibited. Other accesses from an external debugger to the specified registers are not affected by this control.	When FEAT_RME is implemented
0b11	No accesses from an external debugger to the affected PMU Snapshot registers are prohibited by this control.	

If EL3 is not implemented, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

Otherwise:

Reserved, RES0.

EnPMSS, bit [44]
When FEAT_PMUv3_SS is implemented:

Enable access to PMU Snapshot registers. When disabled, accesses to PMU Snapshot registers generate a trap to EL3.

EnPMSS	Meaning
0b0	Accesses of the specified PMU Snapshot registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified PMU Snapshot registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMCCNTSVR_EL1, PMEVCNTSVR<n>_EL1, and PMSSCR_EL1.
- If FEAT_PMUv3_ICNTR is implemented, MRS and MSR accesses to PMICNTSVR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EBWE, bit [43]
When FEAT_Debugv8p9 is implemented:

Extended Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints, and enables a trap to EL3 on accesses to debug registers.

EBWE	Meaning
0b0	The Effective values of MDSCR_EL1.EMBWE and MDCR_EL2.EBWE are 0. The Effective value of MDSELR_EL1.BANK is zero at EL3. Accesses of MDSELR_EL1 at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	The Effective values of MDSCR_EL1.EMBWE, MDCR_EL2.EBWE, and MDSELR_EL1.BANK are not affected by this field. Accesses of MDSELR_EL1 are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to MDSELR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

If EL3 is not implemented, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EnPMS3, bit [42]
When FEAT_SPE_FDS is implemented:

Enable access to SPE registers. When disabled, accesses to SPE registers generate a trap to EL3.

EnPMS3	Meaning
0b0	Accesses of the specified SPE registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified SPE registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to PMSDSFR_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEE, bits [41:40]
When FEAT_EBEP is implemented:

Performance Monitors Exception Enable. Controls the generation of the PMUIRQ signal and the PMU Profiling exception at all Exception levels.

PMEE	Meaning
0b00	The PMUIRQ signal is asserted on a PMU overflow, and the PMU Profiling exception is disabled.
0b01	The PMUIRQ signal and the PMU Profiling exception are both controlled by MDCR_EL2.PMEE.
0b11	The PMUIRQ signal is deasserted, and the PMU Profiling exception is enabled.

All other values are reserved.

If EL3 is not implemented, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTB2, bit [39]
When FEAT_TRBE_MPAM is implemented:

Enable access to Trace Buffer registers. When disabled, accesses to Trace Buffer registers generate a trap to EL3.

EnTB2	Meaning
0b0	Accesses of the specified Trace Buffer registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified Trace Buffer registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to TRBMPAM_EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3BREC, bit [38]
When FEAT_BRBEv1p1 is implemented:

Branch Record Buffer EL3 Cold Reset Enable. With MDCR_EL3.E3BREW, controls branch recording at EL3.

E3BREC	Meaning
0b0	When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is disabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is enabled.
0b1	When MDCR_EL3.E3BREW == 0: Branch recording at EL3 is enabled. When MDCR_EL3.E3BREW == 1: Branch recording at EL3 is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

E3BREW, bit [37]
When FEAT_BRBEv1p1 is implemented:

Branch Record Buffer EL3 Warm Reset Enable. With MDCR_EL3.E3BREC, controls branch recording at EL3.

For a description of the values derived by evaluating MDCR_EL3.E3BREC and MDCR_EL3.E3BREW together, see MDCR_EL3.E3BREC.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EnPMSN, bit [36]
When FEAT_SPE_FnE is implemented:

Trap accesses to PMSNEVFR_EL1. Controls access to Statistical Profiling PMSNEVFR_EL1 System register from EL2 and EL1.

EnPMSN	Meaning
0b0	Accesses to PMSNEVFR_EL1 at EL2 and EL1 generate a Trap exception to EL3.
0b1	Do not trap PMSNEVFR_EL1 to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MPMX, bit [35]
When FEAT_PMUv3p7 is implemented:

Monitor Performance Monitors Extended control. With MDCR_EL3.SPME, controls PMU operation at EL3.

MPMX	Meaning
0b0	Counters are not affected by this mechanism.
0b1	Affected counters are prohibited from counting at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.

The counters affected by this field are:

- If EL2 is implemented and MDCR_EL3.SPME is 1, event counters PMEVCNTR<n>_EL0 in the first range.
- If EL2 is not implemented or MDCR_EL3.SPME is 0, event counters in the first and second ranges.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter, PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

Other event counters are not affected by this field. When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

MCCD, bit [34]
When FEAT_PMUv3p7 is implemented:

Monitor Cycle Counter Disable. Prohibits the Cycle Counter, PMCCNTR_EL0, from counting at EL3.

MCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited at EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SBRBE, bits [33:32]
When FEAT_BRBE is implemented:

Secure Branch Record Buffer Enable. Controls branch recording by the BRBE, and access to BRBE registers and instructions at EL2 and EL1.

SBRBE	Meaning
0b00	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 are prohibited regions.
0b01	Direct accesses to BRBE registers and instructions in Secure state, except when in EL3, generate a Trap exception to EL3. EL0, EL1, and EL2 in Secure state are prohibited regions. This control does not cause any direct accesses to BRBE registers when not in Secure state to be trapped, and does not cause any Exception levels when not in Secure state to be a prohibited region.
0b10	Direct accesses to BRBE registers and instructions, except when in EL3, generate a Trap exception to EL3. This control does not cause any Exception levels to be prohibited regions.
0b11	This control does not cause any direct accesses to BRBE registers or instruction to be trapped, and does not cause any Exception levels to be a prohibited region.

The Branch Record Buffer registers trapped by this control are: BRBCR_EL1, BRBCR_EL2, BRBCR_EL12, BRBFCR_EL1, BRBIDR0_EL1, BRBINF<n>_EL1, BRBINFINJ_EL1, BRBSRC<n>_EL1, BRBSRCINJ_EL1, BRBTGT<n>_EL1, BRBTGTINJ_EL1, and BRBTS_EL1.

The Branch Record Buffer instructions trapped by this control are:

- BRB IALL.
- BRB INJ.

Note

If FEAT_BRBEv1p1 is not implemented, EL3 is a prohibited region.

If EL3 is not implemented, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMSSE, bits [31:30]
When FEAT_PMUv3_SS is implemented:

Performance Monitors Snapshot Enable. Controls the generation of Capture events.

PMSSE	Meaning
0b00	Capture events are disabled.
0b01	Capture events are controlled by MDCR_EL2.PMSSE.
0b10	Capture events are enabled and prohibited.
0b11	Capture events are enabled and allowed.

If EL3 is not implemented, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00'.

Otherwise:

Reserved, RES0.

Bit [29]

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>_EL0.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>_EL0.MT is 0.
0b1	PMEVTYPER<n>_EL0.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Otherwise:

Reserved, RES0.

TDCC, bit [27]
When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel at EL2, EL1, and EL0 to EL3.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers at EL2, EL1, and EL0 generate a Trap exception to EL3, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

AArch64: OSDTRRX_EL1, OSDTRTX_EL1, MDCCSR_EL0, MDCCINT_EL1, and, when the PE is in Non-debug state, DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

The traps are reported with EC syndrome value:

- 0x05 for trapped AArch32 MRC and MCR accesses with coproc == 0b1110.
- 0x06 for trapped AArch32 LDC to DBGDTRTXint and STC from DBGDTRRXint.
- 0x18 for trapped AArch64 MRS and MSR accesses.

When the PE is in Debug state, MDCR_EL3.TDCC does not trap any accesses to:

AArch64: DBGDTR_EL0, DBGDTRRX_EL0, and DBGDTRTX_EL0.

AArch32: DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTBE, bit [26]
When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer Extended. Together with MDCR_EL3.NSTB, controls the trace buffer owning Security state and accesses to trace buffer System registers from EL2 and EL1.

For a description of the values derived by evaluating NSTB and NSTBE together, see MDCR_EL3.NSTB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSTB, bits [25:24]
When FEAT_TRBE is implemented and FEAT_RME is implemented:

Non-secure Trace Buffer. Together with MDCR_EL3.NSTBE, controls the trace buffer owning Security state and accesses to trace buffer System registers from EL2 and EL1.

NSTBE	NSTB	Meaning
0b0	0b00	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Realm and Non-secure states. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b01	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Realm and Non-secure states. Accesses to trace buffer System registers at Realm and Non-secure EL2, and Realm and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b10	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Realm states. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b0	0b11	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Realm states. Accesses to trace buffer System registers at Secure and Realm EL2, and Secure and Realm EL1, are trapped to EL3, unless the access generates a higher priority exception.
0b1	0b10	Trace buffer owning Security state is Realm state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Non-secure states. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a highe priority exception.
0b1	0b11	Trace buffer owning Security state is Realm state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure and Non-secure states. Accesses to trace buffer System registers at Secure and Non-secure EL2, and Secure and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception.

All other combinations of MDCR_EL3.NSTBE and MDCR_EL3.NSTB are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.
- If FEAT_TRBE_MPAM is implemented, MRS and MSR accesses to TRBMPAM_EL1.
- If FEAT_TRBE_EXC is implemented, MRS and MSR accesses to TRBSR_EL2 and TRBSR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

When TraceBufferEnabled()==FALSE, these controls have no effect on whether tracing is prohibited.

If the Trace Buffer Unit is enabled and using Self-hosted mode, and MDCR_EL3.{NSTB, NSTBE} selects a reserved value, then the behavior is CONSTRAINED UNPREDICTABLE, and the Trace Buffer Unit does one of:

- Behaves as if the Trace Buffer Unit is disabled.
- Selects an implemented Security state as the owning Security state.
- When trace data is received from the trace unit, it is not written to memory and the Trace Buffer Unit generates a trace buffer management event, as follows:
  - TRBSR_ELx.IRQ is set to 1.
  - If TRBSR_ELx.S is 0, then all of the following occur:
    - TRBSR_ELx.S is set to 1, Collection is stopped.
    - TRBSR_ELx.EC is set to 0x00, Other buffer management event.
    - TRBSR_ELx.BSC is set to 0b000000, Access not allowed.
  - The other fields in TRBSR_ELx are unchanged.

If the Trace Buffer Unit is enabled and using Self-hosted mode, and MDCR_EL3.{NSTB, NSTBE} selects a reserved value, then it is CONSTRAINED UNPREDICTABLE whether or not accesses to trace buffer System registers at EL2 and EL1 generate Trap exceptions to EL3.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_TRBE is implemented:

Non-secure Trace Buffer. Controls the trace buffer owning Security state and accesses to trace buffer System registers from EL2 and EL1.

NSTB	Meaning
0b00	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Non-secure state. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b01	Trace buffer owning Security state is Secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Non-secure state. Accesses to trace buffer System registers at EL2 and EL1 in Non-secure state are trapped to EL3, unless the access generates a higher priority exception.
0b10	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure state. Accesses to trace buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b11	Trace buffer owning Security state is Non-secure state. When TraceBufferEnabled()==TRUE, tracing is prohibited in Secure state. Accesses to trace buffer System registers at EL2 and EL1 in Secure state are trapped to EL3, unless the access generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to TRBBASER_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBPTR_EL1, TRBSR_EL1, and TRBTRG_EL1.
- If FEAT_TRBE_MPAM is implemented, MRS and MSR accesses to TRBMPAM_EL1.
- If FEAT_TRBE_EXC is implemented, MRS and MSR accesses to TRBSR_EL2 and TRBSR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

When TraceBufferEnabled()==FALSE, this control has no effect on whether tracing is prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCCD, bit [23]
When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR_EL0 from counting in Secure state and EL3.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is prohibited in Secure state and EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

ETAD, bit [22]
When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable. Together with MDCR_EL3.ETADE, controls access to trace unit registers by an external debugger.

ETADE	ETAD	Meaning
0b0	0b0	No accesses from an external debugger to trace unit registers are prohibited by this control.
0b0	0b1	Realm and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected by this control.
0b1	0b0	Secure and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected by this control.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_TRC_EXT is implemented and FEAT_TRBE is implemented:

External Trace Access Disable. Controls Non-secure access to trace unit registers by an external debugger.

ETAD	Meaning
0b0	No accesses from an external debugger to the trace unit registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to some trace unit registers are prohibited. See individual registers for the effect of this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EPMAD, bit [21]
When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable. Together with MDCR_EL3.EPMADE, controls access to Performance Monitor registers by an external debugger.

External accesses of the following Performance Monitor registers are affected by this control:

- PMCCFILTR_EL0, PMCCNTR_EL0, PMCFGR, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, and PMOVSSET_EL0.
- If PMEVFILT2R<n> is implemented, PMEVFILT2R<n>.
- If implemented, PMIIDR.
- If PMSWINC_EL0 is implemented in the external view, PMSWINC_EL0.
- If FEAT_PMUv3p4 is implemented, PMMIR.
- If FEAT_PMUv3_EXT64 is implemented, PMCNTEN, PMINTEN, and PMOVS.
- If FEAT_PMUv3p9 is implemented, PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMCGCR0, PMICFILTR_EL0, and PMICNTR_EL0.
- If FEAT_PCSRv8p9 is implemented, PMPCSCTL.

EPMADE	EPMAD	Meaning
0b0	0b0	No accesses from an external debugger to affected Performance Monitor registers are prohibited by this control.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected by this control.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected by this control.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable. Controls Non-secure access to Performance Monitor registers by an external debugger.

External accesses of the following Performance Monitor registers are affected by this control:

- PMCCFILTR_EL0, PMCCNTR_EL0, PMCFGR, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, and PMOVSSET_EL0.
- If PMEVFILT2R<n> is implemented, PMEVFILT2R<n>.
- If implemented, PMIIDR.
- If PMSWINC_EL0 is implemented in the external view, PMSWINC_EL0.
- If FEAT_PMUv3p4 is implemented, PMMIR.
- If FEAT_PMUv3_EXT64 is implemented, PMCNTEN, PMINTEN, and PMOVS.
- If FEAT_PMUv3p9 is implemented, PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, PMCGCR0, PMICFILTR_EL0, and PMICNTR_EL0.
- If FEAT_PCSRv8p9 is implemented, PMPCSCTL.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected Performance Monitor registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable. Controls access to Performance Monitor registers by an external debugger.

External accesses of the following Performance Monitor registers are affected by this control:

- PMCCFILTR_EL0, PMCCNTR_EL0, PMCFGR, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, and PMOVSSET_EL0.
- If PMEVFILT2R<n> is implemented, PMEVFILT2R<n>.
- If implemented, PMIIDR.
- If PMSWINC_EL0 is implemented in the external view, PMSWINC_EL0.
- If FEAT_PMUv3p4 is implemented, PMMIR.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected Performance Monitor registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EDAD, bit [20]
When FEAT_RME is implemented:

External Debug Access Disable. Together with MDCR_EL3.EDADE, controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, and OSLAR_EL1.

EDADE	EDAD	Meaning
0b0	0b0	No accesses from an external debugger to affected debug registers are prohibited by this control.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected by this control.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected by this control.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable. Controls Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, and OSLAR_EL1.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable. Controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1, and OSLAR_EL1.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

External Debug Access Disable. Controls access to breakpoint registers, watchpoint registers, and optionally OSLAR_EL1 by an external debugger.

External accesses of the following debug registers are affected by this control:

- DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, and DBGWVR<n>_EL1.
- It is IMPLEMENTATION DEFINED whether this control affects OSLAR_EL1.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TTRF, bit [19]
When FEAT_TRF is implemented:

Trap Trace Filter controls. Traps use of the Trace Filter control registers at EL2 and EL1 to EL3.

The Trace Filter registers trapped by this control are:

- TRFCR_EL2, TRFCR_EL12, TRFCR_EL1, reported using EC syndrome value 0x18.
- HTRFCR and TRFCR, reported using EC syndrome value 0x03.

TTRF	Meaning
0b0	Accesses to Trace Filter registers at EL2 and EL1 are not affected by this field.
0b1	Accesses to Trace Filter registers at EL2 and EL1 generate a Trap exception to EL3, unless the access generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

STE, bit [18]
When FEAT_TRF is implemented and Secure state is implemented:

Secure Trace enable. Enables tracing in Secure state.

STE	Meaning
0b0	Trace prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this field.

This field also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SPME, bit [17]
When FEAT_PMUv3 is implemented and FEAT_PMUv3p7 is implemented:

Secure Performance Monitors Enable. Controls PMU operation in Secure state and at EL3 when MDCR_EL3.MPMX is 0.

SPME	Meaning
0b0	Affected counters are prohibited from counting in Secure state and at EL3. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state and at EL3. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	Counters are not affected by this mechanism.

When MDCR_EL3.MPMX is 0, the counters affected by this field are:

- Event counters in the first and second ranges. For more information about event counter ranges, see MDCR_EL2.HPMN.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter, PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

When MDCR_EL3.MPMX is 1, this field controls which event counters are affected by MDCR_EL3.MPMX at EL3. See MDCR_EL3.MPMX for more information.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls PMU operation in Secure state.

SPME	Meaning
0b0	Event counting is prohibited in Secure state. If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

The counters affected by this field are:

- All event counters.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls PMU operation in Secure state.

SPME	Meaning
0b0	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, then all the following apply: • Event counting is prohibited in Secure state. • If PMCR_EL0.DP is 1, PMCCNTR_EL0 is disabled in Secure state. Otherwise, PMCCNTR_EL0 is not affected by this mechanism.
0b1	Event counting and PMCCNTR_EL0 are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, then the event counters and PMCCNTR_EL0 are not affected by this field.

Otherwise, the counters affected by this field are:

- All event counters.
- If PMCR_EL0.DP is 1, the cycle counter, PMCCNTR_EL0.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SDD, bit [16]
When Secure state is implemented:

AArch64 Secure Self-hosted invasive debug disable. Disables Software debug exceptions in Secure state, other than Breakpoint Instruction exceptions.

SDD	Meaning
0b0	Debug exceptions in Secure state are not affected by this field.
0b1	Debug exceptions, other than Breakpoint Instruction exceptions, are disabled from all Exception levels in Secure state.

The SDD bit is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is 0.

If Secure EL2 is implemented and enabled, and Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPD32, bits [15:14]
When FEAT_AA32EL1 is implemented:

AArch32 Secure self-hosted privileged debug. Enables or disables debug exceptions from Secure EL1 using AArch32, other than Breakpoint Instruction exceptions.

SPD32	Meaning
0b00	Legacy mode. Debug exceptions from Secure EL1 are enabled by the IMPLEMENTATION DEFINED authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from Secure EL1 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from Secure EL1 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored unless both of the following are true:

- The PE is in Secure state.
- The Effective value of SCR_EL3.RW is 0.

If Secure EL1 is using AArch32, then:

- If debug exceptions from Secure EL1 are enabled, then debug exceptions from Secure EL0 are also enabled.
- Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER32_EL3.SUIDEN is 1.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPB, bits [13:12]
When FEAT_SPE is implemented and FEAT_RME is implemented:

Non-secure Profiling Buffer. Together with MDCR_EL3.NSPBE, controls the Profiling Buffer owning Security state and accesses to Statistical Profiling and Profiling Buffer System registers from EL2 and EL1.

NSPBE	NSPB	Meaning
0b0	0b00	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Realm and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b01	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Realm and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at Realm and Non-secure EL2, and Realm and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception. When Secure state is not implemented, this encoding is reserved.
0b0	0b10	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure and Realm states. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b0	0b11	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure and Realm states. Accesses to Statistical Profiling and Profiling Buffer System registers at Secure and Realm EL2, and Secure and Realm EL1, are trapped to EL3, unless the access generates a higher priority exception.
0b1	0b10	Profiling Buffer owning Security state is Realm state. Profiling is disabled in Secure and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a highe priority exception.
0b1	0b11	Profiling Buffer owning Security state is Realm state. Profiling is disabled in Secure and Non-secure states. Accesses to Statistical Profiling and Profiling Buffer System registers at Secure and Non-secure EL2, and Secure and Non-secure EL1, are trapped to EL3, unless the access generates a higher priority exception.

All other combinations of MDCR_EL3.NSPBE and MDCR_EL3.NSPB are reserved.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSCR_EL12, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- MRS accesses to PMSIDR_EL1.
- If FEAT_SPE_FnE is implemented, MRS and MSR accesses to PMSNEVFR_EL1.
- If FEAT_SPE_FDS is implemented, MRS and MSR accesses to PMSDSFR_EL1.
- If FEAT_SPE_EXC is implemented, MRS and MSR accesses to PMBSR_EL2 and PMBSR_EL12.
- If FEAT_SPE_nVM is implemented, MRS and MSR accesses to PMBMAR_EL1.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

If profiling is enabled and MDCR_EL3.{NSPB, NSPBE} selects a reserved value, then the behavior is CONSTRAINED UNPREDICTABLE, and the Statistical Profiling Unit does one of:

- Behaves as if profiling is disabled.
- Selects an implemented Security state as the owning Security state.
- When profiling data is generated, it is not written to memory and the Statistical Profiling Unit generates a Profiling Buffer management event, as follows:
  - If PMBSR_ELx.S is 0, then all of the following occur:
    - PMBSR_ELx.S is set to 1.
    - PMBSR_ELx.DL is set to 1.
    - PMBSR_ELx.EC is set to 0b000000, Other buffer management event.
    - PMBSR_ELx.BSC is set to 0b000000, Access not allowed.
  - The other fields in PMBSR_ELx are unchanged.

If profiling is enabled and MDCR_EL3.{NSPB, NSPBE} selects a reserved value, then it is CONSTRAINED UNPREDICTABLE whether or not accesses to the Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 generate Trap exceptions to EL3.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPE is implemented:

Non-secure Profiling Buffer. Controls the Profiling Buffer owning Security state and accesses to Statistical Profiling and Profiling Buffer System registers from EL2 and EL1.

NSPB	Meaning
0b00	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b01	Profiling Buffer owning Security state is Secure state. Profiling is disabled in Non-secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 in Non-secure state are trapped to EL3, unless the access generates a higher priority exception.
0b10	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 are trapped to EL3, unless the access generates a higher priority exception.
0b11	Profiling Buffer owning Security state is Non-secure state. Profiling is disabled in Secure state. Accesses to Statistical Profiling and Profiling Buffer System registers at EL2 and EL1 in Secure state are trapped to EL3, unless the access generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMBLIMITR_EL1, PMBPTR_EL1, PMBSR_EL1, PMSCR_EL1, PMSCR_EL2, PMSCR_EL12, PMSEVFR_EL1, PMSFCR_EL1, PMSICR_EL1, PMSIRR_EL1, and PMSLATFR_EL1.
- MRS accesses to PMSIDR_EL1.
- If FEAT_SPE_FnE is implemented, MRS and MSR accesses to PMSNEVFR_EL1.
- If FEAT_SPE_FDS is implemented, MRS and MSR accesses to PMSDSFR_EL1.
- If FEAT_SPE_EXC is implemented, MRS and MSR accesses to PMBSR_EL2 and PMBSR_EL12.
- If FEAT_SPE_nVM is implemented, MRS and MSR accesses to PMBMAR_EL1.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3, reported using EC syndrome value 0x18.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 1, then the Effective value of this field is 0b11.

If EL3 is not implemented and the Effective value of SCR_EL3.NS is 0, then the Effective value of this field is 0b01.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSPBE, bit [11]
When FEAT_SPE is implemented and FEAT_RME is implemented:

Non-secure Profiling Buffer Extended. Together with MDCR_EL3.NSPB, controls the Profiling Buffer owning Security state and accesses to Statistical Profiling and Profiling Buffer System registers from EL2 and EL1.

For a description of the values derived by evaluating NSPB and NSPBE together, see MDCR_EL3.NSPB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDOSA, bit [10]
When FEAT_DoubleLock is implemented:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

Accesses to the registers are trapped as follows:

- Accesses from AArch64 state, OSLAR_EL1, OSLSR_EL1, OSDLR_EL1, DBGPRCR_EL1, and any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this field, are trapped to EL3 and reported using EC syndrome value 0x18.

- Accesses using MCR or MRC to DBGOSLAR, DBGOSLSR, DBGOSDLR, and DBGPRCR, are trapped to EL3 and reported using EC syndrome value 0x05.
- Accesses to any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this field.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Trap debug OS-related register access. Traps EL2 and EL1 System register accesses to the powerdown debug registers to EL3.

The following registers are affected by this trap:

- AArch64: OSLAR_EL1, OSLSR_EL1, and DBGPRCR_EL1.
- AArch32: DBGOSLAR, DBGOSLSR, and DBGPRCR.
- AArch64 and AArch32: Any IMPLEMENTATION DEFINED register with similar functionality that the implementation specifies as trapped by this field.
- It is IMPLEMENTATION DEFINED whether accesses to OSDLR_EL1 and DBGOSDLR are trapped.

TDOSA	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL2 and EL1 System register accesses to the powerdown debug registers are trapped to EL3, unless it is trapped by HDCR.TDOSA or MDCR_EL2.TDOSA.

Note

The powerdown debug registers are not accessible at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDA, bit [9]

Trap accesses of debug System registers. Enables a trap to EL3 on accesses of debug System registers.

TDA	Meaning
0b0	Accesses of the specified debug System registers are not trapped by this mechanism.
0b1	Accesses of the specified debug System registers at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to DBGAUTHSTATUS_EL1, DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGCLAIMCLR_EL1, DBGCLAIMSET_EL1, DBGVCR32_EL2, DBGWCR<n>_EL1, DBGWVR<n>_EL1, MDCCINT_EL1, MDCCSR_EL0, MDCR_EL2, MDRAR_EL1, MDSCR_EL1, OSDTRRX_EL1, OSDTRTX_EL1, and OSECCR_EL1.
- If FEAT_Debugv8p9 is implemented, MRS and MSR accesses to MDSELR_EL1.
- If FEAT_STEP2 is implemented, MRS and MSR accesses to MDSTEPOP_EL1.
- In Non-debug state, MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to DBGAUTHSTATUS, DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGCLAIMCLR, DBGCLAIMSET, DBGDCCINT, DBGDEVID, DBGDEVID1, DBGDEVID2, DBGDIDR, DBGDRAR, DBGDSAR, DBGDSCRext,

DBGDSCRint, DBGDTRRXext, DBGDTRTXext, DBGOSECCR, DBGVCR, DBGWCR<n>, DBGWFAR, DBGWVR<n>, HDCR, and SDER.
- MRRC accesses to DBGDRAR and DBGDSAR.
- STC accesses to DBGDTRRXint and LDC accesses to DBGDTRTXint.
- In Non-debug state, MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03 for MRC and MCR accesses with coproc == 0b1111, 0x05 for MCR and MCR accesses with coproc == 0b1110, 0x06 for LDC and STC accesses, and 0x0C for MRRC accesses.

The following instructions are not trapped in Debug state:

- AArch64 MRS accesses to DBGDTRRX_EL0 and DBGDTR_EL0 and MSR accesses to DBGDTRTX_EL0 and DBGDTR_EL0.
- AArch32 MRC accesses to DBGDTRRXint and MCR accesses to DBGDTRTXint.

If 16 or fewer breakpoints and 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI, then it is IMPLEMENTATION DEFINED whether AArch64 accesses to MDSELR_EL1 are trapped to EL3 when MDCR_EL3.TDA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [8]

Reserved, RES0.

EnPM2, bit [7]
When FEAT_PMUv3p9 is implemented, or FEAT_SPMU is implemented, or FEAT_EBEP is implemented, or FEAT_PMUv3_SS is implemented, or FEAT_SPMU2 is implemented:

Enable access to PMU registers. When disabled, accesses to PMU registers generate a trap to EL3.

EnPM2	Meaning
0b0	Accesses of the specified PMU registers at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception. If FEAT_PMUv3_ICNTR is implemented, then: • PMCNTENCLR_EL0.F0, PMCNTENSET_EL0.F0, PMOVSCLR_EL0.F0, PMOVSSET_EL0.F0, and PMZR_EL0.F0 read-as-zero and ignore writes at EL2, EL1, and EL0. • PMINTENCLR_EL1.F0 and PMINTENSET_EL1.F0 read-as-zero and ignore writes at EL2 and EL1.
0b1	Accesses of the specified PMU registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are:

- If FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented, MRS and MSR accesses to PMECR_EL1.
- If FEAT_PMUv3_ICNTR is implemented, MRS and MSR accesses to PMICFILTR_EL0 and PMICNTR_EL0.
- If FEAT_PMUv3p9 is implemented, MRS and MSR accesses to PMUACR_EL1.
- If FEAT_SEBEP is implemented, MRS and MSR accesses to PMIAR_EL1.
- If FEAT_SPMU is implemented, MRS and MSR accesses to SPMACCESSR_EL1, SPMACCESSR_EL2, SPMACCESSR_EL12, SPMCFGR_EL1, SPMCGCR<n>_EL1, SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMDEVAFF_EL1, SPMDEVARCH_EL1, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMIIDR_EL1, SPMINTENCLR_EL1, SPMINTENSET_EL1, SPMOVSCLR_EL0, SPMOVSSET_EL0, SPMSCR_EL1, and SPMSELR_EL0.
- If FEAT_SPMU2 is implemented, MSR writes to SPMZR_EL0.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPM, bit [6]
When FEAT_PMUv3 is implemented:

Trap accesses of PMU registers. Enables a trap to EL3 on accesses of PMU registers.

TPM	Meaning
0b0	Accesses of the specified PMU registers are not trapped by this mechanism.
0b1	Accesses of the specified PMU registers at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMINTENCLR_EL1, PMINTENSET_EL1, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMSWINC_EL0, PMUSERENR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
- MRS accesses to PMCEID0_EL0 and PMCEID1_EL0.
- If FEAT_PMUv3p4 is implemented, MRS accesses to PMMIR_EL1.
- If FEAT_PMUv3p9 is implemented, MSR accesses to PMZR_EL0.
- If FEAT_PMUv3_ICNTR is implemented, MRS and MSR accesses to PMICFILTR_EL0 and PMICNTR_EL0.
- If FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented, MRS and MSR accesses to PMECR_EL1.
- If FEAT_SEBEP is implemented, MRS and MSR accesses to PMIAR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to PMCCFILTR, PMCCNTR, PMCEID0, PMCEID1, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMINTENCLR, PMINTENSET, PMOVSR, PMOVSSET, PMSELR, PMSWINC, PMUSERENR, PMXEVCNTR, and PMXEVTYPER.
- MRRC and MCRR accesses to PMCCNTR.
- If FEAT_PMUv3p1 is implemented, MRC accesses to PMCEID2 and PMCEID3.
- If FEAT_PMUv3p4 is implemented, MRC accesses to PMMIR.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03 for MRC and MCR accesses, and 0x04 for MRRC and MCRR accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [5]

Reserved, RES0.

EDADE, bit [4]
When FEAT_RME is implemented:

External Debug Access Disable Extended. Together with MDCR_EL3.EDAD, controls access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger.

For a description of the values derived by evaluating MDCR_EL3.EDAD and MDCR_EL3.EDADE together, see MDCR_EL3.EDAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

ETADE, bit [3]
When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable Extended. Together with MDCR_EL3.ETAD, controls access to trace unit registers by an external debugger.

For a description of the values derived by evaluating MDCR_EL3.ETAD and MDCR_EL3.ETADE together, see MDCR_EL3.ETAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EPMADE, bit [2]
When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable Extended. Together with MDCR_EL3.EPMAD, controls access to Performance Monitor registers by an external debugger.

For a description of the values derived by evaluating MDCR_EL3.EPMAD and MDCR_EL3.EPMADE together, see MDCR_EL3.EPMAD.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [1]

Reserved, RES0.

RLTE, bit [0]
When FEAT_RME is implemented and FEAT_TRF is implemented:

Realm Trace enable. Enables tracing in Realm state.

RLTE	Meaning
0b0	Trace prohibited in Realm state, unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Realm state is not affected by this field.

This field also controls the level of authentication that is required by an external debugger to enable external tracing.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Accessing MDCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = MDCR_EL3();
end;
```

MSR MDCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0011	0b001

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_FGWTE3) && FGWTE3_EL3().MDCR_EL3 == '1' then
        AArch64_SystemAccessTrap(EL3, 0x18);
    else
        MDCR_EL3() = X{64}(t);
    end;
end;
```

MDRAR_EL1, Monitor Debug ROM Address Register

The MDRAR_EL1 characteristics are:

Purpose

Defines the base physical address of a 4KB-aligned memory-mapped debug component, usually a ROM table that locates and describes the memory-mapped debug components in the system. Use of this register is deprecated.

Configuration

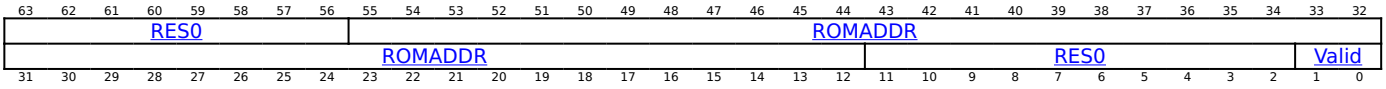
AArch64 System register MDRAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register DBGDRAR[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDRAR_EL1 are UNDEFINED.

Attributes

MDRAR_EL1 is a 64-bit register.

Field descriptions

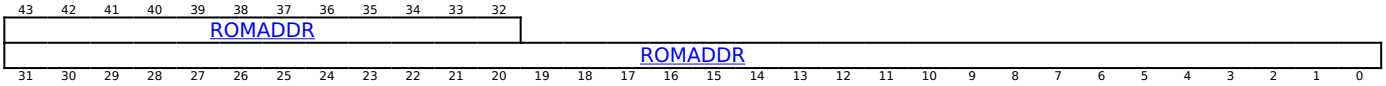


Bits [63:56]

Reserved, RES0.

ROMADDR, bits [55:12]

ROMADDR encoding when FEAT_D128 is implemented and MDRAR_EL1.Valid != '00'



ROMADDR, bits [43:0]

Bits [55:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 56 physical address bits, the corresponding upper bits of this field are RES0

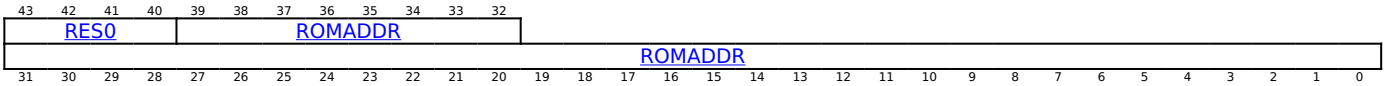
In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in the Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ROMADDR encoding when FEAT_D128 is not implemented, FEAT_LPA is implemented, and MDRAR_EL1.Valid != '00'



Bits [43:40]

Reserved, RES0.

ROMADDR, bits [39:0]

Bits [51:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 52 physical address bits, the corresponding upper bits of this field are RES0

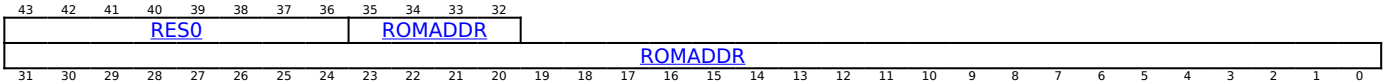
In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in the Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ROMADDR encoding when FEAT_D128 is not implemented, FEAT_LPA is not implemented, and MDRAR_EL1.Valid != '00'



Bits [43:36]

Reserved, RES0.

ROMADDR, bits [35:0]

Bits [39:12] of the ROM table physical address.

Bits [11:0] of the ROM table physical address are zero.

For implementations with fewer than 48 physical address bits, the corresponding upper bits of this field are RES0

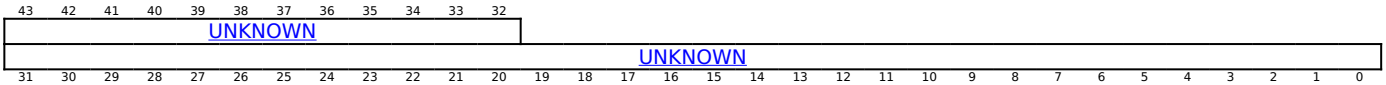
In an implementation that includes EL3, ROMADDR is an address in Non-secure PA space. It is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Secure PA space. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether the ROM table is also accessible in Root or Realm PA spaces.

Arm strongly recommends that bits ROMADDR[(PAsize-1):32] are zero in any system where the implementation only supports execution in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ROMADDR encoding when MDRAR_EL1.Valid == '00'



Bits [43:0]

Reserved, UNKNOWN.

Bits [11:2]

Reserved, RES0.

Valid, bits [1:0]

This field indicates whether the ROM Table address is valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Valid	Meaning
0b00	ROM Table address is not valid. Software must ignore ROMADDR.
0b11	ROM Table address is valid.

Other values are reserved.

Arm recommends implementations set this field to zero.

Access to this field is RO.

Accessing MDRAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDRAR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3().TDA == '1' then
        Undefined();
    elsif EL2Enabled() && MDCR_EL2().[TDE,TDRA] != '00' then
        AArch64_SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && MDCR_EL3().TDA == '1' then
        if EL3SDDUndef() then
            Undefined();
        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    else
        X{64}(t) = MDRAR_EL1();
    end;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3().TDA == '1' then
        Undefined();
    elsif HaveEL(EL3) && MDCR_EL3().TDA == '1' then
        if EL3SDDUndef() then
            Undefined();
        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    else
        X{64}(t) = MDRAR_EL1();
    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = MDRAR_EL1();
end;
```

2025-12-10 16:11:30, 2025-12_rel

MDSCR_EL1, Monitor Debug System Control Register

The MDSCR_EL1 characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

AArch64 System register MDSCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDSCRext[31:0].

AArch64 System register MDSCR_EL1 bit [15] is architecturally mapped to AArch32 System register DBGDSCRint[15].

AArch64 System register MDSCR_EL1 bit [12] is architecturally mapped to AArch32 System register DBGDSCRint[12].

AArch64 System register MDSCR_EL1 bits [5:2] are architecturally mapped to AArch32 System register DBGDSCRint[5:2].

AArch64 System register MDSCR_EL1 bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to External register EDSCR[31:29, 27:26, 23:21, 19, 14, 6].

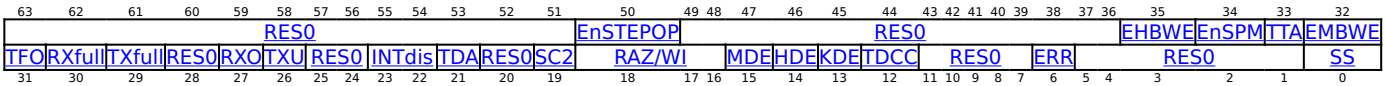
AArch64 System register MDSCR_EL1 bits [35, 33] are architecturally mapped to External register EDSCR2[3, 1].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MDSCR_EL1 are UNDEFINED.

Attributes

MDSCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:51]

Reserved, RES0.

EnSTEPOP, bit [50]
When FEAT_STEP2 is implemented:

Software step control bit. Enable execution from MDSTEPOP_EL1. Permitted values are:

EnSTEPOP	Meaning
0b0	Execution from MDSTEPOP_EL1 is disabled.
0b1	Execution from MDSTEPOP_EL1 is not disabled by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [49:36]

Reserved, RES0.

EHBWE, bit [35]
When FEAT_Debugv8p9 is implemented:

Extended Halting Breakpoint and Watchpoint Enable. Used for save/restore of EDSCR2.EHBWE.

When OSLSR_EL1.OSLK is 0, software must treat this field as UNK/SBZP.

When OSLSR_EL1.OSLK is 1, this field holds the value of EDSCR2.EHBWE. Reads and writes of this field are indirect accesses to EDSCR2.EHBWE.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

EnSPM, bit [34]
When FEAT_SPMU is implemented:

Enable access to System PMU registers. When disabled, accesses to System PMU registers generate a trap to EL1.

EnSPM	Meaning
0b0	Accesses of the specified System PMU registers at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
0b1	Accesses of the specified System PMU registers are not trapped by this mechanism.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMOVSCLR_EL0, SPMOVSSET_EL0, and SPMSELR_EL0.

Unless the instruction generates a higher priority exception:

- If EL2 is implemented and enabled in the current Security state, and HCR_EL2.TGE is 1, then trapped instructions generate an exception to EL2.
- Otherwise, trapped instructions generate an exception to EL1.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTA, bit [33]
When FEAT_TRBE_EXT is implemented or FEAT_ETEv1p3 is implemented:

Trap Trace Accesses. Used for save/restore of EDSCR2.TTA.

When OSLSR_EL1.OSLK is 0, software must treat this field as UNK/SBZP.

When OSLSR_EL1.OSLK is 1, this field holds the value of EDSCR2.TTA. Reads and writes of this field are indirect accesses to EDSCR2.TTA.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '0', access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

EMBWE, bit [32]
When FEAT_Debugv8p9 is implemented:

Extended Monitor Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EMBWE	Meaning
0b0	Breakpoint and Watchpoint exceptions are disabled for each breakpoint <n> and watchpoint <n>, where n is greater than or equal to 16. The Effective value of MDSELR_EL1.BANK is zero at EL1.
0b1	Breakpoint and Watchpoint exceptions are not affected by this mechanism. The Effective value of MDSELR_EL1.BANK is not affected by this field.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and MDCR_EL3.EBWE is 0.
- EL2 is implemented and enabled in the current Security state, and MDCR_EL2.EBWE is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TFO, bit [31]
When FEAT_TRF is implemented:

Trace Filter override. Used for save/restore of EDSCR.TFO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TFO. Reads and writes of this bit are indirect accesses to EDSCR.TFO.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

Used for save/restore of EDSCR.RXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXfull. Reads and writes of this bit are indirect accesses to EDSCR.RXfull.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

TXfull, bit [29]

Used for save/restore of EDSCR.TXfull.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXfull. Reads and writes of this bit are indirect accesses to EDSCR.TXfull.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

Bit [28]

Reserved, RES0.

RXO, bit [27]

Used for save/restore of EDSCR.RXO.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.RXO. Reads and writes of this bit are indirect accesses to EDSCR.RXO.

When OSLSR_EL1.OSLK == 1, if bits [27,6] of the value written to MDSCR_EL1 are {1,0}, that is, the RXO bit is 1 and the ERR bit is 0, the PE sets EDSCR.{RXO,ERR} to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

TXU, bit [26]

Used for save/restore of EDSCR.TXU.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TXU. Reads and writes of this bit are indirect accesses to EDSCR.TXU.

When OSLSR_EL1.OSLK == 1, if bits [26,6] of the value written to MDSCR_EL1 are {1,0}, that is, the TXU bit is 1 and the ERR bit is 0, the PE sets EDSCR.{TXU,ERR} to UNKNOWN values.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

Bits [25:24]

Reserved, RES0.

INTdis, bits [23:22]

Used for save/restore of EDSCR.INTdis.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this field holds the value of EDSCR.INTdis. Reads and writes of this field are indirect accesses to EDSCR.INTdis.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

TDA, bit [21]

Used for save/restore of EDSCR.TDA.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.TDA. Reads and writes of this bit are indirect accesses to EDSCR.TDA.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

Bit [20]

Reserved, RES0.

SC2, bit [19]
When FEAT_PCSRv8 is implemented, FEAT_VHE is implemented, and FEAT_PCSRv8p2 is not implemented:

Used for save/restore of EDSCR.SC2.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.SC2. Reads and writes of this bit are indirect accesses to EDSCR.SC2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [18:16]

Reserved, RAZ/WI.

Hardware must implement this field as RAZ/WI. Software must not rely on the register reading as zero, and must use a read-modify-write sequence to write to the register.

MDE, bit [15]

Monitor debug events. Enable Breakpoint, Watchpoint, and Vector Catch exceptions.

MDE	Meaning
0b0	Breakpoint, Watchpoint, and Vector Catch exceptions disabled.
0b1	Breakpoint, Watchpoint, and Vector Catch exceptions enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HDE, bit [14]

Used for save/restore of EDSCR.HDE.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.HDE. Reads and writes of this bit are indirect accesses to EDSCR.HDE.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

KDE, bit [13]

Local (kernel) debug enable. If EL_D is using AArch64, enable debug exceptions within EL_D. Permitted values are:

KDE	Meaning
0b0	Debug exceptions, other than Breakpoint Instruction exceptions, disabled within EL_D.
0b1	All debug exceptions enabled within EL_D.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TDCC, bit [12]

Traps EL0 accesses to the Debug Communication Channel (DCC) registers to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, as follows:

- In AArch64 state, MRS or MSR accesses to the following DCC registers are trapped, reported using EC syndrome value 0x18:
  - MDCCSR_EL0.
  - If not in Debug state, DBGDTR_EL0, DBGDTRTX_EL0, and DBGDTRRX_EL0.
- In AArch32 state, MRC or MCR accesses to the following registers are trapped, reported using EC syndrome value 0x05.
  - DBGDSCRint, DBGDIDR, DBGDSAR, DBGDRAR.
  - If not in Debug state, DBGDTRRXint, and DBGDTRTXint.
- In AArch32 state, LDC access to DBGDTRRXint and STC access to DBGDTRTXint are trapped, reported using EC syndrome value 0x06.
- In AArch32 state, MRRC accesses to DBGDSAR and DBGDRAR are trapped, reported using EC syndrome value 0x0C.

TDCC	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	EL0 using AArch64: EL0 accesses to the AArch64 DCC registers are trapped. EL0 using AArch32: EL0 accesses to the AArch32 DCC registers are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:7]

Reserved, RES0.

ERR, bit [6]

Used for save/restore of EDSCR.ERR.

When OSLSR_EL1.OSLK == 0, software must treat this bit as UNK/SBZP.

When OSLSR_EL1.OSLK == 1, this bit holds the value of EDSCR.ERR. Reads and writes of this bit are indirect accesses to EDSCR.ERR.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- When OSLSR_EL1.OSLK == '1', access to this field is RW.
- When OSLSR_EL1.OSLK == '0', access to this field is RO.

Bits [5:1]

Reserved, RES0.

SS, bit [0]

Software step control bit. If EL_D is using AArch64, enable Software step. Permitted values are:

SS	Meaning
0b0	Software step disabled
0b1	Software step enabled.

RES0 if EL_D is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0010	0b010

MDSELR_EL1, Breakpoint and Watchpoint Selection Register

The MDSELR_EL1 characteristics are:

Purpose

Selects the current breakpoints or watchpoints accessed by System register instructions.

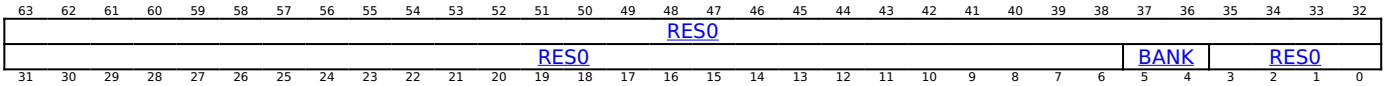
Configuration

This register is present only when FEAT_Debugv8p9 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MDSELR_EL1 are UNDEFINED.

Attributes

MDSELR_EL1 is a 64-bit register.

Field descriptions



Bits [63:6]

Reserved, RES0.

BANK, bits [5:4]

Breakpoint and watchpoint bank select.

BANK	Meaning	Applies when
0b00	Select 0 to 15.	
0b01	Select 16 to 31.	When NUM_BREAKPOINTS > 16 or NUM_WATCHPOINTS > 16
0b10	Select 32 to 47.	When NUM_BREAKPOINTS > 32 or NUM_WATCHPOINTS > 32
0b11	Select 48 to 63.	When NUM_BREAKPOINTS > 48 or NUM_WATCHPOINTS > 48

Each of the following register names accesses a register for breakpoint or watchpoint <n>, where n = UInt(MDSELR_EL1.BANK:m[3:0]):

- DBGBCR<m>_EL1.
- DBGBVR<m>_EL1.
- DBGWCR<m>_EL1.
- DBGWVR<m>_EL1.

This field is ignored by the PE and treated as zeros when any of the following are true:

- Executing at EL3 and MDCR_EL3.EBWE is 0.
- Executing at EL2 and the Effective value of MDCR_EL2.EBWE is 0.
- Executing at EL1 and the Effective value of MDSCR_EL1.EMBWE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RES0 if all the following are true:
  - NUM_BREAKPOINTS <= 16.
  - NUM_WATCHPOINTS <= 16.
- Otherwise, access to this field is RW.

Bits [3:0]

Reserved, RES0.

Accessing MDSELR_EL1

When 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI, it is IMPLEMENTATION DEFINED whether these trap controls have any effect on accesses to MDSELR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSELR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0100	0b010

MDSTEPOP_EL1, Monitor Debug Step Opcode Register

The MDSTEPOP_EL1 characteristics are:

Purpose

Used to execute instructions while Software Step is in active-not-pending state.

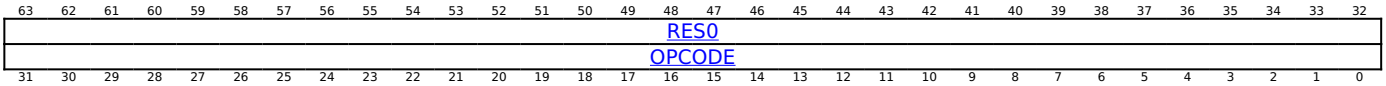
Configuration

This register is present only when FEAT_STEP2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to MDSTEPOP_EL1 are UNDEFINED.

Attributes

MDSTEPOP_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

OPCODE, bits [31:0]

A64 instruction to be executed on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MDSTEPOP_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MDSTEPOP_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0101	0b010

Field descriptions

Bits [63:4]

Reserved, RES0.

MECIDWidthm1, bits [3:0]

MECID width minus 1.

The value of this field plus 1 is the MECID width in bits, that this PE supports.

For example, the value 0b1111 indicates that this PE supports a MECID width of 16 bits, and provides 2^{16} possible MECID values.

MECIDWidth is defined as MECIDR_EL2.MECIDWidthm1 + 1.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MECIDR_EL2

For accesses from EL2 and EL3, this register is RO.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MECIDR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b1000	0b111

```
if !(IsFeatureImplemented(FEAT_MEC) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    X{64}(t) = MECIDR_EL2();
elsif PSTATE.EL == EL3 then
    X{64}(t) = MECIDR_EL2();
end;
```

MFAR_EL3, Physical Fault Address Register (EL3)

The MFAR_EL3 characteristics are:

Purpose

Records the faulting physical address for a Granule Protection Check, synchronous External abort, or SError exception taken to EL3.

Configuration

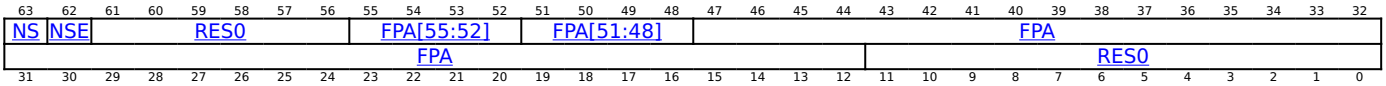
This register is present only when (FEAT_PFAR is implemented or FEAT_RME is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to MFAR_EL3 are UNDEFINED.

Attributes

MFAR_EL3 is a 64-bit register.

Field descriptions

When FEAT_RME is implemented and the exception is a GPC exception:



NS, bit [63]

Together with MFAR_EL3.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [62]

Together with MFAR_EL3.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [61:56]

Reserved, RES0.

FPA[55:52], bits [55:52]
When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to MFAR_EL3.FPA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FPA[51:48], bits [51:48]
When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to MFAR_EL3.FPA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FPA, bits [47:12]

Bits [47:12] of the Faulting Physical Address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

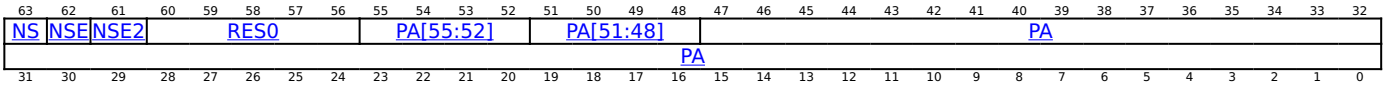
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

When FEAT_PFAR is implemented and the exception is a synchronous External abort or SError exception:



NS, bit [63]
When FEAT_RME_GDI is implemented:

Together with MFAR_EL3.NSE and MFAR_EL3.NSE2, reports the physical address space of the access that triggered the exception.

NSE2	NSE	NS	Meaning
0b0	0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b0	0b1	Non-secure.
0b0	0b1	0b0	Root.
0b0	0b1	0b1	Realm.
0b1	0b0	0b0	System Agent.
0b1	0b0	0b1	NS Protected.
0b1	0b1	0b0	Reserved.
0b1	0b1	0b1	Reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is implemented:

Together with MFAR_EL3.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [62]
When FEAT_RME is implemented:

Together with MFAR_EL3.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE2, bit [61]
When FEAT_RME_GDI is implemented:

Together with MFAR_EL3.NS and MFAR_EL3.NSE, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS, NSE, and NSE2 together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [60:56]

Reserved, RES0.

PA[55:52], bits [55:52]
When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to MFAR_EL3.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]
When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to MFAR_EL3.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA, bits [47:0]

Physical Address. Bits [47:0] of the aborting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED and no larger than the larger than:

- The size of the range of values permitted to be recorded in FAR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MFAR_EL3

MFAR_EL3 is not valid and reads UNKNOWN if ESR_EL3.EC is recorded indicating an Abort or SError exception and ESR_EL3.PFV is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MFAR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0110	0b0000	0b101

```
if !((IsFeatureImplemented(FEAT_PFAR) || IsFeatureImplemented(FEAT_RME)) && IsFeatureImplemented(FEAT_AA64)) then

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

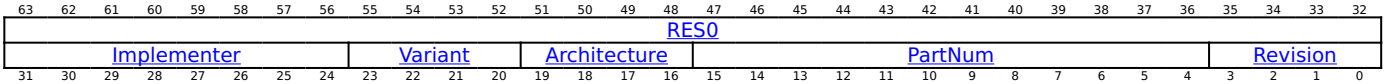
AArch64 System register MIDR_EL1 bits [31:0] are architecturally mapped to External register MIDR_EL1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MIDR_EL1 are UNDEFINED.

Attributes

MIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is RO.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture, bits [19:16]

Architecture version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b000

```

MLBI ALLE1, MLB Invalidate All

The MLBI ALLE1 characteristics are:

Purpose

Invalidates all cached MPAM translations and MITT base addresses associated with the current Security state of EL2.

The completion of a subsequent DSB instruction that applies to both loads and stores guarantees that the MLBI operation is complete.

If SCR_EL3.NS is 0 and SCR_EL3.EEL2 is 0, no MLB entries are guaranteed to be invalidated.

Configuration

This instruction is present only when FEAT_MPAMv2_VID is implemented. Otherwise, direct accesses to MLBI ALLE1 are UNDEFINED.

Attributes

MLBI ALLE1 is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing MLBI ALLE1

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MLBI ALLE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b0111	0b0000	0b100

```
if !IsFeatureImplemented(FEAT_MPAMv2_VID) then

        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch64_MLBI_ALL(PSTATE.EL);
elsif PSTATE.EL == EL3 then
    AArch64_MLBI_ALL(PSTATE.EL);
end;
```

2025-12-10 16:11:30, 2025-12_rel

MLBI VMALLE1, MLB Invalidate by VMID

The MLBI VMALLE1 characteristics are:

Purpose

Invalidate cached MPAM translations and MITT base addresses associated with the current VMID and the current Security state of EL2.

The completion of a subsequent DSB instruction that applies to both loads and stores guarantees that the MLBI operation is complete.

If SCR_EL3.NS is 0 and SCR_EL3.EEL2 is 0, no MLB entries are guaranteed to be invalidated.

Configuration

This instruction is present only when FEAT_MPAMv2_VID is implemented. Otherwise, direct accesses to MLBI VMALLE1 are UNDEFINED.

Attributes

MLBI VMALLE1 is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing MLBI VMALLE1

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MLBI VMALLE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b0111	0b0000	0b101

    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch64_MLBI_VMALL(PSTATE.EL, VMID());
elsif PSTATE.EL == EL3 then
    AArch64_MLBI_VMALL(PSTATE.EL, VMID());
end;
```

2025-12-10 16:11:30, 2025-12_rel

MLBI VPIDE1, MLB Invalidate by Virtual PARTID and VMID

The MLBI VPIDE1 characteristics are:

Purpose

Invalidate cached MPAM translations associated with the specified vPARTID, the current VMID, and the current Security state of EL2.

The completion of a subsequent DSB instruction that applies to both loads and stores guarantees that the MLBI operation is complete.

If SCR_EL3.NS is 0 and SCR_EL3.EEL2 is 0, no MLB entries are guaranteed to be invalidated.

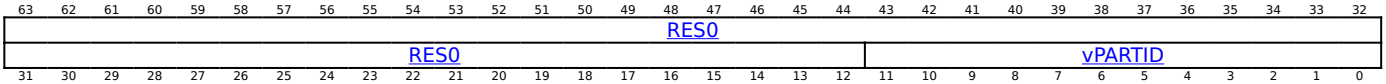
Configuration

This instruction is present only when FEAT_MPAMv2_VID is implemented. Otherwise, direct accesses to MLBI VPIDE1 are UNDEFINED.

Attributes

MLBI VPIDE1 is a 64-bit System instruction.

Field descriptions



Bits [63:12]

Reserved, RES0.

vPARTID, bits [11:0]

The Virtual PARTID to be invalidated

Executing MLBI VPIDE1

Accesses to this instruction use the following encodings in the System instruction encoding space:

MLBI VPIDE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b0111	0b0000	0b110

```
if !IsFeatureImplemented(FEAT_MPAMv2_VID) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then

        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch64_MLBI_VPID(PSTATE.EL, VMID(), X{64}(t));
elsif PSTATE.EL == EL3 then
    AArch64_MLBI_VPID(PSTATE.EL, VMID(), X{64}(t));
end;
```

2025-12-10 16:11:30, 2025-12_rel

MLBI VPMGE1, MLB Invalidate by Virtual PMG and VMID

The MLBI VPMGE1 characteristics are:

Purpose

Invalidate cached MPAM translations associated with the specified vPMG, the current VMID, and the current Security state of EL2.

The completion of a subsequent DSB instruction that applies to both loads and stores guarantees that the MLBI operation is complete.

If SCR_EL3.NS is 0 and SCR_EL3.EEL2 is 0, no MLB entries are guaranteed to be invalidated.

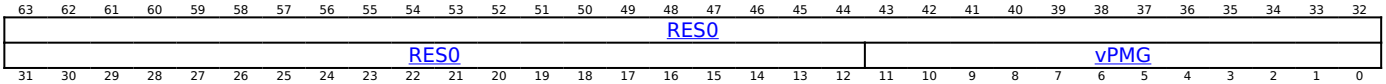
Configuration

This instruction is present only when FEAT_MPAMv2_VID is implemented. Otherwise, direct accesses to MLBI VPMGE1 are UNDEFINED.

Attributes

MLBI VPMGE1 is a 64-bit System instruction.

Field descriptions



Bits [63:12]

Reserved, RES0.

vPMG, bits [11:0]

The Virtual PMG to be invalidated

Executing MLBI VPMGE1

Accesses to this instruction use the following encodings in the System instruction encoding space:

MLBI VPMGE1{, <Xt>}

op0	op1	CRn	CRm	op2
0b01	0b100	0b0111	0b0000	0b111

```
if !IsFeatureImplemented(FEAT_MPAMv2_VID) then

    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch64_MLBI_VPMG(PSTATE.EL, VMID(), X{64}(t));
elsif PSTATE.EL == EL3 then
    AArch64_MLBI_VPMG(PSTATE.EL, VMID(), X{64}(t));
end;
```

2025-12-10 16:11:30, 2025-12_rel

MPAM0_EL1, MPAM0 Register (EL1)

The MPAM0_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL0.

Configuration

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM0_EL1 are UNDEFINED.

If FEAT_MPAM is implemented, EL2 is implemented and enabled in the current Security state, and the MPAM virtualization option is present, then:

- If MPAMHCR_EL2.GSTAPP_PLK == 1 and the Effective value of HCR_EL2.TGE is 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM information to label memory requests.
- If the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1} and MPAMHCR_EL2.EL0_VPMEN == 1, then MPAM PARTIDs in MPAM0_EL1 are virtual and mapped into physical PARTIDs for the current Security state.

Attributes

MPAM0_EL1 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

altPARTID																PARTID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

altPMG, bits [63:48]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative performance monitoring group for accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMG, bits [47:32]

Performance monitoring group for accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

altPARTID, bits [31:16]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative Partition ID for accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

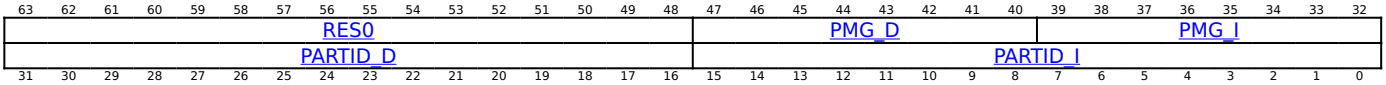
PARTID, bits [15:0]

Partition ID for accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM0_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM0_EL1

MPAM1_EL1, MPAM1 Register (EL1)

The MPAM1_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL1.

Configuration

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented) and EL3 is implemented.

AArch64 System register MPAM1_EL1 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), EL3 is not implemented, and EL2 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM1_EL1 are UNDEFINED.

If FEAT_MPAMv1p0 or FEAT_MPAMv0p1 is implemented, EL2 is implemented and enabled in the current Security state, and the MPAM virtualization option is present, then:

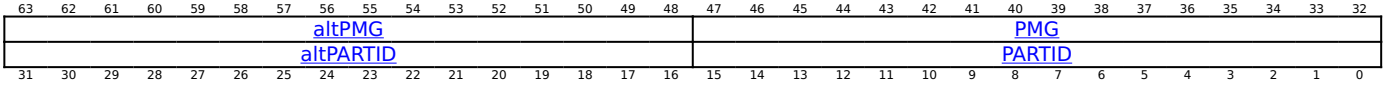
- If MPAMHCR_EL2.GSTAPP_PLK == 1 and the Effective value of HCR_EL2.TGE is 0, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests when executing at EL0.
- If MPAMHCR_EL2.EL1_VPMEN == 1, MPAM PARTIDs in MPAM1_EL1 are virtual and mapped into physical PARTIDs for the current Security state. This mapping of MPAM1_EL1 virtual PARTIDs to physical PARTIDs when EL1_VPMEN is 1 also applies when MPAM1_EL1 is used at EL0 due to MPAMHCR_EL2.GSTAPP_PLK.

Attributes

MPAM1_EL1 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:



altPMG, bits [63:48]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative performance monitoring group for accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMG, bits [47:32]

Performance monitoring group for accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

altPARTID, bits [31:16]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative Partition ID for accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

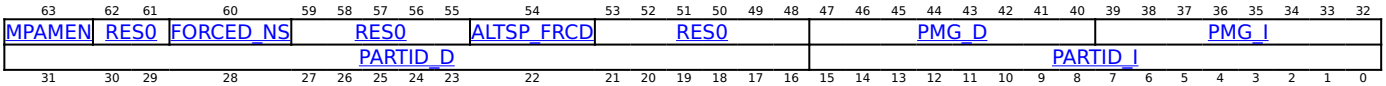
PARTID, bits [15:0]

Partition ID for accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == '0'.
- Access to this field is RAO/WI if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == '1'.
- Access to this field is RAZ/WI if all the following are true:
  - EL3 is not implemented.
  - EL2 is implemented.
  - MPAM2_EL2.MPAMEN == '0'.
- Access to this field is RAO/WI if all the following are true:
  - EL3 is not implemented.
  - EL2 is implemented.
  - MPAM2_EL2.MPAMEN == '1'.

Bits [62:61]

Reserved, RES0.

FORCED_NS, bit [60]
When FEAT_MPAMv0p1 is implemented:

In the Secure state, FORCED_NS indicates the state of MPAM3_EL3.FORCE_NS.

FORCED_NS	Meaning
0b0	In the Non-secure state, always reads as 0. In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 0.
0b1	In the Secure state, indicates that MPAM3_EL3.FORCE_NS == 1.

Always reads as 0 in the Non-secure state.

Writes are ignored.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [59:55]

Reserved, RES0.

ALTSP_FRCD, bit [54]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Alternative PARTID forced for PARTIDs in this register.

ALTSP_FRCD	Meaning
0b0	The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the primary PARTID space.
0b1	The PARTIDs in MPAM1_EL1 and MPAM0_EL1 are using the alternative PARTID space.

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state.

In MPAM1_EL1, it also indicates that MPAM0_EL1 is forced to use alternative PARTID space.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

Accessing this field has the following behavior:

- When !UsePrimarySpaceEL10(), access to this field is RAO/WI.
- Otherwise, access to this field is RAZ/WI.

Otherwise:

Reserved, RES0.

Bits [53:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group property for PARTID_I.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM1_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MPAM1_EL1 or MPAM1_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MPAM2_EL2, MPAM2 Register (EL2)

The MPAM2_EL2 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL2.

Configuration

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM3_EL3[63] when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented) and EL3 is implemented.

AArch64 System register MPAM2_EL2 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63] when FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM2_EL2 are UNDEFINED.

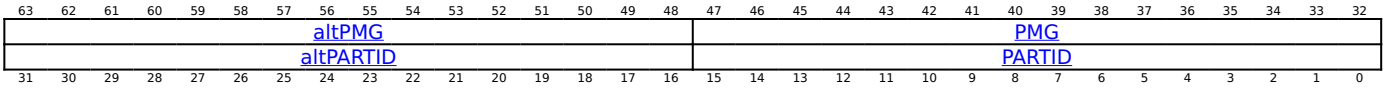
This register has no effect on execution at EL1 and EL0, if EL2 is not enabled in the current Security state.

Attributes

MPAM2_EL2 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:



altPMG, bits [63:48]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative performance monitoring group for accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMG, bits [47:32]

Performance monitoring group for accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

altPARTID, bits [31:16]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative Partition ID for accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

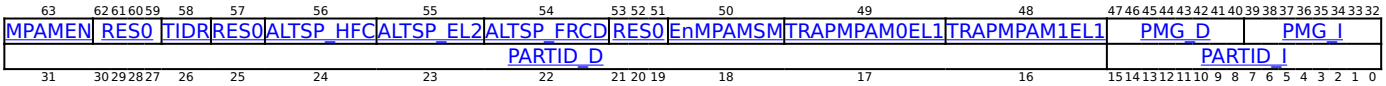
PARTID, bits [15:0]

Partition ID for accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according to the MPAM configuration.

If EL3 is implemented, this field is read-only and reads the current value of the read/write MPAM3_EL3.MPAMEN bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == '0'.
- Access to this field is RAO/WI if all the following are true:
  - EL3 is implemented.
  - MPAM3_EL3.MPAMEN == '1'.
- When EL3 is not implemented, access to this field is RW.

Bits [62:59]

Reserved, RES0.

TIDR, bit [58]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_TIDR == '1':

TIDR traps accesses to MPAMIDR_EL1 from EL1 to EL2.

TIDR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Trap accesses to MPAMIDR_EL1 from EL1 to EL2.

MPAMHCR_EL2.TRAP_MPAMIDR_EL1 == 1 also traps MPAMIDR_EL1 accesses from EL1 to EL2. If either TIDR or TRAP_MPAMIDR_EL1 are 1, accesses are trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [57]

Reserved, RES0.

ALTSP_HFC, bit [56]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Hierarchical force of alternative PARTID space controls. When MPAM3_EL3.ALTSP_HEN is 0, ALTSP controls in MPAM2_EL2 have no effect. When MPAM3_EL3.ALTSP_HEN is 1, this bit selects whether the PARTIDs in MPAM1_EL1 and MPAM0_EL1 are in the primary (0) or alternative (1) PARTID space for the security state.

ALTSP_HFC	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 1, the PARTID space of MPAM1_EL1.PARTID_I, MPAM1_EL1.PARTID_D, MPAM0_EL1.PARTID_I, and MPAM0_EL1.PARTID_D are in the primary PARTID space for the Security state.
0b1	When MPAM3_EL3.ALTSP_HEN is 1, the PARTID space of MPAM1_EL1.PARTID_I, MPAM1_EL1.PARTID_D, MPAM0_EL1.PARTID_I, and MPAM0_EL1.PARTID_D are in the alternative PARTID space for the Security state.

This control has no effect when MPAM3_EL3.ALTSP_HEN is 0.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL2, bit [55]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Select alternative PARTID space for PARTIDs in MPAM2_EL2 when MPAM3_EL3.ALTSP_HEN is 1.

ALTSP_EL2	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 1, selects the primary PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D.
0b1	When MPAM3_EL3.ALTSP_HEN is 1, selects the alternative PARTID space for MPAM2_EL2.PARTID_I and MPAM2_EL2.PARTID_D.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_FRCD, bit [54]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Alternative PARTID forced for PARTIDs in this register.

ALTSP_FRCD	Meaning
0b0	The PARTIDs in this register are using the primary PARTID space.
0b1	The PARTIDs in this register are using the alternative PARTID space.

This bit indicates that a higher Exception level has forced the PARTIDs in this register to use the alternative PARTID space defined for the current Security state. In EL2, it is also 1 when MPAM2_EL2.ALTSP_EL2 is 1.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When !UsePrimarySpaceEL2(), access to this field is RAO/WI.
- Otherwise, access to this field is RAZ/WI.

Otherwise:

Reserved, RES0.

Bits [53:51]

Reserved, RES0.

EnMPAMSM, bit [50]
When FEAT_SME is implemented:

Traps execution at EL1 of instructions that directly access the MPAMSM_EL1 register to EL2. The exception is reported using ESR_ELx.EC syndrome value 0x18.

EnMPAMSM	Meaning
0b0	This control causes execution of these instructions at EL1 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

This field has no effect on accesses to MPAMSM_EL1 from EL2 or EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRAPMPAM0EL1, bit [49]

Trap accesses from EL1 to the MPAM0_EL1 register trap to EL2.

TRAPMPAM0EL1	Meaning
0b0	Accesses to MPAM0_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM0_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to '1'.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

TRAPMPAM1EL1, bit [48]

Trap accesses from EL1 to the MPAM1_EL1 register trap to EL2.

TRAPMPAM1EL1	Meaning
0b0	Accesses to MPAM1_EL1 from EL1 are not trapped.
0b1	Accesses to MPAM1_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to '1'.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MPAM2_EL2 or MPAM1_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM2_EL2

MPAM3_EL3, MPAM3 Register (EL3)

The MPAM3_EL3 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests when executing at EL3.

Configuration

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM2_EL2[63] when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), FEAT_MPAMv2 is not implemented, and EL2 is implemented.

AArch64 System register MPAM3_EL3 bit [63] is architecturally mapped to AArch64 System register MPAM1_EL1[63] when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented) and FEAT_MPAMv2 is not implemented.

This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAM3_EL3 are UNDEFINED.

Attributes

MPAM3_EL3 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
altPMG																PMG															
altPARTID																PARTID															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

altPMG, bits [63:48]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative performance monitoring group for accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMG, bits [47:32]

Performance monitoring group for accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

altPARTID, bits [31:16]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Alternative Partition ID for accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

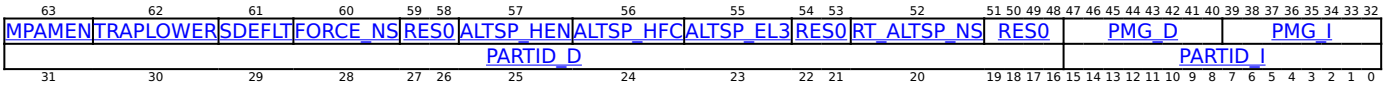
PARTID, bits [15:0]

Partition ID for accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

Values of this field are:

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information when executing at any ELn.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is RW.

TRAPLOWER, bit [62]

Trap direct accesses to MPAM System registers that are not UNDEFINED from all ELn lower than EL3.

TRAPLOWER	Meaning
0b0	Do not force trapping of direct accesses of MPAM System registers to EL3.
0b1	Force direct accesses of MPAM System registers to trap to EL3.

Note

This trap is higher priority than any of the traps controlled by MPAM _EL2 registers.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

SDEFLT, bit [61]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMIDR_EL1.HAS_SDEFLT == '1':

SDEFLT overrides the PARTID and PMG with the default PARTID and default PMG when executing in the Secure state.

SDEFLT	Meaning
0b0	The PARTID and PMG are determined normally in the Secure state.
0b1	When executing in the Secure state, the PARTID is always PARTID 0, and the PMG is always PMG 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FORCE_NS, bit [60]
When FEAT_MPAMv0p1 is implemented and MPAMIDR_EL1.HAS_FORCE_NS == '1':

FORCE_NS forces MPAM_NS to always be 1 in the Secure state.

FORCE_NS	Meaning
0b0	MPAM_NS is 0 when executing in the Secure state.
0b1	MPAM_NS is 1 when executing in the Secure state.

An implementation is permitted to have this field as RAO if the implementation does not support generating MPAM_NS as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [59:58]

Reserved, RES0.

ALTSP_HEN, bit [57]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Hierarchical enable for alternative PARTID space controls. Alternative PARTID space controls in MPAM2_EL2 have no effect when this field is zero.

ALTSP_HEN	Meaning
0b0	Disable alternative PARTID space controls in MPAM2_EL2. The PARTID space for PARTIDs in MPAM2_EL2, MPAM1_EL1, and MPAM0_EL1 is selected by MPAM3_EL3.ALTSP_HFC.
0b1	Enable alternative PARTID space controls in MPAM2_EL2 to control the PARTID space used for PARTIDs in MPAM2_EL2, MPAM1_EL1, and MPAM0_EL1.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_HFC, bit [56]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Hierarchical force of alternative PARTID space controls. When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space for PARTIDs in MPAM2_EL2, MPAM1_EL1, and MPAM0_EL1 is selected by the value of this bit.

ALTSP_HFC	Meaning
0b0	When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2.PARTID, MPAM1_EL1.PARTID and MPAM0_EL1.PARTID are the primary PARTID space for the security state.
0b1	When MPAM3_EL3.ALTSP_HEN is 0, the PARTID space of MPAM2_EL2.PARTID and MPAM1_EL1.PARTID and MPAM0_EL1.PARTID are the alternative PARTID space for the security state.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALTSP_EL3, bit [55]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Select alternative PARTID space for PARTIDs in MPAM3_EL3.

ALTSP_EL3	Meaning
0b0	Selects the primary PARTID space of MPAM3_EL3.PARTID_I and MPAM3_EL3.PARTID_D.
0b1	Selects the alternative PARTID space of MPAM3_EL3.PARTID_I and MPAM3_EL3.PARTID_D.

For more information, see 'In a PE with FEAT_RME, selection of primary or alternative PARTID space'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Bits [54:53]

Reserved, RES0.

RT_ALTSP_NS, bit [52]
When FEAT_RME is implemented and MPAMIDR_EL1.HAS_ALTSP == '1':

Selects whether the alternative PARTID space for the Root security state is the Secure PARTID space or the Non-secure PARTID space. MPAM3_EL3.RT_ALTSP_NS selects the alternative PARTID space for the Root Security state when MPAM3_EL3.ALTSP_EL3 == 1.

RT_ALTSP_NS	Meaning
0b0	The alternative PARTID space in the Root security state is the Secure PARTID space.
0b1	The alternative PARTID space in the Root security state is the Non-secure PARTID space.

This field has no effect except in the Root security state (EL3).

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Bits [51:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group for data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMG_I, bits [39:32]

Performance monitoring group for instruction accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_D, bits [31:16]

Partition ID for data accesses, including load and store accesses, made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID_I, bits [15:0]

Partition ID for instruction accesses made from EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAM3_EL3

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAM3_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_MPAM) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = MPAM3_EL3();
end;
```

MSR MPAM3_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b000

```
if !IsFeatureImplemented(FEAT_MPAM) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_FGWTE3) && FGWTE3_EL3().MPAM3_EL3 == '1' then
        AArch64_SystemAccessTrap(EL3, 0x18);
    else
        MPAM3_EL3() = X{64}(t);
    end;
end;
```

MPAMBW0_EL1, MPAM PE-side Maximum-bandwidth Control Register (EL0)

The MPAMBW0_EL1 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL0 with its current PARTID.

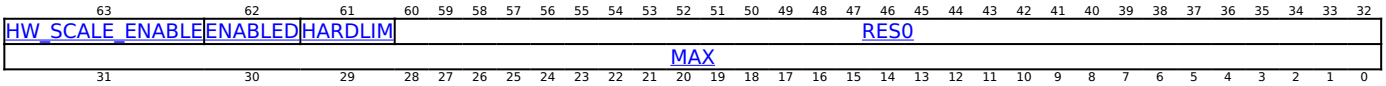
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW0_EL1 are UNDEFINED.

Attributes

MPAMBW0_EL1 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]
When MPAMBWIDR_EL1.HAS_HW_SCALE == '1':

Enables hardware bandwidth scaling of the MPAMBW0_EL1.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL0 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL0 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL0.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL0 is disabled.
0b1	The PE-side memory bandwidth control in EL0 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW0_EL1.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW0_EL1.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW0_EL1.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MPAMBWIDR_EL1.MAX_LIM == '00', access to this field is RW.
- When MPAMBWIDR_EL1.MAX_LIM == '01', access to this field is RAZ/WI.
- When MPAMBWIDR_EL1.MAX_LIM == '10', access to this field is RAO/WI.

Bits [60:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '1' and MPAMBW0_EL1.HW_SCALE_ENABLE == '1'

MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL0 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '0' or MPAMBW0_EL1.HW_SCALE_ENABLE == '0'

Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL0 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW0_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMBW0_EL1

MPAMBW1_EL1, MPAM PE-side Maximum-bandwidth Control Register (EL1)

The MPAMBW1_EL1 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL1 with its current PARTID.

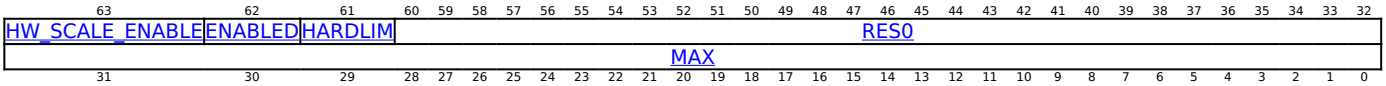
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW1_EL1 are UNDEFINED.

Attributes

MPAMBW1_EL1 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]
When MPAMBWIDR_EL1.HAS_HW_SCALE == '1':

Enables hardware bandwidth scaling of the MPAMBW1_EL1.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL1 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL1 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL1.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL1 is disabled.
0b1	The PE-side memory bandwidth control in EL1 is enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW1_EL1.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW1_EL1.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW1_EL1.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MPAMBWIDR_EL1.MAX_LIM == '00', access to this field is RW.
- When MPAMBWIDR_EL1.MAX_LIM == '01', access to this field is RAZ/WI.
- When MPAMBWIDR_EL1.MAX_LIM == '10', access to this field is RAO/WI.

Bits [60:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '1' and MPAMBW1_EL1.HW_SCALE_ENABLE == '1'

MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL1 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '0' or MPAMBW1_EL1.HW_SCALE_ENABLE == '0'

Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL1 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW1_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MPAMBW1_EL1 or MPAMBW1_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMBW1_EL1

op0	op1	CRn	CRm	op2

0b11	0b000	0b1010	0b0101	0b100

```

MPAMBW2_EL2, MPAM PE-side Maximum-bandwidth Control Register (EL2)

The MPAMBW2_EL2 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL2 with its current PARTID.

Configuration

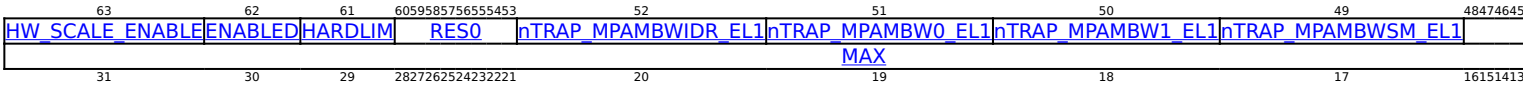
This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMBW2_EL2 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]
When MPAMBWIDR_EL1.HAS_HW_SCALE == '1':

Enables hardware bandwidth scaling of the MPAMBW2_EL2.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL2 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL2 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL2.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL2 is disabled.
0b1	The PE-side memory bandwidth control in EL2 is enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW2_EL2.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW2_EL2.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW2_EL2.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MPAMBWIDR_EL1.MAX_LIM == '00', access to this field is RW.
- When MPAMBWIDR_EL1.MAX_LIM == '01', access to this field is RAZ/WI.
- When MPAMBWIDR_EL1.MAX_LIM == '10', access to this field is RAO/WI.

Bits [60:53]

Reserved, RES0.

nTRAP_MPAMBWIDR_EL1, bit [52]

Traps accesses to MPAMBWIDR_EL1 from EL1 to EL2.

nTRAP_MPAMBWIDR_EL1	Meaning
0b0	Accesses to MPAMBWIDR_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBWIDR_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTRAP_MPAMBW0_EL1, bit [51]

Traps accesses to MPAMBW0_EL1 from EL1 to EL2.

nTRAP_MPAMBW0_EL1	Meaning
0b0	Accesses to MPAMBW0_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBW0_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTRAP_MPAMBW1_EL1, bit [50]

Traps accesses to MPAMBW1_EL1 from EL1 to EL2.

nTRAP_MPAMBW1_EL1	Meaning
0b0	Accesses to MPAMBW1_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBW1_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTRAP_MPAMBWSM_EL1, bit [49]
When FEAT_SME is implemented:

Traps accesses to MPAMBWSM_EL1 from EL1 to EL2.

nTRAP_MPAMBWSM_EL1	Meaning
0b0	Accesses to MPAMBWSM_EL1 from EL1 are trapped to EL2 with EC syndrome value 0x18.
0b1	Accesses to MPAMBWSM_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [48:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '1' and MPAMBW2_EL2.HW_SCALE_ENABLE == '1'

MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL2 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '0' or MPAMBW2_EL2.HW_SCALE_ENABLE == '0'

Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL2 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MPAMBW2_EL2 or MPAMBW1_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMBW2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0101	0b100

```

MPAMBW3_EL3, MPAM PE-side Maximum-bandwidth Control Register (EL3)

The MPAMBW3_EL3 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted to use when executing at EL3 with its current PARTID.

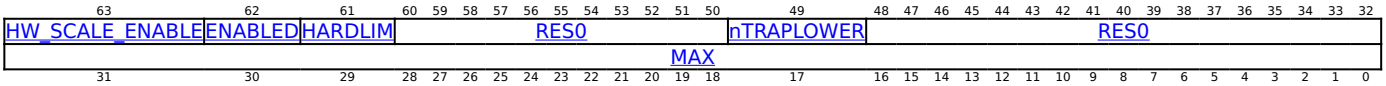
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBW3_EL3 are UNDEFINED.

Attributes

MPAMBW3_EL3 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]
When MPAMBWIDR_EL1.HAS_HW_SCALE == '1':

Enables hardware bandwidth scaling of the MPAMBW3_EL3.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling in EL3 is disabled.
0b1	PE-side memory bandwidth control hardware scaling in EL3 is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control when in EL3.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control in EL3 is disabled.
0b1	The PE-side memory bandwidth control in EL3 is enabled.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

HARDLIM, bit [61]

PE-side Maximum Bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBW3_EL3.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBW3_EL3.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBW3_EL3.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MPAMBWIDR_EL1.MAX_LIM == '00', access to this field is RW.
- When MPAMBWIDR_EL1.MAX_LIM == '01', access to this field is RAZ/WI.
- When MPAMBWIDR_EL1.MAX_LIM == '10', access to this field is RAO/WI.

Bits [60:50]

Reserved, RES0.

nTRAPLOWER, bit [49]

Traps accesses to MPAMBW2_EL2, MPAMBWCAP_EL2, MPAMBW1_EL1, MPAMBW0_EL1, MPAMBWSM_EL1, MPAMBWIDR_EL1 from any lower EL to EL3.

nTRAPLOWER	Meaning
0b0	Accesses to MPAMBW2_EL2, MPAMBWCAP_EL2, MPAMBW1_EL1, MPAMBW0_EL1, MPAMBWSM_EL1, MPAMBWIDR_EL1 from EL1 are trapped to EL3 with EC syndrome value 0x18.
0b1	Accesses to MPAMBW2_EL2, MPAMBWCAP_EL2, MPAMBW1_EL1, MPAMBW0_EL1, MPAMBWSM_EL1, MPAMBWIDR_EL1 from EL1 are not trapped by this mechanism.

Note

This trap is higher priority than any of the traps controlled by MPAM _EL2 registers.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Bits [48:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '1' and MPAMBW3_EL3.HW_SCALE_ENABLE == '1'

MAX, bits [31:0]

Maximum memory bandwidth allocated to the PE when executing at EL3 with its current PARTID.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '0' or MPAMBW3_EL3.HW_SCALE_ENABLE == '0'

Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the PE when executing at EL3 with its current PARTID.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMBW3_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMBW3_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b100

```
if !IsFeatureImplemented(FEAT_MPAM_PE_BW_CTRL) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = MPAMBW3_EL3();
end;
```

MSR MPAMBW3_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b100

```
if !IsFeatureImplemented(FEAT_MPAM_PE_BW_CTRL) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    MPAMBW3_EL3() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

MPAMBWCAP_EL2, MPAM PE-side Maximum-bandwidth Limit Virtualization Register

The MPAMBWCAP_EL2 characteristics are:

Purpose

Allows software executing at EL2 to provide MPAMBWCAP_EL2.CAP as an upper bound to MPAMBW1_EL1.MAX.

If FEAT_SME is implemented, the upper bound also applies to MPAMBWSM_EL1.MAX when executing at EL1: the maximum bandwidth allowed for the PE is MIN(MPAMBWSM_EL1.MAX, MPAMBWCAP_EL2.CAP).

If the Effective value of HCR_EL2.{E2H,TGE} is not {1,1}:

- The upper bound also applies to MPAMBW0_EL1.MAX: the maximum bandwidth allowed for the PE is MIN(MPAMBW0_EL1.MAX, MPAMBWCAP_EL2.CAP).
- If FEAT_SME is implemented, the upper bound also applies to MPAMBWSM_EL1.MAX when executing at EL0: the maximum bandwidth allowed for the PE is MIN(MPAMBWSM_EL1.MAX, MPAMBWCAP_EL2.CAP).

If MPAMBWCAP_EL2.ENABLED is 1, a PARTID that has used more than min(CAP,MAX) is given no access to additional bandwidth.

Configuration

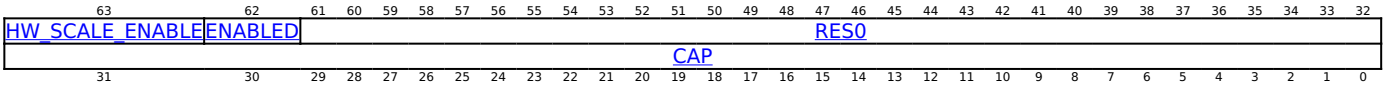
This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented and MPAMIDR_EL1.HAS_HCR == '1'. Otherwise, direct accesses to MPAMBWCAP_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMBWCAP_EL2 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]
When MPAMBWIDR_EL1.HAS_HW_SCALE == '1':

Enables hardware bandwidth scaling of the MPAMBWCAP_EL2.CAP value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling for EL2 capping is disabled.
0b1	PE-side memory bandwidth control hardware scaling for EL2 capping is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control capping by EL2.

ENABLED	Meaning
0b0	The PE-side memory bandwidth control capping by EL2 is disabled.
0b1	The PE-side memory bandwidth control capping by EL2 is enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [61:32]

Reserved, RES0.

CAP, bits [31:0]

CAP encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '1' and MPAMBWCAP_EL2.HW_SCALE_ENABLE == '1'

CAP, bits [31:0]

Upper bound to the maximum memory bandwidth allocated to the current PARTID in MPAMBW1_EL1.MAX, MPAMBW0_EL1.MAX and MPAMBWSM_EL1.MAX.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The value set in the MAX field must be less than or equal to this upper bound.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CAP encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '0' or MPAMBWCAP_EL2.HW_SCALE_ENABLE == '0'

Bits [31:16]

Reserved, RES0.

CAP, bits [15:0]

Upper bound to the maximum memory bandwidth allocated to the current PARTID in MPAMBW1_EL1.MAX, MPAMBW0_EL1.MAX and MPAMBWSM_EL1.MAX.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The value set in the MAX field must be less than or equal to this upper bound.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMBWIDR_EL1, MPAM PE-side Bandwidth Controls ID Register

The MPAMBWIDR_EL1 characteristics are:

Purpose

Indicates the supported PE-side memory bandwidth parameter values.

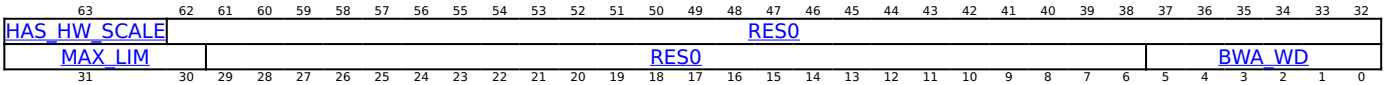
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented. Otherwise, direct accesses to MPAMBWIDR_EL1 are UNDEFINED.

Attributes

MPAMBWIDR_EL1 is a 64-bit register.

Field descriptions



HAS_HW_SCALE, bit [63]

Indicates whether hardware support for auto-scaling of MPAMBWn_ELx.MAX, MPAMBWSM_EL1.MAX and MPAMBWCAP_EL2.CAP limits is available.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_HW_SCALE	Meaning
0b0	Hardware support for auto-scaling is not implemented.
0b1	Hardware support for auto-scaling is implemented.

Access to this field is RO.

Bits [62:32]

Reserved, RES0.

MAX_LIM, bits [31:30]

Indicates the implemented maximum-bandwidth limit partitioning behaviors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MAX_LIM	Meaning
0b00	Both soft limit and hard limit behaviors are implemented.
0b01	Soft limit behavior is implemented.
0b10	Hard limit behavior is implemented.
0b11	Reserved.

Access to this field is RO.

Bits [29:6]

Reserved, RES0.

BWA_WD, bits [5:0]

Indicates the number of implemented bits in the bandwidth allocation fields MPAMBWn_ELx.MAX, MPAMBWSM_EL1.MAX and MPAMBWCAP_EL2.CAP.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BWA_WD	Meaning
0b000001..0b010000	Number of implemented bits in the bandwidth allocation fields.

Access to this field is RO.

Accessing MPAMBWIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMBWIDR_EL1

MPAMBWSM_EL1, MPAM Streaming Mode Bandwidth Control Register (EL1)

The MPAMBWSM_EL1 characteristics are:

Purpose

Enables software to configure a maximum fraction of memory bandwidth that the PE is permitted for SME memory accesses labelled with values from MPAMSM_EL1.

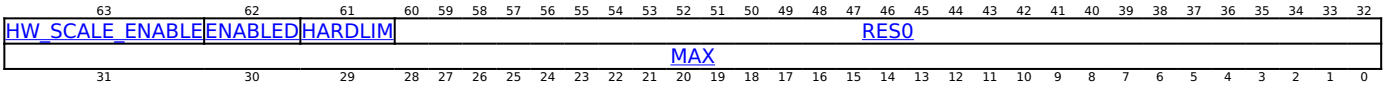
Configuration

This register is present only when FEAT_MPAM_PE_BW_CTRL is implemented and FEAT_SME is implemented. Otherwise, direct accesses to MPAMBWSM_EL1 are UNDEFINED.

Attributes

MPAMBWSM_EL1 is a 64-bit register.

Field descriptions



HW_SCALE_ENABLE, bit [63]
When MPAMBWIDR_EL1.HAS_HW_SCALE == '1':

Enables hardware bandwidth scaling of the MPAMBWSM_EL1.MAX value.

HW_SCALE_ENABLE	Meaning
0b0	PE-side memory bandwidth control hardware scaling for streaming PARTIDs is disabled.
0b1	PE-side memory bandwidth control hardware scaling for streaming PARTIDs is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ENABLED, bit [62]

Enables the PE-side memory bandwidth control for streaming PARTIDs.

ENABLED	Meaning
0b0	PE-side memory bandwidth control for streaming PARTIDs is disabled.
0b1	PE-side memory bandwidth control for streaming PARTIDs is enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

HARDLIM, bit [61]

PE-side Maximum-bandwidth Limit Behavior Selection.

HARDLIM	Meaning
0b0	Soft limit: when MPAMBWSM_EL1.MAX bandwidth is exceeded, the PE is unregulated unless the downstream memory path is saturated. It is IMPLEMENTATION DEFINED how hardware determines when the downstream memory path is saturated.
0b1	Hard limit: when MPAMBWSM_EL1.MAX bandwidth is exceeded, the PE does not use any more bandwidth until the memory bandwidth for the PE falls below MPAMBWSM_EL1.MAX.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MPAMBWIDR_EL1.MAX_LIM == '00', access to this field is RW.
- When MPAMBWIDR_EL1.MAX_LIM == '01', access to this field is RAZ/WI.
- When MPAMBWIDR_EL1.MAX_LIM == '10', access to this field is RAO/WI.

Bits [60:32]

Reserved, RES0.

MAX, bits [31:0]

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '1' and MPAMBWSM_EL1.HW_SCALE_ENABLE == '1'

MAX, bits [31:0]

Maximum memory bandwidth allocated to the partition selected by MPAMSM_EL1.PARTID_D.

The value is represented as a multiplier of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [31:16] represent the integer part of the value.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MAX encoding when MPAMBWIDR_EL1.HAS_HW_SCALE == '0' or MPAMBWSM_EL1.HW_SCALE_ENABLE == '0'

Bits [31:16]

Reserved, RES0.

MAX, bits [15:0]

Maximum memory bandwidth allocated to the partition selected by MPAMSM_EL1.PARTID_D.

The value is represented as a fraction of the available bandwidth for the PE. The value is represented in base-2 fixed-point format.

Bits [15:(16 - MPAMBWIDR_EL1.BWA_WD)] represent the fractional part of the value. When MPAMBWIDR_EL1.BWA_WD indicates a width less than 16 bits, bits [(15 - MPAMBWIDR_EL1.BWA_WD):0] are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMCTL_EL1, MPAM Control Register (EL1)

The MPAMCTL_EL1 characteristics are:

Purpose

Controls the generation of MPAM information for memory requests when executing at EL1 and EL0.

Configuration

AArch64 System register MPAMCTL_EL1 bit [63] is architecturally mapped to AArch64 System register MPAMCTL_EL3[63] when EL3 is implemented.

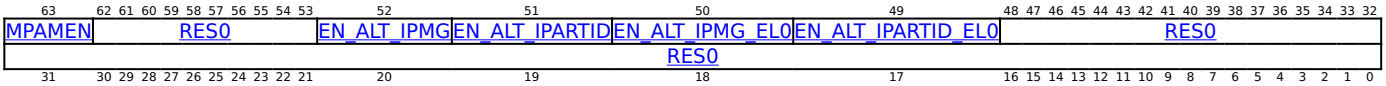
AArch64 System register MPAMCTL_EL1 bit [63] is architecturally mapped to AArch64 System register MPAMCTL_EL2[63] when EL3 is not implemented and EL2 is implemented.

This register is present only when FEAT_MPAMv2 is implemented. Otherwise, direct accesses to MPAMCTL_EL1 are UNDEFINED.

Attributes

MPAMCTL_EL1 is a 64-bit register.

Field descriptions



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according to the MPAM configuration.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - MPAMCTL_EL3.MPAMEN == '0'.
- Access to this field is RAO/WI if all the following are true:
  - EL3 is implemented.
  - MPAMCTL_EL3.MPAMEN == '1'.
- Access to this field is RAZ/WI if all the following are true:
  - EL3 is not implemented.
  - EL2 is implemented.
  - MPAMCTL_EL2.MPAMEN == '0'.
- Access to this field is RAO/WI if all the following are true:
  - EL3 is not implemented.
  - EL2 is implemented.
  - MPAMCTL_EL2.MPAMEN == '1'.

Bits [62:53]

Reserved, RES0.

EN_ALT_IPMG, bit [52]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PMG configured in MPAM1_EL1.altPMG for instruction fetch accesses originating at EL1.

EN_ALT_IPMG	Meaning
0b0	The alternative PMG configured in MPAM1_EL1.altPMG is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PMG configured in MPAM1_EL1.altPMG is used for generating MPAM information for instruction fetch accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN_ALT_IPARTID, bit [51]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PARTID configured in MPAM1_EL1.altPARTID for instruction fetch accesses originating at EL1.

EN_ALT_IPARTID	Meaning
0b0	The alternative PARTID configured in MPAM1_EL1.altPARTID is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PARTID configured in MPAM1_EL1.altPARTID is used for generating MPAM information for instruction fetch accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN_ALT_IPMG_EL0, bit [50]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PMG configured in MPAM0_EL1.altPMG for instruction fetch accesses originating at EL0.

EN_ALT_IPMG_EL0	Meaning
0b0	The alternative PMG configured in MPAM0_EL1.altPMG is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PMG configured in MPAM0_EL1.altPMG is used for generating MPAM information for instruction fetch accesses.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN_ALT_IPARTID_EL0, bit [49]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PARTID configured in MPAM0_EL1.altPARTID for instruction fetch accesses originating at EL0.

EN_ALT_IPARTID_EL0	Meaning
0b0	The alternative PARTID configured in MPAM0_EL1.altPARTID is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PARTID configured in MPAM0_EL1.altPARTID is used for generating MPAM information for instruction fetch accesses.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [48:0]

Reserved, RES0.

Accessing MPAMCTL_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name MPAMCTL_EL1 or MPAMCTL_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMCTL_EL1

MPAMCTL_EL2, MPAM Control Register (EL2)

The MPAMCTL_EL2 characteristics are:

Purpose

Controls the generation of MPAM information for memory requests when executing at EL2 and at lower ELs.

Configuration

AArch64 System register MPAMCTL_EL2 bit [63] is architecturally mapped to AArch64 System register MPAMCTL_EL3[63] when EL3 is implemented.

AArch64 System register MPAMCTL_EL2 bit [63] is architecturally mapped to AArch64 System register MPAMCTL_EL1[63].

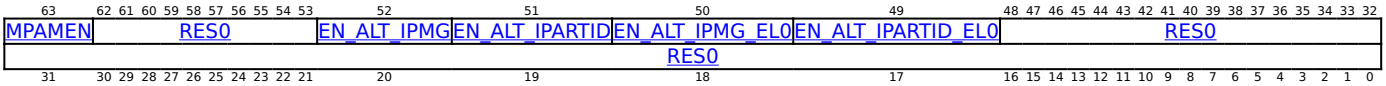
This register is present only when FEAT_MPAMv2 is implemented. Otherwise, direct accesses to MPAMCTL_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMCTL_EL2 is a 64-bit register.

Field descriptions



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information from all Exception levels.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according to the MPAM configuration.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - MPAMCTL_EL3.MPAMEN == '0'.
- Access to this field is RAO/WI if all the following are true:
  - EL3 is implemented.
  - MPAMCTL_EL3.MPAMEN == '1'.

Bits [62:53]

Reserved, RES0.

EN_ALT_IPMG, bit [52]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PMG configured in MPAM2_EL2.altPMG for instruction fetch accesses originating at EL2.

EN_ALT_IPMG	Meaning
0b0	The alternative PMG configured in MPAM2_EL2.altPMG is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PMG configured in MPAM2_EL2.altPMG is used for generating MPAM information for instruction fetch accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN_ALT_IPARTID, bit [51]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PARTID configured in MPAM2_EL2.altPARTID for instruction fetch accesses originating at EL2.

EN_ALT_IPARTID	Meaning
0b0	The alternative PARTID configured in MPAM2_EL2.altPARTID is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PARTID configured in MPAM2_EL2.altPARTID is used for generating MPAM information for instruction fetch accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN_ALT_IPMG_EL0, bit [50]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1' and ELIsInHost(EL2):

Enables use of the alternative PMG configured in MPAM0_EL1.altPMG for instruction fetch accesses originating at EL0.

EN_ALT_IPMG_EL0	Meaning
0b0	The alternative PMG configured in MPAM0_EL1.altPMG is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PMG configured in MPAM0_EL1.altPMG is used for generating MPAM information for instruction fetch accesses.

If HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN_ALT_IPARTID_EL0, bit [49]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1' and ELIsInHost(EL2):

Enables use of the alternative PARTID configured in MPAM0_EL1.altPARTID for instruction fetch accesses originating at EL0.

EN_ALT_IPARTID_EL0	Meaning
0b0	The alternative PARTID configured in MPAM0_EL1.altPARTID is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PARTID configured in MPAM0_EL1.altPARTID is used for generating MPAM information for instruction fetch accesses.

If HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [48:0]

Reserved, RES0.

Accessing MPAMCTL_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name MPAMCTL_EL2 or MPAMCTL_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMCTL_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1010	0b0101	0b010

MPAMCTL_EL3, MPAM Control Register (EL3)

The MPAMCTL_EL3 characteristics are:

Purpose

Controls the generation of MPAM information for memory requests when executing at EL3 and at lower ELs.

Configuration

AArch64 System register MPAMCTL_EL3 bit [63] is architecturally mapped to AArch64 System register MPAMCTL_EL2[63] when EL2 is implemented.

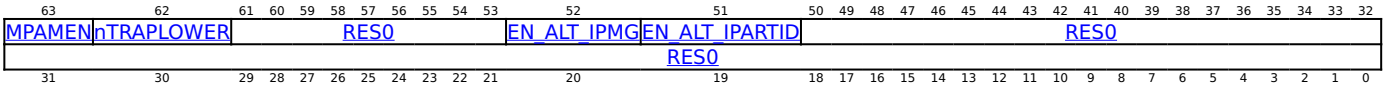
AArch64 System register MPAMCTL_EL3 bit [63] is architecturally mapped to AArch64 System register MPAMCTL_EL1[63].

This register is present only when FEAT_MPAMv2 is implemented. Otherwise, direct accesses to MPAMCTL_EL3 are UNDEFINED.

Attributes

MPAMCTL_EL3 is a 64-bit register.

Field descriptions



MPAMEN, bit [63]

MPAM Enable. MPAM is enabled when MPAMEN == 1. When disabled, all PARTIDs and PMGs are output as their default value in the corresponding ID space.

MPAMEN	Meaning
0b0	The default PARTID and default PMG are output in MPAM information when executing at any ELn.
0b1	MPAM information is output based on the MPAMn_ELx register for ELn according the MPAM configuration.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

nTRAPLOWER, bit [62]

Trap direct accesses to MPAM System registers that are not UNDEFINED from all ELn lower than EL3.

nTRAPLOWER	Meaning
0b0	Force direct accesses of MPAM System registers to trap to EL3.
0b1	Do not force trapping of direct accesses of MPAM System registers to EL3.

Note

This trap is higher priority than any of the traps controlled by MPAM _EL2 registers.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Bits [61:53]

Reserved, RES0.

EN_ALT_IPMG, bit [52]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PMG configured in MPAM3_EL3.altPMG for instruction fetch accesses originating at EL3.

EN_ALT_IPMG	Meaning
0b0	The alternative PMG configured in MPAM3_EL3.altPMG is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PMG configured in MPAM3_EL3.altPMG is used for generating MPAM information for instruction fetch accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EN_ALT_IPARTID, bit [51]
When MPAMIDR_EL1.HAS_INSTR_ALT_ID == '1':

Enables use of the alternative PARTID configured in MPAM3_EL3.altPARTID for instruction fetch accesses originating at EL3.

EN_ALT_IPARTID	Meaning
0b0	The alternative PARTID configured in MPAM3_EL3.altPARTID is not used for generating MPAM information for instruction fetch accesses.
0b1	The alternative PARTID configured in MPAM3_EL3.altPARTID is used for generating MPAM information for instruction fetch accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [50:0]

Reserved, RES0.

Accessing MPAMCTL_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMCTL_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b010

```
if !IsFeatureImplemented(FEAT_MPAMv2) then

    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = MPAMCTL_EL3();
end;
```

MSR MPAMCTL_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0101	0b010

```
if !IsFeatureImplemented(FEAT_MPAMv2) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    MPAMCTL_EL3() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

MPAMHCR_EL2, MPAM Hypervisor Control Register (EL2)

The MPAMHCR_EL2 characteristics are:

Purpose

Controls the PARTID virtualization features of MPAM.

Configuration

This register is present only when ((FEAT_MPAMv1p0 is implemented or FEAT_MPAMv0p1 is implemented) and MPAMIDR_EL1.HAS_HCR == '1') or FEAT_MPAMv2 is implemented. Otherwise, direct accesses to MPAMHCR_EL2 are UNDEFINED.

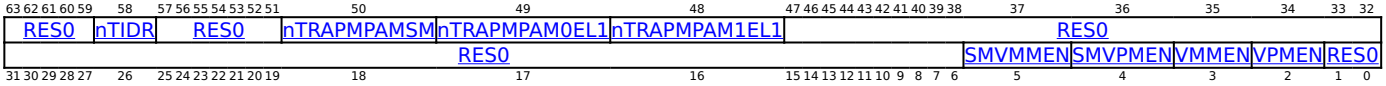
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMHCR_EL2 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:



Bits [63:59]

Reserved, RES0.

nTIDR, bit [58]

Traps accesses to MPAMIDR_EL1 from EL1 to EL2.

nTIDR	Meaning
0b0	Accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.
0b1	Accesses to MPAMIDR_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [57:51]

Reserved, RES0.

nTRAPMPAMSM, bit [50]
When FEAT_SME is implemented:

Traps accesses to MPAMSM_EL1 from EL1 to EL2.

nTRAPMPAMSM	Meaning
0b0	Accesses to MPAMSM_EL1 from EL1 are trapped to EL2.
0b1	Accesses to MPAMSM_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTRAPMPAM0EL1, bit [49]

Traps accesses to MPAM0_EL1 from EL1 to EL2.

nTRAPMPAM0EL1	Meaning
0b0	Accesses to MPAM0_EL1 from EL1 are trapped to EL2.
0b1	Accesses to MPAM0_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTRAPMPAM1EL1, bit [48]

Traps accesses to MPAM1_EL1 and MPAMCTL_EL1 from EL1 to EL2.

nTRAPMPAM1EL1	Meaning
0b0	Accesses to MPAM1_EL1 and MPAMCTL_EL1 from EL1 are trapped to EL2.
0b1	Accesses to MPAM1_EL1 and MPAMCTL_EL1 from EL1 are not trapped by this mechanism.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [47:6]

Reserved, RES0.

SMVMMEN, bit [5]
When FEAT_MPAMv2_VID is implemented and FEAT_SME is implemented:

Enable PMG virtualization for SME or Streaming SVE memory accesses.

SMVMMEN	Meaning
0b0	MPAMSM_EL1.PMG is a physical identifier used to label memory system requests.
0b1	MPAMSM_EL1.PMG is a virtual identifier used to index the physical PMG lookup tables.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SMVPMEN, bit [4]
When FEAT_MPAMv2_VID is implemented and FEAT_SME is implemented:

Enable PARTID virtualization for SME or Streaming SVE memory accesses.

SMVPMEN	Meaning
0b0	MPAMSM_EL1.PARTID is a physical identifier used to label memory system requests.
0b1	MPAMSM_EL1.PARTID is a virtual identifier used to index the physical PARTID lookup tables.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMMEN, bit [3]
When FEAT_MPAMv2_VID is implemented:

Enable virtualized PMG in MPAM0_EL1.PMG and MPAM1_EL1.PMG.

VMMEN	Meaning
0b0	MPAM0_EL1.PMG and MPAM1_EL1.PMG are physical identifiers used to label memory system requests.
0b1	MPAM0_EL1.PMG and MPAM1_EL1.PMG are virtual identifiers used to index the physical PMG lookup table.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, VMMEN is ignored and MPAM0_EL1.PMG is not virtualized.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VPMEN, bit [2]
When FEAT_MPAMv2_VID is implemented:

Enable virtualized PARTID in MPAM0_EL1.PARTID and MPAM1_EL1.PARTID.

VPMEN	Meaning
0b0	MPAM0_EL1.PARTID and MPAM1_EL1.PARTID are physical identifiers used to label memory system requests.
0b1	MPAM0_EL1.PARTID and MPAM1_EL1.PARTID are virtual identifiers used to index the physical PARTID lookup table.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, VPMEN is ignored and MPAM0_EL1.PARTID is not virtualized.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

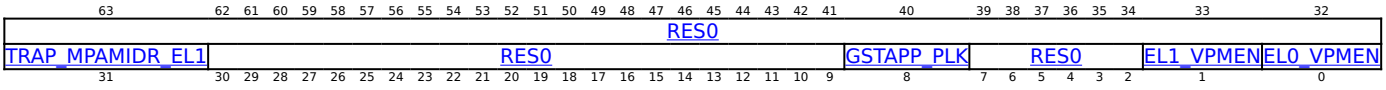
Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented:



Bits [63:32]

Reserved, RES0.

TRAP_MPAMIDR_EL1, bit [31]

Trap accesses from EL1 to MPAMIDR_EL1 to EL2.

TRAP_MPAMIDR_EL1	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Direct accesses to MPAMIDR_EL1 from EL1 are trapped to EL2.

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to '1'.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

GSTAPP_PLK, bit [8]

Make the PARTIDs at EL0 the same as the PARTIDs at EL1. When executing at EL0, EL2 is enabled, HCR_EL2.TGE == 0 and GSTAPP_PLK = 1, MPAM1_EL1 is used instead of MPAM0_EL1 to generate MPAM labels for memory requests.

GSTAPP_PLK	Meaning
0b0	MPAM0_EL1 is used to generate MPAM labels when executing at EL0.
0b1	MPAM1_EL1 is used to generate MPAM labels when executing at EL0 with EL2 enabled and HCR_EL2.TGE == 0. Otherwise MPAM0_EL1 is used.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL1_VPMEN, bit [1]

Enable virtualized identifiers in MPAM1_EL1 when executing at EL1. This bit also enables virtualized identifiers when MPAM1_EL1 is used to generate MPAM identifiers for memory requests at EL0 due to GSTAPP_PLK == 1.

EL1_VPMEN	Meaning
0b0	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are physical PARTIDs used to label memory system requests.
0b1	MPAM1_EL1.PARTID_I and MPAM1_EL1.PARTID_D are virtual PARTIDs used to index the MPAMVPMn_EL2.PhyPARTID fields to map the virtual PARTID into a physical PARTID to label memory system requests.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EL0_VPMEN, bit [0]

Enable virtualized identifiers in MPAM0_EL1 unless the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0_VPMEN is ignored and MPAM0_EL1 identifiers are not virtualized.

When MPAMHCR_EL2.GSTAPP_PLK == 1 and HCR_EL2.TGE == 0, MPAM1_EL1 is used as the source of identifiers and the virtualization of identifiers in MPAM1_EL1 is controlled by MPAMHCR_EL2.EL1_VPMEN.

EL0_VPMEN	Meaning
0b0	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are physical PARTIDs used to label memory system requests.
0b1	MPAM0_EL1.PARTID_I and MPAM0_EL1.PARTID_D are virtual PARTIDs used to index the MPAMVPMn_EL2.PhyPARTID fields to map the virtual PARTID into a physical PARTID to label memory system requests.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMIDR_EL1, MPAM ID Register (EL1)

The MPAMIDR_EL1 characteristics are:

Purpose

Indicates the maximum PARTID and PMG values supported in the implementation and the support for other optional features.

Configuration

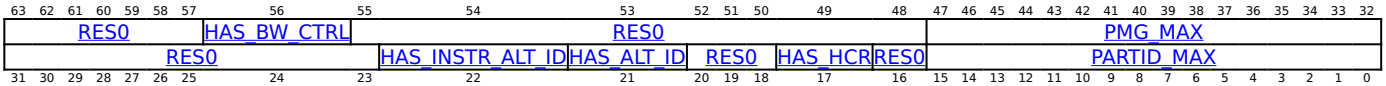
This register is present only when FEAT_MPAM is implemented. Otherwise, direct accesses to MPAMIDR_EL1 are UNDEFINED.

Attributes

MPAMIDR_EL1 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:



Bits [63:57]

Reserved, RES0.

HAS_BW_CTRL, bit [56]

Indicates support for PE-side bandwidth controls.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_BW_CTRL	Meaning
0b0	Support for PE-side bandwidth controls is not implemented.
0b1	Support for PE-side bandwidth controls is implemented via MPAMBW registers.

FEAT_MPAM_PE_BW_CTRL implements the functionality identified by the value 0b1.

Access to this field is RO.

Bits [55:48]

Reserved, RES0.

PMG_MAX, bits [47:32]

Indicates the largest value of PMG supported by the implementation. The PMG field of every MPAMn_ELx register must implement at least enough bits to represent this value.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [31:23]

Reserved, RES0.

HAS_INSTR_ALT_ID, bit [22]
When MPAMIDR_EL1.HAS_ALT_ID == '1':

Indicates support for tagging instruction fetches generated by PE traffic with the configured alternative PARTID and PMG values.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_INSTR_ALT_ID	Meaning
0b0	Support for tagging instruction fetches with alternative PARTID and PMG values is not implemented.
0b1	Support for tagging instruction fetches with alternative PARTID and PMG values is implemented.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_ALT_ID, bit [21]

Indicates support for configuring and using alternative PARTID and PMG values.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ALT_ID	Meaning
0b0	Support for alternative PARTID and PMG values is not implemented.
0b1	Support for alternative PARTID and PMG values is implemented.

Access to this field is RO.

Bits [20:18]

Reserved, RES0.

HAS_HCR, bit [17]

Indicates support for MPAM virtualization.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_HCR	Meaning
0b0	Support for MPAM virtualization is not implemented.
0b1	Support for MPAM virtualization is implemented.

Access to this field is RO.

Bit [16]

Reserved, RES0.

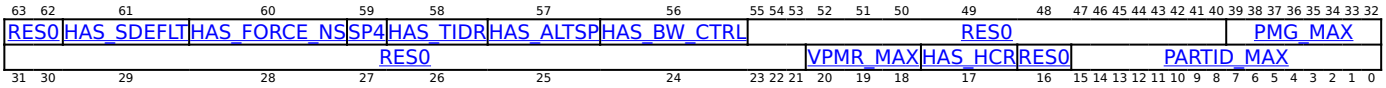
PARTID_MAX, bits [15:0]

Indicates the largest value of PARTID supported by the implementation. The PARTID field of every MPAMn_ELx register must implement at least enough bits to represent this value.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:



Bits [63:62]

Reserved, RES0.

HAS_SDEFLT, bit [61]

HAS_SDEFLT indicates support for MPAM3_EL3.SDEFLT bit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_SDEFLT	Meaning
0b0	The SDEFLT bit is not implemented in MPAM3_EL3.
0b1	The SDEFLT bit is implemented in MPAM3_EL3.

When MPAM3_EL3.SDEFLT == 1, accesses from the Secure Execution state use the default PARTID, PARTID == 0.

Access to this field is RO.

HAS_FORCE_NS, bit [60]

HAS_FORCE_NS indicates support for MPAM3_EL3.FORCE_NS bit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_FORCE_NS	Meaning
0b0	The FORCE_NS bit is not implemented in MPAM3_EL3.
0b1	The FORCE_NS bit is implemented in MPAM3_EL3.

When MPAM3_EL3.FORCE_NS == 1, accesses from the Secure Execution state have MPAM_NS == 1.

Access to this field is RO.

SP4, bit [59]

Supports 4 MPAM PARTID spaces.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SP4	Meaning
0b0	MPAM supports 2 PARTID spaces.
0b1	MPAM supports 4 PARTID spaces.

Access to this field is RO.

HAS_TIDR, bit [58]

HAS_TIDR indicates support for MPAM2_EL2.TIDR bit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_TIDR	Meaning
0b0	The TIDR bit is not implemented in MPAM2_EL2.
0b1	The TIDR bit is implemented in MPAM2_EL2.

Note

Arm recommends that when the MPAM version is MPAM v0.1 or MPAM v1.1, MPAMIDR_EL1.HAS_TIDR is 1 and that the MPAM2_EL2.TIDR field is implemented.

Access to this field is RO.

HAS_ALTSP, bit [57]

HAS_ALTSP indicates support for alternative PARTID spaces.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_ALTSP	Meaning
0b0	Alternative PARTID spaces are not implemented.
0b1	Alternative PARTID spaces are implemented with control bits in MPAM3_EL3 and MPAM2_EL2.

Access to this field is RO.

HAS_BW_CTRL, bit [56]

HAS_BW_CTRL indicates support for PE-side bandwidth controls.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_BW_CTRL	Meaning
0b0	PE-side bandwidth controls are not implemented.
0b1	PE-side bandwidth controls are implemented.

FEAT_MPAM_PE_BW_CTRL implements the functionality identified by the value 0b1.

Access to this field is RO.

Bits [55:40]

Reserved, RES0.

PMG_MAX, bits [39:32]

The largest value of PMG that the implementation can generate. The PMG_I and PMG_D fields of every MPAMn_ELx must implement at least enough bits to represent PMG_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [31:21]

Reserved, RES0.

VPMR_MAX, bits [20:18]
When MPAMIDR_EL1.HAS_HCR == '1':

Indicates the maximum register index n for the MPAMVPM<n>_EL2 registers.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

HAS_HCR, bit [17]

HAS_HCR indicates that the PE implementation supports MPAM virtualization, including MPAMHCR_EL2, MPAMVPMV_EL2, and MPAMVPM<n>_EL2 with n in the range 0 to VPMR_MAX. Must be 0 if EL2 is not implemented in either Security state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_HCR	Meaning
0b0	MPAM virtualization is not supported.
0b1	MPAM virtualization is supported.

Access to this field is RO.

Bit [16]

Reserved, RES0.

PARTID_MAX, bits [15:0]

The largest value of PARTID that the implementation can generate. The PARTID_I and PARTID_D fields of every MPAMn_ELx must implement at least enough bits to represent PARTID_MAX.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPAMIDR_EL1

```

MPAMSM_EL1, MPAM Streaming Mode Register

The MPAMSM_EL1 characteristics are:

Purpose

Holds information to generate MPAM labels for memory requests that are:

- Issued due to the execution of SME load and store instructions.
- Issued when the PE is in Streaming SVE mode due to the execution of SVE and SIMD&FP load and store instructions and SVE prefetch instructions.

If an implementation uses a shared SMCU, then the MPAM labels in this register have precedence over the labels in MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, and MPAM3_EL3.

If an implementation includes an SMCU that is not shared with other PEs, then it is IMPLEMENTATION DEFINED whether the MPAM labels in this register have precedence over the labels in MPAM0_EL1, MPAM1_EL1, MPAM2_EL2, and MPAM3_EL3.

When FEAT_MPAMv1p0 or FEAT_MPAMv0p1 is implemented, the MPAM labels in this register are used if MPAM1_EL1.MPAMEN is 1.

When FEAT_MPAMv2 is implemented, the MPAM labels in this register are used if MPAMCTL_EL1.MPAMEN is 1.

For memory requests issued from EL0, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state, and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.
- The MPAM virtualization option is implemented and MPAMHCR_EL2.EL0_VPMEN is 1.

For memory requests issued from EL1, the MPAM PARTID in this register is virtual and mapped into a physical PARTID when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The MPAM virtualization option is implemented and MPAMHCR_EL2.EL1_VPMEN is 1.

Configuration

This register is present only when FEAT_MPAM is implemented and FEAT_SME is implemented. Otherwise, direct accesses to MPAMSM_EL1 are UNDEFINED.

Attributes

MPAMSM_EL1 is a 64-bit register.

Field descriptions

When FEAT_MPAMv2 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

PARTID																RES0															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:48]

Reserved, RES0.

PMG, bits [47:32]

Performance monitoring group for requests issued due to the execution at any Exception level of SME load and store instructions and, when the PE is in Streaming SVE mode, SVE and SIMD&FP load and store instructions and SVE prefetch instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PARTID, bits [31:16]

Partition ID for requests issued due to the execution at any Exception level of SME load and store instructions and, when the PE is in Streaming SVE mode, SVE and SIMD&FP load and store instructions and SVE prefetch instructions.

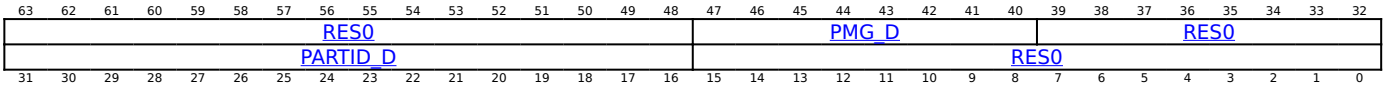
The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

Otherwise:



Bits [63:48]

Reserved, RES0.

PMG_D, bits [47:40]

Performance monitoring group property for PARTID_D.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [39:32]

Reserved, RES0.

PARTID_D, bits [31:16]

Partition ID for requests issued due to the execution at any Exception level of SME load and store instructions and, when the PE is in Streaming SVE mode, SVE and SIMD&FP load and store instructions and SVE prefetch instructions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:0]

Reserved, RES0.

Accessing MPAMSM_EL1

None of the fields in this register are permitted to be cached in a TLB.

Accesses to this register use the following encodings in the System register encoding space:

MPAMVIDCR_EL2, MPAM Virtual Identifier Control Register

The MPAMVIDCR_EL2 characteristics are:

Purpose

MPAMVIDCR_EL2 points to the MPAM Virtual Machine Structure in memory that maps virtual PARTID and PMG values to physical PARTID and PMG values.

This register is intended for use by hypervisors configuring mappings between guest PARTIDs and PMGs and physical PARTIDs and PMGs.

Configuration

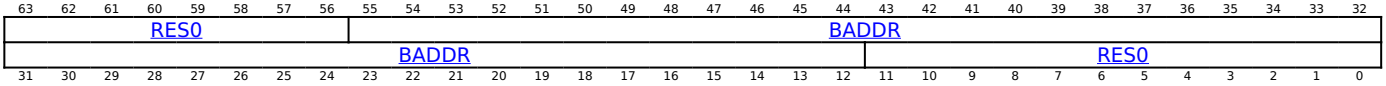
This register is present only when FEAT_MPAMv2_VID is implemented. Otherwise, direct accesses to MPAMVIDCR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVIDCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

BADDR, bits [55:12]

MPAM VMS base address, bits [55:12].

- Bits [55:12] of the base address are the value of this field.
- Bits [11:0] of the base address are 0.

Bits of this field that correspond to address bits beyond the implemented physical address size, as indicated by ID_AA64MMFR0_EL1.PARange, are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

MPAMVIDSR_EL2, MPAM Virtual Identifier Status Register

The MPAMVIDSR_EL2 characteristics are:

Purpose

Enables hardware to report faults on accesses to the MVMS or an MITT.

Configuration

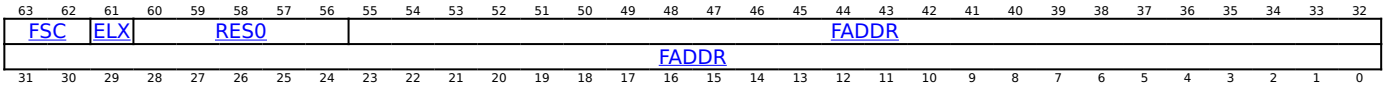
This register is present only when FEAT_MPAMv2_VID is implemented. Otherwise, direct accesses to MPAMVIDSR_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVIDSR_EL2 is a 64-bit register.

Field descriptions



FSC, bits [63:62]

Fault Status Code. Reports the fault type generated on an MVMS or MITT access.

FSC	Meaning	Applies when
0b00	The PE has not experienced any error on access to the MVMS or an MITT.	
0b01	Granule Protection Check Fault on access to the MVMS or an MITT.	When FEAT_RME is implemented
0b10	External Abort on access to the MVMS or an MITT.	

The reset behavior of this field is:

- On a Warm reset:
  - When EL3 is not implemented, this field resets to '00'.
  - When EL3 is implemented, this field resets to an architecturally UNKNOWN value.

ELX, bit [61]

EL that initiated the virtual ID lookup where the fault occurred.

ELX	Meaning
0b0	EL0 initiated the virtual ID lookup where the fault occurred.
0b1	EL1 initiated the virtual ID lookup where the fault occurred.

Bits [60:56]

Reserved, RES0.

FADDR, bits [55:0]

Bits [55:12] of the physical address of the MVMS or MITT entry accessed by the memory access that generated the fault.

- Bits [55:12] of the address are the value of this field.
- Bits [11:0] of the address are 0.

Bits of this field that correspond to address bits beyond the implemented physical address size, as indicated by ID_AA64MMFR0_EL1.PARange, are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM0_EL2, MPAM Virtual PARTID Mapping Register 0

The MPAMVPM0_EL2 characteristics are:

Purpose

MPAMVPM0_EL2 provides mappings from virtual PARTIDs 0 - 3 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 register. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for the PARTID in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

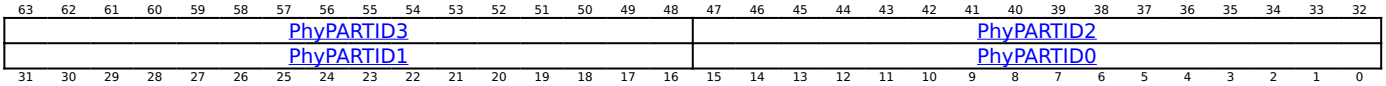
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented) and MPAMIDR_EL1.HAS_HCR == '1'. Otherwise, direct accesses to MPAMVPM0_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM0_EL2 is a 64-bit register.

Field descriptions



PhyPARTID3, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 3. PhyPARTID3 gives the mapping of virtual PARTID 3 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID2, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 2. PhyPARTID2 gives the mapping of virtual PARTID 2 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID1, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 1. PhyPARTID1 gives the mapping of virtual PARTID 1 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID0, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 0. PhyPARTID0 gives the mapping of virtual PARTID 0 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMVPM0_EL2

MPAMVPM1_EL2, MPAM Virtual PARTID Mapping Register 1

The MPAMVPM1_EL2 characteristics are:

Purpose

MPAMVPM1_EL2 provides mappings from virtual PARTIDs 4 - 7 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for the PARTID in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

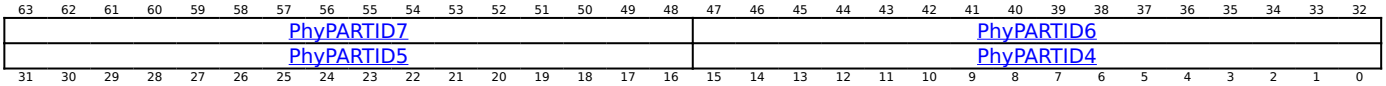
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), MPAMIDR_EL1.HAS_HCR == '1', and UInt(MPAMIDR_EL1.VPMR_MAX) > 0. Otherwise, direct accesses to MPAMVPM1_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM1_EL2 is a 64-bit register.

Field descriptions



PhyPARTID7, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 7. PhyPARTID7 gives the mapping of virtual PARTID 7 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID6, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 6. PhyPARTID6 gives the mapping of virtual PARTID 6 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID5, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 5. PhyPARTID5 gives the mapping of virtual PARTID 5 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID4, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 4. PhyPARTID4 gives the mapping of virtual PARTID 4 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM2_EL2, MPAM Virtual PARTID Mapping Register 2

The MPAMVPM2_EL2 characteristics are:

Purpose

MPAMVPM2_EL2 provides mappings from virtual PARTIDs 8 - 11 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM0_EL2 to MPAMVPM7_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for the PARTID in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

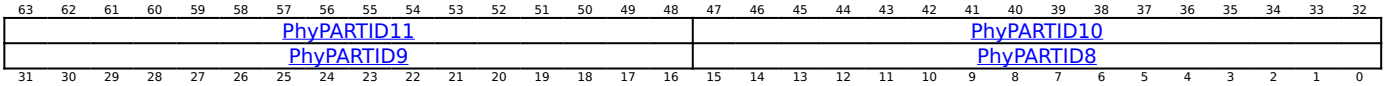
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), MPAMIDR_EL1.HAS_HCR == '1', and UInt(MPAMIDR_EL1.VPMR_MAX) > 1. Otherwise, direct accesses to MPAMVPM2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM2_EL2 is a 64-bit register.

Field descriptions



PhyPARTID11, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 11. PhyPARTID11 gives the mapping of virtual PARTID 11 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID10, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 10. PhyPARTID10 gives the mapping of virtual PARTID 10 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID9, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 9. PhyPARTID9 gives the mapping of virtual PARTID 9 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID8, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 8. PhyPARTID8 gives the mapping of virtual PARTID 8 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM3_EL2, MPAM Virtual PARTID Mapping Register 3

The MPAMVPM3_EL2 characteristics are:

Purpose

MPAMVPM3_EL2 provides mappings from virtual PARTIDs 12 - 15 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for the PARTID in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

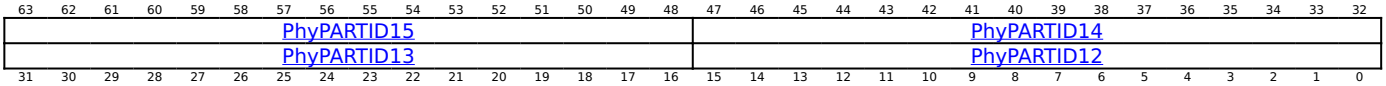
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), MPAMIDR_EL1.HAS_HCR == '1', and UInt(MPAMIDR_EL1.VPMR_MAX) > 2. Otherwise, direct accesses to MPAMVPM3_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM3_EL2 is a 64-bit register.

Field descriptions



PhyPARTID15, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 15. PhyPARTID15 gives the mapping of virtual PARTID 15 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID14, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 14. PhyPARTID14 gives the mapping of virtual PARTID 14 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID13, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 13. PhyPARTID13 gives the mapping of virtual PARTID 13 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID12, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 12. PhyPARTID12 gives the mapping of virtual PARTID 12 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM4_EL2, MPAM Virtual PARTID Mapping Register 4

The MPAMVPM4_EL2 characteristics are:

Purpose

MPAMVPM4_EL2 provides mappings from virtual PARTIDs 16 - 19 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for the PARTID in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

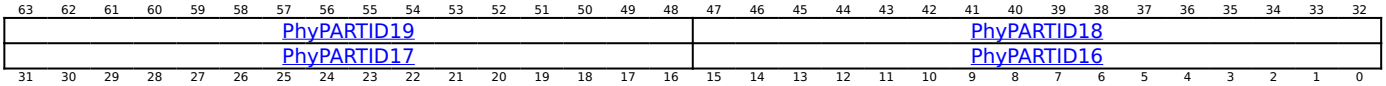
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), MPAMIDR_EL1.HAS_HCR == '1', and UInt(MPAMIDR_EL1.VPMR_MAX) > 3. Otherwise, direct accesses to MPAMVPM4_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM4_EL2 is a 64-bit register.

Field descriptions



PhyPARTID19, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 19. PhyPARTID19 gives the mapping of virtual PARTID 19 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID18, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 18. PhyPARTID18 gives the mapping of virtual PARTID 18 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID17, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 17. PhyPARTID17 gives the mapping of virtual PARTID 17 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID16, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 16. PhyPARTID16 gives the mapping of virtual PARTID 16 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM5_EL2, MPAM Virtual PARTID Mapping Register 5

The MPAMVPM5_EL2 characteristics are:

Purpose

MPAMVPM5_EL2 provides mappings from virtual PARTIDs 20 - 23 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for the PARTID in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

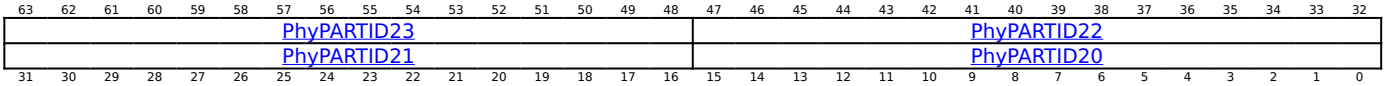
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), MPAMIDR_EL1.HAS_HCR == '1', and UInt(MPAMIDR_EL1.VPMR_MAX) > 4. Otherwise, direct accesses to MPAMVPM5_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM5_EL2 is a 64-bit register.

Field descriptions



PhyPARTID23, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 23. PhyPARTID23 gives the mapping of virtual PARTID 23 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID22, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 22. PhyPARTID22 gives the mapping of virtual PARTID 22 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID21, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 21. PhyPARTID21 gives the mapping of virtual PARTID 21 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID20, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 20. PhyPARTID20 gives the mapping of virtual PARTID 20 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM6_EL2, MPAM Virtual PARTID Mapping Register 6

The MPAMVPM6_EL2 characteristics are:

Purpose

MPAMVPM6_EL2 provides mappings from virtual PARTIDs 24 - 27 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for the PARTID in MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

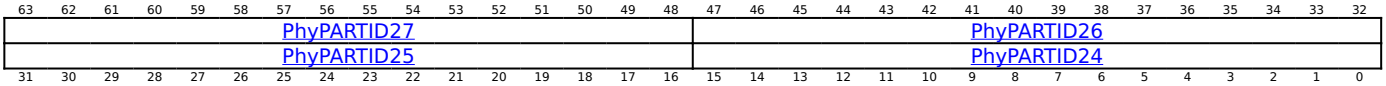
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), MPAMIDR_EL1.HAS_HCR == '1', and UInt(MPAMIDR_EL1.VPMR_MAX) > 5. Otherwise, direct accesses to MPAMVPM6_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM6_EL2 is a 64-bit register.

Field descriptions



PhyPARTID27, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 27. PhyPARTID27 gives the mapping of virtual PARTID 27 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID26, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 26. PhyPARTID26 gives the mapping of virtual PARTID 26 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID25, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 25. PhyPARTID25 gives the mapping of virtual PARTID 25 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID24, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 24. PhyPARTID24 gives the mapping of virtual PARTID 24 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPM7_EL2, MPAM Virtual PARTID Mapping Register 7

The MPAMVPM7_EL2 characteristics are:

Purpose

MPAMVPM7_EL2 provides mappings from virtual PARTIDs 28 - 31 to physical PARTIDs.

MPAMIDR_EL1.VPMR_MAX field gives the index of the highest implemented MPAMVPM<n>_EL2 registers. VPMR_MAX can be as large as 7 (8 registers) or 32 virtual PARTIDs. If MPAMIDR_EL1.VPMR_MAX == 0, there is only a single MPAMVPM<n>_EL2 register, MPAMVPM0_EL2.

Virtual PARTID mapping is enabled by MPAMHCR_EL2.EL1_VPMEN for the PARTID in MPAM1_EL1 and by MPAMHCR_EL2.EL0_VPMEN for MPAM0_EL1.

A virtual-to-physical PARTID mapping entry, PhyPARTID<n>, is valid only when the MPAMVPMV_EL2.VPM_V bit in bit position n is set to 1.

Configuration

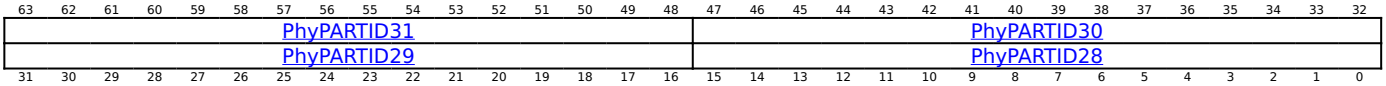
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented), MPAMIDR_EL1.HAS_HCR == '1', and UInt(MPAMIDR_EL1.VPMR_MAX) == 7. Otherwise, direct accesses to MPAMVPM7_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPM7_EL2 is a 64-bit register.

Field descriptions



PhyPARTID31, bits [63:48]

Virtual PARTID Mapping Entry for virtual PARTID 31. PhyPARTID31 gives the mapping of virtual PARTID 31 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID30, bits [47:32]

Virtual PARTID Mapping Entry for virtual PARTID 30. PhyPARTID30 gives the mapping of virtual PARTID 30 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID29, bits [31:16]

Virtual PARTID Mapping Entry for virtual PARTID 29. PhyPARTID29 gives the mapping of virtual PARTID 29 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PhyPARTID28, bits [15:0]

Virtual PARTID Mapping Entry for virtual PARTID 28. PhyPARTID28 gives the mapping of virtual PARTID 28 to a physical PARTID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MPAMVPMV_EL2, MPAM Virtual Partition Mapping Valid Register

The MPAMVPMV_EL2 characteristics are:

Purpose

Valid bits for virtual PARTID mapping entries. Each bit m corresponds to virtual PARTID mapping entry m in the MPAMVPM<n>_EL2 registers where n = m >> 2.

Configuration

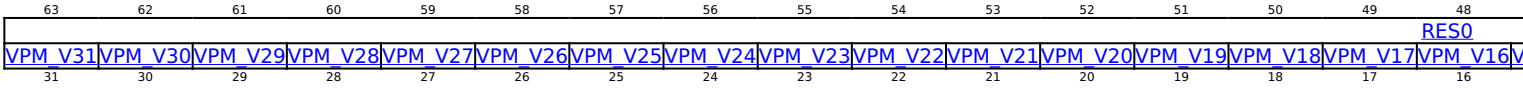
This register is present only when (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p0 is implemented) and MPAMIDR_EL1.HAS_HCR == '1'. Otherwise, direct accesses to MPAMVPMV_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

MPAMVPMV_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

VPM_V<m>, bit [m], for m = 31 to 0

Contains valid bit for virtual PARTID mapping entry corresponding to virtual PARTID<m>.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing MPAMVPMV_EL2

Accesses to this register use the following encodings in the System register encoding space:
