- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMEVCNTR<n>.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>

PMEVTYPER<n> can also be accessed by using PMXEVTYPER with PMSELR.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVTYPER<n> is as follows:

- If <n> is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<n> are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMEVTYPER<n> are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<n> == 0.

Permitted writes of PMEVTYPER<n> are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see HDCR.HPMN and MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>} ; Where m = 0-30

PMINTENCLR, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR characteristics are:

Purpose

Allows software to disable the generation of interrupt requests on overflows from the following counters:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENCLR bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENCLR are UNDEFINED.

Attributes

PMINTENCLR is a 32-bit register.

Field descriptions

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing PMINTENCLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b010

PMINTENSET, Performance Monitors Interrupt Enable Set register

The PMINTENSET characteristics are:

Purpose

Allows software to enable the generation of interrupt requests on overflows from the following counters:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows which overflow interrupt requests are enabled.

Configuration

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

AArch32 System register PMINTENSET bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMINTENSET are UNDEFINED.

Attributes

PMINTENSET is a 32-bit register.

Field descriptions

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> enable. On writes, allows software to enable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m> enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Accessing PMINTENSET

PMMIR, Performance Monitors Machine Identification Register

The PMMIR characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

AArch32 System register PMMIR bits [31:0] are architecturally mapped to AArch64 System register PMMIR_EL1[31:0].

AArch32 System register PMMIR bits [31:0] are architecturally mapped to External register PMMIR[31:0] when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p4 is implemented.

This register is present only when FEAT_AA32EL1 is implemented and FEAT_PMUv3p4 is implemented. Otherwise, direct accesses to PMMIR are UNDEFINED.

Attributes

PMMIR is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

EDGE, bits [27:24]

PMU event edge detection. With PMMIR.THWIDTH, indicates implementation of event counter thresholding features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, the only permitted value is 0b0000.

FEAT_PMUv3_EDGE implements the functionality identified by the value 0b0001.

Note

PMEVTYPER<n>_EL0.TE cannot be accessed through PMEVTYPER<n>.

Access to this field is RO.

THWIDTH, bits [23:20]

PMEVTYPER<n>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<n>_EL0.TH field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<n>_EL0.TH is $2^{(PMMIR.THWIDTH)}$ minus one.

Note

PMEVTYPER<n>_EL0.TH cannot be accessed through PMEVTYPER<n>.

Access to this field is RO.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is RO.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment by in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMMIR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b110

PMOVSR, Performance Monitors Overflow Flag Status Register

The PMOVSR characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSR bits [31:0] are architecturally mapped to External register PMOVS[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSR are UNDEFINED.

Attributes

PMOVSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
C	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

C, bit [31]

Unsigned overflow flag for PMCCNTR clear. On writes, allows software to clear the unsigned overflow flag for PMCCNTR to 0. On reads, returns the unsigned overflow flag for PMCCNTR overflow status.

C	Meaning
0b0	PMCCNTR has not overflowed.
0b1	PMCCNTR has overflowed.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.C == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,CR] == '11'.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m> clear. On writes, allows software to clear the unsigned overflow flag for PMEVCNTR<m> to 0. On reads, returns the unsigned overflow flag for PMEVCNTR<m> overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m> has not overflowed.
0b1	PMEVCNTR<m> has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>[31:0] or unsigned overflow of PMEVCNTR<m>[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.P<m> == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,ER] == '11'.
- Otherwise, access to this field is W1C.

Accessing PMOVSR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

PMOVSSET, Performance Monitors Overflow Flag Status Set register

The PMOVSSET characteristics are:

Purpose

Allows software to set the unsigned overflow flags for the following counters to 1:

- The cycle counter PMCCNTR.
- The event counters PMEVCNTR<n>.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

AArch32 System register PMOVSSET bits [31:0] are architecturally mapped to External register PMOVS[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMOVSSET are UNDEFINED.

Attributes

PMOVSSET is a 32-bit register.

Field descriptions

C, bit [31]

Unsigned overflow flag for PMCCNTR set. On writes, allows software to set the unsigned overflow flag for PMCCNTR to 1. On reads, returns the unsigned overflow flag for PMCCNTR overflow status.

C	Meaning
0b0	PMCCNTR has not overflowed.
0b1	PMCCNTR has overflowed.

PMCR.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR[31:0] or unsigned overflow of PMCCNTR[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.C == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,CR] == '11'.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m> set. On writes, allows software to set the unsigned overflow flag for PMEVCNTR<m> to 1. On reads, returns the unsigned overflow flag for PMEVCNTR<m> overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m> has not overflowed.
0b1	PMEVCNTR<m> has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP, HDCR.HLP, and PMCR.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>[31:0] or unsigned overflow of PMEVCNTR<m>[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.P<m> == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,ER] == '11'.
- Otherwise, access to this field is W1S.

Accessing PMOVSSET

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b011

PMSELR, Performance Monitors Event Counter Selection Register

The PMSELR characteristics are:

Purpose

Selects the current event counter PMEVCNTR<n> or the cycle counter PMCCNTR.

Used in conjunction with PMXEVTYPER to determine the event that increments a selected counter, and the modes and states in which the selected counter increments.

Used in conjunction with PMXEVCNTR to determine the value of a selected counter.

Configuration

AArch32 System register PMSELR bits [31:0] are architecturally mapped to AArch64 System register PMSELR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSELR are UNDEFINED.

Attributes

PMSELR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

SEL, bits [4:0]

Event counter select. Selects the counter accessed by subsequent accesses to PMXEVTYPER and PMXEVCNTR.

SEL	Meaning
0b00000..0b11110	Select event counter PMEVCNTR<n>, where n is the value of this field: • MRC and MCR of PMXEVTYPER access PMEVTYPER<n>. • MRC and MCR of PMXEVCNTR access PMEVCNTR<n>.
0b11111	Select the cycle counter, PMCCNTR: • MRC and MCR of PMXEVTYPER access PMCCFILTR. • MRC and MCR of PMXEVCNTR are CONSTRAINED UNPREDICTABLE. For more information, see PMXEVCNTR.

For more information about the results of accesses to the event counters, including when PMSELR.SEL is set to the index of an unimplemented or inaccessible event counter, see PMXEVTYPER and PMXEVCNTR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b101

PMSWINC, Performance Monitors Software Increment register

The PMSWINC characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to AArch64 System register PMSWINC_EL0[31:0].

AArch32 System register PMSWINC bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0] when FEAT_PMUv3p9 is not implemented.

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMSWINC are UNDEFINED.

Attributes

PMSWINC is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES0.

P<m>, bit [m], for m = 30 to 0

Software increment.

P<m>	Meaning
0b0	Write is ignored.
0b1	Increment PMEVCNTR<m>, if PMEVCNTR<m> is configured to count software increment events.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - EL1 is using AArch64.
  - PMUSERENR_EL0.[UEN,SW] == '10'.
  - PMUACR_EL1.P<m> == '0'.
- Otherwise, access to this field is WO/RAZ.

Accessing PMSWINC

Accesses to this register use the following encodings in the System register encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1100	0b100

PMUSERENR, Performance Monitors User Enable Register

The PMUSERENR characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

AArch32 System register PMUSERENR bits [31:0] are architecturally mapped to AArch64 System register PMUSERENR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMUSERENR are UNDEFINED.

Attributes

PMUSERENR is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

TID, bit [6]
When FEAT_PMUv3p9 is implemented:

Trap ID registers. Traps EL0 read access to common event identification registers.

TID	Meaning
0b0	Accesses to PMCEID<n> are not trapped by this mechanism.
0b1	EL0 read accesses to PMCEID<n> are trapped.

The register accesses affected by this control are:

- MRC reads of PMCEID0, PMCEID1, PMCEID2, and PMCEID3.

When trapped, reads are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES0.

ER, bit [3]

Event counters Read enable.

When PMUSERENR.EN is 0, PMUSERENR.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

ER	Meaning
0b0	EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC reads of PMEVCNTR<n> and PMXEVCNTR.
- MRC and MCR accesses to PMSELR.

When disabled, reads and writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]

Cycle counter Read enable.

When PMUSERENR.EN is 0, PMUSERENR.CR enables EL0 reads of the cycle counter.

CR	Meaning
0b0	EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 reads of the cycle counter are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC reads of PMCCNTR.
- MRRC reads of PMCCNTR.

When disabled, reads are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [1]

Software increment register Write enable.

When PMUSERENR.EN is 0, PMUSERENR.SW enables EL0 writes to the Software increment register.

SW	Meaning
0b0	EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR.EN.
0b1	EL0 writes to the Software increment register are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes are UNDEFINED.

This field is ignored by the PE when PMUSERENR.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enable. Enables EL0 read/write access to PMU registers.

EN	Meaning
0b0	EL0 accesses to the specified PMU System registers are trapped, unless enabled by PMUSERENR.{ER,CR,SW}.
0b1	EL0 accesses to the specified PMU System registers are enabled, unless trapped by another control.

The register accesses affected by this control are:

- MRC or MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMOVSR, PMOVSSET, PMSELR, PMXEVCNTR, and PMXEVTYPER.
- MRC reads of the following registers:
  - PMCEID0 and PMCEID1.
  - If FEAT_PMUv3p1 is implemented, PMCEID2 and PMCEID3.
- MCR writes to PMSWINC.
- MRRC or MCRR accesses to PMCCNTR.

When trapped, reads and writes are UNDEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUSERENR

When FEAT_PMUv3p9 is implemented and EL1 is using AArch64, PMUSERENR_EL0 contains additional controls that affect the behavior of this register.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1110	0b000

PMXEVCNTR, Performance Monitors Selected Event Count Register

The PMXEVCNTR characteristics are:

Purpose

Reads or writes the value of the selected event counter, PMEVCNTR<n>. PMSELR.SEL determines which event counter is selected.

Configuration

AArch32 System register PMXEVCNTR bits [31:0] are architecturally mapped to AArch64 System register PMXEVCNTR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVCNTR are UNDEFINED.

Attributes

PMXEVCNTR is a 32-bit register.

Field descriptions

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>, where n is the value stored in PMSELR.SEL.

If FEAT_PMUv3p5 is implemented, the event counter is 64 bits and only the least-significant part of the event counter is accessible in AArch32 state:

- Reads from PMXEVCNTR return bits [31:0] of the counter.
- Writes to PMXEVCNTR update bits [31:0] and leave bits [63:32] unchanged.
- There is no means to access bits [63:32] directly from AArch32 state.
- If the implementation does not support AArch64, bits [63:32] are not required to be implemented.

If FEAT_PMUv3p5 is not implemented, the event counter is 32 bits.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR

If FEAT_FGT is implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVCNTR is as follows:

- If PMSELR.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR.SEL is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVCNTR are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVCNTR are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<UInt(PMSELR.SEL)> == 0.

Permitted writes of PMXEVCNTR are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.{ER,EN} or PMUSERENR_EL0.{UEN,ER,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see HDCR.HPMN, MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1001	0b1101	0b010

PMXEVTYPER, Performance Monitors Selected Event Type Register

The PMXEVTYPER characteristics are:

Purpose

When PMSELR.SEL selects an event counter, this accesses a PMEVTYPER<n> register. When PMSELR.SEL selects the cycle counter, this accesses PMCCFILTR.

Configuration

AArch32 System register PMXEVTYPER bits [31:0] are architecturally mapped to AArch64 System register PMXEVTYPER_EL0[31:0].

This register is present only when FEAT_AA32 is implemented and FEAT_PMUv3 is implemented. Otherwise, direct accesses to PMXEVTYPER are UNDEFINED.

Attributes

PMXEVTYPER is a 32-bit register.

Field descriptions

ETR, bits [31:0]

Event type register or PMCCFILTR.

When PMSELR.SEL == 31, this register accesses PMCCFILTR.

Otherwise, this register accesses PMEVTYPER<n> where n is the value in PMSELR.SEL.

Accessing PMXEVTYPER

If FEAT_FGT is implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVTYPER is as follows:

- If PMSELR.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR.SEL is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVTYPER are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, and PMSELR.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVTYPER are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
  - PMSELR.SEL != 31 and PMUACR_EL1.P<UInt(PMSELR.SEL)> == 0.
  - PMSELR.SEL == 31 and PMUACR_EL1.C == 0.

Permitted writes of PMXEVTYPER are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- EL1 is using AArch64.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
  - PMSELR.SEL != 31 and PMUSERENR_EL0.ER == 1.
  - PMSELR.SEL == 31 and PMUSERENR_EL0.CR == 1.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR.EN or PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, at EL0 and EL1:

- If EL2 is using AArch32, HDCR.HPMN identifies the number of accessible event counters.
- If EL2 is using AArch64, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see HDCR.HPMN, MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

PRRR, Primary Region Remap Register

The PRRR characteristics are:

Purpose

Controls the top-level mapping of the TEX[0], C, and B memory region attributes.

Configuration

This register is banked between PRRR and PRRR_S and PRRR_NS.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch64 System register MAIR_EL1[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] are architecturally mapped to AArch32 System register MAIR0[31:0] when EL3 is not implemented or EL3 is using AArch64.

AArch32 System register PRRR bits [31:0] (PRRR_S) are architecturally mapped to AArch32 System register MAIR0[31:0] (MAIR0_S) when EL3 is using AArch32.

AArch32 System register PRRR bits [31:0] (PRRR_NS) are architecturally mapped to AArch32 System register MAIR0[31:0] (MAIR0_NS) when EL3 is using AArch32.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to PRRR are UNDEFINED.

MAIR0 and PRRR are the same register, with a different view depending on the value of TTBCR.EAE:

- When it is set to 0, the register is as described in PRRR.
- When it is set to 1, the register is as described in MAIR0.

Attributes

PRRR is a 32-bit register.

This register has the following instances:

- PRRR, when EL3 is not implemented or FEAT_AA64 is implemented.
- PRRR_S, when FEAT_AA32EL3 is implemented.
- PRRR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == '0':

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NOS7	NOS6	NOS5	NOS4	NOS3	NOS2	NOS1	NOS0	RES0				NS1	NS0	DS1	DS0	TR7		TR6		TR5		TR4		TR3		TR2		TR1		TR0	

NOS<n>, bit [n+24], for n = 7 to 0

Not Outer Shareable. NOS<n> is the Outer Shareable property for memory attributes n, if the region is mapped as Normal memory that is not Inner Non-cacheable, Outer Non-cacheable, and the appropriate PRRR.{NS0, NS1} field identifies the region as shareable. n is the value of the concatenation of the {TEX[0], C, B} bits from the Translation table descriptor. The possible values of each NOS<n> field other than NOS6 are:

NOS<n>	Meaning
0b0	Memory region is Outer Shareable.
0b1	Memory region is Inner Shareable.

The value of this bit is ignored if the region is:

- Device memory
- Normal memory that is at least one of:
  - Inner Non-cacheable, Outer Non-cacheable.
  - Identified by the appropriate PRRR.{NS0, NS1} field as Non-shareable.

The meaning of the NOS6 field is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [23:20]

Reserved, RES0.

NS1, bit [19]

Mapping of S = 1 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the Translation table descriptor set to 1.

NS1	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS0, bit [18]

Mapping of S = 0 attribute for Normal memory regions. This field is used in determining the Shareability of a memory region that is mapped to Normal memory and both:

- Is not Inner Non-cacheable, Outer Non-cacheable.
- Has the S bit in the Translation table descriptor set to 0.

NS0	Meaning
0b0	Region is Non-shareable.
0b1	Region is shareable. The value of the appropriate PRRR.NOS<n> field determines whether the region is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS1, bit [17]

Mapping of S = 1 attribute for Device memory. From Armv8.0, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DS0, bit [16]

Mapping of S = 0 attribute for Device memory. From Armv8.0, all types of Device memory are Outer Shareable, and therefore this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TR<n>, bits [2n+1:2n], for n = 7 to 0

TR<n> is the primary TEX mapping for memory attributes n, and defines the mapped memory type for a region with attributes n. n is the value of the concatenation of the {TEX[0], C, B} bits from the Translation table descriptor. The possible values for each field other than TR6 are:

TR<n>	Meaning
0b00	Device-nGnRnE memory
0b01	Device-nGnRE memory
0b10	Normal memory

The value 0b11 is reserved. The effect of programming a field to 0b11 is CONSTRAINED UNPREDICTABLE.

The meaning of the TR6 field is IMPLEMENTATION DEFINED.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PRRR

Accesses to this register use the following encodings in the System register encoding space:

REVIDR, Revision ID Register

The REVIDR characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch32 System register REVIDR bits [31:0] are architecturally mapped to AArch64 System register REVIDR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to REVIDR are UNDEFINED.

If REVIDR has the same value as MIDR, then its contents have no significance.

Attributes

REVIDR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing REVIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

RMR, Reset Management Register

The RMR characteristics are:

Purpose

If EL1 or EL3 is the highest implemented Exception level and this register is implemented:

- A write to the register at the highest implemented Exception level can request a Warm reset.
- If the highest implemented Exception level can use AArch32 and AArch64, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL1[31:0] when the highest implemented Exception level is EL1.

AArch32 System register RMR bits [31:0] are architecturally mapped to AArch64 System register RMR_EL3[31:0] when EL3 is implemented.

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to RMR are UNDEFINED.

Only implemented if EL1 or EL3 is the highest implemented Exception level. In this case:

- If the highest implemented Exception level can use AArch32 and AArch64 then this register must be implemented.
- If the highest implemented Exception level cannot use AArch64 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When the highest implemented Exception level can use AArch64, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If the highest implemented Exception level cannot use AArch64 this bit is RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing RMR

When EL3 is implemented, Arm deprecates accessing this register from any PE mode other than Monitor mode.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    Undefined();
elsif PSTATE.EL IN {EL1, EL3} && IsHighestEL(PSTATE.EL) then
    R(t) = RMR();
else
    Undefined();
end;
```

RVBAR, Reset Vector Base Address Register

The RVBAR characteristics are:

Purpose

If EL3 is not implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch32 state.

Configuration

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to RVBAR are UNDEFINED.

This register is implemented only if the highest Exception level implemented is capable of using AArch32, and is not EL3.

Attributes

RVBAR is a 32-bit register.

Field descriptions

ResetAddress, bits [31:1]

Bits [31:1] of the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 32-bit state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [0]

Reserved, RES1.

Accessing RVBAR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1100	0b0000	0b001

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if IsHighestEL(EL1) then
        R(t) = RVBAR();
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2().T12 == '1' then
        AArch64_AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR().T12 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) &&
IsCurrentSecurityState(SS_Secure) then
        AArch64_AArch32SystemAccessTrap(EL2, 0x03);
    elsif IsFeatureImplemented(FEAT_AA64EL3) && !ELUsingAArch32(EL3) && IsCurrentSecurityState(SS_Secure) then
        AArch64_AArch32SystemAccessTrap(EL3, 0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    if IsHighestEL(EL2) then
        R(t) = RVBAR();
    else
        Undefined();
    end;
elsif PSTATE.EL == EL3 then
    R(t) = MVBAR();
end;
```

SCR, Secure Configuration Register

The SCR characteristics are:

Purpose

When EL3 is implemented and can use AArch32, defines the configuration of the current Security state. It specifies:

- The Security state, either Secure or Non-secure.
- What mode the PE branches to if an IRQ, FIQ, or External abort occurs.
- Whether the PSTATE.F or PSTATE.A bits can be modified when SCR.NS==1.

Configuration

This register is present only when FEAT_AA32EL3 is implemented. Otherwise, direct accesses to SCR are UNDEFINED.

Attributes

SCR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

TERR, bit [15]
When FEAT_RAS is implemented:

Trap Error record accesses. Generate a Monitor Trap exception on MRC, MCR, MRRC, or MCRR accesses to the following registers from modes other than Monitor mode, reported using EC syndrome values 0x03 and 0x04:

ERRIDR, ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXFR, ERXFR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS. When FEAT_RASv1p1 is implemented, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7.

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses to the specified registers from modes other than Monitor mode generate a Monitor Trap exception.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [14]

Reserved, RES0.

TWE, bit [13]

Traps WFE instructions to Monitor mode.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWE or HCR.TWE. Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

TWI, bit [12]

Traps WFI instructions to Monitor mode.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction in any mode other than Monitor mode is trapped to Monitor mode, if the instruction would otherwise have caused the PE to enter a low-power state and the attempted execution does not generate an exception that is taken to EL1 or EL2 by SCTLR.nTWI or HCR.TWI. Any exception that is taken to EL1 or to EL2 has priority over this trap.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Bits [11:10]

Reserved, RES0.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction execution from Non-secure memory.

SIF	Meaning
0b0	Secure state instruction execution from Non-secure memory is permitted.
0b1	Secure state instruction execution from Non-secure memory is not permitted.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

HCE, bit [8]

Hypervisor Call instruction enable. If EL2 is implemented, enables execution of HVC instructions at Non-secure EL1 and EL2.

HCE	Meaning
0b0	HVC instructions are: • UNDEFINED at Non-secure EL1. The Undefined Instruction exception is taken from PL1 to PL1. • UNPREDICTABLE at EL2. Behavior is one of the following: ◦ The instruction is UNDEFINED. ◦ The instruction executes as a NOP.
0b1	HVC instructions are enabled at Non-secure EL1 and EL2.

Note

HVC instructions are always UNDEFINED at EL0 and in Secure state.

If EL2 is not implemented, this bit is RES0 and HVC is UNDEFINED.

The reset behavior of this field is:

• On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

SCD, bit [7]

Secure Monitor Call disable. Disables SMC instructions.

SCD	Meaning
0b0	SMC instructions are enabled.
0b1	In Non-secure state, SMC instructions are UNDEFINED. The Undefined Instruction exception is taken from the current Exception level to the current Exception level. In Secure state, behavior is one of the following: • The instruction is UNDEFINED. • The instruction executes as a NOP.

Note

SMC instructions are always UNDEFINED at PL0.

The reset behavior of this field is:

• On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

nET, bit [6]

Not Early Termination. This bit disables early termination.

nET	Meaning
0b0	Early termination permitted. Execution time of data operations can depend on the data values.
0b1	Disable early termination. The number of cycles required for data operations is forced to be independent of the data values.

This IMPLEMENTATION DEFINED mechanism can disable data dependent timing optimizations from multiplies and data operations. It can provide system support against information leakage that might be exploited by timing correlation types of attack.

On implementations that do not support early termination or do not support disabling early termination, this bit is RES0.

The reset behavior of this field is:

• On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

AW, bit [5]

When the value of SCR.EA is 1 and the value of HCR.AMO is 0, this bit controls whether PSTATE.A masks an External abort taken from Non-secure state.

AW	Meaning
0b0	External aborts taken from Non-secure state are not masked by PSTATE.A, and are taken to EL3. External aborts taken from Secure state are masked by PSTATE.A.
0b1	External aborts taken from either Security state are masked by PSTATE.A. When PSTATE.A is 0, the abort is taken to EL3.

When SCR.EA is 0 or HCR.AMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

FW, bit [4]

When the value of SCR.FIQ is 1 and the value of HCR.FMO is 0, this bit controls whether PSTATE.F masks an FIQ interrupt taken from Non-secure state.

FW	Meaning
0b0	An FIQ taken from Non-secure state is not masked by PSTATE.F, and is taken to EL3. An FIQ taken from Secure state is masked by PSTATE.F.
0b1	An FIQ taken from either Security state is masked by PSTATE.F. When PSTATE.F is 0, the FIQ is taken to EL3.

When SCR.FIQ is 0 or HCR.FMO is 1, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

EA, bit [3]

External Abort handler. This bit controls which mode takes External aborts and SError exceptions.

EA	Meaning
0b0	External aborts taken to Abort mode.
0b1	External aborts taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

FIQ, bit [2]

FIQ handler. This bit controls which mode takes FIQ exceptions.

FIQ	Meaning
0b0	FIQs taken to FIQ mode.
0b1	FIQs taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

IRQ, bit [1]

IRQ handler. This bit controls which mode takes IRQ exceptions.

IRQ	Meaning
0b0	IRQs taken to IRQ mode.
0b1	IRQs taken to Monitor mode.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

NS, bit [0]

Non-secure bit. Except when the PE is in Monitor mode, this bit determines the Security state of the PE:

NS	Meaning
0b0	PE is in Secure state.
0b1	PE is in Non-secure state.

If the HCR.TGE bit is set, an attempt to change from a Secure PL1 mode to a Non-secure EL1 mode by changing the SCR.NS bit from 0 to 1 results in the SCR.NS bit remaining as 0.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Accessing SCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

```

2025-12-10 16:11:30, 2025-12_rel

SCTLR, System Control Register

The SCTLR characteristics are:

Purpose

Provides the top-level control of the system, including its memory system.

Configuration

This register is banked between SCTLR and SCTLR_S and SCTLR_NS.

AArch32 System register SCTLR bits [31:0] are architecturally mapped to AArch64 System register SCTLR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to SCTLR are UNDEFINED.

Some bits in the register are read-only. These bits relate to non-configurable features of an implementation, and are provided for compatibility with previous versions of the architecture.

Attributes

SCTLR is a 32-bit register.

This register has the following instances:

- SCTLR, when EL3 is not implemented or FEAT_AA64 is implemented.
- SCTLR_S, when FEAT_AA32EL3 is implemented.
- SCTLR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

DSSBS, bit [31]
When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry. The defined values are:

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to any mode in this security state except Hyp mode
0b1	PSTATE.SSBS is set to 1 on an exception to any mode in this security state except Hyp mode

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

TE, bit [30]

T32 Exception Enable. This bit controls whether exceptions to an Exception level that is executing at PL1 are taken to A32 or T32 state:

TE	Meaning
0b0	Exceptions, including reset, taken to A32 state.
0b1	Exceptions, including reset, taken to T32 state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

AFE, bit [29]

Access Flag Enable. When using the Short-descriptor translation table format for the PL1&0 translation regime, this bit enables use of the AP[0] bit in the translation descriptors as the Access flag, and restricts access permissions in the translation descriptors to the simplified model.

AFE	Meaning
0b0	In the Translation table descriptors, AP[0] is an access permissions bit. The full range of access permissions is supported. No Access flag is implemented.
0b1	In the Translation table descriptors, AP[0] is the Access flag. Only the simplified model for access permissions is supported.

When using the Long-descriptor translation table format, the VMSA behaves as if this bit is set to 1, regardless of the value of this bit.

The AFE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

TRE, bit [28]

TEX remap enable. This bit enables remapping of the TEX[2:1] bits in the PL1&0 translation regime for use as two translation table bits that can be managed by the operating system. Enabling this remapping also changes the scheme used to describe the memory region attributes in the VMSA.

TRE	Meaning
0b0	TEX remap disabled. TEX[2:0] are used, with the C and B bits, to describe the memory region attributes.
0b1	TEX remap enabled. TEX[2:1] are reassigned for use as bits managed by the operating system. The TEX[0], C, and B bits are used to describe the memory region attributes, with the MMU remap registers.

When the value of TTBCR.EAE is 1, this bit is RES1.

The TRE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [27:26]

Reserved, RES0.

EE, bit [25]

The value of the PSTATE.E bit on branch to an exception vector or coming out of reset, and the endianness of stage 1 translation table walks in the PL1&0 translation regime.

EE	Meaning
0b0	Little-endian. PSTATE.E is cleared to 0 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are little-endian.
0b1	Big-endian. PSTATE.E is set to 1 on taking an exception or coming out of reset. Stage 1 translation table walks in the PL1&0 translation regime are big-endian.

If an implementation does not provide Big-endian support for data accesses at Exception levels higher than EL0, this bit is RES0.

If an implementation does not provide Little-endian support for data accesses at Exception levels higher than EL0, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [24]

Reserved, RES0.

SPAN, bit [23]
When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1 from either Secure or Non-secure state, or to EL3 from Secure state when EL3 is using AArch32.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 in the following situations: • In Non-secure state, on taking an exception to EL1. • In Secure state, when EL3 is using AArch64, on taking an exception to EL1. • In Secure state, when EL3 is using AArch32, on taking an exception to EL3.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [22]

Reserved, RES1.

Bit [21]

Reserved, RES0.

UWXN, bit [20]

Unprivileged write permission implies PL1 XN (Execute-never). This bit can force all memory regions that are writable at PL0 to be treated as XN for accesses from software executing at PL1.

UWXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable at PL0 forced to XN for accesses from software executing at PL1.

The UWXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

WXN, bit [19]

Write permission implies XN (Execute-never). For the PL1&0 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the PL1&0 translation regime is forced to XN for accesses from software executing at PL1 or PL0.

This bit applies only when SCTLR.M bit is set.

The WXN bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to Undefined mode.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to Undefined mode.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped to Undefined mode, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

The attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bits [15:14]

Reserved, RES0.

V, bit [13]

Vectors bit. This bit selects the base address of the exception vectors for exceptions taken to a PE mode other than Monitor mode or Hyp mode:

V	Meaning
0b0	Normal exception vectors. Base address is held in VBAR.
0b1	High exception vectors (Hivecs), base address 0xFFFF0000. This base address cannot be remapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

I, bit [12]

Instruction access Cacheability control, for accesses at EL1 and EL0:

I	Meaning
0b0	All instruction access to Normal memory from PL1 and PL0 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	All instruction access to Normal memory from PL1 and PL0 can be cached at all levels of instruction and unified cache. If the value of SCTLR.M is 0, instruction accesses from stage 1 of the PL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

Instruction accesses to Normal memory from EL1 and EL0 are Cacheable regardless of the value of the SCTLR.I bit if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [11]

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented:

Enable EL0 access to the following System instructions:

- CFPRCTX.
- DVPRCTX.
- CPPRCTX.
- If FEAT_SPECRES2 is implemented, COSPRCTX.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1.
0b1	EL0 access to these instructions is enabled.

Note

When EL3 is implemented and is using AArch32, this bit is banked between the two Security states.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [9]

Reserved, RES0.

SED, bit [8]

SETEND instruction disable. Disables SETEND instructions at PL0 and PL1.

SED	Meaning
0b0	SETEND instruction execution is enabled at PL0 and PL1.
0b1	SETEND instructions are UNDEFINED at PL0 and PL1.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

ITD, bit [7]

IT Disable. Disables some uses of IT instructions at PL1 and PL0.

ITD	Meaning
0b0	All IT instruction functionality is enabled at PL1 and PL0.
0b1	Any attempt at PL1 or PL0 to execute any of the following is UNDEFINED: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. ◦ 0b10100xxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1, then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR, then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and HSCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When an implementation does not implement ITD, access to this field is RAZ/WI.

UNK, bit [6]

Writes to this bit are IGNORED. Reads of this bit return an UNKNOWN value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from PL1 and PL0:

CP15BEN	Meaning
0b0	PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1	PL0 and PL1 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR, then it must also be implemented in the SCTLR_EL1, SCTLR_EL2, and HSCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

When an implementation does not implement CP15BEN, access to this field is RAO/WI.

LSMAOE, bit [4]
When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL1 or EL0, T32 and A32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of T32 and A32 Load Multiple and Store Multiple at EL1 or EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Otherwise:

Reserved, RES1.

nTLSMD, bit [3]
When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL1 or EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Otherwise:

Reserved, RES1.

C, bit [2]

Cacheability control, for data accesses at EL1 and EL0:

C	Meaning
0b0	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	All data access to Normal memory from PL1 and PL0, and all accesses to the PL1&0 stage 1 translation tables, can be cached at all levels of data and unified cache.

The PE ignores SCTLR.C, and data accesses to Normal memory from EL1 and EL0 are Cacheable, if either:

- EL2 is using AArch32 and the value of HCR.DC is 1.
- EL2 is using AArch64 and the value of HCR_EL2.DC is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at PL1 and PL0:

A	Meaning
0b0	Alignment fault checking disabled when executing at PL1 or PL0. Instructions that load or store one or more registers, other than load/store exclusive and load-acquire/store-release, do not check that the address being accessed is aligned to the size of the data element(s) being accessed.
0b1	Alignment fault checking enabled when executing at PL1 or PL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

Load/store exclusive and load-acquire/store-release instructions have an alignment check regardless of the value of the A bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

M, bit [0]

MMU enable for EL1 and EL0 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL1 and EL0 stage 1 address translation disabled. See the SCTLR.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1 and EL0 stage 1 address translation enabled.

The PE behaves as if the value of the SCTLR.M field is 0 for all purposes other than returning the value of a direct read of the field if either:

- EL2 is using AArch32 and the value of HCR.{DC, TGE} is not {0, 0}.
- EL2 is using AArch64 and the value of HCR_EL2.{DC, TGE} is not {0, 0}.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing SCTLR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    Undefined();

SDCR, Secure Debug Control Register

The SDCR characteristics are:

Purpose

Provides EL3 configuration options for self-hosted debug, trace, and the Performance Monitors Extension.

Configuration

This register is present only when FEAT_AA32EL3 is implemented. Otherwise, direct accesses to SDCR are UNDEFINED.

Attributes

SDCR is a 32-bit register.

Field descriptions

Bits [31:29]

Reserved, RES0.

MTPME, bit [28]
When FEAT_MTPMU is implemented:

Multi-threaded PMU Enable. Enables use of the PMEVTYPER<n>.MT bits.

MTPME	Meaning
0b0	FEAT_MTPMU is disabled. The Effective value of PMEVTYPER<n>.MT is 0.
0b1	PMEVTYPER<n>.MT bits not affected by this field.

If FEAT_MTPMU is disabled for any other PE in the system that has the same level 1 Affinity as the PE, it is IMPLEMENTATION DEFINED whether the PE behaves as if this field is 0.

The reset behavior of this field is:

- On a Cold reset, when the highest implemented Exception level is EL3, this field resets to '1'.

Otherwise:

Reserved, RES0.

TDCC, bit [27]
When FEAT_FGT is implemented:

Trap DCC. Traps use of the Debug Comms Channel in modes other than Monitor mode to Monitor mode.

TDCC	Meaning
0b0	This control does not cause any register accesses to be trapped.
0b1	Accesses to the DCC registers in modes other than Monitor mode generate a Monitor Trap exception, unless the access also generates a higher priority exception. Traps on the DCC data transfer registers are ignored when the PE is in Debug state.

The DCC registers trapped by this control are:

- DBGDTRRXext, DBGDTRTXext, DBGDSCRint, DBGDCCINT, and, when the PE is in Non-debug state, DBGDTRRXint and DBGDTRTXint.

When the PE is in Debug state, SDCR.TDCC does not trap any accesses to:

- DBGDTRRXint and DBGDTRTXint.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [26:24]

Reserved, RES0.

SCCD, bit [23]
When FEAT_PMUv3p5 is implemented:

Secure Cycle Counter Disable. Prohibits PMCCNTR from counting in Secure state and EL3.

SCCD	Meaning
0b0	Cycle counting by PMCCNTR is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR is prohibited in Secure state and EL3.

This field does not affect the CPU_CYCLES event or any other event that counts cycles.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [22]

Reserved, RES0.

EPMAD, bit [21]
When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Non-secure access disable. Controls Non-secure access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected Performance Monitor registers are prohibited.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

When FEAT_PMUv3_EXT is implemented:

External Performance Monitors access disable. Controls access to Performance Monitors registers by an external debugger.

EPMAD	Meaning
0b0	No accesses from an external debugger to the Performance Monitor registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected Performance Monitor registers are prohibited.

Otherwise, if EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

EDAD, bit [20]
When FEAT_Debugv8p4 is implemented:

External debug Non-secure access disable. Controls Non-secure access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	Non-secure accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

When FEAT_Debugv8p2 is implemented:

External debug access disable. Controls access to breakpoint, watchpoint, and OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

External debug access disable. Controls access to breakpoint, watchpoint, and optionally OSLAR_EL1 registers by an external debugger.

EDAD	Meaning
0b0	No accesses from an external debugger to the debug registers are prohibited by this control.
0b1	If the IMPLEMENTATION DEFINED authentication interface function ExternalSecureInvasiveDebugEnabled() returns FALSE, then accesses from an external debugger to the affected debug registers are prohibited.

It is IMPLEMENTATION DEFINED whether accesses to OSLAR_EL1 from an external debugger are affected by this control.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

TTRF, bit [19]
When FEAT_TRF is implemented:

Trap Trace Filter controls. Controls whether accesses in modes other than Monitor mode to the trace filter control registers generate a Monitor Trap exception.

TTRF	Meaning
0b0	Accesses to HTRFCR and TRFCR are not affected by this control bit.
0b1	When not in Monitor mode, accesses to HTRFCR and TRFCR generate a Monitor Trap exception, unless the access generates a higher priority exception.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

STE, bit [18]
When FEAT_TRF is implemented:

Secure Trace Enable. This field enables tracing in Secure state and controls the level of authentication required by an external debugger to enable external tracing.

STE	Meaning
0b0	Trace is prohibited in Secure state unless overridden by the IMPLEMENTATION DEFINED authentication interface.
0b1	Trace in Secure state is not affected by this field.

This field also controls the level of authentication required by an external debugger to enable external tracing. See 'Register controls to enable self-hosted trace'.

If EL3 is not implemented and the Effective value of SCR.NS is 0, the PE behaves as if this field is set to 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

SPME, bit [17]
When FEAT_PMUv3 is implemented and FEAT_Debugv8p2 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	Event counting is prohibited in Secure state. If PMCR.DP is 1, PMCCNTR is disabled in Secure state. Otherwise, PMCCNTR is not affected by this mechanism.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

This field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

When FEAT_PMUv3 is implemented:

Secure Performance Monitors Enable. Controls event counting in Secure state.

SPME	Meaning
0b0	If ExternalSecureNoninvasiveDebugEnabled() is FALSE, event counting is prohibited in Secure state, and if PMCR.DP is 1, PMCCNTR is disabled in Secure state.
0b1	Event counting and PMCCNTR are not affected by this mechanism.

If ExternalSecureNoninvasiveDebugEnabled() is TRUE, the event counters and PMCCNTR are not affected by this field.

Otherwise, this field affects the operation of all event counters in Secure state, and if PMCR.DP is 1, the operation of PMCCNTR in Secure state. When PMCR.DP is 0, PMCCNTR is not affected by this field.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

SPD, bits [15:14]

AArch32 Secure self-hosted Privileged Debug. Enables or disables debug exceptions from EL3, other than Breakpoint Instruction exceptions.

SPD	Meaning
0b00	Legacy mode. Debug exceptions from EL3 are enabled by the authentication interface.
0b10	Secure privileged debug disabled. Debug exceptions from EL3 are disabled.
0b11	Secure privileged debug enabled. Debug exceptions from EL3 are enabled.

Other values are reserved, and have the CONSTRAINED UNPREDICTABLE behavior that they must have the same behavior as 0b00. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

This field has no effect on Breakpoint Instruction exceptions. These are always enabled.

This field is ignored in Non-secure state.

If debug exceptions from EL3 are enabled, then debug exceptions from Secure EL0 are also enabled.

Otherwise, debug exceptions from Secure EL0 are enabled only if the value of SDER.SUIDEN is 1.

If EL3 is not implemented and the Effective value of SCR.NS is 0, then the Effective value of this field is 0b11.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '00'.

Bits [13:0]

Reserved, RES0.

Accessing SDCR

end;
```

2025-12-10 16:11:30, 2025-12_rel

SDER, Secure Debug Enable Register

The SDER characteristics are:

Purpose

Controls invasive and non-invasive debug in the Secure EL0 mode.

Configuration

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL2[31:0] when EL2 is implemented and FEAT_SEL2 is implemented.

AArch32 System register SDER bits [31:0] are architecturally mapped to AArch64 System register SDER32_EL3[31:0] when EL3 is implemented.

This register is present only when (EL3 is implemented and FEAT_AA32EL3 is implemented) or (FEAT_AA32EL1 is implemented, Secure EL1 is implemented, and FEAT_Secure is implemented). Otherwise, direct accesses to SDER are UNDEFINED.

Attributes

SDER is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit has no effect on non-invasive debug.
0b1	Non-invasive debug is allowed in Secure EL0 using AArch32.

When EL3 or Secure EL1 is using AArch32, the forms of non-invasive debug affected by this control are:

- The PC Sample-based Profiling Extension. See About the PC Sample-based Profiling Extension.
- When SelfHostedTraceEnabled() == FALSE, processor trace.
- When EL3 is implemented, Performance Monitors.

When Secure EL1 is using AArch64, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SUIDEN, bit [0]
When EL3 is implemented:

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL3 or EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Accessing SDER

Accesses to this register use the following encodings in the System register encoding space:

SPSR, Saved Program Status Register

The SPSR characteristics are:

Purpose

Holds the saved process state for the current mode.

Configuration

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR are UNDEFINED.

Attributes

SPSR is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to the current mode, and copied to PSTATE.N on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to the current mode, and copied to PSTATE.Z on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to the current mode, and copied to PSTATE.C on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to the current mode, and copied to PSTATE.V on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to the current mode, and copied to PSTATE.Q on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to the current mode, and copied to PSTATE.IT on executing an exception return operation in the current mode.

On executing an exception return operation in the current mode, SPSR.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR[26:25].
- IT[7:2] is SPSR[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to the current mode, and copied to PSTATE.SSBS on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to the current mode, and copied to PSTATE.PAN on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to the current mode, and copied to PSTATE.DIT on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to the current mode, and copied to PSTATE.IL on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to the current mode, and copied to PSTATE.GE on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to the current mode, and copied to PSTATE.E on executing an exception return operation in the current mode.

If the implementation does not support big-endian operation, SPSR.E is RES0. If the implementation does not support little-endian operation, SPSR.E is RES1. On executing an exception return operation in the current mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to the current mode, and copied to PSTATE.A on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to the current mode, and copied to PSTATE.I on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to the current mode, and copied to PSTATE.F on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to the current mode, and copied to PSTATE.T on executing an exception return operation in the current mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to the current mode, and copied to PSTATE.M[4:0] on executing an exception return operation in the current mode.

M[4:0]	Meaning	Applies when
0b10000	User.	
0b10001	FIQ.	
0b10010	IRQ.	
0b10011	Supervisor.	
0b10110	Monitor.	When FEAT_EL3 is implemented
0b10111	Abort.	
0b11010	Hyp.	When FEAT_EL3 is implemented
0b11011	Undefined.	
0b11111	System.	

Other values are reserved. If SPSR.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in the current mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR

SPSR can be read using the MRS instruction and written using the MSR (register) or MSR (immediate) instructions.

The MSR (register) and MRS instructions used to access SPSR are data-independent-time instructions as described in About PSTATE.DIT.

2025-12-10 16:11:30, 2025-12_rel

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch32 System register SPSR_abt bits [31:0] are architecturally mapped to AArch64 System register SPSR_abt[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

Attributes

SPSR_abt is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode, SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

SPSR_abt is accessible in all modes other than User mode and Abort mode.

The MSR (register) and MRS instructions used to access SPSR_abt are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_abt

R	M	M1
0b1	0b1	0b0100

MSR{<c>}{<q>} SPSR_abt, <Rn>

R	M	M1
0b1	0b1	0b0100

2025-12-10 16:11:30, 2025-12_rel

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch32 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch64 System register SPSR_fiq[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

Attributes

SPSR_fiq is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode, SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

SPSR_fiq is accessible in all modes other than User mode and FIQ mode.

The MSR (register) and MRS instructions used to access SPSR_fiq are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_fiq

R	M	M1
0b1	0b0	0b1110

MSR{<c>}{<q>} SPSR_fiq, <Rn>

R	M	M1
0b1	0b0	0b1110

SPSR_hyp, Saved Program Status Register (Hyp mode)

The SPSR_hyp characteristics are:

Purpose

Holds the saved process state when an exception is taken to Hyp mode.

Configuration

AArch32 System register SPSR_hyp bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to SPSR_hyp are UNDEFINED.

Attributes

SPSR_hyp is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Hyp mode, and copied to PSTATE.N on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Hyp mode, and copied to PSTATE.Z on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Hyp mode, and copied to PSTATE.C on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Hyp mode, and copied to PSTATE.V on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Hyp mode, and copied to PSTATE.Q on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Hyp mode, and copied to PSTATE.IT on executing an exception return operation in Hyp mode.

On executing an exception return operation in Hyp mode, SPSR_hyp.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_hyp[26:25].
- IT[7:2] is SPSR_hyp[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Hyp mode, and copied to PSTATE.SSBS on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Hyp mode, and copied to PSTATE.PAN on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Hyp mode, and copied to PSTATE.DIT on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Hyp mode, and copied to PSTATE.IL on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Hyp mode, and copied to PSTATE.GE on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Hyp mode, and copied to PSTATE.E on executing an exception return operation in Hyp mode.

If the implementation does not support big-endian operation, SPSR_hyp.E is RES0. If the implementation does not support little-endian operation, SPSR_hyp.E is RES1. On executing an exception return operation in Hyp mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_hyp.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_hyp.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Hyp mode, and copied to PSTATE.A on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Hyp mode, and copied to PSTATE.I on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Hyp mode, and copied to PSTATE.F on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Hyp mode, and copied to PSTATE.T on executing an exception return operation in Hyp mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Hyp mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Hyp mode.

M[4:0]	Meaning	Applies when
0b10000	User.	
0b10001	FIQ.	
0b10010	IRQ.	
0b10011	Supervisor.	
0b10111	Abort.	
0b11010	Hyp.	When FEAT_EL3 is implemented
0b11011	Undefined.	
0b11111	System.	

Other values are reserved. If SPSR_hyp.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Hyp mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_hyp

SPSR_hyp is accessible only in Monitor mode.

The MSR (register) and MRS instructions used to access SPSR_hyp are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_hyp

R	M	M1
0b1	0b1	0b1110

MSR{<c>}{<q>} SPSR_hyp, <Rn>

R	M	M1
0b1	0b1	0b1110

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch32 System register SPSR_irq bits [31:0] are architecturally mapped to AArch64 System register SPSR_irq[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

Attributes

SPSR_irq is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode, SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

SPSR_irq is accessible in all modes other than User mode and IRQ mode.

The MSR (register) and MRS instructions used to access SPSR_irq are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_irq

R	M	M1
0b1	0b1	0b0000

MSR{<c>}{<q>} SPSR_irq, <Rn>

R	M	M1
0b1	0b1	0b0000

2025-12-10 16:11:30, 2025-12_rel

SPSR_mon, Saved Program Status Register (Monitor mode)

The SPSR_mon characteristics are:

Purpose

Holds the saved process state when an exception is taken to Monitor mode.

Configuration

This register is present only when FEAT_AA32EL3 is implemented. Otherwise, direct accesses to SPSR_mon are UNDEFINED.

Attributes

SPSR_mon is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Monitor mode, and copied to PSTATE.N on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Monitor mode, and copied to PSTATE.Z on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Monitor mode, and copied to PSTATE.C on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Monitor mode, and copied to PSTATE.V on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Monitor mode, and copied to PSTATE.Q on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Monitor mode, and copied to PSTATE.IT on executing an exception return operation in Monitor mode.

On executing an exception return operation in Monitor mode, SPSR_mon.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_mon[26:25].
- IT[7:2] is SPSR_mon[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Monitor mode, and copied to PSTATE.SSBS on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Monitor mode, and copied to PSTATE.PAN on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Monitor mode, and copied to PSTATE.DIT on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Monitor mode, and copied to PSTATE.IL on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Monitor mode, and copied to PSTATE.GE on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Monitor mode, and copied to PSTATE.E on executing an exception return operation in Monitor mode.

If the implementation does not support big-endian operation, SPSR_mon.E is RES0. If the implementation does not support little-endian operation, SPSR_mon.E is RES1. On executing an exception return operation in Monitor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_mon.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_mon.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Monitor mode, and copied to PSTATE.A on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Monitor mode, and copied to PSTATE.I on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Monitor mode, and copied to PSTATE.F on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Monitor mode, and copied to PSTATE.T on executing an exception return operation in Monitor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Monitor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Monitor mode.

M[4:0]	Meaning	Applies when
0b10000	User.	
0b10001	FIQ.	
0b10010	IRQ.	
0b10011	Supervisor.	
0b10110	Monitor.	When FEAT_EL3 is implemented
0b10111	Abort.	
0b11010	Hyp.	When FEAT_EL3 is implemented
0b11011	Undefined.	
0b11111	System.	

Other values are reserved. If SPSR_mon.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Monitor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_mon

SPSR_mon is only accessible in EL3 modes other than Monitor mode.

The MSR (register) and MRS instructions used to access SPSR_mon are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_mon

R	M	M1
0b1	0b1	0b1100

MSR{<c>}{<q>} SPSR_mon, <Rn>

R	M	M1
0b1	0b1	0b1100

2025-12-10 16:11:30, 2025-12_rel

SPSR_svc, Saved Program Status Register (Supervisor mode)

The SPSR_svc characteristics are:

Purpose

Holds the saved process state when an exception is taken to Supervisor mode.

Configuration

AArch32 System register SPSR_svc bits [31:0] are architecturally mapped to AArch64 System register SPSR_EL1[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_svc are UNDEFINED.

Attributes

SPSR_svc is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Supervisor mode, and copied to PSTATE.N on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Supervisor mode, and copied to PSTATE.Z on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Supervisor mode, and copied to PSTATE.C on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Supervisor mode, and copied to PSTATE.V on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Supervisor mode, and copied to PSTATE.Q on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Supervisor mode, and copied to PSTATE.IT on executing an exception return operation in Supervisor mode.

On executing an exception return operation in Supervisor mode, SPSR_svc.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_svc[26:25].
- IT[7:2] is SPSR_svc[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Supervisor mode, and copied to PSTATE.SSBS on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Supervisor mode, and copied to PSTATE.PAN on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Supervisor mode, and copied to PSTATE.DIT on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Supervisor mode, and copied to PSTATE.IL on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Supervisor mode, and copied to PSTATE.GE on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Supervisor mode, and copied to PSTATE.E on executing an exception return operation in Supervisor mode.

If the implementation does not support big-endian operation, SPSR_svc.E is RES0. If the implementation does not support little-endian operation, SPSR_svc.E is RES1. On executing an exception return operation in Supervisor mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_svc.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_svc.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Supervisor mode, and copied to PSTATE.A on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Supervisor mode, and copied to PSTATE.I on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Supervisor mode, and copied to PSTATE.F on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Supervisor mode, and copied to PSTATE.T on executing an exception return operation in Supervisor mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Supervisor mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Supervisor mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_svc.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Supervisor mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_svc

SPSR_svc is accessible in all modes other than User mode and Supervisor mode.

The MSR (register) and MRS instructions used to access SPSR_svc are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_svc

R	M	M1
0b1	0b1	0b0010

MSR{<c>}{<q>} SPSR_svc, <Rn>

R	M	M1
0b1	0b1	0b0010

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch32 System register SPSR_und bits [31:0] are architecturally mapped to AArch64 System register SPSR_und[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to SPSR_und are UNDEFINED.

Attributes

SPSR_und is a 32-bit register.

Field descriptions

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode, SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

SPSR_und is accessible in all modes other than User mode and Undefined mode.

The MSR (register) and MRS instructions used to access SPSR_und are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS{<c>}{<q>} <Rd>, SPSR_und

R	M	M1
0b1	0b1	0b0110

MSR{<c>}{<q>} SPSR_und, <Rn>

R	M	M1
0b1	0b1	0b0110

TCMTR, TCM Type Register

The TCMTR characteristics are:

Purpose

Provides information about the implementation of the TCM.

Configuration

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TCMTR are UNDEFINED.

If EL1 or above can use AArch32 then this register must be implemented.

Attributes

TCMTR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing TCMTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then

TLBIALL, TLB Invalidate All

The TLBIALL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIALL are UNDEFINED.

Attributes

TLBIALL is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALL

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL1) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then

        AArch64_AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HCR_EL2().TTLB == '1' && (!
IsFeatureImplemented(FEAT_NV3) || (IsFeatureImplemented(FEAT_NV3) && EffectiveHCRX_EL2_NVTGE() == '1' &&
NVHCR_EL2().TGE == '1' && HCRX_EL2().NVnTTLB == '0')) then
        AArch64_AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HCR().TTLB == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        AArch32_TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_VMALL(SecurityStateAtEL(EL1), Regime_EL10, VMID(), Broadcast_NSH, TLBI_AllAttr);
elsif PSTATE.EL == EL3 then
    AArch32_TLBI_ALL(SecurityStateAtEL(EL3), Regime_EL30, Broadcast_NSH, TLBI_ExcludeXS);
end;
```

2025-12-10 16:11:30, 2025-12_rel

TLBIALLH, TLB Invalidate All, Hyp mode

The TLBIALLH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIALLH are UNDEFINED.

Attributes

TLBIALLH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b000

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2().T8 == '1' then
        AArch64_AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR().T8 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    AArch32_TLBI_ALL(SecurityStateAtEL(EL2), Regime_EL2, Broadcast_NSH, TLBI_AllAttr);
elsif PSTATE.EL == EL3 then
    if !HaveEL(EL2) then
        Undefined();
    else
        AArch32_TLBI_ALL(SS_NonSecure, Regime_EL2, Broadcast_NSH, TLBI_AllAttr);
    end;
end;
```

2025-12-10 16:11:30, 2025-12_rel

TLBIALLHIS, TLB Invalidate All, Hyp mode, Inner Shareable

The TLBIALLHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for the Non-secure EL2 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIALLHIS are UNDEFINED.

Attributes

TLBIALLHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b000

TLBIALLIS, TLB Invalidate All, Inner Shareable

The TLBIALLIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk. The entries that are invalidated are as follows:

- If executed at EL1, all entries that:
  - Would be required for the EL1&0 translation regime.
  - Match the current VMID, if EL2 is implemented and enabled in the current Security state.
- If executed in Secure state when EL3 is using AArch32, all entries that would be required for the Secure PL1&0 translation regime.
- If executed at EL2, and if EL2 is enabled in the current Security state, the stage 1 or stage 2 translation table entries that would be required for the PL1&0 translation regime and matches the current VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIALLIS are UNDEFINED.

Attributes

TLBIALLIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLIS

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

end;
```

TLBIALLNSNH, TLB Invalidate All, Non-Secure Non-Hyp

The TLBIALLNSNH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIALLNSNH are UNDEFINED.

Attributes

TLBIALLNSNH is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLNSNH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

TLBIALLNSNHIS, TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable

The TLBIALLNSNHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from any level of the translation table walk that would be required for stage 1 or stage 2 of the Non-secure PL1&0 translation regime, regardless of the associated VMID.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIALLNSNHIS are UNDEFINED.

Attributes

TLBIALLNSNHIS is a 32-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Rt> is ignored.

Executing TLBIALLNSNHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0011	0b100

```
if !IsFeatureImplemented(FEAT_AA32EL2) then

TLBIASID, TLB Invalidate by ASID match

The TLBIASID characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIASID are UNDEFINED.

Attributes

TLBIASID is a 32-bit System instruction.

Field descriptions

Bits [31:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries for non-global pages that match the ASID values will be affected by this System instruction.

Executing TLBIASID

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b010

```

TLBIASIDIS, TLB Invalidate by ASID match, Inner Shareable

The TLBIASIDIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used for the specified ASID, and either:
  - Is from a level of lookup above the final level.
  - Is a non-global entry from the final level of lookup.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIASIDIS are UNDEFINED.

Attributes

TLBIASIDIS is a 32-bit System instruction.

Field descriptions

Bits [31:8]

TLBIIPAS2, TLB Invalidate by Intermediate Physical Address, Stage 2

The TLBIIPAS2 characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 2 only translation table entry, from any level of the translation table walk.
- SCR.NS is 1.
- The entry would be used for the specified IPA.
- The entry would be used with the current VMID.
- The entry would be required for the PL1&0 translation regime.

The invalidation is not required to apply to caching structures that combine stage 1 and stage 2 translation table entries.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIIPAS2 are UNDEFINED.

Note

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIIPAS2 is a 32-bit System instruction.

Field descriptions

Bits [31:28]

Reserved, RES0.

IPA[39:12], bits [27:0]

Bits[39:12] of the intermediate physical address to match.

Executing TLBIIPAS2

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBIMVA, TLB Invalidate by VA

The TLBIMVA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVA are UNDEFINED.

Attributes

TLBIMVA is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVA

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

TLBIMVAA, TLB Invalidate by VA, All ASID

The TLBIMVAA characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAA are UNDEFINED.

Attributes

TLBIMVAA is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any unlocked TLB entries that match the VA will be affected by this System instruction, regardless of the ASID.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVAA

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b011

```

TLBIMVAAIS, TLB Invalidate by VA, All ASID, Inner Shareable

The TLBIMVAAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry, from any level of the translation table walk.
- The entry would be used to translate the specified address.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAAIS are UNDEFINED.

Attributes

TLBIMVAAIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

TLBIMVAIS, TLB Invalidate by VA, Inner Shareable

The TLBIMVAIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is from a level of lookup above the final level and matches the specified ASID.
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAIS are UNDEFINED.

Attributes

TLBIMVAIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAIS

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0011	0b001

```
if !IsFeatureImplemented(FEAT_AA32EL1) then

TLBIMVAL, TLB Invalidate by VA, Last level

The TLBIMVAL characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVAL are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVAL is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVAL

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b1000	0b0111	0b101

```

TLBIMVALH, TLB Invalidate by VA, Last level, Hyp mode

The TLBIMVALH characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation only applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIMVALH are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALH is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVALH

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b1000	0b0111	0b101

TLBIMVALHIS, TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable

The TLBIMVALHIS characteristics are:

Purpose

If EL2 is implemented, invalidate all cached copies of translation table entries from TLBs that are from the final level of the translation table walk that would be required for the Non-secure EL2 translation regime and used to translate the specified address.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to TLBIMVALHIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALHIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:0]

Reserved, RES0.

Executing TLBIMVALHIS

If this instruction is executed in a Secure privileged mode other than Monitor mode, then the behavior is CONSTRAINED UNPREDICTABLE, and one of the following behaviors must occur:

- The instruction is UNDEFINED.
- The instruction is treated as a NOP.
- The instruction executes as if it had been executed in Monitor mode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

MCR{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TLBIMVALIS, TLB Invalidate by VA, Last level, Inner Shareable

The TLBIMVALIS characteristics are:

Purpose

Invalidate all cached copies of translation table entries from TLBs that meet the following requirements:

- The entry is a stage 1 translation table entry.
- The entry would be used to translate the specified address, and one of the following applies:
  - The entry is a global entry from the final level of lookup.
  - The entry is a non-global entry from the final level of lookup that matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state, the entry would be used with the current VMID.

From the entries that match these requirements, the entries that are invalidated are required for the following translation regime:

- If executed at Secure EL1 when EL3 is using AArch64, the Secure EL1&0 translation regime.
- If executed in Secure state when EL3 is using AArch32, the Secure PL1&0 translation regime.
- If executed in Non-secure state, the Non-secure PL1&0 translation regime.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBIMVALIS are UNDEFINED.

This System instruction is not implemented in architecture versions before Armv8.

Attributes

TLBIMVALIS is a 32-bit System instruction.

Field descriptions

VA, bits [31:12]

Virtual address to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Bits [11:8]

Reserved, RES0.

ASID, bits [7:0]

ASID value to match. Any TLB entries that match the ASID value and VA value will be affected by this System instruction.

Global TLB entries that match the VA value will be affected by this System instruction, regardless of the value of the ASID field.

Executing TLBIMVALIS

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see the relevant instruction in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

TLBTR, TLB Type Register

The TLBTR characteristics are:

Purpose

Provides information about the TLB implementation. The register must define whether the implementation provides separate instruction and data TLBs, or a unified TLB. Normally, the IMPLEMENTATION DEFINED information in this register includes the number of lockable entries in the TLB.

Configuration

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TLBTR are UNDEFINED.

Attributes

TLBTR is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:1]

IMPLEMENTATION DEFINED.

nU, bit [0]

Not Unified TLB. Indicates whether the implementation has a unified TLB.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nU	Meaning
0b0	Unified TLB.
0b1	Separate Instruction and Data TLBs.

Access to this field is RO.

Accessing TLBTR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0000	0b0000	0b011

```
if !IsFeatureImplemented(FEAT_AA32EL1) then

end;
```

TPIDRPRW, PL1 Software Thread ID Register

The TPIDRPRW characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is not visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

This register is banked between TPIDRPRW and TPIDRPRW_S and TPIDRPRW_NS.

AArch32 System register TPIDRPRW bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TPIDRPRW are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRPRW is a 32-bit register.

This register has the following instances:

- TPIDRPRW, when EL3 is not implemented or FEAT_AA64 is implemented.
- TPIDRPRW_S, when FEAT_AA32EL3 is implemented.
- TPIDRPRW_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRPRW

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TPIDRURO, PL0 Read-Only Software Thread ID Register

The TPIDRURO characteristics are:

Purpose

Provides a location where software executing at EL1 or higher can store thread identifying information that is visible to software executing at EL0, for OS management purposes.

The PE makes no use of this register.

Configuration

This register is banked between TPIDRURO and TPIDRURO_S and TPIDRURO_NS.

AArch32 System register TPIDRURO bits [31:0] are architecturally mapped to AArch64 System register TPIDRRO_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to TPIDRURO are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRURO is a 32-bit register.

This register has the following instances:

- TPIDRURO, when EL3 is not implemented or FEAT_AA64 is implemented.
- TPIDRURO_S, when FEAT_AA32EL3 is implemented.
- TPIDRURO_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURO

Accesses to this register use the following encodings in the System register encoding space:

TPIDRURW, PL0 Read/Write Software Thread ID Register

The TPIDRURW characteristics are:

Purpose

Provides a location where software executing at EL0 can store thread identifying information, for OS management purposes.

The PE makes no use of this register.

Configuration

This register is banked between TPIDRURW and TPIDRURW_S and TPIDRURW_NS.

AArch32 System register TPIDRURW bits [31:0] are architecturally mapped to AArch64 System register TPIDR_EL0[31:0].

This register is present only when FEAT_AA32 is implemented. Otherwise, direct accesses to TPIDRURW are UNDEFINED.

Note

The PE never updates this register.

Attributes

TPIDRURW is a 32-bit register.

This register has the following instances:

- TPIDRURW, when EL3 is not implemented or FEAT_AA64 is implemented.
- TPIDRURW_S, when FEAT_AA32EL3 is implemented.
- TPIDRURW_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

TID, bits [31:0]

Thread ID. Thread identifying information stored by software running at this Exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TPIDRURW

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

TRFCR, Trace Filter Control Register

The TRFCR characteristics are:

Purpose

Provides EL1 controls for Trace.

Configuration

AArch32 System register TRFCR bits [31:0] are architecturally mapped to AArch64 System register TRFCR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_TRF is implemented. Otherwise, direct accesses to TRFCR are UNDEFINED.

Attributes

TRFCR is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

TS, bits [6:5]

Timestamp Control. Controls which timebase is used for trace timestamps.

TS	Meaning	Applies when
0b01	Virtual timestamp. The traced timestamp is the physical counter value minus the value of CNTVOFF.	
0b10	Guest physical timestamp. The traced timestamp is the physical counter value minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • EL3 is implemented and is using AArch32. • EL3 is implemented, using AArch64, and SCR_EL3.ECVEn == 0b0. • EL2 is using AArch32. • EL2 is using AArch64 and CNTHCTL_EL2.ECV == 0b0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented
0b11	Physical timestamp. The traced timestamp is the physical counter value.	

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- EL2 is implemented and HTRFCR.TS != 0b00.
- SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [4:2]

Reserved, RES0.

E1TRE, bit [1]

EL1 Trace Enable.

E1TRE	Meaning
0b0	Tracing is prohibited in PL1 modes.
0b1	Tracing is allowed in PL1 modes.

This field is ignored if SelfHostedTraceEnabled() == FALSE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

E0TRE, bit [0]

EL0 Trace Enable.

E0TRE	Meaning
0b0	Tracing is prohibited at EL0.
0b1	Tracing is allowed at EL0.

This field is ignored if any of the following are true:

- SelfHostedTraceEnabled() == FALSE.
- EL2 is implemented and enabled in the current security state and HCR.TGE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing TRFCR

TTBCR, Translation Table Base Control Register

The TTBCR characteristics are:

Purpose

The control register for stage 1 of the PL1&0 translation regime. Its controls include:

- Where the VA range is split between addresses translated using TTBR0 and addresses translated using TTBR1.
- The translation table format used by this stage of translation.

From Armv8.2, when the value of TTBCR.{EAE, T2E} is {1, 1}, TTBCR is used with TTBCR2.

Configuration

This register is banked between TTBCR and TTBCR_S and TTBCR_NS.

AArch32 System register TTBCR bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TTBCR are UNDEFINED.

The current translation table format determines which format of the register is used.

Some RW fields of this register have defined reset values. These apply only if the PE resets into an Exception level that is using AArch32. If the PE resets into EL3 using AArch32, then:

- The EAE bit resets to 0 in both the Secure and the Non-secure instances of the register.
- Other reset values apply only to the Secure instance of the register.

Attributes

TTBCR is a 32-bit register.

This register has the following instances:

- TTBCR, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBCR_S, when FEAT_AA32EL3 is implemented.
- TTBCR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == '0':

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b0	Use the VMSAv8-32 translation system with the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [30:6]

Reserved, RES0.

PD1, bit [5]

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

PD1	Meaning
0b0	Perform translation table walks using TTBR1.
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

PD0, bit [4]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss for an address that is translated using TTBR0.

PD0	Meaning
0b0	Perform translation table walks using TTBR0.
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [3]

Reserved, RES0.

N, bits [2:0]

Indicate the width of the base address held in TTBR0. In TTBR0, the base address field is bits[31:14-N]. The value of N also determines:

- Whether TTBR0 or TTBR1 is used as the base address for translation table walks.
- The size of the translation table pointed to by TTBR0.

N can take any value from 0 to 7, that is, from 0b000 to 0b111.

When N has its reset value of 0, the translation table base is compatible with Armv5 and Armv6.

The reset behavior of this field is:

- On a Warm reset, this field resets to '000'.

When TTBCR.EAE == '1':

31	30	29 28	27 26	25 24	23	22	21 20 19	18 17 16	15 14	13 12	11 10	9 8	7	6	5 4 3	2 1 0
EAE	IMPLEMENTATION DEFINED	SH1	ORGN1	IRGN1	EPD1	A1	RES0	T1SZ	RES0	SH0	ORGN0	IRGN0	EPD0	T2E	RES0	T0SZ

EAE, bit [31]

Extended Address Enable.

EAE	Meaning
0b1	Use the VMSAv8-32 translation system with the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

IMPLEMENTATION DEFINED, bit [30]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1.

EPD1	Meaning
0b0	Perform translation table walks using TTBR1.
0b1	A TLB miss on an address that is translated using TTBR1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

A1, bit [22]

Selects whether TTBR0 or TTBR1 defines the ASID.

A1	Meaning
0b0	TTBR0.ASID defines the ASID.
0b1	TTBR1.ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [21:19]

Reserved, RES0.

T1SZ, bits [18:16]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '000'.

Bits [15:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0.

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to '00'.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0.

EPD0	Meaning
0b0	Perform translation table walks using TTBR0.
0b1	A TLB miss on an address that is translated using TTBR0 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

T2E, bit [6]
When FEAT_AA32HPD is implemented:

TTBCR2 Enable.

T2E	Meaning
0b0	TTBCR2 is disabled. The contents of TTBCR2 are treated as 0 for all purposes other than reading or writing the register.
0b1	TTBCR2 is enabled.

If TTBCR.EAE==0, then the behavior is as if the bit is 0.

Otherwise:

Reserved, RES0.

Bits [5:3]

Reserved, RES0.

T0SZ, bits [2:0]

See 'Selecting between TTBR0 and TTBR1, VMSAv8-32 Long-descriptor translation table format' for how TTBCR.{T1SZ, T0SZ} determine the input address ranges and memory region sizes translated using TTBR0 and TTBR1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '000'.

Accessing TTBCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b000	0b0010	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL1) then

    end;
end;
```

TTBCR2, Translation Table Base Control Register 2

The TTBCR2 characteristics are:

Purpose

The second control register for stage 1 of the PL1&0 translation regime.

If FEAT_AA32HPD is not implemented then this register is not implemented and its encoding is UNDEFINED. Otherwise:

- When the value of TTBCR.{EAE, T2E} is not {1, 1} the contents of TTBCR2 are treated as zero for all purposes other than reading or writing the register.
- When the value of TTBCR.{EAE, T2E} is {1, 1} TTBCR2 is used with TTBCR.

Configuration

This register is banked between TTBCR2 and TTBCR2_S and TTBCR2_NS.

AArch32 System register TTBCR2 bits [31:0] are architecturally mapped to AArch64 System register TCR_EL1[63:32].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_AA32HPD is implemented. Otherwise, direct accesses to TTBCR2 are UNDEFINED.

Attributes

TTBCR2 is a 32-bit register.

This register has the following instances:

- TTBCR2, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBCR2_S, when FEAT_AA32EL3 is implemented.
- TTBCR2_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

Bits [31:19]

Reserved, RES0.

HWU162, bit [18]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU162	Meaning
0b0	For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [17]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU161	Meaning
0b0	For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [16]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU160	Meaning
0b0	For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [15]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1.

HWU159	Meaning
0b0	For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD1 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD1 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [14]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU062	Meaning
0b0	For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [13]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU061	Meaning
0b0	For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [12]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU060	Meaning
0b0	For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [11]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0.

HWU059	Meaning
0b0	For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TTBCR2.HPD0 is 1.

The Effective value of this field is 0 if the value of TTBCR2.HPD0 is 0 or the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [10]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR1.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E == 1.

When disabled, the permissions are treated as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HPD0, bit [9]

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, XNTable, and PXNTable, in the translation tables pointed to by TTBR0.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled if TTBCR.T2E ==1.

When disabled, the permissions are treated is as if the bits are 0.

The Effective value of this field is 0 if the value of TTBCR.T2E is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:0]

Reserved, RES0.

Accessing TTBCR2

2025-12-10 16:11:30, 2025-12_rel

TTBR0, Translation Table Base Register 0

The TTBR0 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the lower VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

This register is banked between TTBR0 and TTBR0_S and TTBR0_NS.

AArch32 System register TTBR0 bits [63:0] are architecturally mapped to AArch64 System register TTBR0_EL1[63:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TTBR0 are UNDEFINED.

TTBR0 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

TTBCR.EAE determines which TTBR0 format is used:

- TTBCR.EAE == 0b0: 32-bit format is used. TTBR0[63:32] are ignored.
- TTBCR.EAE == 0b1: 64-bit format is used.

When EL3 is using AArch32, write access to TTBR0(S) is disabled when the CP15SDISABLE signal is asserted HIGH.

Used in conjunction with the TTBCR. When the 64-bit TTBR0 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR0.

Attributes

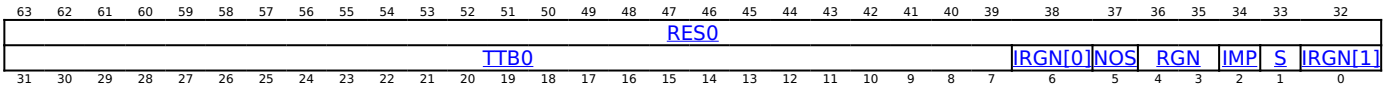
TTBR0 is a 64-bit register.

This register has the following instances:

- TTBR0, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBR0_S, when FEAT_AA32EL3 is implemented.
- TTBR0_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == '0':



Bits [63:32]

Reserved, RES0.

TTB0, bits [31:7]

Translation table base address, bits[31:x], where x is 14-(TTBCR.N). Register bits [x-1:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [0, 6]

Inner region bits. Bits [0,6] of this register together indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for ARMv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[0] is TTBR0[6].
- IRGN[1] is TTBR0[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR0.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR0.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

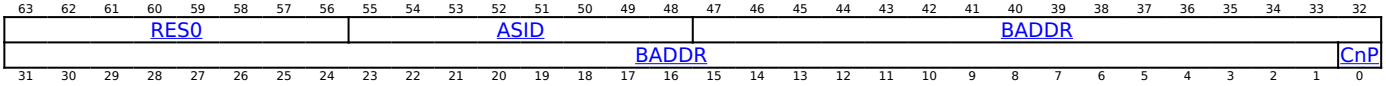
Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR0.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == '1':



Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T0SZ as follows:

- If TTBCR.T0SZ is 0 or 1, x = 5 - TTBCR.T0SZ.
- If TTBCR.T0SZ is greater than 1, x = 14 - TTBCR.T0SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. When TTBCR.EAE ==1, this bit indicates whether each entry that is pointed to by TTBR0 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by this instance of TTBR0, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR0 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR0.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR0, the value of the current VMID.
0b1	The translation table entries pointed to by this instance of TTBR0 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR0.CnP is 1 for this instance of TTBR0 and all of the following apply: • The translation table entries are pointed to by this instance of TTBR0. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR0, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR0.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR0s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR0

Accesses to this register use the following encodings in the System register encoding space:

2025-12-10 16:11:30, 2025-12_rel

TTBR1, Translation Table Base Register 1

The TTBR1 characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 1 of the translation of an address from the higher VA range in the PL1&0 translation regime, and other information for this translation regime.

Configuration

This register is banked between TTBR1 and TTBR1_S and TTBR1_NS.

AArch32 System register TTBR1 bits [63:0] are architecturally mapped to AArch64 System register TTBR1_EL1[63:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to TTBR1 are UNDEFINED.

TTBR1 is a 64-bit register that can also be accessed as a 32-bit value. If it is accessed as a 32-bit register, accesses read and write bits [31:0] and do not modify bits [63:32].

TTBCR.EAE determines which TTBR1 format is used:

- TTBCR.EAE == 0b0: 32-bit format is used. TTBR1[63:32] are ignored.
- TTBCR.EAE == 0b1: 64-bit format is used.

Used in conjunction with the TTBCR. When the 64-bit TTBR1 format is used, cacheability and shareability information is held in the TTBCR, not in TTBR1.

Attributes

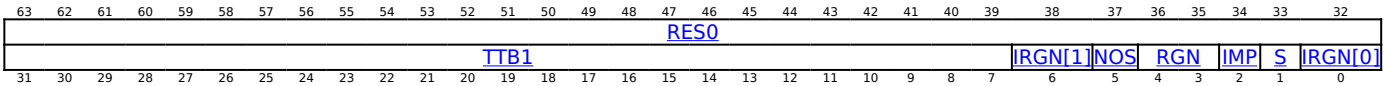
TTBR1 is a 64-bit register.

This register has the following instances:

- TTBR1, when EL3 is not implemented or FEAT_AA64 is implemented.
- TTBR1_S, when FEAT_AA32EL3 is implemented.
- TTBR1_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

When TTBCR.EAE == '0':



Bits [63:32]

Reserved, RES0.

TTB1, bits [31:7]

Translation table base address, bits[31:14]. Register bits [13:7] are RES0, with the additional requirement that if these bits are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [13:7] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN, bits [6, 0]

Inner region bits. IRGN[1:0] indicate the Inner Cacheability attributes for the memory associated with the translation table walks. The possible values of IRGN[1:0] are:

IRGN	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Cacheable.
0b11	Normal memory, Inner Write-Back no Write-Allocate Cacheable.

Note

The encoding of the IRGN bits is counter-intuitive, with register bit[6] being IRGN[0] and register bit[0] being IRGN[1]. This encoding is chosen to give a consistent encoding of memory region types and to ensure that software written for Armv7 without the Multiprocessing Extensions can run unmodified on an implementation that includes the functionality introduced by the ARMv7 Multiprocessing Extensions.

The IRGN field is split as follows:

- IRGN[1] is TTBR1[6].
- IRGN[0] is TTBR1[0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NOS, bit [5]

Not Outer Shareable. When the value of TTBR1.S is 1, indicates whether the memory associated with a translation table walk is Inner Shareable or Outer Shareable:

NOS	Meaning
0b0	Memory is Outer Shareable.
0b1	Memory is Inner Shareable.

This bit is ignored when the value of TTBR1.S is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RGN, bits [4:3]

Region bits. Indicates the Outer cacheability attributes for the memory associated with the translation table walks:

RGN	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Cacheable.
0b11	Normal memory, Outer Write-Back no Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMP, bit [2]

The effect of this bit is IMPLEMENTATION DEFINED. If the translation table implementation does not include any IMPLEMENTATION DEFINED features this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S, bit [1]

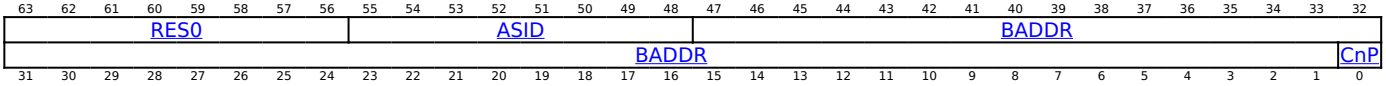
Shareable. Indicates whether the memory associated with the translation table walks is Shareable:

S	Meaning
0b0	Memory is Non-shareable.
0b1	Memory is Shareable. The TTBR1.NOS field indicates whether the memory is Inner Shareable or Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When TTBCR.EAE == '1':



Bits [63:56]

Reserved, RES0.

ASID, bits [55:48]

An ASID for the translation table base address. The TTBCR.A1 field selects either TTBR0.ASID or TTBR1.ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of TTBCR.T1SZ as follows:

- If TTBCR.T1SZ is 0 or 1, x = 5 - TTBCR.T1SZ.
- If TTBCR.T1SZ is greater than 1, x = 14 - TTBCR.T1SZ.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. When TTBCR.EAE ==1, this bit indicates whether each entry that is pointed to by TTBR1 is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by this instance of TTBR1, for the current ASID, are permitted to differ from corresponding entries for this instance of TTBR1 for other PEs in the Inner Shareable domain. This is not affected by: • The value of TTBR1.CnP on those other PEs. • The value of TTBCR.EAE on those other PEs. • The value of the current ASID or, for the Non-secure instance of TTBR1, the value of the current VMID.
0b1	The translation table entries pointed to by this instance of TTBR1 are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of TTBR1.CnP is 1 for this instance of TTBR1 and all of the following apply: • The translation table entries are pointed to by this instance of TTBR1. • The value of the applicable TTBCR.EAE field is 1. • The ASID is the same as the current ASID. • For the Non-secure instance of TTBR1, the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the TTBR1.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those TTBR1s do not point to the same translation table entries when the other conditions specified for the case when the value of CnP is 1 apply, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TTBR1

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

VBAR, Vector Base Address Register

The VBAR characteristics are:

Purpose

When high exception vectors are not selected, holds the vector base address for exceptions that are not taken to Monitor mode or to Hyp mode.

Software must program VBAR(NS) with the required initial value as part of the PE boot sequence.

Configuration

This register is banked between VBAR and VBAR_S and VBAR_NS.

AArch32 System register VBAR bits [31:0] are architecturally mapped to AArch64 System register VBAR_EL1[31:0].

This register is present only when FEAT_AA32EL1 is implemented. Otherwise, direct accesses to VBAR are UNDEFINED.

Attributes

VBAR is a 32-bit register.

This register has the following instances:

- VBAR, when EL3 is not implemented or FEAT_AA64 is implemented.
- VBAR_S, when FEAT_AA32EL3 is implemented.
- VBAR_NS, when FEAT_AA32EL3 is implemented.

Field descriptions

VBA, bits [31:5]

Vector Base Address. Bits[31:5] of the base address of the exception vectors for exceptions taken to this Exception level. Bits[4:0] of an exception vector are the exception offset.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [4:0]

Reserved, RES0.

Accessing VBAR

Accesses to this register use the following encodings in the System register encoding space:

2025-12-10 16:11:30, 2025-12_rel

VDFSR, Virtual SError Exception Syndrome Register

The VDFSR characteristics are:

Purpose

Provides the syndrome value reported to software on taking a virtual SError exception exception to EL1, or on executing an ESB instruction at EL1.

When the virtual SError exception injected using HCR.VA is taken to EL1 using AArch32, then the syndrome value is reported in DFSR.{AET, ExT} and the remainder of DFSR is set as defined by VMSAv8-32. For more information, see The AArch32 Virtual Memory System Architecture.

If the virtual SError exception injected using HCR.VA is deferred by an ESB instruction, then the syndrome value is written to VDISR.

Configuration

AArch32 System register VDFSR bits [31:0] are architecturally mapped to AArch64 System register VSESR_EL2[31:0].

This register is present only when FEAT_RAS is implemented and FEAT_AA32EL1 is implemented. Otherwise, direct accesses to VDFSR are UNDEFINED.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDFSR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

AET, bits [15:14]

When a virtual SError exception is taken to EL1 using AArch32, DFSR[15:14] is set to VDFSR.AET.

When a virtual SError exception is deferred by an ESB instruction, VDISR[15:14] is set to VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

When a virtual SError exception is taken to EL1 using AArch32, DFSR[12] is set to VDFSR.ExT.

When a virtual SError exception is deferred by an ESB instruction, VDISR[12] is set to VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:0]

Reserved, RES0.

Accessing VDFSR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

If EL2 is not implemented, then VDFSR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

VDISR, Virtual Deferred Interrupt Status Register

The VDISR characteristics are:

Purpose

Records that an SError exception has been consumed by an ESB instruction.

Configuration

AArch32 System register VDISR bits [31:0] are architecturally mapped to AArch64 System register VDISR_EL2[31:0].

This register is present only when FEAT_AA32EL1 is implemented and FEAT_RAS is implemented. Otherwise, direct accesses to VDISR are UNDEFINED.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Attributes

VDISR is a 32-bit register.

Field descriptions

When TTBCR.EAE == '0':

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

FS, bits [10, 3:0]

Fault status code. Set to 0b10110 when an ESB instruction defers a virtual SError exception.

FS	Meaning
0b10110	Asynchronous SError exception.

All other values are reserved.

The FS field is split as follows:

- FS[4] is VDISR[10].
- FS[3:0] is VDISR[3:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError exception.

LPAE	Meaning
0b0	Using the Short-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:4]

Reserved, RES0.

When TTBCR.EAE == '1':

A, bit [31]

Set to 1 when an ESB instruction defers a virtual SError exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [30:16]

Reserved, RES0.

AET, bits [15:14]

The value copied from VDFSR.AET.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

ExT, bit [12]

The value copied from VDFSR.ExT.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:10]

Reserved, RES0.

LPAE, bit [9]

Format.

Set to TTBCR.EAE when an ESB instruction defers a virtual SError exception.

LPAE	Meaning
0b1	Using the Long-descriptor translation table format.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:6]

Reserved, RES0.

STATUS, bits [5:0]

Fault status code. Set to 0b010001 when an ESB instruction defers a virtual SError exception.

STATUS	Meaning
0b010001	Asynchronous SError exception.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VDISR

Direct reads and writes of VDFSR are UNDEFINED if EL3 is implemented and using AArch32 in all Secure privileged modes other than Monitor mode.

An indirect write to VDISR made by an ESB instruction does not require an explicit synchronization operation for the value that is written to be observed by a direct read of DISR occurring in program order after the ESB instruction.

If EL2 is not implemented, then VDISR is RES0 from Monitor mode when SCR.NS == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

VMPIDR, Virtualization Multiprocessor ID Register

The VMPIDR characteristics are:

Purpose

Holds the value of the Virtualization Multiprocessor ID. This is the value returned by Non-secure EL1 reads of MPIDR, which in a multiprocessor system, provides an additional PE identification system.

Configuration

AArch32 System register VMPIDR bits [31:0] are architecturally mapped to AArch64 System register VMPIDR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VMPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MPIDR.

Attributes

VMPIDR is a 32-bit register.

Field descriptions

M, bit [31]

Indicates whether this implementation includes the functionality introduced by the Armv7 Multiprocessing Extensions.

M	Meaning
0b0	This implementation does not include the Armv7 Multiprocessing Extensions functionality.
0b1	This implementation includes the Armv7 Multiprocessing Extensions functionality.

Access to this field is RES1 .

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.U.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using a multithreading type approach. See the description of Aff0 for more information about affinity levels.

MT	Meaning
0b0	Performance of PEs at the lowest affinity level is largely independent.
0b1	Performance of PEs at the lowest affinity level is very interdependent.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.MT.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.Aff2.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.Aff1.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MPIDR.Aff0.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing VMPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

```

VPIDR, Virtualization Processor ID Register

The VPIDR characteristics are:

Purpose

Holds the value of the Virtualization Processor ID. This is the value returned by Non-secure EL1 reads of MIDR.

Configuration

AArch32 System register VPIDR bits [31:0] are architecturally mapped to AArch64 System register VPIDR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VPIDR are UNDEFINED.

If EL2 is not implemented but EL3 is implemented, this register takes the value of the MIDR.

Attributes

VPIDR is a 32-bit register.

Field descriptions

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Implementer.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Variant.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Architecture, bits [19:16]

Architecture version.

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Architecture.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.PartNum.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the value in MIDR.Revision.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing VPIDR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2

VTCR, Virtualization Translation Control Register

The VTCR characteristics are:

Purpose

The control register for stage 2 of the Non-secure PL1&0 translation regime.

Note

This stage of translation always uses the Long-descriptor translation table format.

Configuration

AArch32 System register VTCR bits [31:0] are architecturally mapped to AArch64 System register VTCR_EL2[31:0].

This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VTCR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTCR is a 32-bit register.

Field descriptions

Bit [31]

Reserved, RES1.

Bits [30:29]

Reserved, RES0.

HWU62, bit [28]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 2 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 2 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 2 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 2 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 2 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 2 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:14]

Reserved, RES0.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using VTTBR.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using VTTBR.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using VTTBR.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SL0, bits [7:6]

Starting level for translation table walks using VTTBR.

SL0	Meaning
0b00	Start at level 2
0b01	Start at level 1

All other values are reserved. If this field is programmed to a reserved value, or to a value that is not consistent with the programming of T0SZ, then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

S, bit [4]

Sign extension bit. This bit must be programmed to the value of T0SZ[3]. If it is not, then the stage 2 T0SZ value is treated as an UNKNOWN value

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T0SZ, bits [3:0]

The size offset of the memory region addressed by VTTBR. The region size is $2^{(32-T0SZ)}$ bytes.

This field holds a four-bit signed integer value, meaning it supports values from -8 to 7.

Note

This is different from the other translation control registers, where TnSZ holds a three-bit unsigned integer, supporting values from 0 to 7.

If this field is programmed to a value that is not consistent with the programming of SL0 then a stage 2 level 1 Translation fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing VTCR

Accesses to this register use the following encodings in the System register encoding space:

MRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <CRn>, <CRm>{, {#}<opc2>}

coproc	opc1	CRn	CRm	opc2
0b1111	0b100	0b0010	0b0001	0b010

```
if !IsFeatureImplemented(FEAT_AA32EL2) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && IsFeatureImplemented(FEAT_AA64EL2) && !ELUsingAArch32(EL2) && HSTR_EL2().T2 == '1' then
        AArch64_AArch32SystemAccessTrap(EL2, 0x03);
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_AA32EL2) && ELUsingAArch32(EL2) && HSTR().T2 == '1' then
        AArch32_TakeHypTrapException(0x03);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    R(t) = VTCR();
elsif PSTATE.EL == EL3 then

VTTBR, Virtualization Translation Table Base Register

The VTTBR characteristics are:

Purpose

Holds the base address of the translation table for the initial lookup for stage 2 of an address translation in the Non-secure PL1&0 translation regime, and other information for this translation regime.

Configuration

AArch32 System register VTTBR bits [63:0] are architecturally mapped to AArch64 System register VTTBR_EL2[63:0].

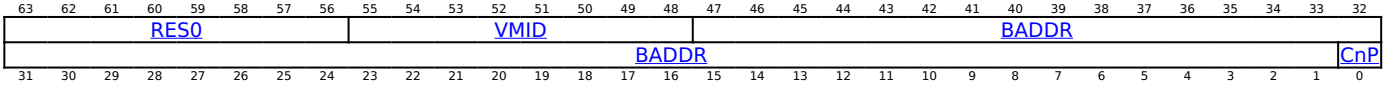
This register is present only when FEAT_AA32EL2 is implemented. Otherwise, direct accesses to VTTBR are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

VTTBR is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

VMID, bits [55:48]

The VMID for the translation table.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL3 or the highest implemented Exception level is EL2, this field resets to the expression `0x00`.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

BADDR, bits [47:1]

Translation table base address, bits[47:x], Bits [x-1:1] are RES0, with the additional requirement that if bits[x-1:3] are not all zero, this is a misaligned translation table base address, with effects that are CONSTRAINED UNPREDICTABLE, and must be one of the following:

- Register bits [x-1:3] are treated as if all the bits are zero. The value read back from these bits is either the value written or zero.
- The result of the calculation of an address for a translation table walk using this register can be corrupted in those bits that are nonzero.

x is determined from the value of VTCR.SL0 and VTCR.T0SZ as follows:

- If VTCR.SL0 is 0b00, meaning that lookup starts at level 2, then x is 14 - VTCR.T0SZ.
- If VTCR.SL0 is 0b01, meaning that lookup starts at level 1, then x is 5 - VTCR.T0SZ.
- If VTCR.SL0 is either 0b10 or 0b11 then a stage 2 level 1 Translation fault is generated.

If bits[47:40] of the translation table base address are not zero, an Address size fault is generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CnP, bit [0]
When FEAT_TTCNP is implemented:

Common not Private. This bit indicates whether each entry that is pointed to by VTTBR is a member of a common set that can be used by every PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1.

CnP	Meaning
0b0	The translation table entries pointed to by VTTBR are permitted to differ from the entries for VTTBR for other PEs in the Inner Shareable domain. This is not affected by the value of the current VMID.
0b1	The translation table entries pointed to by VTTBR are the same as the translation table entries for every other PE in the Inner Shareable domain for which the value of VTTBR.CnP is 1 and the VMID is the same as the current VMID.

When a TLB combines entries from stage 1 translation and stage 2 translation into a single entry, that entry can only be shared between different PEs if the value of the CnP bit is 1 for both stage 1 and stage 2.

Note

If the value of the VTTBR.CnP bit is 1 on multiple PEs in the same Inner Shareable domain and those VTTBRs do not point to the same translation table entries when the VMID value is the same as the current VMID, then the results of translations are CONSTRAINED UNPREDICTABLE, see 'CONSTRAINED UNPREDICTABLE behaviors due to caching of control or data values'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing VTTBR

Accesses to this register use the following encodings in the System register encoding space:

MRRC{<c>}{<q>} <coproc>, {#}<opc1>, <Rt>, <Rt2>, <CRm>

coproc	CRm	opc1

System Register index by instruction and encoding

Below are indexes for registers and operations accessed in the following ways:

For AArch32

- MRC/MCR
- MRRC/MCRR
- MRS/MSR
- VMRS/VMSR

For AArch64

- APAS
- AT
- BRB
- CFP
- COSP
- CPP
- DC
- DVP
- GIC/GICR
- GCSPOPCX
- GCSPOPX
- GCSPUSHM
- GCSPUSHX
- GCSSS1
- GCSPOPM
- GCSSS2
- IC
- MRRS/MSRR
- MRS/MSR
- TLBI
- TLBIP
- PLBI
- TRCIT

Registers and operations in AArch32

Index by functional group

Below are indexes for registers with the following main functional groups:

- IMP DEF
- Exception
- Memory
- PSTATE
- Address

AArch64	TLBI VMALLE1	TLB Invalidate by VMID, All at stage 1, EL1
AArch64	TLBI VMALLE1IS	TLB Invalidate by VMID, All at stage 1, EL1, Inner Shareable
AArch64	TLBI VMALLE1OS	TLB Invalidate by VMID, All at stage 1, EL1, Outer Shareable
AArch64	TLBI VMALLS12E1	TLB Invalidate by VMID, All at Stage 1 and 2, EL1
AArch64	TLBI VMALLS12E1IS	TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Inner Shareable
AArch64	TLBI VMALLS12E1OS	TLB Invalidate by VMID, All at Stage 1 and 2, EL1, Outer Shareable
AArch64	TLBI VMALLWS2E1	TLB Invalidate stage 2 dirty state by VMID, EL1&0
AArch64	TLBI VMALLWS2E1IS	TLB Invalidate stage 2 dirty state by VMID, EL1&0, Inner Shareable
AArch64	TLBI VMALLWS2E1OS	TLB Invalidate stage 2 write permission by VMID, EL1&0, Outer Shareable
AArch32	TLBIALL	TLB Invalidate All
AArch32	TLBIALLH	TLB Invalidate All, Hyp mode
AArch32	TLBIALLHIS	TLB Invalidate All, Hyp mode, Inner Shareable

Exec state	Name	Description
AArch32	TLBIALLIS	TLB Invalidate All, Inner Shareable
AArch32	TLBIALLNSNH	TLB Invalidate All, Non-Secure Non-Hyp
AArch32	TLBIALLNSNHIS	TLB Invalidate All, Non-Secure Non-Hyp, Inner Shareable
AArch32	TLBIASID	TLB Invalidate by ASID match
AArch32	TLBIASIDIS	TLB Invalidate by ASID match, Inner Shareable
AArch32	TLBIIPAS2	TLB Invalidate by Intermediate Physical Address, Stage 2
AArch32	TLBIIPAS2IS	TLB Invalidate by Intermediate Physical Address, Stage 2, Inner Shareable
AArch32	TLBIIPAS2L	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level
AArch32	TLBIIPAS2LIS	TLB Invalidate by Intermediate Physical Address, Stage 2, Last level, Inner Shareable
AArch32	TLBIMVA	TLB Invalidate by VA
AArch32	TLBIMVAA	TLB Invalidate by VA, All ASID
AArch32	TLBIMVAAIS	TLB Invalidate by VA, All ASID, Inner Shareable
AArch32	TLBIMVAAL	TLB Invalidate by VA, All ASID, Last level
AArch32	TLBIMVAALIS	TLB Invalidate by VA, All ASID, Last level, Inner Shareable
AArch32	TLBIMVAH	TLB Invalidate by VA, Hyp mode
AArch32	TLBIMVAHIS	TLB Invalidate by VA, Hyp mode, Inner Shareable
AArch32	TLBIMVAIS	TLB Invalidate by VA, Inner Shareable
AArch32	TLBIMVAL	TLB Invalidate by VA, Last level
AArch32	TLBIMVALH	TLB Invalidate by VA, Last level, Hyp mode
AArch32	TLBIMVALHIS	TLB Invalidate by VA, Last level, Hyp mode, Inner Shareable
AArch32	TLBIMVALIS	TLB Invalidate by VA, Last level, Inner Shareable
AArch64	TLBIP IPAS2E1	TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1
AArch64	TLBIP IPAS2E1IS	TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Inner Shareable
AArch64	TLBIP IPAS2E1OS	TLB Invalidate Pair by Intermediate Physical Address, Stage 2, EL1, Outer Shareable
AArch64	TLBIP IPAS2LE1	TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1
AArch64	TLBIP IPAS2LE1IS	TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable
AArch64	TLBIP IPAS2LE1OS	TLB Invalidate Pair by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable
AArch64	TLBIP RIPAS2E1	TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1
AArch64	TLBIP RIPAS2E1IS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Inner Shareable
AArch64	TLBIP RIPAS2E1OS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, EL1, Outer Shareable
AArch64	TLBIP RIPAS2LE1	TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1
AArch64	TLBIP RIPAS2LE1IS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Inner Shareable
AArch64	TLBIP RIPAS2LE1OS	TLB Range Invalidate by Intermediate Physical Address, Stage 2, Last level, EL1, Outer Shareable
AArch64	TLBIP RVAAE1	TLB Range Invalidate by VA, All ASID, EL1
AArch64	TLBIP RVAAE1IS	TLB Range Invalidate by VA, All ASID, EL1, Inner Shareable
AArch64	TLBIP RVAAE1OS	TLB Range Invalidate by VA, All ASID, EL1, Outer Shareable
AArch64	TLBIP RVAALE1	TLB Range Invalidate by VA, All ASID, Last level, EL1
AArch64	TLBIP RVAALE1IS	TLB Range Invalidate by VA, All ASID, Last Level, EL1, Inner Shareable
AArch64	TLBIP RVAALE1OS	TLB Range Invalidate by VA, All ASID, Last Level, EL1, Outer Shareable
AArch64	TLBIP RVAE1	TLB Range Invalidate by VA, EL1
AArch64	TLBIP RVAE1IS	TLB Range Invalidate by VA, EL1, Inner Shareable
AArch64	TLBIP RVAE1OS	TLB Range Invalidate by VA, EL1, Outer Shareable
AArch64	TLBIP RVAE2	TLB Range Invalidate by VA, EL2
AArch64	TLBIP RVAE2IS	TLB Range Invalidate by VA, EL2, Inner Shareable
AArch64	TLBIP RVAE2OS	TLB Range Invalidate by VA, EL2, Outer Shareable
AArch64	TLBIP RVAE3	TLB Range Invalidate by VA, EL3
AArch64	TLBIP RVAE3IS	TLB Range Invalidate by VA, EL3, Inner Shareable
AArch64	TLBIP RVAE3OS	TLB Range Invalidate by VA, EL3, Outer Shareable
AArch64	TLBIP RVALE1	TLB Range Invalidate by VA, Last level, EL1
AArch64	TLBIP RVALE1IS	TLB Range Invalidate by VA, Last level, EL1, Inner Shareable
AArch64	TLBIP RVALE1OS	TLB Range Invalidate by VA, Last level, EL1, Outer Shareable
AArch64	TLBIP RVALE2	TLB Range Invalidate by VA, Last level, EL2
AArch64	TLBIP RVALE2IS	TLB Range Invalidate by VA, Last level, EL2, Inner Shareable
AArch64	TLBIP RVALE2OS	TLB Range Invalidate by VA, Last level, EL2, Outer Shareable
AArch64	TLBIP RVALE3	TLB Range Invalidate by VA, Last level, EL3
AArch64	TLBIP RVALE3IS	TLB Range Invalidate by VA, Last level, EL3, Inner Shareable
AArch64	TLBIP RVALE3OS	TLB Range Invalidate by VA, Last level, EL3, Outer Shareable
AArch64	TLBIP VAAE1	TLB Invalidate Pair by VA, All ASID, EL1
AArch64	TLBIP VAAE1IS	TLB Invalidate Pair by VA, All ASID, EL1, Inner Shareable
AArch64	TLBIP VAAE1OS	TLB Invalidate Pair by VA, All ASID, EL1, Outer Shareable
AArch64	TLBIP VAALE1	TLB Invalidate Pair by VA, All ASID, Last level, EL1

Exec state	Name	Description
AArch64	TLBIP VAALE1IS	TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Inner Shareable
AArch64	TLBIP VAALE1OS	TLB Invalidate Pair by VA, All ASID, Last Level, EL1, Outer Shareable
AArch64	TLBIP VAE1	TLB Invalidate Pair by VA, EL1
AArch64	TLBIP VAE1IS	TLB Invalidate Pair by VA, EL1, Inner Shareable
AArch64	TLBIP VAE1OS	TLB Invalidate Pair by VA, EL1, Outer Shareable
AArch64	TLBIP VAE2	TLB Invalidate Pair by VA, EL2
AArch64	TLBIP VAE2IS	TLB Invalidate Pair by VA, EL2, Inner Shareable
AArch64	TLBIP VAE2OS	TLB Invalidate Pair by VA, EL2, Outer Shareable
AArch64	TLBIP VAE3	TLB Invalidate Pair by VA, EL3
AArch64	TLBIP VAE3IS	TLB Invalidate Pair by VA, EL3, Inner Shareable
AArch64	TLBIP VAE3OS	TLB Invalidate Pair by VA, EL3, Outer Shareable
AArch64	TLBIP VALE1	TLB Invalidate Pair by VA, Last level, EL1
AArch64	TLBIP VALE1IS	TLB Invalidate Pair by VA, Last level, EL1, Inner Shareable
AArch64	TLBIP VALE1OS	TLB Invalidate Pair by VA, Last level, EL1, Outer Shareable
AArch64	TLBIP VALE2	TLB Invalidate Pair by VA, Last level, EL2
AArch64	TLBIP VALE2IS	TLB Invalidate Pair by VA, Last level, EL2, Inner Shareable
AArch64	TLBIP VALE2OS	TLB Invalidate Pair by VA, Last level, EL2, Outer Shareable
AArch64	TLBIP VALE3	TLB Invalidate Pair by VA, Last level, EL3
AArch64	TLBIP VALE3IS	TLB Invalidate Pair by VA, Last level, EL3, Inner Shareable
AArch64	TLBIP VALE3OS	TLB Invalidate Pair by VA, Last level, EL3, Outer Shareable

In the Legacy functional group:

Exec state	Name	Description
AArch32	CP15DMB	Data Memory Barrier System instruction
AArch32	CP15DSB	Data Synchronization Barrier System instruction
AArch32	CP15ISB	Instruction Synchronization Barrier System instruction
AArch32	FCSEIDR	FCSE Process ID register
AArch32	JIDR	Jazelle ID Register
AArch32	JMCR	Jazelle Main Configuration Register
AArch32	JOSCR	Jazelle OS Control Register

In the Other functional group:

Exec state	Name	Description
AArch64	ACTLRMASK_EL1	Auxiliary Control Masking Register (EL1)
AArch64	ACTLRMASK_EL2	Auxiliary Control Masking Register (EL2)
AArch32	CPACR	Architectural Feature Access Control Register
AArch64	CPACRMASK_EL1	Architectural Feature Access Control Masking Register
AArch64	CPACR_EL1	Architectural Feature Access Control Register
AArch64	CPTRMASK_EL2	Architectural Feature Trap Masking Register
AArch32	SCTLR	System Control Register
AArch64	SCTLR2MASK_EL1	Extended System Control Masking Register (EL1)
AArch64	SCTLR2MASK_EL2	Extended System Control Masking Register (EL2)
AArch64	SCTLR2_EL1	System Control Register (EL1)
AArch64	SCTLR2_EL3	System Control Register (EL3)
AArch64	SCTLRMASK_EL1	System Control Masking Register (EL1)
AArch64	SCTLRMASK_EL2	System Control Masking Register (EL2)
AArch64	SCTLR_EL1	System Control Register (EL1)
AArch64	SCTLR_EL3	System Control Register (EL3)
AArch64	SMCR_EL1	SME Control Register (EL1)
AArch64	SMCR_EL2	SME Control Register (EL2)
AArch64	SMCR_EL3	SME Control Register (EL3)
AArch64	SMPRIMAP_EL2	Streaming Mode Priority Mapping Register
AArch64	SMPRI_EL1	Streaming Mode Priority Register
AArch64	TCR2MASK_EL1	Extended Translation Control Masking Register (EL1)
AArch64	TCR2MASK_EL2	Extended Translation Control Masking Register (EL2)
AArch64	TCRMASK_EL1	Translation Control Masking Register (EL1)
AArch64	TCRMASK_EL2	Translation Control Masking Register (EL2)
AArch64	ZCR_EL1	SVE Control Register (EL1)
AArch64	ZCR_EL2	SVE Control Register (EL2)
AArch64	ZCR_EL3	SVE Control Register (EL3)

In the Debug functional group:

Exec state	Name	Description
AArch32	DBGAUTHSTATUS	Debug Authentication Status register
AArch64	DBGAUTHSTATUS_EL1	Debug Authentication Status Register
External	DBGAUTHSTATUS_EL1	Debug Authentication Status Register
AArch32	DBGBCR<n>	Debug Breakpoint Control Registers
AArch64	DBGBCR<n>_EL1	Debug Breakpoint Control Registers
External	DBGBCR<n>_EL1	Debug Breakpoint Control Registers
AArch32	DBGBVR<n>	Debug Breakpoint Value Registers
AArch64	DBGBVR<n>_EL1	Debug Breakpoint Value Registers
External	DBGBVR<n>_EL1	Debug Breakpoint Value Registers
AArch32	DBGBXVR<n>	Debug Breakpoint Extended Value Registers
AArch32	DBGCLAIMCLR	Debug CLAIM Tag Clear register
AArch64	DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear Register
External	DBGCLAIMCLR_EL1	Debug CLAIM Tag Clear Register
AArch32	DBGCLAIMSET	Debug CLAIM Tag Set register
AArch64	DBGCLAIMSET_EL1	Debug CLAIM Tag Set Register
External	DBGCLAIMSET_EL1	Debug CLAIM Tag Set Register
AArch32	DBGDCCINT	DCC Interrupt Enable Register
AArch32	DBGDEVID	Debug Device ID register 0
AArch32	DBGDEVID1	Debug Device ID register 1
AArch32	DBGDEVID2	Debug Device ID register 2
AArch32	DBGDIDR	Debug ID Register
AArch32	DBGDRAR	Debug ROM Address Register
AArch32	DBGDSAR	Debug Self Address Register
AArch32	DBGDSCRext	Debug Status and Control Register, External View
AArch32	DBGDSCRint	Debug Status and Control Register, Internal View
AArch64	DBGDTRRX_EL0	Debug Data Transfer Register, Receive
External	DBGDTRRX_EL0	Debug Data Transfer Register, Receive
AArch32	DBGDTRRXext	Debug OS Lock Data Transfer Register, Receive, External View
AArch32	DBGDTRRXint	Debug Data Transfer Register, Receive
AArch64	DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
External	DBGDTRTX_EL0	Debug Data Transfer Register, Transmit
AArch32	DBGDTRTXext	Debug OS Lock Data Transfer Register, Transmit
AArch32	DBGDTRTXint	Debug Data Transfer Register, Transmit
AArch64	DBGDTR_EL0	Debug Data Transfer Register, half-duplex
AArch32	DBGOSDLR	Debug OS Double Lock Register
AArch32	DBGOSECCR	Debug OS Lock Exception Catch Control Register
AArch32	DBGOSLAR	Debug OS Lock Access Register
AArch32	DBGOSLSR	Debug OS Lock Status Register
AArch32	DBGPRCR	Debug Power Control Register
AArch64	DBGPRCR_EL1	Debug Power Control Register
AArch32	DBGVCR	Debug Vector Catch Register
AArch64	DBGVCR32_EL2	Debug Vector Catch Register
AArch32	DBGWCR<n>	Debug Watchpoint Control Registers
AArch64	DBGWCR<n>_EL1	Debug Watchpoint Control Registers
External	DBGWCR<n>_EL1	Debug Watchpoint Control Registers
AArch32	DBGWFAR	Debug Watchpoint Fault Address Register
AArch32	DBGWVR<n>	Debug Watchpoint Value Registers
AArch64	DBGWVR<n>_EL1	Debug Watchpoint Value Registers

AArch64	SPSR_fiq	Saved Program Status Register (FIQ mode)
AArch32	SPSR_hyp	Saved Program Status Register (Hyp mode)
AArch32	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch64	SPSR_irq	Saved Program Status Register (IRQ mode)
AArch32	SPSR_mon	Saved Program Status Register (Monitor mode)
AArch32	SPSR_svc	Saved Program Status Register (Supervisor mode)
AArch32	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	SPSR_und	Saved Program Status Register (Undefined mode)
AArch64	SP_EL0	Stack Pointer (EL0)
AArch64	SP_EL1	Stack Pointer (EL1)
AArch64	SP_EL2	Stack Pointer (EL2)
AArch64	SP_EL3	Stack Pointer (EL3)
AArch64	STINDEX_EL1	Saved TIndex (EL1)
AArch64	STINDEX_EL2	Saved TIndex (EL2)
AArch64	STINDEX_EL3	Saved TIndex (EL3)
AArch64	TINDEX_EL0	TIndex (EL0)
AArch64	TINDEX_EL1	TIndex (EL1)
AArch64	TINDEX_EL2	TIndex (EL2)
AArch64	TINDEX_EL3	TIndex (EL3)

In the Unknown functional group:

Exec state	Name	Description
AArch64	ACCDATA_EL1	Accelerator Data
AArch32	DSPSR2	Debug Saved Process State Register 2
AArch64	FGWTE3_EL3	Fine-Grained Write Traps EL3
AArch64	HAFGRTR_EL2	Hypervisor Activity Monitors Fine-Grained Read Trap Register
AArch64	HDFGRTR2_EL2	Hypervisor Debug Fine-Grained Read Trap Register 2
AArch64	HDFGRTR_EL2	Hypervisor Debug Fine-Grained Read Trap Register
AArch64	HDFGWTR2_EL2	Hypervisor Debug Fine-Grained Write Trap Register 2
AArch64	HDFGWTR_EL2	Hypervisor Debug Fine-Grained Write Trap Register
AArch64	HFGITR_EL2	Hypervisor Fine-Grained Instruction Trap Register
AArch64	HFGRTR2_EL2	Hypervisor Fine-Grained Read Trap Register 2
AArch64	HFGRTR_EL2	Hypervisor Fine-Grained Read Trap Register
AArch64	HFGWTR2_EL2	Hypervisor Fine-Grained Write Trap Register 2
AArch64	HFGWTR_EL2	Hypervisor Fine-Grained Write Trap Register
AArch64	MDSELR_EL1	Breakpoint and Watchpoint Selection Register
AArch64	MDSTEPOP_EL1	Monitor Debug Step Opcode Register
AArch64	PFAR_EL1	Physical Fault Address Register (EL1)
AArch64	PFAR_EL2	Physical Fault Address Register (EL2)
AArch64	PMICNTSVR_EL1	Performance Monitors Instruction Count Saved Value Register
AArch64	PMSSCR_EL1	Performance Monitors Snapshot Status and Capture Register
AArch64	SPMACCESSR_EL1	System Performance Monitors Access Register (EL1)
AArch64	SPMACCESSR_EL2	System Performance Monitors Access Register (EL2)
AArch64	SPMACCESSR_EL3	System Performance Monitors Access Register (EL3)
AArch64	SPMCFGR_EL1	System Performance Monitors Configuration Register
AArch64	SPMCGCR<n>_EL1	System PMU Counter Group Configuration Registers
AArch64	SPMCNTENCLR_EL0	System Performance Monitors Count Enable Clear Register
AArch64	SPMCNTENSET_EL0	System Performance Monitors Count Enable Set Register
AArch64	SPMCR_EL0	System Performance Monitor Control Register
AArch64	SPMDEVAFF_EL1	System Performance Monitors Device Affinity Register
AArch64	SPMDEVARCH_EL1	System Performance Monitors Device Architecture Register
AArch64	SPMEVCNTR<n>_EL0	System Performance Monitors Event Count Register
AArch64	SPMEVFILT2R<n>_EL0	System Performance Monitors Event Filter Control Register 2
AArch64	SPMEVFILTR<n>_EL0	System Performance Monitors Event Filter Control Register
AArch64	SPMEVTYPER<n>_EL0	System Performance Monitors Event Type Register
AArch64	SPMIIDR_EL1	System PMU Implementation Identification Register
AArch64	SPMINTENCLR_EL1	System Performance Monitors Interrupt Enable Clear Register
AArch64	SPMINTENSET_EL1	System Performance Monitors Interrupt Enable Set Register
AArch64	SPMOVSCLR_EL0	System Performance Monitors Overflow Flag Status Clear Register
AArch64	SPMOVSSET_EL0	System Performance Monitors Overflow Flag Status Set Register
AArch64	SPMROOTCR_EL3	System Performance Monitors Root and Realm Control Register
AArch64	SPMSCR_EL1	System Performance Monitors Secure Control Register
AArch64	SPMSELR_EL0	System Performance Monitors Select Register
AArch64	SPMZR_EL0	System Performance Monitors Zero with Mask

In the Float functional group:

Exec state	Name	Description
AArch64	FPCR	Floating-point Control Register
AArch32	FPEXC	Floating-Point Exception Control register
AArch64	FPEXC32_EL2	Floating-Point Exception Control Register
AArch64	FPMR	Floating-point Mode Register
AArch32	FPSCR	Floating-Point Status and Control Register
AArch32	FPSID	Floating-Point System ID register
AArch64	FPSR	Floating-point Status Register
AArch32	MVFR0	Media and VFP Feature Register 0
AArch64	MVFR0_EL1	AArch32 Media and VFP Feature Register 0
AArch32	MVFR1	Media and VFP Feature Register 1
AArch64	MVFR1_EL1	AArch32 Media and VFP Feature Register 1
AArch32	MVFR2	Media and VFP Feature Register 2
AArch64	MVFR2_EL1	AArch32 Media and VFP Feature Register 2

In the Reset Management functional group:

Exec state	Name	Description
AArch32	HRMR	Hyp Reset Management Register
AArch32	RMR	Reset Management Register
AArch64	RMR_EL1	Reset Management Register (EL1)
AArch64	RMR_EL2	Reset Management Register (EL2)
AArch64	RMR_EL3	Reset Management Register (EL3)
AArch32	RVBAR	Reset Vector Base Address Register
AArch64	RVBAR_EL1	Reset Vector Base Address Register (if EL2 and EL3 not implemented)
AArch64	RVBAR_EL2	Reset Vector Base Address Register (if EL3 not implemented)
AArch64	RVBAR_EL3	Reset Vector Base Address Register (if EL3 implemented)

In the Thread functional group:

Exec state	Name	Description
AArch32	HTPIDR	Hyp Software Thread ID Register
AArch64	SCXTNUM_EL0	EL0 Read/Write Software Context Number
AArch64	SCXTNUM_EL1	EL1 Read/Write Software Context Number
AArch64	SCXTNUM_EL2	EL2 Read/Write Software Context Number
AArch64	SCXTNUM_EL3	EL3 Read/Write Software Context Number
AArch64	TPIDR2_EL0	EL0 Read/Write Software Thread ID Register 2
AArch64	TPIDR3_EL0	EL0 Read/Write Software Thread ID Register 3
AArch64	TPIDR3_EL1	EL1 Software Thread ID Register 3
AArch64	TPIDR3_EL2	EL2 Software Thread ID Register 3
AArch64	TPIDR3_EL3	EL3 Software Thread ID Register 3
AArch32	TPIDRPRW	PL1 Software Thread ID Register
AArch64	TPIDRRO_EL0	EL0 Read-Only Software Thread ID Register
AArch32	TPIDRURO	PL0 Read-Only Software Thread ID Register
AArch32	TPIDRURW	PL0 Read/Write Software Thread ID Register
AArch64	TPIDR_EL0	EL0 Read/Write Software Thread ID Register
AArch64	TPIDR_EL1	EL1 Software Thread ID Register
AArch64	TPIDR_EL2	EL2 Software Thread ID Register
AArch64	TPIDR_EL3	EL3 Software Thread ID Register

In the GIC control registers functional group:

Exec state	Name	Description
AArch32	ICC_AP0R<n>	Interrupt Controller Active Priorities Group 0 Registers
AArch64	ICC_AP0R<n>_EL1	Interrupt Controller Active Priorities Group 0 Registers

AArch32	PMXEVCNTR	Performance Monitors Selected Event Count Register
AArch64	PMXEVCNTR_EL0	Performance Monitors Selected Event Count Register
AArch32	PMXEVTYPER	Performance Monitors Selected Event Type Register
AArch64	PMXEVTYPER_EL0	Performance Monitors Selected Event Type Register
AArch64	PMZR_EL0	Performance Monitors Zero with Mask
External	PMZR_EL0	Performance Monitors Zero with Mask

In the Root functional group:

Exec state	Name	Description
AArch64	APAS	Associate PA space
AArch64	GPCBW_EL3	Granule Protection Check Bypass Window Register (EL3)
AArch64	GPCCR_EL3	Granule Protection Check Control Register (EL3)
AArch64	GPTBR_EL3	Granule Protection Table Base Register

In the Pointer authentication functional group:

Exec state	Name	Description
AArch64	APDAKeyHi_EL1	Pointer Authentication Key A for Data (bits[127:64])
AArch64	APDAKeyLo_EL1	Pointer Authentication Key A for Data (bits[63:0])
AArch64	APDBKeyHi_EL1	Pointer Authentication Key B for Data (bits[127:64])
AArch64	APDBKeyLo_EL1	Pointer Authentication Key B for Data (bits[63:0])
AArch64	APGAKeyHi_EL1	Pointer Authentication Key A for Code (bits[127:64])
AArch64	APGAKeyLo_EL1	Pointer Authentication Key A for Code (bits[63:0])
AArch64	APIAKeyHi_EL1	Pointer Authentication Key A for Instruction (bits[127:64])
AArch64	APIAKeyLo_EL1	Pointer Authentication Key A for Instruction (bits[63:0])
AArch64	APIBKeyHi_EL1	Pointer Authentication Key B for Instruction (bits[127:64])
AArch64	APIBKeyLo_EL1	Pointer Authentication Key B for Instruction (bits[63:0])

In the BRBE Instructions functional group:

Exec state	Name	Description
AArch64	BRB IALL	Invalidate the Branch Record Buffer
AArch64	BRB INJ	Branch Record Injection into the Branch Record Buffer

In the Debug Secondary functional group:

Exec state	Name	Description
AArch64	DLR_EL0	Debug Link Register
AArch64	DSPSR_EL0	Debug Saved Program Status Register

In the GCSE Instructions functional group:

Exec state	Name	Description
AArch64	GCSPOPCX	Guarded Control Stack Pop and Compare exception return record
AArch64	GCSPOPM	Guarded Control Stack Pop
AArch64	GCSPOPX	Guarded Control Stack Pop exception return record
AArch64	GCSPUSHM	Guarded Control Stack Push
AArch64	GCSPUSHX	Guarded Control Stack Push exception return record
AArch64	GCSSS1	Guarded Control Stack Switch Stack 1
AArch64	GCSSS2	Guarded Control Stack Switch Stack 2

In the System Instructions functional group:

Exec state	Name	Description
AArch64	GIC CDAFF	Interrupt Set Target in the Current Interrupt Domain
AArch64	GIC CDDI	Interrupt Deactivate in the Current Interrupt Domain
AArch64	GIC CDDIS	Interrupt Disable in the Current Interrupt Domain
AArch64	GIC CDEN	Interrupt Enable in the Current Interrupt Domain
AArch64	GIC CDEOI	Priority Drop in the Current Interrupt Domain
AArch64	GIC CDHM	Interrupt Handling mode state in the Current Interrupt Domain
AArch64	GIC CDPEND	Interrupt Set/Clear Pending state in the Current Interrupt Domain
AArch64	GIC CDPRI	Interrupt Set priority in the Current Interrupt Domain
AArch64	GIC CDRCFG	Request Interrupt Configuration in the Current Interrupt Domain
AArch64	GIC LDAFF	Interrupt Set Target in the Logical Interrupt Domain
AArch64	GIC LDDI	Interrupt Deactivate in the Logical Interrupt Domain
AArch64	GIC LDDIS	Interrupt Disable in the Logical Interrupt Domain
AArch64	GIC LDEN	Interrupt Enable in the Logical Interrupt Domain
AArch64	GIC LDHM	Interrupt Handling mode in the Logical Interrupt Domain
AArch64	GIC LDPEND	Interrupt Set/Clear Pending state in the Logical Interrupt Domain
AArch64	GIC LDPRI	Interrupt Set priority in the Logical Interrupt Domain
AArch64	GIC LDRCFG	Request Interrupt Configuration in the Logical Interrupt Domain
AArch64	GIC VDAFF	Interrupt Set Target in the Virtual Interrupt Domain
AArch64	GIC VDDI	Interrupt Deactivate in the Virtual Interrupt Domain
AArch64	GIC VDDIS	Interrupt Disable in the Virtual Interrupt Domain
AArch64	GIC VDEN	Interrupt Enable in the Virtual Interrupt Domain
AArch64	GIC VDHM	Interrupt Handling mode in the Virtual Interrupt Domain
AArch64	GIC VDPEND	Interrupt Set/Clear Pending state in the Virtual Interrupt Domain
AArch64	GIC VDPRI	Interrupt Set priority in the Virtual Interrupt Domain
AArch64	GIC VDRCFG	Request Interrupt Configuration in the Virtual Interrupt Domain
AArch64	GICR CDIA	Interrupt Acknowledge in the Current Interrupt Domain
AArch64	GICR CDNMIA	Non-maskable Interrupt Acknowledge in the Current Interrupt Domain
AArch64	GSB ACK	GIC Synchronization Barrier Interrupt Acknowledge
AArch64	GSB SYS	GIC Synchronization Barrier System

In the RAS functional group:

Exec state	Name	Description
AArch32	DISR	Deferred Interrupt Status Register
AArch64	DISR_EL1	Deferred Interrupt Status Register
External	ERR<n>ADDR	Error Record <n> Address Register
External	ERR<n>CTLR	Error Record <n> Control Register

External	CTIDEVID1	CTI Device ID register 1
External	CTIDEVID2	CTI Device ID register 2
External	CTIDEVTYPE	CTI Device Type register
External	CTIGATE	CTI Channel Gate Enable register
External	CTIINEN<n>	CTI Input Trigger to Output Channel Enable registers
External	CTIINTACK	CTI Output Trigger Acknowledge register
External	CTIITCTRL	CTI Integration mode Control register
External	CTILAR	CTI Lock Access Register
External	CTILSR	CTI Lock Status Register
External	CTIOUTEN<n>	CTI Input Channel to Output Trigger Enable registers
External	CTIPIDR0	CTI Peripheral Identification Register 0
External	CTIPIDR1	CTI Peripheral Identification Register 1
External	CTIPIDR2	CTI Peripheral Identification Register 2
External	CTIPIDR3	CTI Peripheral Identification Register 3
External	CTIPIDR4	CTI Peripheral Identification Register 4
External	CTITRIGINSTATUS	CTI Trigger In Status register
External	CTITRIGOUTSTATUS	CTI Trigger Out Status register

In the GICC functional group:

Exec state	Name	Description
External	GICC_ABPR	CPU Interface Aliased Binary Point Register
External	GICC_AEOIR	CPU Interface Aliased End Of Interrupt Register
External	GICC_AHPPIR	CPU Interface Aliased Highest Priority Pending Interrupt Register
External	GICC_AIAR	CPU Interface Aliased Interrupt Acknowledge Register
External	GICC_APR<n>	CPU Interface Active Priorities Registers
External	GICC_BPR	CPU Interface Binary Point Register
External	GICC_CTLR	CPU Interface Control Register
External	GICC_DIR	CPU Interface Deactivate Interrupt Register
External	GICC_EOIR	CPU Interface End Of Interrupt Register
External	GICC_HPPIR	CPU Interface Highest Priority Pending Interrupt Register
External	GICC_IAR	CPU Interface Interrupt Acknowledge Register
External	GICC_IIDR	CPU Interface Identification Register
External	GICC_NSAPR<n>	CPU Interface Non-secure Active Priorities Registers
External	GICC_PMR	CPU Interface Priority Mask Register
External	GICC_RPR	CPU Interface Running Priority Register
External	GICC_STATUSR	CPU Interface Status Register

In the GICD functional group:

Exec state	Name	Description
External	GICD_CLRSPI_NSR	Clear Non-secure SPI Pending Register
External	GICD_CLRSPI_SR	Clear Secure SPI Pending Register
External	GICD_CPENDSGIR<n>	SGI Clear-Pending Registers
External	GICD_CTLR	Distributor Control Register
External	GICD_ICACTIVER<n>	Interrupt Clear-Active Registers
External	GICD_ICACTIVER<n>E	Interrupt Clear-Active Registers (extended SPI range)
External	GICD_ICENABLER<n>	Interrupt Clear-Enable Registers
External	GICD_ICENABLER<n>E	Interrupt Clear-Enable Registers
External	GICD_ICFGR<n>	Interrupt Configuration Registers
External	GICD_ICFGR<n>E	Interrupt Configuration Registers (Extended SPI Range)
External	GICD_ICPENDR<n>	Interrupt Clear-Pending Registers
External	GICD_ICPENDR<n>E	Interrupt Clear-Pending Registers (extended SPI range)
External	GICD_IGROUPR<n>	Interrupt Group Registers
External	GICD_IGROUPR<n>E	Interrupt Group Registers (extended SPI range)
External	GICD_IGRPMODR<n>	Interrupt Group Modifier Registers
External	GICD_IGRPMODR<n>E	Interrupt Group Modifier Registers (extended SPI range)
External	GICD_IIDR	Distributor Implementer Identification Register
External	GICD_INMIR<n>	Non-maskable Interrupt Registers, x = 0 to 31
External	GICD_INMIR<n>E	Non-maskable Interrupt Registers for Extended SPIs, x = 0 to 31
External	GICD_IPRIORITYR<n>	Interrupt Priority Registers
External	GICD_IPRIORITYR<n>E	Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.
External	GICD_IROUTER<n>	Interrupt Routing Registers
External	GICD_IROUTER<n>E	Interrupt Routing Registers (Extended SPI Range)
External	GICD_ISACTIVER<n>	Interrupt Set-Active Registers
External	GICD_ISACTIVER<n>E	Interrupt Set-Active Registers (extended SPI range)
External	GICD_ISENABLER<n>	Interrupt Set-Enable Registers
External	GICD_ISENABLER<n>E	Interrupt Set-Enable Registers
External	GICD_ISPENDR<n>	Interrupt Set-Pending Registers
External	GICD_ISPENDR<n>E	Interrupt Set-Pending Registers (extended SPI range)
External	GICD_ITARGETSR<n>	Interrupt Processor Targets Registers
External	GICD_NSACR<n>	Non-secure Access Control Registers
External	GICD_NSACR<n>E	Non-secure Access Control Registers
External	GICD_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICD_SETSPI_SR	Set Secure SPI Pending Register
External	GICD_SGIR	Software Generated Interrupt Register
External	GICD_SPENDSGIR<n>	SGI Set-Pending Registers
External	GICD_STATUSR	Error Reporting Status Register
External	GICD_TYPER	Interrupt Controller Type Register
External	GICD_TYPER2	Interrupt Controller Type Register 2
External	GICM_CLRSPI_NSR	Clear Non-secure SPI Pending Register
External	GICM_CLRSPI_SR	Clear Secure SPI Pending Register
External	GICM_IIDR	Distributor Implementer Identification Register
External	GICM_SETSPI_NSR	Set Non-secure SPI Pending Register
External	GICM_SETSPI_SR	Set Secure SPI Pending Register
External	GICM_TYPER	Distributor MSI Type Register

In the GICH functional group:

Exec state	Name	Description
External	GICH_APR<n>	Active Priorities Registers
External	GICH_EISR	End Interrupt Status Register
External	GICH_ELRSR	Empty List Register Status Register
External	GICH_HCR	Hypervisor Control Register
External	GICH_LR<n>	List Registers
External	GICH_MISR	Maintenance Interrupt Status Register
External	GICH_VMCR	Virtual Machine Control Register
External	GICH_VTR	Virtual Type Register

In the GICR functional group:

Exec state	Name	Description
External	GICR_CLRLPIR	Clear LPI Pending Register
External	GICR_CTLR	Redistributor Control Register
External	GICR_ICACTIVER0	Interrupt Clear-Active Register 0
External	GICR_ICACTIVER<n>E	Interrupt Clear-Active Registers
External	GICR_ICENABLER0	Interrupt Clear-Enable Register 0
External	GICR_ICENABLER<n>E	Interrupt Clear-Enable Registers
External	GICR_ICFGR0	Interrupt Configuration Register 0
External	GICR_ICFGR1	Interrupt Configuration Register 1
External	GICR_ICFGR<n>E	Interrupt configuration registers
External	GICR_ICPENDR0	Interrupt Clear-Pending Register 0
External	GICR_ICPENDR<n>E	Interrupt Clear-Pending Registers
External	GICR_IGROUPR0	Interrupt Group Register 0
External	GICR_IGROUPR<n>E	Interrupt Group Registers
External	GICR_IGRPMODR0	Interrupt Group Modifier Register 0
External	GICR_IGRPMODR<n>E	Interrupt Group Modifier Registers
External	GICR_IIDR	Redistributor Implementer Identification Register
External	GICR_INMIR0	Non-maskable Interrupt Register 0
External	GICR_INMIR<n>E	Non-maskable Interrupt Registers for Extended PPIs, x = 1 to 2.
External	GICR_INVALLR	Redistributor Invalidate All Register
External	GICR_INVLPIR	Redistributor Invalidate LPI Register
External	GICR_IPRIORITYR<n>	Interrupt Priority Registers
External	GICR_IPRIORITYR<n>E	Interrupt Priority Registers (extended PPI range)
External	GICR_ISACTIVER0	Interrupt Set-Active Register 0
External	GICR_ISACTIVER<n>E	Interrupt Set-Active Registers
External	GICR_ISENABLER0	Interrupt Set-Enable Register 0
External	GICR_ISENABLER<n>E	Interrupt Set-Enable Registers
External	GICR_ISPENDR0	Interrupt Set-Pending Register 0
External	GICR_ISPENDR<n>E	Interrupt Set-Pending Registers
External	GICR_MPAMIDR	Report maximum PARTID and PMG Register
External	GICR_NSACR	Non-secure Access Control Register
External	GICR_PARTIDR	Set PARTID and PMG Register
External	GICR_PENDBASER	Redistributor LPI Pending Table Base Address Register
External	GICR_PROPBASER	Redistributor Properties Base Address Register
External	GICR_SETLPIR	Set LPI Pending Register
External	GICR_STATUSR	Error Reporting Status Register
External	GICR_SYNCR	Redistributor Synchronize Register
External	GICR_TYPER	Redistributor Type Register
External	GICR_VPENDBASER	Virtual Redistributor LPI Pending Table Base Address Register
External	GICR_VPROPBASER	Virtual Redistributor Properties Base Address Register
External	GICR_VSGIPENDR	Redistributor virtual SGI pending state register
External	GICR_VSGIR	Redistributor virtual SGI pending state request register
External	GICR_WAKER	Redistributor Wake Register

In the GICV functional group:

Exec state	Name	Description
External	GICV_ABPR	Virtual Machine Aliased Binary Point Register
External	GICV_AEOIR	Virtual Machine Aliased End Of Interrupt Register
External	GICV_AHPPIR	Virtual Machine Aliased Highest Priority Pending Interrupt Register
External	GICV_AIAR	Virtual Machine Aliased Interrupt Acknowledge Register
External	GICV_APR<n>	Virtual Machine Active Priorities Registers
External	GICV_BPR	Virtual Machine Binary Point Register
External	GICV_CTLR	Virtual Machine Control Register

AArch64	AMEVTYPER1<n>_EL0	Activity Monitors Event Type Registers 1
External	AMIIDR	Activity Monitors Implementation Identification Register
External	AMPIDR0	Activity Monitors Peripheral Identification Register 0
External	AMPIDR1	Activity Monitors Peripheral Identification Register 1
External	AMPIDR2	Activity Monitors Peripheral Identification Register 2
External	AMPIDR3	Activity Monitors Peripheral Identification Register 3
External	AMPIDR4	Activity Monitors Peripheral Identification Register 4
External	AMROOTCR	Activity Monitors Root Control Register
External	AMSCR	Activity Monitors Secure Control Register
AArch32	AMUSERENR	Activity Monitors User Enable Register
AArch64	AMUSERENR_EL0	Activity Monitors User Enable Register

In the BRBE functional group:

Exec state	Name	Description
AArch64	BRBCR_EL1	Branch Record Buffer Control Register (EL1)
AArch64	BRBCR_EL2	Branch Record Buffer Control Register (EL2)
AArch64	BRBFCR_EL1	Branch Record Buffer Function Control Register
AArch64	BRBIDR0_EL1	Branch Record Buffer ID0 Register
AArch64	BRBINF<n>_EL1	Branch Record Buffer Information Register <n>
AArch64	BRBINFINJ_EL1	Branch Record Buffer Information Injection Register
AArch64	BRBSRC<n>_EL1	Branch Record Buffer Source Address Register <n>
AArch64	BRBSRCINJ_EL1	Branch Record Buffer Source Address Injection Register
AArch64	BRBTGT<n>_EL1	Branch Record Buffer Target Address Register <n>
AArch64	BRBTGTINJ_EL1	Branch Record Buffer Target Address Injection Register
AArch64	BRBTS_EL1	Branch Record Buffer Timestamp Register

In the Trace Management functional group:

Exec state	Name	Description
AArch64	TRCAUTHSTATUS	Trace Authentication Status Register
External	TRCAUTHSTATUS	Trace Authentication Status Register
External	TRCCIDR0	Trace Component Identification Register 0
External	TRCCIDR1	Trace Component Identification Register 1
External	TRCCIDR2	Trace Component Identification Register 2
External	TRCCIDR3	Trace Component Identification Register 3
External	TRCDEVAFF	Trace Device Affinity Register
AArch64	TRCDEVARCH	Trace Device Architecture Register
External	TRCDEVARCH	Trace Device Architecture Register
AArch64	TRCDEVID	Trace Device Configuration Register
External	TRCDEVID	Trace Device Configuration Register
External	TRCDEVID1	Trace Device Configuration Register 1
External	TRCDEVID2	Trace Device Configuration Register 2
External	TRCDEVTYPE	Trace Device Type Register
External	TRCITCTRL	Trace Integration Mode Control Register
External	TRCLAR	Trace Lock Access Register
External	TRCLSR	Trace Lock Status Register
AArch64	TRCOSLSR	Trace OS Lock Status Register
External	TRCOSLSR	Trace OS Lock Status Register
External	TRCPDCR	Trace PowerDown Control Register
External	TRCPDSR	Trace PowerDown Status Register
External	TRCPIDR0	Trace Peripheral Identification Register 0
External	TRCPIDR1	Trace Peripheral Identification Register 1
External	TRCPIDR2	Trace Peripheral Identification Register 2
External	TRCPIDR3	Trace Peripheral Identification Register 3
External	TRCPIDR4	Trace Peripheral Identification Register 4
External	TRCPIDR5	Trace Peripheral Identification Register 5
External	TRCPIDR6	Trace Peripheral Identification Register 6
External	TRCPIDR7	Trace Peripheral Identification Register 7

In the Guarded Control Stack registers functional group:

Exec state	Name	Description
AArch64	GCSCRE0_EL1	Guarded Control Stack Control Register (EL0)
AArch64	GCSCR_EL1	Guarded Control Stack Control Register (EL1)
AArch64	GCSCR_EL2	Guarded Control Stack Control Register (EL2)
AArch64	GCSCR_EL3	Guarded Control Stack Control Register (EL3)
AArch64	GCSPR_EL0	Guarded Control Stack Pointer Register (EL0)
AArch64	GCSPR_EL1	Guarded Control Stack Pointer Register (EL1)
AArch64	GCSPR_EL2	Guarded Control Stack Pointer Register (EL2)
AArch64	GCSPR_EL3	Guarded Control Stack Pointer Register (EL3)

In the GICv5 PMU functional group:

Exec state	Name	Description
External	GIC_PMEVFILT2R<n>	GIC PMU Event Filter 2 Register
External	GIC_PMEVFILTR<n>	GIC PMU Event Filter Register
External	GIC_PMEVTYPER<n>	GIC PMU Event Type Select Register

In the GICv5 IRS functional group:

Exec state	Name	Description
External	IRS_AIDR	IRS Architecture Identification Register
External	IRS_CR0	IRS Control Register 0
External	IRS_CR1	IRS Control Register 1
External	IRS_IDR0	IRS Identification Register 0
External	IRS_IDR1	IRS Identification Register 1
External	IRS_IDR2	IRS Identification Register 2
External	IRS_IDR3	IRS Identification Register 3
External	IRS_IDR4	IRS Identification Register 4
External	IRS_IDR5	IRS Identification Register 5
External	IRS_IDR6	IRS Identification Register 6
External	IRS_IDR7	IRS Identification Register 7
External	IRS_IIDR	IRS Implementer Identification Register
External	IRS_IST_BASER	IRS IST Base Address Register
External	IRS_IST_CFGR	IRS IST Configuration Register
External	IRS_IST_STATUSR	IRS Physical IST Management Status Register
External	IRS_MAP_L2_ISTR	IRS Map Physical Level 2 IST Register
External	IRS_MEC_IDR	IRS MEC Identification Register
External	IRS_MEC_MECID_R	IRS MEC MECID Register for the Realm PAS
External	IRS_MPAM_IDR	IRS MPAM Identification Register
External	IRS_MPAM_PARTID_R	IRS MPAM PARTID and PMG Register
External	IRS_PE_CR0	IRS PE Control Register 0
External	IRS_PE_SELR	IRS PE Selection Register
External	IRS_PE_STATUSR	IRS PE Status Register
External	IRS_SAVE_VMR	IRS Save VM Register
External	IRS_SAVE_VM_STATUSR	IRS Save VM Status Register
External	IRS_SETLPIR	IRS SET LPI Register
External	IRS_SPI_CFGR	IRS SPI Configuration Register
External	IRS_SPI_DOMAINR	IRS SPI Interrupt Domain Configuration Register
External	IRS_SPI_RESAMPLER	IRS SPI Resample Register
External	IRS_SPI_SELR	IRS SPI Selection Register
External	IRS_SPI_STATUSR	IRS SPI Status Register
External	IRS_SPI_VMR	IRS SPI VM Assignment Register
External	IRS_SWERR_STATUSR	IRS Software Error Status Register
External	IRS_SWERR_SYNDROMER0	IRS Software Error Syndrome Register 0
External	IRS_SWERR_SYNDROMER1	IRS Software Error Syndrome Register 1
External	IRS_SYNCR	IRS Synchronize Interrupt Events Register
External	IRS_SYNC_STATUSR	IRS Synchronize Interrupt Events Status Register
External	IRS_VMAP_L2_VISTR	IRS Map Level 2 Virtual IST Register
External	IRS_VMAP_L2_VMTR	IRS Map Level 2 VM Table Register
External	IRS_VMAP_VISTR	IRS Map Virtual IST Register
External	IRS_VMAP_VMR	IRS Map VM Register
External	IRS_VMAP_VPER	IRS Map VPE Register
External	IRS_VMT_BASER	IRS VM Table Base Address Register
External	IRS_VMT_CFGR	IRS VM Table Configuration Register
External	IRS_VMT_STATUSR	IRS Virtualization Data Structures Management Status Register
External	IRS_VM_DBR	IRS VM 1ofN Doorbell Configuration Register
External	IRS_VM_SELR	IRS VM Selection Register
External	IRS_VM_STATUSR	IRS VM Status Register
External	IRS_VPE_CR0	IRS VPE Control Register 0
External	IRS_VPE_DBR	IRS VPE Doorbell Settings Register
External	IRS_VPE_HPPIR	IRS VPE HPPI Register
External	IRS_VPE_SELR	IRS VPE Selection Register
External	IRS_VPE_STATUSR	IRS VPE Status Register

In the GICv5 ITS functional group:

Exec state	Name	Description
External	ITS_AIDR	ITS Architecture Identification Register
External	ITS_CR0	ITS Configuration Register 0
External	ITS_CR1	ITS Configuration Register 1
External	ITS_DIDR	ITS DeviceID Register
External	ITS_DT_BASER	ITS Device Table Base Address Register
External	ITS_DT_CFGR	ITS Device Table Base Address Configuration Register
External	ITS_EIDR	ITS EventID Register
External	ITS_GEN_EVENTR	ITS Generate Incoming Event Register
External	ITS_GEN_EVENT_DIDR	ITS Generate Incoming Event DeviceID Register
External	ITS_GEN_EVENT_EIDR	ITS Generate Incoming Event EventID Register
External	ITS_GEN_EVENT_STATUSR	ITS Generate Incoming Event Status Register
External	ITS_IDR0	ITS Identification Register 0
External	ITS_IDR1	ITS Identification Register 1

PMCNTEN: Performance Monitors Count Enable register

PMCNTENCLR_EL0: Performance Monitors Count Enable Clear Register

PMCNTENSET_EL0: Performance Monitors Count Enable Set Register

PMCR_EL0: Performance Monitors Control Register

PMDEVAFF: Performance Monitors Device Affinity register

PMDEVAFF0: Performance Monitors Device Affinity register 0

PMDEVAFF1: Performance Monitors Device Affinity register 1

PMDEVARCH: Performance Monitors Device Architecture register

PMDEVID: Performance Monitors Device ID register

PMDEVTYPE: Performance Monitors Device Type register

PMEVCNTR<n>_EL0: Performance Monitors Event Count Registers

PMEVCNTSVR<n>_EL1: Performance Monitors Event Count Saved Value Registers

PMEVFILT2R<n>: Performance Monitors Event Filter Registers

PMEVTYPER<n>_EL0: Performance Monitors Event Type Registers

PMICFILTR_EL0: Performance Monitors Instruction Counter Filter Register

PMICNTR_EL0: Performance Monitors Instruction Counter Register

PMICNTSVR_EL1: Performance Monitors Instruction Count Saved Value Register

PMIIDR: Performance Monitors Implementation Identification Register

PMINTEN: Performance Monitors Interrupt Enable register

PMINTENCLR_EL1: Performance Monitors Interrupt Enable Clear Register

PMINTENSET_EL1: Performance Monitors Interrupt Enable Set Register

PMITCTRL: Performance Monitors Integration mode Control register

PMLAR: Performance Monitors Lock Access Register

PMLSR: Performance Monitors Lock Status Register

PMMIR: Performance Monitors Machine Identification Register

PMOVS: Performance Monitors Overflow Flag Status register

PMOVSCLR_EL0: Performance Monitors Overflow Flag Status Clear register

PMOVSSET_EL0: Performance Monitors Overflow Flag Status Set Register

PMPCSCTL: PC Sample-based Profiling Control Register

PMPCSR: Program Counter Sample Register

PMPIDR0: Performance Monitors Peripheral Identification Register 0

PMPIDR1: Performance Monitors Peripheral Identification Register 1

PMPIDR2: Performance Monitors Peripheral Identification Register 2

PMPIDR3: Performance Monitors Peripheral Identification Register 3

PMPIDR4: Performance Monitors Peripheral Identification Register 4

PMSSCR_EL1: Performance Monitors Snapshot Status and Capture Register

PMSWINC_EL0: Performance Monitors Software Increment Register

PMVCIDSR: CONTEXTIDR_EL1 and VMID Sample Register

PMVIDSR: VMID Sample Register

PMZR_EL0: Performance Monitors Zero with Mask

TRBAUTHSTATUS: Authentication Status Register

TRBBASER_EL1: Trace Buffer Base Address Register

TRBCIDR0: Component Identification Register 0

TRBCIDR1: Component Identification Register 1

TRBCIDR2: Component Identification Register 2

TRBCIDR3: Component Identification Register 3

TRBCR: Trace Buffer Control Register

TRBDEVAFF: Device Affinity Register

TRBDEVARCH: Trace Buffer Device Architecture Register

TRBDEVID: Device Configuration Register

TRBDEVID1: Device Configuration Register 1

TRBDEVID2: Device Configuration Register 2

TRBDEVTYPE: Device Type Register

TRBIDR_EL1: Trace Buffer ID Register

TRBITCTRL: Integration Mode Control Register

TRBLAR: Lock Access Register

TRBLIMITR_EL1: Trace Buffer Limit Address Register

TRBLSR: Lock Status Register

TRBMAR_EL1: Trace Buffer Memory Attribute Register

TRBMPAM_EL1: Trace Buffer MPAM Configuration Register

TRBPIDR0: Peripheral Identification Register 0

TRBPIDR1: Peripheral Identification Register 1

TRBPIDR2: Peripheral Identification Register 2

TRBPIDR3: Peripheral Identification Register 3

TRBPIDR4: Peripheral Identification Register 4

TRBPIDR5: Peripheral Identification Register 5

TRBPIDR6: Peripheral Identification Register 6

TRBPIDR7: Peripheral Identification Register 7

TRBPTR_EL1: Trace Buffer Write Pointer Register

TRBSR_EL1: Trace Buffer Status/syndrome Register

TRBTRG_EL1: Trace Buffer Trigger Counter Register

TRCACATR<n>: Trace Address Comparator Access Type Register <n>

TRCACVR<n>: Trace Address Comparator Value Register <n>

TRCAUTHSTATUS: Trace Authentication Status Register

TRCAUXCTLR: Trace Auxiliary Control Register

TRCBBCTLR: Trace Branch Broadcast Control Register

TRCCCCTLR: Trace Cycle Count Control Register

TRCCIDCCTLR0: Trace Context Identifier Comparator Control Register 0

TRCCIDCCTLR1: Trace Context Identifier Comparator Control Register 1

TRCCIDCVR<n>: Trace Context Identifier Comparator Value Registers <n>

TRCCIDR0: Trace Component Identification Register 0

TRCCIDR1: Trace Component Identification Register 1

TRCCIDR2: Trace Component Identification Register 2

TRCCIDR3: Trace Component Identification Register 3

TRCCLAIMCLR: Trace Claim Tag Clear Register

TRCCLAIMSET: Trace Claim Tag Set Register

TRCCNTCTLR<n>: Trace Counter Control Register <n>

TRCCNTRLDVR<n>: Trace Counter Reload Value Register <n>

TRCCNTVR<n>: Trace Counter Value Register <n>

TRCCONFIGR: Trace Configuration Register

TRCDEVAFF: Trace Device Affinity Register

TRCDEVARCH: Trace Device Architecture Register

TRCDEVID: Trace Device Configuration Register

TRCDEVID1: Trace Device Configuration Register 1

TRCDEVID2: Trace Device Configuration Register 2

TRCDEVTYPE: Trace Device Type Register

TRCEVENTCTL0R: Trace Event Control 0 Register

TRCEVENTCTL1R: Trace Event Control 1 Register

TRCEXTINSELR<n>: Trace External Input Select Register <n>

TRCIDR0: Trace ID Register 0

TRCIDR1: Trace ID Register 1

TRCIDR10: Trace ID Register 10

TRCIDR11: Trace ID Register 11

TRCIDR12: Trace ID Register 12

TRCIDR13: Trace ID Register 13

TRCIDR2: Trace ID Register 2

TRCIDR3: Trace ID Register 3

TRCIDR4: Trace ID Register 4

TRCIDR5: Trace ID Register 5

TRCIDR6: Trace ID Register 6

TRCIDR7: Trace ID Register 7

TRCIDR8: Trace ID Register 8

TRCIDR9: Trace ID Register 9

TRCIMSPEC0: Trace IMP DEF Register 0

TRCIMSPEC<n>: Trace IMP DEF Register <n>

TRCITCTRL: Trace Integration Mode Control Register

TRCITEEDCR: Instrumentation Trace Extension External Debug Control Register

TRCLAR: Trace Lock Access Register

TRCLSR: Trace Lock Status Register

TRCOSLSR: Trace OS Lock Status Register

TRCPDCR: Trace PowerDown Control Register

TRCPDSR: Trace PowerDown Status Register

TRCPIDR0: Trace Peripheral Identification Register 0

TRCPIDR1: Trace Peripheral Identification Register 1

TRCPIDR2: Trace Peripheral Identification Register 2

TRCPIDR3: Trace Peripheral Identification Register 3

TRCPIDR4: Trace Peripheral Identification Register 4

TRCPIDR5: Trace Peripheral Identification Register 5

TRCPIDR6: Trace Peripheral Identification Register 6

TRCPIDR7: Trace Peripheral Identification Register 7

TRCPRGCTLR: Trace Programming Control Register

TRCQCTLR: Trace Q Element Control Register

TRCRSCTLR<n>: Trace Resource Selection Control Register <n>

TRCRSR: Trace Resources Status Register

TRCSEQEVR<n>: Trace Sequencer State Transition Control Register <n>

TRCSEQRSTEVR: Trace Sequencer Reset Control Register

TRCSEQSTR: Trace Sequencer State Register

TRCSSCCR<n>: Trace Single-shot Comparator Control Register <n>

TRCSSCSR<n>: Trace Single-shot Comparator Control Status Register <n>

TRCSSPCICR<n>: Trace Single-shot Processing Element Comparator Input Control Register <n>

TRCSTALLCTLR: Trace Stall Control Register

TRCSTATR: Trace Status Register

TRCSYNCPR: Trace Synchronization Period Register

TRCTRACEIDR: Trace ID Register

TRCTSCTLR: Trace Timestamp Control Register

TRCVICTLR: Trace ViewInst Main Control Register

TRCVIIECTLR: Trace ViewInst Include/Exclude Control Register

TRCVIPCSSCTLR: Trace ViewInst Start/Stop PE Comparator Control Register

TRCVISSCTLR: Trace ViewInst Start/Stop Control Register

TRCVMIDCCTLR0: Trace Virtual Context Identifier Comparator Control Register 0

TRCVMIDCCTLR1: Trace Virtual Context Identifier Comparator Control Register 1

TRCVMIDCVR<n>: Trace Virtual Context Identifier Comparator Value Register <n>

External register index by offset

Below are indexes for external registers in the following blocks:

- AMU
- CTI
- Debug
- ETE
- GIC CPU interface
- GIC Distributor
- GIC ITS control
- GIC ITS translation
- GIC Redistributor
- GIC Virtual CPU interface
- GIC Virtual interface control
- GIC_PMU_FRAME
- IRS_CONFIG_FRAME
- IRS_SETLPI_FRAME
- ITS_CONFIG_FRAME
- ITS_TRANSLATE_FRAME
- IWB_CONFIG_FRAME
- MPAM
- PMU
- RAS
- TRBE
- Timer

In the AMU block:

Offset	Name	Description	Access	Accessor Condition	Register Condition
0x000 + (8 * n) for n in 16:0	AMEVCNTR0<n>	Activity Monitors Event Counter Registers 0	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0x000 + (8 * n) for n in 16:0	AMEVCNTR0<n>	Activity Monitors Event Counter Registers 0	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0x100 + (8 * n) for n in 16:0	AMEVCNTR1<n>	Activity Monitors Event Counter Registers 1	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0x100 + (8 * n) for n in 16:0	AMEVCNTR1<n>	Activity Monitors Event Counter Registers 1	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0x400 + (8 * n) for n in 16:0	AMEVTYPER0<n>	Activity Monitors Event Type Registers 0	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0x400 + (4 * n) for n in 16:0	AMEVTYPER0<n>	Activity Monitors Event Type Registers 0	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0x480 + (4 * n) for n in 16:0	AMEVTYPER1<n>	Activity Monitors Event Type Registers 1	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0x500 + (8 * n) for n in 16:0	AMEVTYPER1<n>	Activity Monitors Event Type Registers 1	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xC00	AMCNTENSET	Activity Monitors Count Enable Set Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT64 is implemented
0xC00	AMCNTENSET0	Activity Monitors Count Enable Set Register 0	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT32 is implemented
0xC04	AMCNTENSET1	Activity Monitors Count Enable Set Register 1	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT32 is implemented
0xC10	AMCNTEN	Activity Monitors Count Set and Clear Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT64 is implemented
0xC20	AMCNTENCLR	Activity Monitors Count Enable Clear Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT64 is implemented
0xC20	AMCNTENCLR0	Activity Monitors Count Enable Clear Register 0	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT32 is implemented
0xC24	AMCNTENCLR1	Activity Monitors Count Enable Clear Register 1	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xCE0	AMCGCR	Activity Monitors Counter Group Configuration Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xCE0	AMCGCR	Activity Monitors Counter Group Configuration Register	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xE00	AMCFGR	Activity Monitors Configuration Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xE00	AMCFGR	Activity Monitors Configuration Register	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xE04	AMCR	Activity Monitors Control Register	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xE08	AMIIDR	Activity Monitors Implementation Identification Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xE08	AMIIDR	Activity Monitors Implementation Identification Register	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented

Offset	Name	Description	Access	Accessor Condition	Register Condition
0xE10	AMCR	Activity Monitors Control Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented and FEAT_AMU_EXT is implemented
0xE40	AMSCR	Activity Monitors Secure Control Register	RW	When FEAT_AMU_EXTACR is implemented and FEAT_RME is not implemented	When FEAT_AMU_EXTACR is implemented and FEAT_RME is not implemented
0xE48	AMROOTCR	Activity Monitors Root Control Register	RW	When FEAT_AMU_EXTACR is implemented and FEAT_RME is implemented	When FEAT_AMU_EXTACR is implemented and FEAT_RME is implemented
0xFA8	AMDEVAFF	Activity Monitors Device Affinity Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented, FEAT_AMU_EXT64 is implemented, and an implementation implements AMDEVAFF1
0xFA8	AMDEVAFF0	Activity Monitors Device Affinity Register 0	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented, FEAT_AMU_EXT32 is implemented, and an implementation implements AMDEVAFF0
0xFAC	AMDEVAFF1	Activity Monitors Device Affinity Register 1	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented, FEAT_AMU_EXT32 is implemented, and an implementation implements AMDEVAFF1
0xFBC	AMDEVARCH	Activity Monitors Device Architecture Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMDEVARCH, and FEAT_AMU_EXT is implemented
0xFBC	AMDEVARCH	Activity Monitors Device Architecture Register	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMDEVARCH, and FEAT_AMU_EXT is implemented
0xFCC	AMDEVTYPE	Activity Monitors Device Type Register	RO	When FEAT_AMU_EXT64 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMDEVTYPE, and FEAT_AMU_EXT is implemented
0xFCC	AMDEVTYPE	Activity Monitors Device Type Register	RO	When FEAT_AMU_EXT32 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMDEVTYPE, and FEAT_AMU_EXT is implemented
0xFD0	AMPIDR4	Activity Monitors Peripheral Identification Register 4	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR4, and FEAT_AMU_EXT
0xFE0	AMPIDR0	Activity Monitors Peripheral Identification Register 0	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR0, and FEAT_AMU_EXT is implemented
0xFE4	AMPIDR1	Activity Monitors Peripheral Identification Register 1	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR1, and FEAT_AMU_EXT is implemented
0xFE8	AMPIDR2	Activity Monitors Peripheral Identification Register 2	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR2, and FEAT_AMU_EXT is implemented
0xFEC	AMPIDR3	Activity Monitors Peripheral Identification Register 3	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMPIDR3, and FEAT_AMU_EXT is implemented
0xFF0	AMCIDR0	Activity Monitors Component Identification Register 0	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR0, and FEAT_AMU_EXT is implemented
0xFF4	AMCIDR1	Activity Monitors Component Identification Register 1	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR1, and FEAT_AMU_EXT is implemented
0xFF8	AMCIDR2	Activity Monitors Component Identification Register 2	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR2, and FEAT_AMU_EXT is implemented

Offset	Name	Description	Access	Accessor Condition	Register Condition
0xFFC	AMCIDR3	Activity Monitors Component Identification Register 3	RO	When FEAT_AMUv1 is implemented	When FEAT_AMUv1 is implemented, an implementation implements AMCIDR3, and FEAT_AMU_EXT is implemented

2025-12-10 16:11:30, 2025-12_rel

ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

Purpose

Can be used to provide IMPLEMENTATION DEFINED controls for the CTI. For example, the register might be used to control multiplexors for additional IMPLEMENTATION DEFINED triggers. The IMPLEMENTATION DEFINED controls provided by this register might modify the architecturally defined behavior of the CTI.

Note

The architecturally-defined triggers must not be multiplexed.

Configuration

It is IMPLEMENTATION DEFINED whether ASICCTL is implemented in the Core power domain or in the Debug power domain.

If it is implemented in the Core power domain, then it is IMPLEMENTATION DEFINED whether it is in the Cold reset domain or the Warm reset domain.

This register must reset to a value that supports the architecturally-defined behavior of the CTI. Changing the value of the register from its reset value causes IMPLEMENTATION DEFINED behavior that might differ from the architecturally-defined behavior of the CTI.

Other than the requirements listed in this register description, all aspects of the reset behavior of the ASICCTL are IMPLEMENTATION DEFINED.

Attributes

ASICCTL is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ASICCTL

ASICCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x144	ASICCTL

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), !OSLockStatus(), AllowExternalDebugAccess(addrdesc), and SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are IMPDEF.

2025-12-10 16:11:30, 2025-12_rel

CNTACR<n>, Counter-timer Access Control Registers, n = 0 - 7

The CNTACR<n> characteristics are:

Purpose

Provides top-level access controls for the elements of a timer frame. CNTACR<n> provides the controls for frame CNTBaseN.

In addition to the CNTACR<n> control:

- CNTNSAR controls whether CNTACR<n> is accessible by Non-secure accesses.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTACR<n> is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Implemented only if the value of CNTTIDR.Frame<n> is 1.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<n> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

Attributes

CNTACR<n> is a 32-bit register.

Field descriptions

Bits [31:6]

Reserved, RES0.

RWPT, bit [5]

Read/write access to the EL1 Physical Timer registers CNTP_CVAL, CNTP_TVAL, and CNTP_CTL, in frame <n>.

RWPT	Meaning
0b0	No access to the EL1 Physical Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the EL1 Physical Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RWVT, bit [4]

Read/write access to the Virtual Timer register CNTV_CVAL, CNTV_TVAL, and CNTV_CTL, in frame <n>.

RWVT	Meaning
0b0	No access to the Virtual Timer registers in frame <n>. The registers are RES0.
0b1	Read/write access to the Virtual Timer registers in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVOFF, bit [3]

Read-only access to CNTVOFF, in frame <n>.

RVOFF	Meaning
0b0	No access to CNTVOFF in frame <n>. The register is RES0.
0b1	Read-only access to CNTVOFF in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RFRQ, bit [2]

Read-only access to CNTFRQ, in frame <n>.

RFRQ	Meaning
0b0	No access to CNTFRQ in frame <n>. The register is RES0.
0b1	Read-only access to CNTFRQ in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RVCT, bit [1]

Read-only access to CNTVCT, in frame <n>.

RVCT	Meaning
0b0	No access to CNTVCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTVCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

RPCT, bit [0]

Read-only access to CNTPCT, in frame <n>.

RPCT	Meaning
0b0	No access to CNTPCT in frame <n>. The register is RES0.
0b1	Read-only access to CNTPCT in frame <n>.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTACR<n>

In a system that supports the Realm Management Extension, CNTNSAR.NS<n> describes how these registers can be accessed by Root or Realm accesses.

In a system that recognizes two Security states:

- CNTACR<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTACR<n> is accessible by Non-secure accesses.

CNTACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x040 + (4 * n)	CNTACR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTCR, Counter Control Register

The CNTCR characteristics are:

Purpose

Enables the counter, controls the counter resolution, and controls counter behavior during debug.

Configuration

It is IMPLEMENTATION DEFINED whether CNTCR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCR is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

FCREQ, bits [17:8]

Frequency change request. Indicates the number of the entry in the Frequency modes table to select.

Selecting an unimplemented entry, or an entry that contains 0, has no effect on the counter.

The maximum number of entries in the Frequency modes table is IMPLEMENTATION DEFINED up to a maximum of 1004 entries, see 'The Frequency modes table'. An implementation is only required to implement an FCREQ field that can hold values from 0 to the highest supported Frequency modes table entry. Any unrequired most-significant bits of FCREQ can be implemented as RES0.

The reset behavior of this field is:

- On a Timer reset, this field resets to the expression `0x0`.

Bits [7:3]

Reserved, RES0.

SCEN, bit [2]
When FEAT_CNTSC is implemented:

Scale Enable.

SCEN	Meaning
0b0	Scaling is not enabled. The counter value is incremented by 0x1.0000000 for each counter tick.
0b1	Scaling is enabled. The counter is incremented by CNTSCR.ScaleVal for each counter tick.

The SCEN bit can only be changed when the counter is disabled, when CNTCR.EN == 0.

If the value of CNTCR.SCEN changes when CNTCR.EN == 1, then:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

When the CNTCV register in the CNTControlBase frame of the memory mapped counter module is written to, the accumulated fraction information is reset to zero.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBG, bit [1]

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

HDBG	Meaning
0b0	System counter ignores Halt-on-debug.
0b1	Asserted Halt-on-debug signal halts system counter update.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enables the counter:

EN	Meaning
0b0	System counter disabled.
0b1	System counter enabled.

The reset behavior of this field is:

- On a Timer reset, this field resets to '0'.

Accessing CNTCR

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x000	CNTCR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTCV, Counter Count Value register

The CNTCV characteristics are:

Purpose

Indicates the current count value.

Configuration

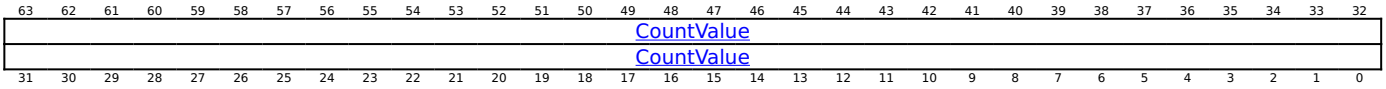
It is IMPLEMENTATION DEFINED whether CNTCV is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTCV is a 64-bit register.

Field descriptions



CountValue, bits [63:0]

Indicates the counter value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTCV

Frame	Accessibility
CNTControlBase	RW
CNTReadBase	RO

A write to CNTCV must be visible in the CNTPCT register of each running processor in a finite time.

For the instance of the register in the CNTControlBase frame:

- In a system that supports the Realm Management Extension, this register is implemented only in the Root physical address space.
- In a system that supports Secure and Non-secure physical address spaces, this register is implemented only in the Secure physical address space.
- If the counter is enabled, the effect of writing to the register is UNKNOWN.

For the instance of the register in the CNTReadBase frame, this register is accessible in all physical address spaces.

In an implementation that supports 64-bit atomic memory accesses, this register must be accessible using a 64-bit atomic access.

CNTCV can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTControlBase	0x008	CNTCV	63:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTReadBase	0x000	CNTCV	63:0

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CNTEL0ACR, Counter-timer EL0 Access Control Register

The CNTEL0ACR characteristics are:

Purpose

An implementation of CNTEL0ACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTEL0BaseN.

Configuration

It is IMPLEMENTATION DEFINED whether CNTEL0ACR is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTEL0ACR is a 32-bit register.

Field descriptions

Bits [31:10]

Reserved, RES0.

EL0PTEN, bit [9]

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0PTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame, then they are accessible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0VTEN, bit [8]

Second view read/write access control for the Virtual Timer registers. This bit controls whether the CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTEL0BaseN frame.

EL0VTEN	Meaning
0b0	No access. Registers are RES0 in the second view.
0b1	Access permitted. If the registers are accessible in the current frame, then they are accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding CNTEL0BaseN frame, regardless of the value of this bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bits [7:2]

Reserved, RES0.

EL0VCTEN, bit [1]

Second view read access control for CNTVCT and CNTFRQ.

EL0VCTEN	Meaning
0b0	CNTVCT is not visible in the second view. If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTVCT and CNTFRQ are visible in the current frame, then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

EL0PCTEN, bit [0]

Second view read access control for CNTPCT and CNTFRQ.

EL0PCTEN	Meaning
0b0	CNTPCT is not visible in the second view. If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.
0b1	Access permitted. If CNTPCT and CNTFRQ are visible in the current frame, then they are visible in the second view.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTEL0ACR

CNTEL0ACR can be implemented in any implemented CNTBaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

If CNTEL0ACR is not implemented in an implemented CNTBaseN frame:

- The register location in that frame is RAZ/WI.
- If the corresponding CNTEL0BaseN frame is implemented, the registers CNTFRQ, CNTP_CTL, CNTP_CVAL, CNTP_TVAL, CNTPCT, CNTV_CTL, CNTV_CVAL, CNTV_TVAL, and CNTVCT are not visible and accesses are RAZ/WI in that frame.

CNTEL0ACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x014	CNTEL0ACR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

Purpose

Indicates the base frequency of the system counter.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID0 is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0. For more information, see 'The Frequency modes table'.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID0 is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

The base frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID0

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTFID0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020	CNTFID0

Accesses to this register are RO or RW.

2025-12-10 16:11:30, 2025-12_rel

CNTFID<n>, Counter Frequency IDs, n > 0, n = 1 - 1003

The CNTFID<n> characteristics are:

Purpose

Indicates alternative system counter frequencies.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFID<n> is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

The possible frequencies for the system counter are stored in the Frequency modes table as 32-bit words starting with the base frequency, CNTFID0, see 'The Frequency modes table'.

The number of CNTFID<n> registers is IMPLEMENTATION DEFINED, and the only required CNTFID<n> register is CNTFID0.

The final entry in the Frequency modes table must be followed by a 32-bit word of zero value, to mark the end of the table.

The architecture can support up to 1004 entries in the Frequency modes table, including the zero-word end marker, and the number of entries is IMPLEMENTATION DEFINED up to this limit. For an implementation that includes registers in the IMPLEMENTATION DEFINED register space 0x0C0-0x0FC, the maximum number of entries in the Frequency modes table is 40, including the zero-word end marker.

Typically, the Frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialize the table entries as part of its start-up sequence.

If the Frequency modes table is in read/write memory, Arm strongly recommends that the table is not updated once the system is running.

Attributes

CNTFID<n> is a 32-bit register.

Field descriptions

Frequency, bits [31:0]

A system counter frequency, in Hz. Must be an exact divisor of the base frequency. Arm strongly recommends that all frequency values in the Frequency modes table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is increased by the ratio of the base frequency and the selected frequency.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFID<n>

It is IMPLEMENTATION DEFINED whether this register is RO or RW

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes these registers, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes these registers, is implemented only in the Secure physical address space.

CNTFID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x020 + (4 * n)	CNTFID<n>

Accesses to this register are RO or RW.

2025-12-10 16:11:30, 2025-12_rel

CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

Purpose

This register is provided so that software can discover the effective frequency of the system counter. The instance of the register in the CNTCTLBase frame must be programmed with this value as part of system initialization. The value of the register is not interpreted by hardware.

Configuration

It is IMPLEMENTATION DEFINED whether CNTFRQ is implemented in the Core power domain or in the Debug power domain.

For more information see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTFRQ is a 32-bit register.

Field descriptions

ClockFreq, bits [31:0]

Clock frequency. Indicates the effective frequency of the system counter, in Hz.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTFRQ

CNTFRQ must be implemented as an RW register in the CNTCTLBase frame.

In a system that supports the Realm Management Extension, the instance of the register in the CNTCTLBase frame is accessible as follows:

- For Root accesses, it is IMPLEMENTATION DEFINED whether accesses to the register are permitted or behave as RES0.
- For Realm accesses, this register behaves as RES0.

In a system that recognizes two Security states, the instance of the register in the CNTCTLBase frame is only accessible by Secure accesses.

CNTFRQ can be implemented as a RO register in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTFRQ is accessible in that frame, as a RO register, if the value of CNTACR<n>.RFRQ is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTFRQ is accessible as a RO register in that frame if both:
  - CNTFRQ is accessible in the corresponding CNTBaseN frame.
  - Either the value of CNTEL0ACR.EL0VCTEN is 1 or the value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTFRQ address in that frame is RAZ/WI.

CNTFRQ can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x010	CNTFRQ

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x010	CNTFRQ

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x000	CNTFRQ

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CNTID, Counter Identification Register

The CNTID characteristics are:

Purpose

Indicates whether counter scaling is implemented.

Configuration

It is IMPLEMENTATION DEFINED whether CNTID is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTID are RES0.

Attributes

CNTID is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

CNTSC, bits [3:0]

Indicates whether Counter Scaling is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CNTSC	Meaning
0b0000	Counter scaling is not implemented.
0b0001	Counter scaling is implemented.

All other values are reserved.

Access to this field is RO.

Accessing CNTID

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTID can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x1C	CNTID

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

Purpose

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

Configuration

It is IMPLEMENTATION DEFINED whether CNTNSAR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTNSAR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

NS<n>, bit [n], for n = 7 to 0

Non-secure access to frame n.

NS<n>	Meaning
0b0	Secure access only. Behaves as RES0 to Non-secure accesses. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether Root accesses to the specified registers are permitted or behave as RES0. For Realm accesses, the specified registers behave as RES0.
0b1	Secure and Non-secure accesses permitted. If FEAT_RME is implemented, it is IMPLEMENTATION DEFINED whether Root and Realm accesses to the specified registers are permitted. If not permitted, the specified registers behave as RES0 for Root and Realm accesses.

This bit also determines whether, in the CNTCTLBase frame, CNTACR<n> and CNTVOFF<n> are accessible to Non-secure accesses.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible by both Secure and Non-secure accesses, then NS<n> is RES1.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTNSAR

In a system that supports the Realm Management Extension, this register is accessible as follows:

- For Root accesses, it is IMPLEMENTATION DEFINED whether accesses to the register are permitted or behave as RES0.
- For Realm accesses, this register behaves as RES0.

In a system that recognizes two Security states, this register is only accessible by Secure accesses.

CNTNSAR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x004	CNTNSAR

Accesses to this register are RW.

CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

Purpose

Control register for the EL1 physical timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTP_CTL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0, then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTP_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CTL

CNTP_CTL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CTL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CTL is accessible in that frame if both:
  - CNTP_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CTL address in that frame is RAZ/WI.

CNTP_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x02C	CNTP_CTL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x02C	CNTP_CTL

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the EL1 physical timer.

Configuration

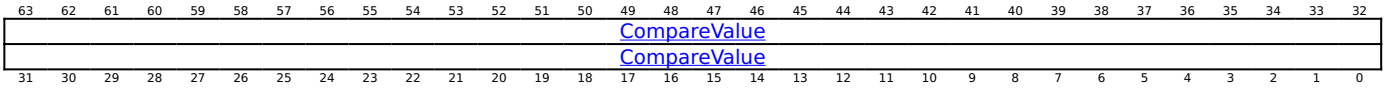
It is IMPLEMENTATION DEFINED whether CNTP_CVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the EL1 physical timer CompareValue.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTP_CTL.IMASK is 0.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_CVAL

CNTP_CVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_CVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_CVAL is accessible in that frame if both:
  - CNTP_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

CNTP_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x020	CNTP_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x024	CNTP_CVAL	63:32

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

Purpose

Holds the timer value for the EL1 physical timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTP_TVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTP_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the EL1 physical timer.

On a read of this register:

- If CNTP_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTP_CTL.ENABLE is 1, the value returned is (CompareValue - CNTPCT).

On a write of this register, CompareValue is set to (CNTPCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTP_CTL.ENABLE is 1, the timer condition is met when (CNTPCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTP_CTL.ISTATUS is set to 1.
- If CNTP_CTL.IMASK is 0, an interrupt is generated.

When CNTP_CTL.ENABLE is 0, the timer condition is not met, but CNTPCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTP_TVAL

CNTP_TVAL can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTP_TVAL is accessible in that frame if the value of CNTACR<n>.RWPT is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTP_TVAL is accessible in that frame if both:
  - CNTP_TVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0PTEN is 1.
- Otherwise, the CNTP_TVAL address in that frame is RAZ/WI.

CNTP_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x028	CNTP_TVAL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x028	CNTP_TVAL

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

Purpose

Holds the 64-bit physical count value.

Configuration

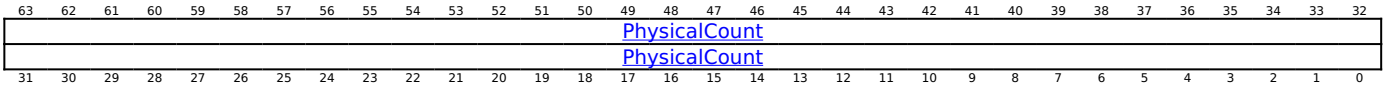
It is IMPLEMENTATION DEFINED whether CNTPCT is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTPCT is a 64-bit register.

Field descriptions



PhysicalCount, bits [63:0]

Physical count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTPCT

CNTPCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTPCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RPCT is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTPCT is accessible in that frame if both:
  - CNTPCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0PCTEN is 1.
- Otherwise, the CNTPCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

CNTPCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x000	CNTPCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x004	CNTPCT	63:32

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x000	CNTPCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x004	CNTPCT	63:32

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CNTSCR, Counter Scale Register

The CNTSCR characteristics are:

Purpose

Enables the counter, controls the counter effective frequency setting, and controls counter behavior during debug.

Configuration

It is IMPLEMENTATION DEFINED whether CNTSCR is implemented in the Core power domain or in the Debug power domain.

This register is present only when FEAT_CNTSC is implemented. Otherwise, direct accesses to CNTSCR are RES0.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSCR is a 32-bit register.

Field descriptions

ScaleVal, bits [31:0]

Scale Value

When counter scaling is enabled, ScaleVal is the average amount added to the counter value for one period of the frequency of the Generic counter as described in the CNTFRQ register.

The actual rate of update of the counter value is determined by the counter resolution.

ScaleVal is expressed as an unsigned fixed point number with an 8-bit integer value and a 24-bit fractional value.

CNTSCR.ScaleVal can only be changed when CNTCR.EN == 0. If the value of this field is changed when CNTCR.EN == 1:

- The counter value becomes UNKNOWN.
- The counter value remains UNKNOWN on future ticks of the clock.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTSCR

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTSCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x10	CNTSCR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTSR, Counter Status Register

The CNTSR characteristics are:

Purpose

Provides counter resolution status information.

Configuration

It is IMPLEMENTATION DEFINED whether CNTSR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTSR is a 32-bit register.

Field descriptions

Bits [31:18]

Reserved, RES0.

FCACK, bits [17:8]

Frequency Change Acknowledge. Indicates the currently selected entry in the Frequency modes table, see 'The Frequency modes table'.

The reset behavior of this field is:

- On a Timer reset, this field resets to the expression `0x000000`.

Bits [7:2]

Reserved, RES0.

DBGH, bit [1]

Indicates whether the counter is halted because the Halt-on-debug signal is asserted:

DBGH	Meaning
0b0	Counter is not halted.
0b1	Counter is halted.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Bit [0]

Reserved, RES0.

Accessing CNTSR

In a system that supports the Realm Management Extension, the CNTControlBase frame, which includes this register, is implemented only in the Root physical address space.

In a system that supports Secure and Non-secure physical address spaces, the CNTControlBase frame, which includes this register, is implemented only in the Secure physical address space.

CNTSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0x004	CNTSR

Accesses to this register are RO.

CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

Purpose

Indicates the implemented timers in the physical address space, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

Configuration

It is IMPLEMENTATION DEFINED whether CNTTIDR is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTTIDR is a 32-bit register.

Field descriptions

Frame<n>, bits [4n+3:4n], for n = 7 to 0

A 4-bit field indicating the features of frame CNTBase<n>.

Bit[3] of the field is RES0.

Bit[2], the FEL0 subfield, indicates whether frame CNTBase<n> has a second view, CNTEL0Base<n>. The possible values of this bit are:

Bit[2]	Meaning
0b0	Frame<n> does not have a second view. The CNTEL0ACR register in the first view of the frame is RES0.
0b1	Frame<n> has a second view, CNTEL0Base<n>.

If bit[0] is 0, bit[2] is RES0.

Bit[1], the FVI subfield, indicates whether both:

- Frame CNTBase<n> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<n>.

The possible values of bit[1] are:

Bit[1]	Meaning
0b0	Frame<n> does not have virtual capability. The virtual time and offset registers are RES0.
0b1	Frame<n> has virtual capability. The virtual time and offset registers are implemented.

If bit[0] is 0, bit[1] is RES0.

Bit[0], the FI subfield, indicates whether frame CNTBase<n> is implemented. The possible values of this bit are:

Bit[0]	Meaning
0b0	Frame<n> is not implemented. All registers associated with the frame are RES0.
0b1	Frame<n> is implemented.

Accessing CNTTIDR

In a system that supports the Realm Management Extension, it is IMPLEMENTATION DEFINED whether Root and Realm accesses to this register are permitted. If not permitted, this register behaves as RES0 for Root and Realm accesses.

In a system that recognizes two Security states, this register is accessible by both Secure and Non-secure accesses.

CNTTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0x008	CNTTIDR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

Purpose

Control register for the virtual timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTV_CTL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CTL is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

ISTATUS, bit [2]

The status of the timer. This bit indicates whether the timer condition is met:

ISTATUS	Meaning
0b0	Timer condition is not met.
0b1	Timer condition is met.

When the value of the ENABLE bit is 1, ISTATUS indicates whether the timer condition is met. ISTATUS takes no account of the value of the IMASK bit. If the value of ISTATUS is 1 and the value of IMASK is 0, then the timer interrupt is asserted.

When the value of the ENABLE bit is 0, the ISTATUS field is UNKNOWN.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

IMASK, bit [1]

Timer interrupt mask bit. Permitted values are:

IMASK	Meaning
0b0	Timer interrupt is not masked by the IMASK bit.
0b1	Timer interrupt is masked by the IMASK bit.

For more information, see the description of the ISTATUS bit.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

ENABLE, bit [0]

Enables the timer. Permitted values are:

ENABLE	Meaning
0b0	Timer disabled.
0b1	Timer enabled.

Setting this bit to 0 disables the timer output signal, but the timer value accessible from CNTV_TVAL continues to count down.

Note

Disabling the output signal might be a power-saving option.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CTL

CNTV_CTL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CTL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CTL is accessible in that frame if both:
  - CNTV_CTL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CTL address in that frame is RAZ/WI.

CNTV_CTL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x03C	CNTV_CTL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x03C	CNTV_CTL

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

Purpose

Holds the 64-bit compare value for the virtual timer.

Configuration

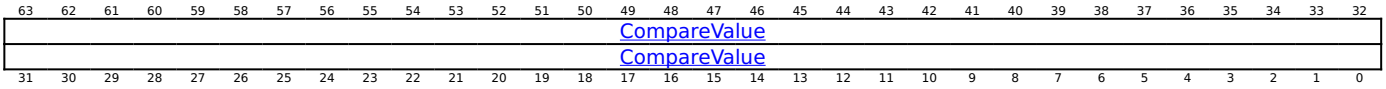
It is IMPLEMENTATION DEFINED whether CNTV_CVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_CVAL is a 64-bit register.

Field descriptions



CompareValue, bits [63:0]

Holds the virtual timer CompareValue.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that CompareValue acts like a 64-bit upcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- An interrupt is generated if CNTV_CTL.IMASK is 0.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_CVAL

CNTV_CVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_CVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_CVAL is accessible in that frame if both:
  - CNTV_CVAL is accessible in the corresponding CNTBaseN frame:
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_CVAL address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

CNTV_CVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x030	CNTV_CVAL	31:0

Accesses to this register are RW.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x034	CNTV_CVAL	63:32

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

Purpose

Holds the timer value for the virtual timer.

Configuration

It is IMPLEMENTATION DEFINED whether CNTV_TVAL is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTV_TVAL is a 32-bit register.

Field descriptions

TimerValue, bits [31:0]

The TimerValue view of the virtual timer.

On a read of this register:

- If CNTV_CTL.ENABLE is 0, the value returned is UNKNOWN.
- If CNTV_CTL.ENABLE is 1, the value returned is (CompareValue - CNTVCT).

On a write of this register, CompareValue is set to (CNTVCT + TimerValue), where TimerValue is treated as a signed 32-bit integer.

When CNTV_CTL.ENABLE is 1, the timer condition is met when (CNTVCT - CompareValue) is greater than or equal to zero. This means that TimerValue acts like a 32-bit downcounter timer. When the timer condition is met:

- CNTV_CTL.ISTATUS is set to 1.
- If CNTV_CTL.IMASK is 0, an interrupt is generated.

When CNTV_CTL.ENABLE is 0, the timer condition is not met, but CNTVCT continues to count, so the TimerValue view appears to continue to count down.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTV_TVAL

CNTV_TVAL can be implemented in any implemented CNTBaseN frame that has virtual timer capability, and in the corresponding CNTEL0BaseN frame.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTV_TVAL is accessible in that frame if the value of CNTACR<n>.RWVT is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTV_TVAL is accessible in that frame if both:
  - CNTV_TVAL is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VTEN is 1.
- Otherwise, the CNTV_TVAL address in that frame is RAZ/WI.

CNTV_TVAL can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTBaseN	0x038	CNTV_TVAL

Accesses to this register are RW.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0x038	CNTV_TVAL

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.

Configuration

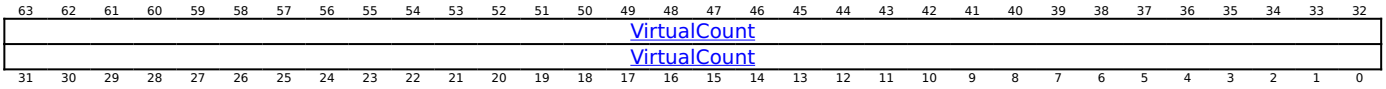
It is IMPLEMENTATION DEFINED whether CNTVCT is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVCT is a 64-bit register.

Field descriptions



VirtualCount, bits [63:0]

Virtual count value.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVCT

CNTVCT can be implemented in any implemented CNTBaseN frame, and in the corresponding CNTEL0BaseN frame, as a RO register.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame:

- CNTVCT is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVCT is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

For an implemented CNTEL0BaseN frame:

- CNTVCT is accessible in that frame if both:
  - CNTVCT is accessible in the corresponding CNTBaseN frame.
  - The value of CNTEL0ACR.EL0VCTEN is 1.
- Otherwise, the CNTVCT address in that frame is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTVCT register must be accessible as an atomic 64-bit value.

CNTVCT can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x008	CNTVCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTBaseN	0x00C	CNTVCT	63:32

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x008	CNTVCT	31:0

Accesses to this register are RO.

Component	Frame	Offset	Instance	Range
Timer	CNTEL0BaseN	0x00C	CNTVCT	63:32

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

Purpose

Holds the 64-bit virtual offset for a CNTBaseN frame that has virtual timer capability. This is the offset between real time and virtual time.

Configuration

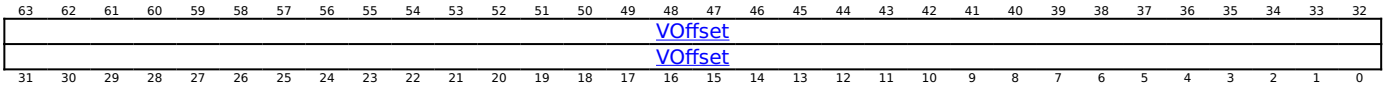
It is IMPLEMENTATION DEFINED whether CNTVOFF is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF

CNTVOFF is implemented, as a RO register, in any implemented CNTBaseN frame that has virtual timer capability.

'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a CNTBaseN frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

For an implemented CNTBaseN frame that has virtual timer capability:

- CNTVOFF is accessible in that frame, as a RO register, if the value of CNTACR<n>.RVOFF is 1.
- Otherwise, the CNTVOFF address in that frame is RAZ/WI.

Note

CNTVOFF is never visible in any CNTEL0BaseN frame. This means that the CNTVOFF address in any implemented CNTEL0BaseN frame is RAZ/WI.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF register must be accessible as an atomic 64-bit value.

CNTVOFF can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTBaseN	0x018	31:0

Accesses to this register are RO.

Component	Frame	Offset	Range
Timer	CNTBaseN	0x01C	63:32

Accesses to this register are RO.

CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose

Holds the 64-bit virtual offset for frame CNTBase<n>. This is the offset between real time and virtual time.

Configuration

It is IMPLEMENTATION DEFINED whether CNTVOFF<n> is implemented in the Core power domain or in the Debug power domain.

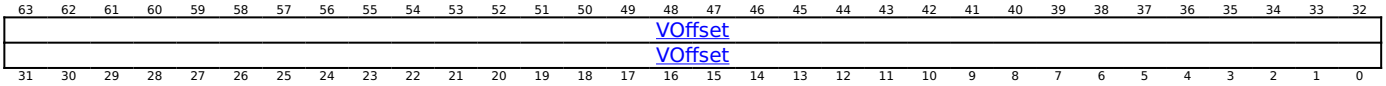
Implementation of this register is OPTIONAL.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

Attributes

CNTVOFF<n> is a 64-bit register.

Field descriptions



VOffset, bits [63:0]

Virtual offset.

The reset behavior of this field is:

- On a Timer reset, this field resets to an architecturally UNKNOWN value.

Accessing CNTVOFF<n>

In the CNTCTLBase frame a CNTVOFF<n> register must be implemented, as a RW register, for each CNTBaseN frame that has virtual timer capability. For more information, see 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames'.

Note

The value of <n> in an instance of CNTVOFF<n> specifies the value of N for the associated CNTBaseN frame.

In a system that supports the Realm Management Extension, CNTNSAR.NS<n> describes how these registers can be accessed by Root or Realm accesses.

In a system that recognizes two Security states, for any CNTVOFF<n> register in the CNTCTLBase frame:

- CNTVOFF<n> is always accessible by Secure accesses.
- CNTNSAR.NS<n> determines whether CNTVOFF<n> is accessible by Non-secure accesses.

The register location of any unimplemented CNTVOFF<n> register in the CNTCTLBase frame is RAZ/WI.

The CNTVOFF<n> register is accessible in the CNTBaseN frame using CNTVOFF.

In an implementation that supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

CNTVOFF<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Range
Timer	CNTCTLBase	0x080 + (8 * n)	31:0

Accesses to this register are RW.

Component	Frame	Offset	Range
Timer	CNTCTLBase	0x084 + (8 * n)	63:32

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CounterID<n>, Counter ID registers, n = 0 - 11

The CounterID<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.

Configuration

It is IMPLEMENTATION DEFINED whether CounterID<n> is implemented in the Core power domain or in the Debug power domain.

For more information, see 'Power and reset domains for the system level implementation of the Generic Timer'.

These registers are implemented independently in each of the implemented Generic Timer memory-mapped frames.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the Arm Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of 0xF.

Attributes

CounterID<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing CounterID<n>

These registers must be implemented, as RO registers, in every implemented Generic Timer memory-mapped frame.

For the CNTCTLBase frame, in a system that supports the Realm Management Extension, it is IMPLEMENTATION DEFINED whether Root and Realm accesses to these registers are permitted. If not permitted, these registers behave as RES0 for Root and Realm accesses.

For the CNTCTLBase frame, in a system that recognizes two Security states these registers are accessible by both Secure and Non-secure accesses.

For the CNTControlBase frame, in a system that supports the Realm Management Extension, the frame is implemented only in the Root physical address space, meaning these registers are implemented only in the Root physical address space.

For the CNTControlBase frame, in a system that supports Secure and Non-secure physical address spaces, the frame is implemented only in the Secure physical address space, meaning these registers are implemented only in the Secure physical address space.

For the CNTReadBase frame, these registers are accessible in all physical address spaces.

For the CNTBaseN frames, 'CNTCTLBase status and control fields for the CNTBaseN and CNTEL0BaseN frames' describes the status fields that identify whether a frame is implemented, and for an implemented frame:

- Whether the CNTBaseN frame has virtual timer capability.
- Whether the corresponding CNTEL0BaseN frame is implemented.
- For an implementation that supports the Realm Management Extension, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Root and Realm accesses.
- For an implementation that recognizes two Security states, whether the CNTBaseN frame, and any corresponding CNTEL0BaseN frame, is accessible by Non-secure accesses. The CNTBaseN frame is always accessible by Secure accesses.

CounterID<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
Timer	CNTControlBase	0xFD0 + (4 * n)	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTReadBase	0xFD0 + (4 * n)	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTBaseN	0xFD0 + (4 * n)	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTEL0BaseN	0xFD0 + (4 * n)	CounterID<n>

Accesses to this register are RO.

Component	Frame	Offset	Instance
Timer	CNTCTLBase	0xFD0 + (4 * n)	CounterID<n>

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

Purpose

Clears the application triggers.

Configuration

External register CTIAPPCLEAR bits [31:0] are architecturally mapped to External register CTIAPPSET[31:0].

CTIAPPCLEAR is in the Debug power domain.

Attributes

CTIAPPCLEAR is a 32-bit register.

Field descriptions

APPCLEAR<x>, bit [x], for x = 31 to 0

Application trigger <x> disable.

Writing to this bit has the following effect:

APPCLEAR<x>	Meaning
0b0	No effect.
0b1	Clear corresponding application trigger to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPPULSE.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RAZ/W1C.

Accessing CTIAPPCLEAR

CTIAPPCLEAR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x018	CTIAPPCLEAR

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

CTIAPPPULSE, CTI Application Pulse register

The CTIAPPPULSE characteristics are:

Purpose

Causes event pulses to be generated on ECT channels.

Configuration

CTIAPPPULSE is in the Debug power domain.

Attributes

CTIAPPPULSE is a 32-bit register.

Field descriptions

APPPULSE<x>, bit [x], for x = 31 to 0

Generate event pulse on ECT channel <x>.

APPPULSE<x>	Meaning
0b0	No effect.
0b1	Channel <x> event pulse generated.

Note

- The CTIAPPPULSE operation does not affect the state of the application trigger. If the channel is active, either because of an earlier event or from the application trigger, then the value written to CTIAPPPULSE might have no effect.
- Multiple pulse events that occur close together might be merged into a single pulse event.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/UNKNOWN.

Accessing CTIAPPPULSE

It is CONSTRAINED UNPREDICTABLE whether a write to CTIAPPPULSE generates an event on a channel if CTICONTROL.GLBEN is 0.

CTIAPPPULSE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x01C	CTIAPPPULSE

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets the application triggers.

Configuration

External register CTIAPPSET bits [31:0] are architecturally mapped to External register CTIAPPCLEAR[31:0].

CTIAPPSET is in the Debug power domain.

Attributes

CTIAPPSET is a 32-bit register.

Field descriptions

APPSET<x>, bit [x], for x = 31 to 0

Application trigger <x> enable.

APPSET<x>	Meaning
0b0	Reading this means the application trigger is inactive. Writing this has no effect.
0b1	Reading this means the application trigger is active. Writing this sets the corresponding application trigger to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPPULSE.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Accessing CTIAPPSET

CTIAPPSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x014	CTIAPPSET

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

Configuration

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance.

Attributes

CTIAUTHSTATUS is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

Bits [27:24]

Reserved, RAZ.

Bits [23:16]

Reserved, RES0.

Bits [15:12]

Reserved, RAZ.

Bits [11:8]

Reserved, RES0.

Bits [7:4]

Reserved, RAZ.

NSNID, bits [3:2]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSNID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SNID.

NSID, bits [1:0]

If EL3 is implemented, this field holds the same value as DBGAUTHSTATUS_EL1.NSID.

If EL3 is not implemented and the implemented Security state is Secure state, this field holds the same value as DBGAUTHSTATUS_EL1.SID.

Accessing CTIAUTHSTATUS

CTIAUTHSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFB8	CTIAUTHSTATUS

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

Purpose

Provides the raw status of the ECT channel inputs to the CTI.

Configuration

CTICHINSTATUS is in the Debug power domain.

Attributes

CTICHINSTATUS is a 32-bit register.

Field descriptions

CHIN<n>, bit [n], for n = 31 to 0

Input channel <n> status.

CHIN<n>	Meaning
0b0	Input channel <n> is inactive.
0b1	Input channel <n> is active.

If the ECT channels do not support multicycle events, then it is IMPLEMENTATION DEFINED whether an input channel can be observed as active.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTICHINSTATUS

CTICHINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x138	CTICHINSTATUS

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTICHOUTSTATUS, CTI Channel Out Status register

The CTICHOUTSTATUS characteristics are:

Purpose

Provides the status of the ECT channel outputs from the CTI.

Configuration

CTICHOUTSTATUS is in the Debug power domain.

Attributes

CTICHOUTSTATUS is a 32-bit register.

Field descriptions

CHOUT<n>, bit [n], for n = 31 to 0

Output channel <n> status.

CHOUT<n>	Meaning
0b0	Output channel <n> is inactive.
0b1	Output channel <n> is active.

If the ECT channels do not support multicycle events, then it is IMPLEMENTATION DEFINED whether an output channel can be observed as active.

Note

The value in CTICHOUTSTATUS is after gating by the channel gate. For more information, see CTIGATE.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTICHOUTSTATUS

CTICHOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x13C	CTICHOUTSTATUS

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing CTICIDR0

CTICIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF0	CTICIDR0

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is RO.

Accessing CTICIDR1

CTICIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF4	CTICIDR1

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing CTICIDR2

CTICIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFF8	CTICIDR2

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Component Identification scheme'.

Configuration

CTICIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing CTICIDR3

CTICIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFFC	CTICIDR3

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTICLAIMCLR, CTI CLAIM Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear CLAIM tag bits to 0.

Configuration

External register CTICLAIMCLR bits [31:0] are architecturally mapped to External register CTICLAIMSET[31:0].

CTICLAIMCLR is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMCLR is a 32-bit register.

Field descriptions

CLAIM<m>, bit [m], for m = 31 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The number of Claim Tag bits implemented is indicated in CTICLAIMSET.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When m >= NUM_CTI_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing CTICLAIMCLR

CTICLAIMCLR can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA4	CTICLAIMCLR

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTICLAIMSET, CTI CLAIM Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

Configuration

External register CTICLAIMSET bits [31:0] are architecturally mapped to External register CTICLAIMCLR[31:0].

CTICLAIMSET is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTICLAIMSET is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15
CLAIM31	CLAIM30	CLAIM29	CLAIM28	CLAIM27	CLAIM26	CLAIM25	CLAIM24	CLAIM23	CLAIM22	CLAIM21	CLAIM20	CLAIM19	CLAIM18	CLAIM17	CLAIM16	CLAIM15

CLAIM<m>, bit [m], for m = 31 to 0

Claim Tag Set. Indicates whether Claim Tag bit <m> is implemented, and is used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not implemented. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is implemented. On a write: Set Claim Tag bit <m> to 1.

An External Debug reset clears the CLAIM tag bits to 0.

Accessing this field has the following behavior:

- When m >= NUM_CTI_CLAIM_TAGS, access to this field is RAZ/WI.
- Otherwise, access to this field is RAO/W1S.

Accessing CTICLAIMSET

CTICLAIMSET can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA0	CTICLAIMSET

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.

Configuration

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

GLBEN	Meaning
0b0	CTI mapping functions and application trigger disabled.
0b1	CTI mapping functions and application trigger enabled.

When GLBEN is 0, the input channel to output trigger, input trigger to output channel, and application trigger functions are disabled and do not signal new events on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it is CONSTRAINED UNPREDICTABLE which of the following occurs:

- The output trigger remains asserted after the mapping functions are disabled.
- The output trigger is deasserted after the mapping functions are disabled.

All output triggers are disabled by CTI reset.

If the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Accessing CTICONTROL

CTICONTROL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x000	CTICONTROL

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTIDEVAFF0, CTI Device Affinity register 0

The CTIDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF0 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

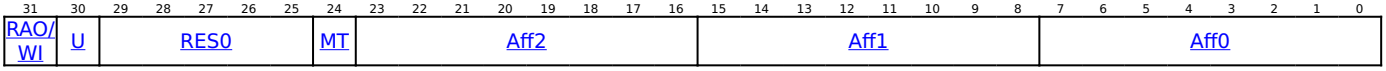
In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF1 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF0 is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVAFF0

CTIDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFA8	CTIDEVAFF0

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the CTI component relates to.

Configuration

CTIDEVAFF1 is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is implemented, then CTIDEVAFF0 must also be implemented. If the CTI of a PE does not implement the CTI Device Affinity registers, the CTI block of the external debug memory map must be located 64KB above the debug registers in the external debug interface.

Attributes

CTIDEVAFF1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of CTIDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVAFF1

CTIDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFAC	CTIDEVAFF1

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the CTI component.

Configuration

CTIDEVARCH is in the Debug power domain.

If the CTI is CTIv1, this register is OPTIONAL. If the CTI is CTIv2, this register is mandatory.

Arm recommends that the CTI is CTIv2.

In an Armv8.5 compliant implementation, the CTI must be CTIv2.

If this register is not implemented, CTIDEVAFF0 and CTIDEVAFF1 are also not implemented.

Attributes

CTIDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architect of the component. For CTI, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the CTIDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
0b0000	First revision.
0b0001	As 0b0000, and also adds support for CTIDEVCTL.

All other values are reserved.

When FEAT_DoPD is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

ARCHID, bits [15:0]

Defines this part to be an Armv8 debug component. For architectures defined by Arm this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.

Reads as 0x1A14.

Access to this field is RO.

Accessing CTIDEVARCH

CTIDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFBC	CTIDEVARCH

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIDEVCTL, CTI Device Control register

The CTIDEVCTL characteristics are:

Purpose

Provides target-specific device controls

Configuration

CTIDEVCTL is in the Debug power domain.

This register is present only when FEAT_DoPD is implemented. Otherwise, direct accesses to CTIDEVCTL are RES0.

Attributes

CTIDEVCTL is a 32-bit register.

Field descriptions

Bits [31:2]

Reserved, RES0.

RCE, bit [1]

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

OSUCE, bit [0]

OS Unlock Catch Enable

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Accessing CTIDEVCTL

CTIDEVCTL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x150	CTIDEVCTL

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

Purpose

Describes the CTI component to the debugger.

Configuration

CTIDEVID is in the Debug power domain.

Attributes

CTIDEVID is a 32-bit register.

Field descriptions

Bits [31:26]

Reserved, RES0.

INOUT, bits [25:24]

Input/output options. Indicates presence of the input gate. If the CTM is not implemented or CTIv2 is not implemented, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INOUT	Meaning
0b00	CTIGATE does not mask propagation of input events from external channels.
0b01	CTIGATE masks propagation of input events from external channels.

All other values are reserved.

Access to this field is RO.

Bits [23:22]

Reserved, RES0.

NUMCHAN, bits [21:16]

Number of ECT channels implemented. For Armv8, valid values are:

- 0b000011 3 channels (0..2) implemented.
- 0b000100 4 channels (0..3) implemented.
- 0b000101 5 channels (0..4) implemented.
- 0b000110 6 channels (0..5) implemented.

and so on up to 0b100000, 32 channels (0..31) implemented.

All other values are reserved.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [15:14]

Reserved, RES0.

NUMTRIG, bits [13:8]

Upper bound for number of triggers. The indices of all implemented input and output triggers are less than this value.

There is no guarantee that all of the input and output triggers, including the highest numbered, are connected to any components, or that the implementation of input and output triggers is symmetrical.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [7:5]

Reserved, RES0.

EXTMUXNUM, bits [4:0]

Number of multiplexors available on triggers. This value is used in conjunction with External Control register, ASICCTL.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIDEVID

CTIDEVID can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC8	CTIDEVID

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID1 is in the Debug power domain.

Attributes

CTIDEVID1 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID1

CTIDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC4	CTIDEVID1

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.

Configuration

CTIDEVID2 is in the Debug power domain.

Attributes

CTIDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing CTIDEVID2

CTIDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFC0	CTIDEVID2

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's cross-trigger interface.

Configuration

CTIDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

CTIDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a cross-trigger component.

Reads as 0b0100.

Access to this field is RO.

Accessing CTIDEVTYPE

CTIDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFCC	CTIDEVTYPE

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

Purpose

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

Configuration

CTIGATE is in the Debug power domain.

Attributes

CTIGATE is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13
GATE31	GATE30	GATE29	GATE28	GATE27	GATE26	GATE25	GATE24	GATE23	GATE22	GATE21	GATE20	GATE19	GATE18	GATE17	GATE16	GATE15	GATE14	GATE13

GATE<x>, bit [x], for x = 31 to 0

Channel <x> gate enable.

GATE<x>	Meaning
0b0	Disable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.
0b1	Enable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.

If GATE<x> is set to 0, no new events will be propagated to the ECT, and if the ECT supports multicycle channel events any existing output channel events will be terminated.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing CTIGATE

CTIGATE can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x140	CTIGATE

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTIINEN<n>, CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN<n> characteristics are:

Purpose

Enables the signaling of an event on output channels when input trigger event n is received by the CTI.

Configuration

CTIINEN<n> is in the Debug power domain.

If input trigger n is not implemented or not connected, CTIINEN<n> is RES0.

Attributes

CTIINEN<n> is a 32-bit register.

Field descriptions

INEN<x>, bit [x], for x = 31 to 0

Input trigger <n> to output channel <x> enable.

INEN<x>	Meaning
0b0	Input trigger <n> will not generate an event on output channel <x>.
0b1	Input trigger <n> will generate an event on output channel <x>.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing CTIINEN<n>

CTIINEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x020 + (4 * n)	CTIINEN<n>

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

Purpose

Can be used to deactivate the output triggers.

Configuration

CTIINTACK is in the Debug power domain.

Attributes

CTIINTACK is a 32-bit register.

Field descriptions

ACK<n>, bit [n], for n = 31 to 0

Acknowledge for output trigger <n>.

If any of the following is true, writes to ACK<n> are ignored:

- n >= CTIDEVID.NUMTRIG, the number of implemented triggers.
- Output trigger n is not active.
- The channel mapping function output, as controlled by CTIOUTEN<n>, is still active.

Otherwise, if any of the following are true, ACK<n> is RES0:

- Output trigger n is not implemented.
- Output trigger n is not connected.
- Output trigger n is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<n> is as follows:

ACK<n>	Meaning
0b0	No effect
0b1	Deactivate the trigger.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is RAZ/WI.
- Otherwise, access to this field is WO/UNKNOWN.

Accessing CTIINTACK

A debugger must read CTITRIGOUTSTATUS to confirm that the output trigger has been acknowledged before generating any event that must be ordered after the write to CTIINTACK, such as a write to CTIAPPPULSE to activate another trigger.

CTIINTACK can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x010	CTIINTACK

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

The power domain of CTIITCTRL is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

Attributes

CTIITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to 0.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to 0.
  - On a Warm reset, the value of this field is unchanged.

Accessing CTIITCTRL

CTIITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xF00	CTIITCTRL

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are IMPDEF.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILAR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

Field descriptions

When CTI Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing CTILAR

CTILAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
CTI	0xFB0	CTILAR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

Purpose

Indicates the current status of the Software Lock for CTI registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

CTILSR is in the Debug power domain.

If FEAT_Debugv8p4 is implemented, the Software Lock is not implemented.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLK, bit [1]
When CTI Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when the Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when the Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On an External debug reset, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing CTILSR

CTILSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
CTI	0xFB4	CTILSR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

Purpose

Defines which input channels generate output trigger n.

Configuration

CTIOUTEN<n> is in the Debug power domain.

If output trigger n is not implemented or not connected, CTIOUTEN<n> is RES0.

Attributes

CTIOUTEN<n> is a 32-bit register.

Field descriptions

OUTEN<x>, bit [x], for x = 31 to 0

Input channel <x> to output trigger <n> enable.

OUTEN<x>	Meaning
0b0	An event on input channel <x> will not cause output trigger <n> to be asserted.
0b1	An event on input channel <x> will cause output trigger <n> to be asserted.

The reset behavior of this field is:

- On an External debug reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When x >= UInt(CTIDEVID.NUMCHAN), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing CTIOUTEN<n>

CTIOUTEN<n> can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x0A0 + (4 * n)	CTIOUTEN<n>

Accessible as follows:

- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - CTIPIDR1.PART_1 contains part number bits [11:8].
  - CTIPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - CTIPIDR1.PART_1 contains part number bits [15:12].
  - CTIPIDR0.PART_0 contains part number bits [11:4].
  - CTIPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, CTIPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR0

CTIPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE0	CTIPIDR0

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- CTIPIDR1.DES_0: JEP106 identification code bits[3:0].
- CTIPIDR2.DES_1: JEP106 identification code bits[6:4].
- CTIPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - CTIPIDR1.PART_1 contains part number bits [11:8].
  - CTIPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - CTIPIDR1.PART_1 contains part number bits [15:12].
  - CTIPIDR0.PART_0 contains part number bits [11:4].
  - CTIPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, CTIPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR1

CTIPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE4	CTIPIDR1

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- CTIPIDR2.REVISION indicates the 4-bit revision number.
- CTIPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- CTIPIDR2.REVISION indicates the 4-bit major revision number.
- CTIPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- CTIPIDR2.REVISION contains part number bits [3:0].
- CTIPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- CTIPIDR1.DES_0: JEP106 identification code bits[3:0].
- CTIPIDR2.DES_1: JEP106 identification code bits[6:4].
- CTIPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR2

CTIPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFE8	CTIPIDR2

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- CTIPIDR2.REVISION indicates the 4-bit revision number.
- CTIPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- CTIPIDR2.REVISION indicates the 4-bit major revision number.
- CTIPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- CTIPIDR2.REVISION contains part number bits [3:0].
- CTIPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

CTIPIDR3.CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component

modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

CTIPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR3

CTIPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFEC	CTIPIDR3

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

Purpose

Provides information to identify a CTI component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

CTIPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

CTIPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- CTIPIDR1.DES_0: JEP106 identification code bits[3:0].
- CTIPIDR2.DES_1: JEP106 identification code bits[6:4].
- CTIPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing CTIPIDR4

CTIPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0xFD0	CTIPIDR4

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTITRIGINSTATUS, CTI Trigger In Status register

The CTITRIGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

Configuration

CTITRIGINSTATUS is in the Debug power domain.

Attributes

CTITRIGINSTATUS is a 32-bit register.

Field descriptions

TRIN<n>, bit [n], for n = 31 to 0

Trigger input <n> status.

TRIN<n>	Meaning
0b0	Input trigger n is inactive.
0b1	Input trigger n is active.

Not implemented and not-connected input triggers are always inactive.

It is IMPLEMENTATION DEFINED whether an input trigger that does not support multicycle events can be observed as active.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Accessing CTITRIGINSTATUS

CTITRIGINSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x130	CTITRIGINSTATUS

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

Purpose

Provides the raw status of the trigger outputs, after processing by any IMPLEMENTATION DEFINED trigger interface logic. For output triggers that are self-acknowledging, this is only meaningful if the CTI implements multicycle channel events.

Configuration

CTITRIGOUTSTATUS is in the Debug power domain.

Attributes

CTITRIGOUTSTATUS is a 32-bit register.

Field descriptions

TROUT<n>, bit [n], for n = 31 to 0

Trigger output <n> status.

If n is less than CTIDEVID.NUMTRIG, and output trigger <n> is implemented and connected, and either the trigger is not self-acknowledging or the CTI implements multicycle channel events, then permitted values for TROUT<n> are:

TROUT<n>	Meaning
0b0	Output trigger n is inactive.
0b1	Output trigger n is active.

Otherwise when n is less than CTIDEVID.NUMTRIG, it is IMPLEMENTATION DEFINED whether TROUT<n> behaves as described here or is RAZ.

Accessing this field has the following behavior:

- When n >= UInt(CTIDEVID.NUMTRIG), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - Output trigger <n> is not implemented or not connected or (Output trigger <n> is self-acknowledging and CTI does not implement multicycle channel events).
  - an implementation implements TROUT<n>.
- Otherwise, access to this field is RO.

Accessing CTITRIGOUTSTATUS

CTITRIGOUTSTATUS can be accessed through the external debug interface:

Component	Offset	Instance
CTI	0x134	CTITRIGOUTSTATUS

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

DBGAUTHSTATUS_EL1, Debug Authentication Status Register

The DBGAUTHSTATUS_EL1 characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for debug.

Configuration

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGAUTHSTATUS_EL1[31:0].

External register DBGAUTHSTATUS_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGAUTHSTATUS[31:0].

When FEAT_DoPD is implemented, DBGAUTHSTATUS_EL1 is in the Core power domain. Otherwise, DBGAUTHSTATUS_EL1 is in the Debug power domain.

Attributes

DBGAUTHSTATUS_EL1 is a 32-bit register.

Field descriptions

31 30 29 28	27 26	25 24	23 22 21 20 19 18 17 16	15 14	13 12	11 10 9 8	7 6	5 4	3 2	1 0
RES0	RTNID	RTID	RES0	RLNID	RLID	RES0	SNID	SID	NSNID	NSID

Bits [31:28]

Reserved, RES0.

RTNID, bits [27:26]

Root non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RTID.

RTID, bits [25:24]

Root invasive debug.

RTID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRootInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRootInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 0b00.

Bits [23:16]

Reserved, RES0.

RLNID, bits [15:14]

Realm non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.RLID.

RLID, bits [13:12]

Realm invasive debug.

RLID	Meaning
0b00	Not implemented.
0b10	Implemented and disabled. ExternalRealmInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalRealmInvasiveDebugEnabled() == TRUE.

All other values are reserved.

If FEAT_RME is not implemented, the only permitted value is 0b00.

Bits [11:8]

Reserved, RES0.

SNID, bits [7:6]
When FEAT_Debugv8p4 is implemented:

Secure non-invasive debug.

This field has the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise:

Secure non-invasive debug.

SNID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

SID, bits [5:4]

Secure invasive debug.

SID	Meaning
0b00	Secure state is not implemented.
0b10	Implemented and disabled. ExternalSecureInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalSecureInvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSNID, bits [3:2]
When FEAT_Debugv8p4 is implemented:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

Otherwise:

Non-secure non-invasive debug.

NSNID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalNoninvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalNoninvasiveDebugEnabled() == TRUE.

All other values are reserved.

NSID, bits [1:0]

Non-secure invasive debug.

NSID	Meaning
0b00	Non-secure state is not implemented.
0b10	Implemented and disabled. ExternalInvasiveDebugEnabled() == FALSE.
0b11	Implemented and enabled. ExternalInvasiveDebugEnabled() == TRUE.

All other values are reserved.

Accessing DBGAUTHSTATUS_EL1

DBGAUTHSTATUS_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFB8	DBGAUTHSTATUS_EL1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

DBGBCR<n>_EL1, Debug Breakpoint Control Registers, n = 0 - 63

The DBGBCR<n>_EL1 characteristics are:

Purpose

Holds control information for a breakpoint. Forms breakpoint n together with value register DBGBVR<n>_EL1.

Configuration

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[31:0].

External register DBGBCR<n>_EL1 bits [63:32] are architecturally mapped to AArch64 System register DBGBCR<n>_EL1[63:32] when FEAT_Debugv8p9 is implemented.

External register DBGBCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBCR<n>[31:0].

DBGBCR<n>_EL1 is in the Core power domain.

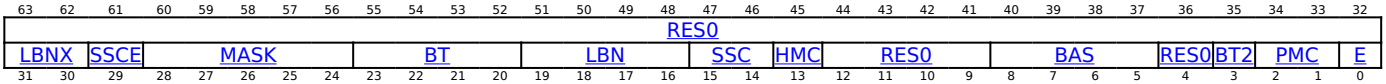
If breakpoint n is not implemented, then accesses to this register are:

- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBCR<n>_EL1 is a 64-bit register.

Field descriptions



When the E field is zero, all the other fields in the register are ignored.

Bits [63:32]

Reserved, RES0.

LBNX, bits [31:30]
When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGBCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]
When FEAT_RME is implemented:

Security State Control Extended.

The fields that indicate when the breakpoint can be generated are: HMC, PMC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]
When FEAT_BWE is implemented:

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If any of the following apply, then the behavior of the breakpoint is CONSTRAINED UNPREDICTABLE:

- DBGBCR<n>_EL1.MASK is a reserved value.
- DBGBCR<n>_EL1.MASK is zero, DBGBCR<n>_EL1.{BT2, BT} is {0, 0b010x} (address mismatch breakpoint without linking enabled), and AArch32 is not supported at EL1.
- DBGBCR<n>_EL1.MASK is a valid nonzero value and any of the following apply:
  - DBGBCR<n>_EL1.BAS is not 0b1111, and AArch32 is supported at EL0.
  - DBGBVR<n>_EL1[(MASK-1):0] is nonzero.
  - DBGBCR<n>_EL1.{BT2, BT} is {0, 0b0x1x} or {0, 0b1xxx} (Context matching breakpoint).

When any of these conditions apply, the breakpoint behaves as if one of the following:

- DBGBCR<n>_EL1.MASK has been programmed with a defined value, which might be 0b00000 (no mask), other than for a direct read of DBGBCR<n>_EL1.
- The breakpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bits [23:20]

Breakpoint Type.

With DBGBCR<n>_EL1.BT2 when implemented, specifies breakpoint type.

BT	Meaning	Applies when
0b0000	Unlinked instruction address match. DBGBVR<n>_EL1 is the address of an instruction.	
0b0001	Linked instruction address match. As 0b0000, but linked to a breakpoint that has linking enabled.	
0b0010	Unlinked Context ID match. If the Effective value of HCR_EL2.E2H is 1 and either the PE is executing at EL0 with HCR_EL2.TGE set to 1 or the PE is executing at EL2, then DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL2. Otherwise, DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1.	When breakpoint n is context-aware
0b0011	As 0b0010, with linking enabled.	When breakpoint n is context-aware
0b0100	Unlinked instruction address mismatch. DBGBVR<n>_EL1 is the address of an instruction.	When FEAT_BWE is implemented or EL1 is using AArch32
0b0101	Linked instruction address mismatch. As 0b0100, but linked to a breakpoint that has linking enabled.	When FEAT_BWE is implemented or EL1 is using AArch32
0b0110	Unlinked CONTEXTIDR_EL1 match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b0111	As 0b0110, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1000	Unlinked VMID match. DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.	When EL2 is implemented and breakpoint n is context-aware
0b1001	As 0b1000, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1010	Unlinked VMID and Context ID match. DBGBVR<n>_EL1.ContextID is a Context ID compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.VMID is a VMID compared against VTTBR_EL2.VMID.	When EL2 is implemented and breakpoint n is context-aware
0b1011	As 0b1010, with linking enabled.	When EL2 is implemented and breakpoint n is context-aware
0b1100	Unlinked CONTEXTIDR_EL2 match. DBGBVR<n>_EL1.ContextID2 is a Context ID compared against CONTEXTIDR_EL2.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1101	As 0b1100, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1110	Unlinked Full Context ID match. DBGBVR<n>_EL1.ContextID is compared against CONTEXTIDR_EL1, and DBGBVR<n>_EL1.ContextID2 is compared against CONTEXTIDR_EL2.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware
0b1111	As 0b1110, with linking enabled.	When EL2 is implemented, FEAT_Debugv8p1 is implemented, and breakpoint n is context-aware

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked address matching breakpoints, with DBGBCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other breakpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the HMC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information, including the effect of programming the fields to a reserved set of values, see 'Reserved DBGBCR<n>_EL1.{SSC, HMC, PMC} values'.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and PMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [12:9]

Reserved, RES0.

BAS, bits [8:5]
When FEAT_AA32 is implemented:

Byte address select. Defines which half-words an address-matching breakpoint matches, regardless of the instruction set and Execution state.

The permitted values depend on the breakpoint type.

For Address match breakpoints in either AArch32 or AArch64 state, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0011	DBGBVR<n>_EL1	Use for T32 instructions.
0b1100	DBGBVR<n>_EL1 + 2	Use for T32 instructions.
0b1111	DBGBVR<n>_EL1	Use for A64 and A32 instructions.

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Address mismatch breakpoints in an AArch32 stage 1 translation regime, the permitted values are:

BAS	Match instruction at	Constraint for debuggers
0b0000	-	Use for a match anywhere breakpoint.
0b0011	DBGBVR<n>_EL1	Use for stepping T32 instructions.
0b1100	DBGBVR<n>_EL1 + 2	Use for stepping T32 instructions.
0b1111	DBGBVR<n>_EL1	Use for stepping A64 and A32 instructions.

All other values are reserved.

For more information, see 'Using the BAS field in Address Match breakpoints'.

For Context matching breakpoints, this field is RES1 and ignored.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bit [4]

Reserved, RES0.

BT2, bit [3]
When FEAT_ABLE is implemented and breakpoint n supports address breakpoint linking:

Breakpoint Type 2. With DBGBCR<n>_EL1.BT, specifies breakpoint type.

BT2	Meaning
0b0	As DBGBCR<n>_EL1.BT.
0b1	As DBGBCR<n>_EL1.BT, but with linking enabled. This value is only defined for the following DBGBCR<n>_EL1.BT values: 0b0000, 0b0001, 0b0100, and 0b0101. All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMC, bits [2:1]

Privilege mode control. Determines the Exception level or levels at which a Breakpoint debug event for breakpoint n is generated. This field must be interpreted along with the SSC and HMC fields, and there are constraints on the permitted values of the {HMC, SSC, PMC} fields. For more information see the DBGBCR<n>_EL1.SSC description.

For more information on the operation of the SSC, HMC, and PMC fields, see 'Execution conditions for which a breakpoint generates Breakpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable breakpoint n.

E	Meaning
0b0	Breakpoint n disabled.
0b1	Breakpoint n enabled.

This field is ignored by the PE and treated as zero when all of the following are true:

- Any of the following are true:
  - HaltOnBreakpointOrWatchpoint() is FALSE and the Effective value of MDSCR_EL1.EMBWE is 0.
  - HaltOnBreakpointOrWatchpoint() is TRUE and the Effective value of EDSCR2.EHBWE is 0.
- FEAT_Debugv8p9 is implemented.
- n >= 16.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBCR<n>_EL1

When FEAT_Debugv8p9 is not implemented, this register is 32-bits wide and offset 0x40C + (16 * n) is reserved.

DBGBCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x408 + (16 * n)	DBGBCR<n>_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

DBGBVR<n>_EL1, Debug Breakpoint Value Registers, n = 0 - 63

The DBGBVR<n>_EL1 characteristics are:

Purpose

Holds a virtual address, or a VMID and/or a context ID, for use in breakpoint matching. Forms breakpoint n together with control register DBGBCR<n>_EL1.

Configuration

External register DBGBVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGBVR<n>_EL1[63:0].

External register DBGBVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGBVR<n>[31:0].

External register DBGBVR<n>_EL1 bits [63:32] are architecturally mapped to AArch32 System register DBGBXVR<n>[31:0].

DBGBVR<n>_EL1 is in the Core power domain.

How this register is interpreted depends on the value of DBGBCR<n>_EL1.BT.

- When DBGBCR<n>_EL1.BT is 0b0x0x, this register holds a virtual address.
- When DBGBCR<n>_EL1.BT is 0b001x, 0b011x, or 0b110x, this register holds a Context ID.
- When DBGBCR<n>_EL1.BT is 0b100x, this register holds a VMID.
- When DBGBCR<n>_EL1.BT is 0b101x, this register holds a VMID and a Context ID.
- When DBGBCR<n>_EL1.BT is 0b111x, this register holds two Context ID values.

For other values of DBGBCR<n>_EL1.BT, this register is RES0.

If breakpoint n is not implemented, then accesses to this register are:

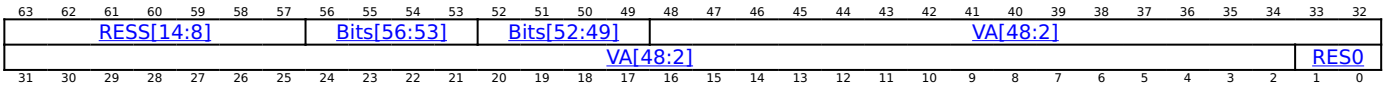
- RES0 when IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess().
- A CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR otherwise.

Attributes

DBGBVR<n>_EL1 is a 64-bit register.

Field descriptions

When DBGBCR<n>_EL1.BT IN {'0x0x'}:



RESS[14:8], bits [63:57]

Reserved, Sign extended. Software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

Bits[56:53]
When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[7:4], bits [3:0] of bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]
When FEAT_LVA is implemented:

VA[52:49], bits [3:0] of bits [52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0], bits [3:0] of bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

If the address is being matched in an AArch64 stage 1 translation regime:

- This field contains bits[48:2] of the address for comparison.
- When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. If FEAT_LVA3 is not implemented, bits VA[56:53] are part of the RESS field.
- When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. If FEAT_LVA is not implemented, bits [52:49] are part of the RESS field.

If the address is being matched in an AArch32 stage 1 translation regime, the first 20 bits of this field are RES0, and the rest of the field contains bits[31:2] of the address for comparison.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {'001x'}:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

ContextID, bits [31:0]

Context ID value for comparison.

The value is compared against CONTEXTIDR_EL2 when the Effective value of HCR_EL2.E2H is 1, and either:

- The PE is executing at EL2.
- HCR_EL2.TGE is 1, the PE is executing at EL0, and EL2 is enabled in the current Security state.

Otherwise, the value is compared against the following:

- CONTEXTIDR when the PE is executing at AArch32.
- CONTEXTIDR_EL1 when the PE is executing at AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {'011x'}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																															
ContextID																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bits [63:32]

Reserved, RES0.

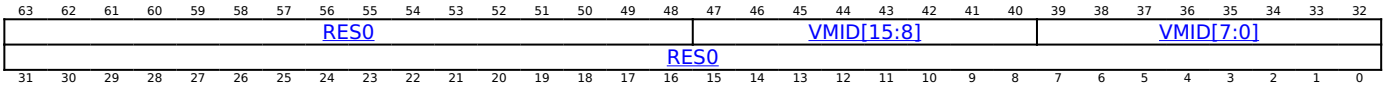
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {'100x'} and EL2 is implemented:



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]
When FEAT_VMID16 is implemented and VTCR_EL2.VS == '1':

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

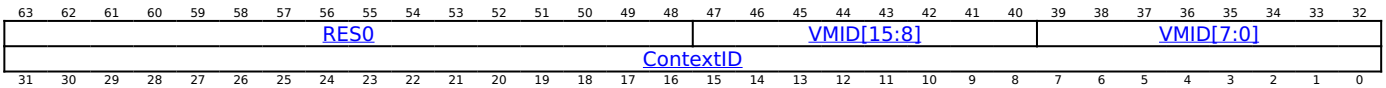
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {'101x'} and EL2 is implemented:



Bits [63:48]

Reserved, RES0.

VMID[15:8], bits [47:40]
When FEAT_VMID16 is implemented and VTCR_EL2.VS == '1':

Extension to VMID[7:0]. For more information, see DBGBVR<n>_EL1.VMID[7:0].

If EL2 is using AArch32, or if the implementation has an 8-bit VMID, this field is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID[7:0], bits [39:32]

VMID value for comparison.

The VMID is 8 bits when any of the following are true:

- EL2 is using AArch32.
- VTCR_EL2.VS is 0.
- FEAT_VMID16 is not implemented.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

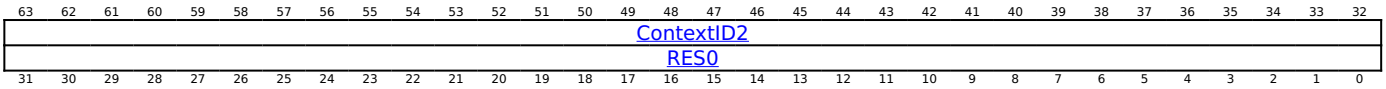
ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When DBGBCR<n>_EL1.BT IN {'110x'}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

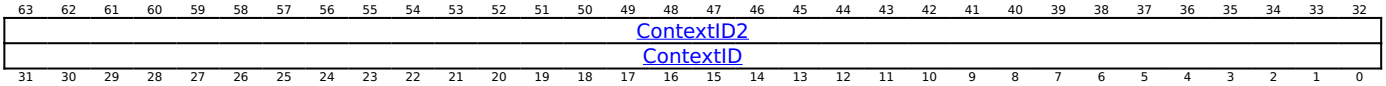
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

When DBGBCR<n>_EL1.BT IN {'111x'}, EL2 is implemented, and FEAT_Debugv8p1 is implemented:



ContextID2, bits [63:32]

Context ID value for comparison against CONTEXTIDR_EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

ContextID, bits [31:0]

Context ID value for comparison against CONTEXTIDR_EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGBVR<n>_EL1

DBGBVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x400 + (16 * n)	DBGBVR<n>_EL1	63:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

DBGCLAIMCLR_EL1, Debug CLAIM Tag Clear Register

The DBGCLAIMCLR_EL1 characteristics are:

Purpose

Used by software to read the values of the CLAIM tag bits, and to clear CLAIM tag bits to 0.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMSET_EL1 register.

Configuration

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

External register DBGCLAIMCLR_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMSET_EL1[31:0].

DBGCLAIMCLR_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMCLR_EL1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bit [m], for m = 7 to 0

Claim Tag Clear. Indicates the current status of Claim Tag bit <m>, and is used to clear Claim Tag bit <m> to 0.

CLAIM<m>	Meaning
0b0	On a read: Claim Tag bit <m> is not set. On a write: Ignored.
0b1	On a read: Claim Tag bit <m> is set. On a write: Clear Claim tag bit <m> to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is W1C.

Accessing DBGCLAIMCLR_EL1

DBGCLAIMCLR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA4	DBGCLAIMCLR_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

DBGCLAIMSET_EL1, Debug CLAIM Tag Set Register

The DBGCLAIMSET_EL1 characteristics are:

Purpose

Used by software to set the CLAIM tag bits to 1.

The architecture does not define any functionality for the CLAIM tag bits.

Note

CLAIM tags are typically used for communication between the debugger and target software.

Used in conjunction with the DBGCLAIMCLR_EL1 register.

Configuration

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMSET_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGCLAIMCLR_EL1[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMSET[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGCLAIMCLR[31:0].

External register DBGCLAIMSET_EL1 bits [31:0] are architecturally mapped to External register DBGCLAIMCLR_EL1[31:0].

DBGCLAIMSET_EL1 is in the Core power domain.

An implementation must include eight CLAIM tag bits.

Attributes

DBGCLAIMSET_EL1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RAZ/WI.

CLAIM<m>, bit [m], for m = 7 to 0

Claim Tag Set. Used to set Claim Tag bit <m> to 1.

CLAIM<m>	Meaning
0b0	On a write: Ignored.
0b1	On a write: Set Claim Tag bit <m> to 1.

Access to this field is RAO/W1S.

Accessing DBGCLAIMSET_EL1

DBGCLAIMSET_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA0	DBGCLAIMSET_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

DBGDTRRX_EL0, Debug Data Transfer Register, Receive

The DBGDTRRX_EL0 characteristics are:

Purpose

Transfers data from an external debugger to the PE. For example, it is used by a debugger transferring commands and data to a debug target. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communications Channel.

Configuration

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRRX_EL0[31:0].

External register DBGDTRRX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXint[31:0].

DBGDTRRX_EL0 is in the Core power domain.

Attributes

DBGDTRRX_EL0 is a 32-bit register.

Field descriptions

DTRRX, bits [31:0]

Update DTRRX.

Writes to this register:

- If RXfull is 0, update the value in DTRRX and set RXfull to 1.
- If RXfull is 1, the written value is ignored and RXO is set to 1.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRRX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in Memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRRX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x080	DBGDTRRX_EL0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

DBGDTRTX_EL0, Debug Data Transfer Register, Transmit

The DBGDTRTX_EL0 characteristics are:

Purpose

Transfers data from the PE to an external debugger. For example, it is used by a debug target to transfer data to the debugger. See DBGDTR_EL0 for additional architectural mappings. It is a component of the Debug Communication Channel.

Configuration

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch64 System register DBGDTRTX_EL0[31:0].

External register DBGDTRTX_EL0 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRTXint[31:0].

DBGDTRTX_EL0 is in the Core power domain.

Attributes

DBGDTRTX_EL0 is a 32-bit register.

Field descriptions

DTRTX, bits [31:0]

Return DTRTX.

Reads of this register:

- If TXfull is 1, return the value in DTRTX and clear TXfull to 0.
- If TXfull is 0, return an UNKNOWN value and set TXU to 1.

Writes of this register update the value in DTRTX and do not change TXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGDTRTX_EL0

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any operation issued by a DTR access in Memory access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

DBGDTRTX_EL0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x08C	DBGDTRTX_EL0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

DBGWCR<n>_EL1, Debug Watchpoint Control Registers, n = 0 - 63

The DBGWCR<n>_EL1 characteristics are:

Purpose

Holds control information for a watchpoint. Forms watchpoint n together with value register DBGWVR<n>_EL1.

Configuration

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[31:0].

External register DBGWCR<n>_EL1 bits [63:32] are architecturally mapped to AArch64 System register DBGWCR<n>_EL1[63:32] when FEAT_Debugv8p9 is implemented.

External register DBGWCR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWCR<n>[31:0].

DBGWCR<n>_EL1 is in the Core power domain.

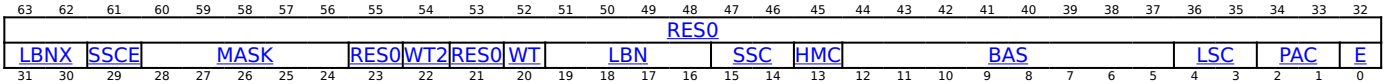
If watchpoint n is not implemented, then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWCR<n>_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

LBNX, bits [31:30]
When FEAT_Debugv8p9 is implemented:

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBN, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

This field extends DBGWCR<n>_EL1.LBN to support up to 64 implemented breakpoints.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSCE, bit [29]
When FEAT_RME is implemented:

Security State Control Extended.

The fields that indicate when the watchpoint can be generated are: HMC, PAC, SSC, and SSCE. These fields must be considered in combination, and the values that are permitted for these fields are constrained.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MASK, bits [28:24]

Address Mask. Only address ranges up to 2GB can be watched using a single mask.

MASK	Meaning
0b00000	No mask.
0b00011..0b11111	Number of address bits masked.

All other values are reserved.

Indicates the number of masked address bits, from 0b00011 masking 3 address bits (0x00000007 mask for address) to 0b11111 masking 31 address bits (0x7FFFFFFF mask for address).

If programmed with a reserved value, the watchpoint behaves as if one of the following:

- DBGWCR<n>_EL1.MASK has been programmed with a defined value, which might be 0b00000 (no mask), other than for a direct read of DBGWCR<n>_EL1.
- The watchpoint is disabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bit [23]

Reserved, RES0.

WT2, bit [22]
When FEAT_BWE2 is implemented:

Watchpoint Type 2. With DBGWCR<n>_EL1.WT, specifies watchpoint type.

WT2	Meaning
0b0	Watchpoint n is an address match watchpoint.
0b1	Watchpoint n is an address mismatch watchpoint.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [21]

Reserved, RES0.

WT, bit [20]

Watchpoint type. Possible values are:

WT	Meaning
0b0	Unlinked data address match.
0b1	Linked data address match.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LBN, bits [19:16]

Linked Breakpoint Number.

For Linked data address watchpoints, with DBGWCR<n>_EL1.LBNX when implemented, specifies the index of the breakpoint linked to.

For all other watchpoint types, this field is ignored and reads of the register return an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SSC, bits [15:14]

Security state control. Determines the Security states under which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the HMC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

HMC, bit [13]

Higher mode control. Determines the debug perspective for deciding when a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and PAC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

BAS, bits [12:5]

Byte address select. Each bit of this field selects whether a byte from within the word or double-word addressed by DBGWVR<n>_EL1 is being watched.

BAS	Description
xxxxxxx1	Match byte at DBGWVR<n>_EL1
xxxxxx1x	Match byte at DBGWVR<n>_EL1 + 1
xxxxx1xx	Match byte at DBGWVR<n>_EL1 + 2
xxxx1xxx	Match byte at DBGWVR<n>_EL1 + 3

In cases where DBGWVR<n>_EL1 addresses a double-word:

BAS	Description, if DBGWVR<n>_EL1[2] == 0
xxx1xxxx	Match byte at DBGWVR<n>_EL1 + 4
xx1xxxxx	Match byte at DBGWVR<n>_EL1 + 5
x1xxxxxx	Match byte at DBGWVR<n>_EL1 + 6
1xxxxxxx	Match byte at DBGWVR<n>_EL1 + 7

If DBGWVR<n>_EL1[2] == 1, only BAS[3:0] is used. Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The valid values for BAS are nonzero binary number all of whose set bits are contiguous. All other values are reserved and must not be used by software. See 'Reserved DBGWCR<n>.BAS values'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

LSC, bits [4:3]

Load/store control. This field enables watchpoint matching on the type of access being made. Possible values of this field are:

LSC	Meaning
0b01	Match instructions that load from a watchpointed address.
0b10	Match instructions that store to a watchpointed address.
0b11	Match instructions that load from or store to a watchpointed address.

All other values are reserved, but must behave as if the watchpoint is disabled. Software must not rely on this property as the behavior of reserved values might change in a future revision of the architecture.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

PAC, bits [2:1]

Privilege of access control. Determines the Exception level or levels at which a Watchpoint debug event for watchpoint n is generated. This field must be interpreted along with the SSC and HMC fields.

For more information on the operation of the SSC, HMC, and PAC fields, see 'Execution conditions for which a watchpoint generates Watchpoint exceptions'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Enable watchpoint n.

E	Meaning
0b0	Watchpoint n disabled.
0b1	Watchpoint n enabled.

This field is ignored by the PE and treated as zero when all of the following are true:

- Any of the following are true:
  - HaltOnBreakpointOrWatchpoint() is FALSE and the Effective value of MDSCR_EL1.EMBWE is 0.
  - HaltOnBreakpointOrWatchpoint() is TRUE and the Effective value of EDSCR2.EHBWE is 0.
- FEAT_Debugv8p9 is implemented.
- n >= 16.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing DBGWCR<n>_EL1

When FEAT_Debugv8p9 is not implemented, this register is 32-bits wide and offset 0x80C + (16 * n) is reserved.

DBGWCR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x808 + (16 * n)	DBGWCR<n>_EL1

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

DBGWVR<n>_EL1, Debug Watchpoint Value Registers, n = 0 - 63

The DBGWVR<n>_EL1 characteristics are:

Purpose

Holds a data address value for use in watchpoint matching. Forms watchpoint n together with control register DBGWCR<n>_EL1.

Configuration

External register DBGWVR<n>_EL1 bits [63:0] are architecturally mapped to AArch64 System register DBGWVR<n>_EL1[63:0].

External register DBGWVR<n>_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGWVR<n>[31:0].

DBGWVR<n>_EL1 is in the Core power domain.

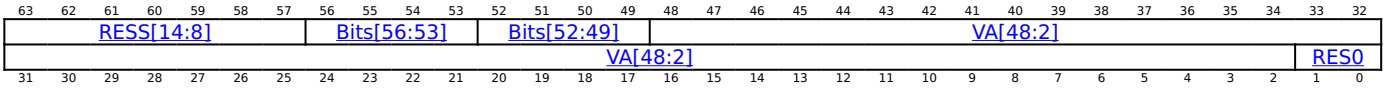
If watchpoint n is not implemented, then accesses to this register are:

- When IsCorePowered() && !DoubleLockStatus() && !OSLockStatus() && AllowExternalDebugAccess(), RES0.
- Otherwise, a CONSTRAINED UNPREDICTABLE choice of RES0 or ERROR.

Attributes

DBGWVR<n>_EL1 is a 64-bit register.

Field descriptions



RESS[14:8], bits [63:57]

Reserved, Sign extended. Hardware and software must treat this field as RES0 if the most significant bit of VA is 0 or RES0, and as RES1 if the most significant bit of VA is 1.

Hardware always ignores the value of these bits and it is IMPLEMENTATION DEFINED whether:

- The bits are hardwired to a copy of the most significant bit of VA, meaning writes to these bits are ignored, and reads to the bits always return the hardwired value.
- The value in those bits can be written, and reads will return the last value written. The value held in those bits is ignored by hardware.

Bits[56:53]
When FEAT_LVA3 is implemented:

VA[56:53], bits [3:0] of bits [56:53]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[7:4], bits [3:0] of bits [56:53]

Extension to RESS[14:8]. For more information, see RESS[14:8].

Bits[52:49]
When FEAT_LVA is implemented:

VA[52:49], bits [3:0] of bits [52:49]

Extension to VA[48:2]. For more information, see VA[48:2].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

RESS[3:0], bits [3:0] of bits [52:49]

Extension to RESS[14:8]. For more information, see RESS[14:8].

VA[48:2], bits [48:2]

Bits[48:2] of the address value for comparison.

When FEAT_LVA3 is implemented, (VA[56:53]:VA[52:49]) forms the upper part of the address value. If FEAT_LVA3 is not implemented, bits VA[56:53] are part of the RESS field.

When FEAT_LVA is implemented, VA[52:49] forms the upper part of the address value. If FEAT_LVA is not implemented, bits [52:49] are part of the RESS field.

Arm deprecates setting DBGWVR<n>_EL1[2] == 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

Accessing DBGWVR<n>_EL1

DBGWVR<n>_EL1 can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x800 + (16 * n)	DBGWVR<n>_EL1	63:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), or !AllowExternalDebugAccess(addrdesc), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDAA32PFR, External Debug Auxiliary Processor Feature Register

The EDAA32PFR characteristics are:

Purpose

Provides information about implemented PE features.

Note

The register mnemonic, EDAA32PFR, is derived from previous definitions of this register that defined this register only when AArch64 was not supported.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

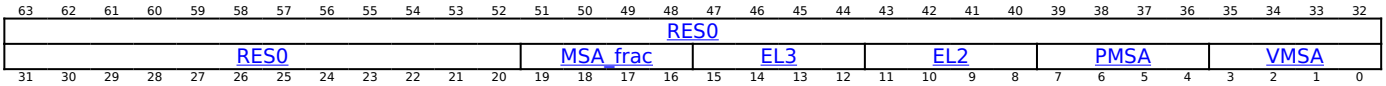
Configuration

There are no configuration notes.

Attributes

EDAA32PFR is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

MSA_frac, bits [19:16]
When EDAA32PFR.PMSA == '0000' and EDAA32PFR.VMSA == '1111':

Memory System Architecture fractional field. This holds the information on additional Memory System Architectures supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MSA_frac	Meaning
0b0001	PMSAv8-64 supported in all translation regimes. VMSAv8-64 not supported.
0b0010	PMSAv8-64 supported in all translation regimes. In addition to PMSAv8-64, stage 1 EL1&0 translation regime also supports VMSAv8-64.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

EL3, bits [15:12]
When EDPFR.EL3 == '0000':

AArch32 EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
0b0000	EL3 is not implemented or can be executed in AArch64 state.
0b0001	EL3 can be executed in AArch32 state only.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

EL2, bits [11:8]
When EDPFR.EL2 == '0000':

AArch32 EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
0b0000	EL2 is not implemented or can be executed in AArch64 state.
0b0001	EL2 can be executed in AArch32 state only.

All other values are reserved.

Note

EDPFR.{EL1, EL0} indicate whether EL1 and EL0 can only be executed in AArch32 state.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

PMSA, bits [7:4]

Indicates support for a 32-bit PMSA.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMSA	Meaning
0b0000	PMSA-32 not supported.
0b0100	PMSAv8-32 supported.

In Armv8-A, the only permitted value is 0b0000. All other values are reserved.

Access to this field is RO.

VMSA, bits [3:0]
When EDAA32PFR.PMSA != '0000':

Indicates support for a VMSA in addition to a 32-bit PMSA.

VMSA	Meaning
0b0000	VMSA not supported.

All other values are reserved.

Access to this field is RO.

When EDAA32PFR.PMSA == '0000':

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMSA	Meaning
0b0000	VMSAv8-64 supported.
0b1111	Memory system architecture described by EDAA32PFR.MSA_frac.

All other values are reserved.

In Armv8-A, the only permitted value is 0b0000.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing EDAA32PFR

EDAA32PFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD60	EDAA32PFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are RO.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are IMPDEF.

2025-12-10 16:11:30, 2025-12_rel

EDACR, External Debug Auxiliary Control Register

The EDACR characteristics are:

Purpose

Allows implementations to support IMPLEMENTATION DEFINED controls.

Configuration

When FEAT_DoPD is implemented, EDACR is in the Core power domain. Otherwise, it is IMPLEMENTATION DEFINED whether EDACR is implemented in the Core power domain or in the Debug power domain.

Implementation of this register is OPTIONAL.

If this register is implemented, EDDEVID.AuxRegs == 0b0001.

If FEAT_DoPD is implemented, any mechanism to preserve control bits in EDACR over power down is optional and IMPLEMENTATION DEFINED.

If FEAT_DoPD is not implemented and EDACR contains any control bits that must be preserved over power down, then these bits must be accessible by the external debug interface when the OS Lock is locked, OSLSR_EL1.OSLK == 1, and when the Core is powered off.

Changing this register from its reset value causes IMPLEMENTATION DEFINED behavior, including possible deviation from the architecturally-defined behavior.

Attributes

EDACR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
IMPLEMENTATION DEFINED																															

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The following resets apply:

- If the register is implemented in the Core power domain:
  - On a Cold reset, this field resets to an architecturally UNKNOWN value.
  - On an External debug reset, the value of this field is unchanged.
  - On a Warm reset, the value of this field is unchanged.
- If the register is implemented in the External debug power domain:
  - On a Cold reset, the value of this field is unchanged.
  - On an External debug reset, this field resets to an architecturally UNKNOWN value.
  - On a Warm reset, the value of this field is unchanged.

Accessing EDACR

EDACR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x094	EDACR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are IMPDEF.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDCIDR0, External Debug Component Identification Register 0

The EDCIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR0 is in the Core power domain. Otherwise, EDCIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Preamble.

Reads as 0x0D.

Access to this field is RO.

Accessing EDCIDR0

EDCIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF0	EDCIDR0

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDCIDR1, External Debug Component Identification Register 1

The EDCIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR1 is in the Core power domain. Otherwise, EDCIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1001	CoreSight component.

Other values are defined by the CoreSight Architecture.

This field reads as 0x9.

Access to this field is RO.

PRMBL_1, bits [3:0]

Preamble.

Reads as 0b0000.

Access to this field is RO.

Accessing EDCIDR1

EDCIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF4	EDCIDR1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDCIDR2, External Debug Component Identification Register 2

The EDCIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR2 is in the Core power domain. Otherwise, EDCIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Preamble.

Reads as 0x05.

Access to this field is RO.

Accessing EDCIDR2

EDCIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFF8	EDCIDR2

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDCIDR3, External Debug Component Identification Register 3

The EDCIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Component Identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDCIDR3 is in the Core power domain. Otherwise, EDCIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble.

Reads as 0xB1.

Access to this field is RO.

Accessing EDCIDR3

EDCIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFFC	EDCIDR3

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDCIDSR, External Debug Context ID Sample Register

The EDCIDSR characteristics are:

Purpose

Contains the sampled value of the Context ID, captured on reading EDPCSR[31:0].

Configuration

EDCIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDCIDSR are RES0.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDCIDSR is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CONTEXTIDR																															

CONTEXTIDR, bits [31:0]

Context ID. The value of CONTEXTIDR that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample is generated:

- If EL1 is using AArch64, then the Context ID is sampled from CONTEXTIDR_EL1.
- If EL1 is using AArch32, then the Context ID is sampled from CONTEXTIDR.
- If EL3 is implemented and is using AArch32, then CONTEXTIDR is a banked register, and EDCIDSR samples the current banked copy of CONTEXTIDR for the Security state that is associated with the most recent EDPCSR sample.

Because the value written to EDCIDSR is an indirect read of CONTEXTIDR, it is CONSTRAINED UNPREDICTABLE whether EDCIDSR is set to the original or new value if EDPCSR samples:

- An instruction that writes to CONTEXTIDR.
- The next Context synchronization event.
- Any instruction executed between these two instructions.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDCIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDCIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A4	EDCIDSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDDEVAFF0, External Debug Device Affinity register 0

The EDDEVAFF0 characteristics are:

Purpose

Copy of the low half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

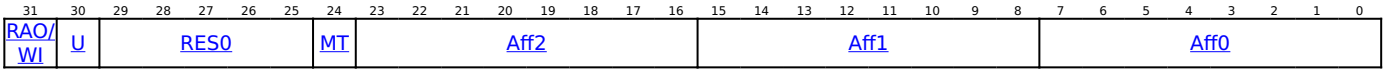
Configuration

When FEAT_DoPD is implemented, EDDEVAFF0 is in the Core power domain. Otherwise, EDDEVAFF0 is in the Debug power domain.

Attributes

EDDEVAFF0 is a 32-bit register.

Field descriptions



Bit [31]

Reserved, RAO/WI.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDDEVAFF0

EDDEVAFF0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFA8	EDDEVAFF0

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDDEVAFF1, External Debug Device Affinity register 1

The EDDEVAFF1 characteristics are:

Purpose

Copy of the high half of the PE MPIDR_EL1 register that allows a debugger to determine which PE in a multiprocessor system the external debug component relates to.

Configuration

When FEAT_DoPD is implemented, EDDEVAFF1 is in the Core power domain. Otherwise, EDDEVAFF1 is in the Debug power domain.

Attributes

EDDEVAFF1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Aff3, bits [7:0]

Affinity level 3. See the description of EDDEVAFF0.Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDDEVAFF1

EDDEVAFF1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFAC	EDDEVAFF1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDDEVARCH, External Debug Device Architecture Register

The EDDEVARCH characteristics are:

Purpose

Identifies the programmers' model architecture of the external debug component.

Configuration

When FEAT_DoPD is implemented, EDDEVARCH is in the Core power domain. Otherwise, EDDEVARCH is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architect of the component. For External Debug, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the EDDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]

Defines the architecture revision. For architectures defined by Arm this is the minor revision.

For debug, the revision defined by Armv8 is 0x0.

All other values are reserved.

Reads as 0b0000.

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHVER	Meaning
0b0110	Armv8 debug architecture.
0b0111	Armv8.1 debug architecture, FEAT_Debugv8p1.
0b1000	Armv8.2 debug architecture, FEAT_Debugv8p2.
0b1001	Armv8.4 debug architecture, FEAT_Debugv8p4.
0b1010	Armv8.8 debug architecture, FEAT_Debugv8p8.
0b1011	Armv8.9 debug architecture, FEAT_Debugv8p9.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHVER is EDDEVARCH.ARCHID[15:12].

FEAT_Debugv8p1 implements the functionality identified by the value 0b0111.

FEAT_Debugv8p2 implements the functionality identified by the value 0b1000.

FEAT_Debugv8p4 implements the functionality identified by the value 0b1001.

FEAT_Debugv8p8 implements the functionality identified by the value 0b1010.

FEAT_Debugv8p9 implements the functionality identified by the value 0b1011.

From Armv8.1, when FEAT_Debugv8p1 is implemented the value 0b0110 is not permitted.

From Armv8.2, the values 0b0110 and 0b0111 are not permitted.

From Armv8.4, the value 0b1000 is not permitted.

From Armv8.8, the value 0b1001 is not permitted.

From Armv8.9, the value 0b1010 is not permitted.

Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

ARCHPART	Meaning
0xA15	Armv8-A debug architecture.

EDDEVARCH.ARCHVER and EDDEVARCH.ARCHPART are also defined as a single field, EDDEVARCH.ARCHID, so that EDDEVARCH.ARCHPART is EDDEVARCH.ARCHID[11:0].

Armv8-A debug architecture.

Access to this field is RO.

Accessing EDDEVARCH

EDDEVARCH can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFBC	EDDEVARCH

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

EDDEVID, External Debug Device ID register 0

The EDDEVID characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

When FEAT_DoPD is implemented, EDDEVID is in the Core power domain. Otherwise, EDDEVID is in the Debug power domain.

Attributes

EDDEVID is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

AuxRegs, bits [27:24]

Indicates support for Auxiliary registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AuxRegs	Meaning
0b0000	None supported.
0b0001	Support for External Debug Auxiliary Control Register, EDACR.

All other values are reserved.

Access to this field is RO.

Bits [23:8]

Reserved, RES0.

DebugPower, bits [7:4]

Indicates support for the FEAT_DoPD feature.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DebugPower	Meaning
0b0000	FEAT_DoPD not implemented. Registers in the external debug interface register map are implemented in a mix of the Debug and Core power domains.
0b0001	FEAT_DoPD implemented. All registers in the external debug interface register map are implemented in the Core power domain.

FEAT_DoPD implements the functionality added by the value 0b0001.

All other values are reserved.

Access to this field is RO.

PCSample, bits [3:0]

Indicates the level of PC Sample-based Profiling support using external debug registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSample	Meaning
0b0000	PC Sample-based Profiling Extension is not implemented in the external debug registers space.
0b0010	Only EDPCSR and EDCIDSR are implemented. This option is only permitted if EL3 and EL2 are not implemented.
0b0011	EDPCSR, EDCIDSR, and EDVIDSR are implemented.

All other values are reserved.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Access to this field is RO.

Accessing EDDEVID

EDDEVID can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC8	EDDEVID

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDDEVID1, External Debug Device ID Register 1

The EDDEVID1 characteristics are:

Purpose

Provides extra information for external debuggers about features of the debug implementation.

Configuration

When FEAT_DoPD is implemented, EDDEVID1 is in the Core power domain. Otherwise, EDDEVID1 is in the Debug power domain.

Attributes

EDDEVID1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

HSR, bits [7:4]

Indicates support for the External Debug Halt Status Register, EDHSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HSR	Meaning
0b0000	EDHSR not implemented, and the PE follows behaviors consistent with all of the EDHSR fields having a zero value.
0b0001	EDHSR implemented.
0b0010	As 0b0001, but extends EDHSR to include the VNCR, CM, and WnR fields.

All other values are reserved.

FEAT_EDHSR implements the functionality identified by the value 0b0001.

FEAT_Debugv8p9 implements the functionality identified by the value 0b0010.

When FEAT_Debugv8p2 is not implemented, the only permitted value is 0b0000.

From Armv8.9, the values 0b0000 and 0b0001 are not permitted.

Access to this field is RO.

PCSROffset, bits [3:0]

Indicates the offset applied to PC samples returned by reads of EDPCSR.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PCSROffset	Meaning
0b0000	EDPCSR not implemented.
0b0010	EDPCSR implemented, and samples have no offset applied and do not sample the instruction set state in AArch32 state.

When FEAT_PCSRv8p2 is implemented, the only permitted value is 0b0000.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors register space, as indicated by the value of PMDEVID.PCSample.

Access to this field is RO.

Accessing EDDEVID1

EDDEVID1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC4	EDDEVID1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDDEVID2, External Debug Device ID register 2

The EDDEVID2 characteristics are:

Purpose

Reserved for future descriptions of features of the debug implementation.

Configuration

When FEAT_DoPD is implemented, EDDEVID2 is in the Core power domain. Otherwise, EDDEVID2 is in the Debug power domain.

Attributes

EDDEVID2 is a 32-bit register.

Field descriptions

Bits [31:0]

Reserved, RES0.

Accessing EDDEVID2

EDDEVID2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFC0	EDDEVID2

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDDEVTYPE, External Debug Device Type register

The EDDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a PE's debug logic.

Configuration

When FEAT_DoPD is implemented, EDDEVTYPE is in the Core power domain. Otherwise, EDDEVTYPE is in the Debug power domain.

Implementation of this register is OPTIONAL.

Attributes

EDDEVTYPE is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Indicates this is a component within a PE.

Reads as 0b0001.

Access to this field is RO.

MAJOR, bits [3:0]

Major type. Indicates this is a debug logic component.

Reads as 0b0101.

Access to this field is RO.

Accessing EDDEVTYPE

EDDEVTYPE can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFCC	EDDEVTYPE

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDDFR, External Debug Feature Register

The EDDFR characteristics are:

Purpose

Provides top-level information about the debug system.

Note

Debuggers must use EDDEVARCH to determine the Debug architecture version.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

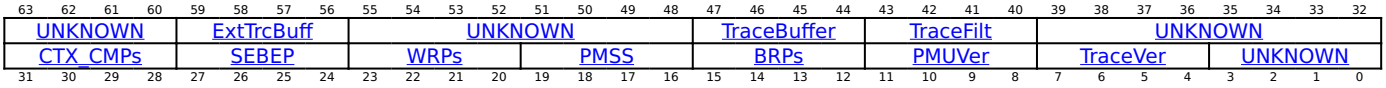
Configuration

There are no configuration notes.

Attributes

EDDFR is a 64-bit register.

Field descriptions



Bits [63:60]

Reserved, UNKNOWN.

ExtTrcBuff, bits [59:56]

Trace Buffer External Mode Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ExtTrcBuff	Meaning
0b0000	Trace Buffer Extension not implemented or Trace Buffer External Mode not implemented.
0b0001	Trace Buffer Extension implemented and Trace Buffer External Mode implemented.

All other values are reserved.

If FEAT_TRBE is not implemented, the only permitted value is 0b0000.

FEAT_TRBE_EXT implements the functionality identified by the value 0b0001.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.ExtTrcBuff.

Access to this field is RO.

Bits [55:48]

Reserved, UNKNOWN.

TraceBuffer, bits [47:44]
When FEAT_TRBE_EXT is implemented:

Trace Buffer Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceBuffer	Meaning
0b0000	Trace Buffer Extension not implemented.
0b0001	Trace Buffer Extension implemented.
0b0010	As 0b0001, and adds: • If EL2 and FEAT_FGT are implemented, a fine-grained trap on the TSB CSYNC instruction. • If EL2 is implemented, an EL2 control to override TRBLIMITR_EL1.nVM. • The TRBE Profiling exception extension, FEAT_TRBE_EXC.

All other values are reserved.

FEAT_TRBE implements the functionality identified by the value 0b0001.

FEAT_TRBEv1p1 implements the functionality identified by the value 0b0010.

In any Armv9 implementation, if FEAT_ETE is implemented, the value 0b0000 is not permitted.

From Armv9.6, if FEAT_TRBE is implemented, the value 0b0001 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, UNKNOWN.

TraceFilt, bits [43:40]

Armv8.4 Self-hosted Trace Extension version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceFilt	Meaning
0b0000	Armv8.4 Self-hosted Trace Extension not implemented.
0b0001	Armv8.4 Self-hosted Trace Extension implemented.

All other values are reserved.

FEAT_TRF implements the functionality identified by the value 0b0001.

From Armv8.4, if FEAT_ETMv4 is implemented, the value 0b0000 is not permitted.

If FEAT_ETE is implemented, the value 0b0000 is not permitted.

Access to this field is RO.

Bits [39:32]

Reserved, UNKNOWN.

CTX_CMPs, bits [31:28]

Number of context-aware breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0b0000..0b1111	The number of context-aware breakpoints, minus 1.

The value of this field is never greater than EDDFR.BRPs.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.CTX_CMPs.

If FEAT_Debugv8p9 is implemented and 16 or more context-aware breakpoints are implemented, then this field reads as 0b1111 and EDDFR1.CTX_CMPs indicates the number of context-aware breakpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

Access to this field is RO.

SEBEP, bits [27:24]

This field either has the same value as ID_AA64DFR0_EL1.SEBEP or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

WRPs, bits [23:20]

Number of watchpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

WRPs	Meaning
0b0001..0b1111	The number of watchpoints, minus 1.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.WRPs.

If FEAT_Debugv8p9 is implemented and 16 or more watchpoints are implemented, then this field reads as 0b1111 and EDDFR1.WRPs indicates the number of watchpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 watchpoints.

The value 0b0000 is reserved.

Access to this field is RO.

PMSS, bits [19:16]

This field either has the same value as ID_AA64DFR0_EL1.PMSS or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

BRPs, bits [15:12]

Number of breakpoints, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BRPs	Meaning
0b0001..0b1111	The number of breakpoints, minus 1.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.BRPs.

If FEAT_Debugv8p9 is implemented and 16 or more breakpoints are implemented, then this field reads as 0b1111 and EDDFR1.BRPs indicates the number of breakpoints.

Note

If AArch32 is supported at EL1, then the PE does not implement more than 16 breakpoints.

The value 0b0000 is reserved.

Access to this field is RO.

PMUVer, bits [11:8]

Performance Monitors Extension version.

This field does not follow the standard ID scheme, but uses the alternative ID scheme described in 'Alternative ID scheme used for the Performance Monitors Extension version'

The value of this field is an IMPLEMENTATION DEFINED choice of:

PMUVer	Meaning
0b0000	Performance Monitors Extension not implemented.
0b0001	Performance Monitors Extension, PMUv3 implemented.
0b0100	PMUv3 for Armv8.1. As 0b0001, and adds support for: • Extended 16-bit PMEVTYPER<n>_EL0.evtCount field. • If EL2 is implemented, the MDCR_EL2.HPMD control.
0b0101	PMUv3 for Armv8.4. As 0b0100, and adds support for the PMMIR_EL1 register.
0b0110	PMUv3 for Armv8.5. As 0b0101, and adds support for: • 64-bit event counters. • If EL2 is implemented, the MDCR_EL2.HCCD control. • If EL3 is implemented, the MDCR_EL3.SCCD control.
0b0111	PMUv3 for Armv8.7. As 0b0110, and adds support for: • The PMCR_EL0.FZO and, if EL2 is implemented, MDCR_EL2.HPMFZO controls. • If EL3 is implemented, the MDCR_EL3.{MPMX,MCCD} controls.
0b1000	PMUv3 for Armv8.8. As 0b0111, and: • Extends the Common event number space to include 0x0040 to 0x00BF and 0x4040 to 0x40BF. • Removes the CONSTRAINED UNPREDICTABLE behaviors if a reserved or unimplemented PMU event number is selected.
0b1001	PMUv3 for Armv8.9. As 0b1000, and: • Updates the definitions of existing PMU events. • Adds support for the PMUSERENR_EL0.UEN control and the PMUACR_EL1 register. • Adds support for the EDECR.PME control.
0b1111	IMPLEMENTATION DEFINED form of performance monitors supported, PMUv3 not supported. Arm does not recommend this value for new implementations.

All other values are reserved.

FEAT_PMUv3 implements the functionality identified by the value 0b0001.

FEAT_PMUv3p1 implements the functionality identified by the value 0b0100.

FEAT_PMUv3p4 implements the functionality identified by the value 0b0101.

FEAT_PMUv3p5 implements the functionality identified by the value 0b0110.

FEAT_PMUv3p7 implements the functionality identified by the value 0b0111.

FEAT_PMUv3p8 implements the functionality identified by the value 0b1000.

FEAT_PMUv3p9 implements the functionality identified by the value 0b1001.

From Armv8.1, if FEAT_PMUv3 is implemented, the value 0b0001 is not permitted.

From Armv8.4, if FEAT_PMUv3 is implemented, the value 0b0100 is not permitted.

From Armv8.5, if FEAT_PMUv3 is implemented, the value 0b0101 is not permitted.

From Armv8.7, if FEAT_PMUv3 is implemented, the value 0b0110 is not permitted.

From Armv8.8, if FEAT_PMUv3 is implemented, the value 0b0111 is not permitted.

From Armv8.9, if FEAT_PMUv3 is implemented, the value 0b1000 is not permitted.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR0_EL1.PMUVer.

Access to this field is RO.

TraceVer, bits [7:4]

Trace support. Indicates whether System register interface to a trace unit is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TraceVer	Meaning
0b0000	Trace unit System registers not implemented.
0b0001	Trace unit System registers implemented.

All other values are reserved.

A value of 0b0000 only indicates that no System register interface to a trace unit is implemented. A trace unit might nevertheless be implemented without a System register interface.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64DFR0_EL1.TraceVer.

Access to this field is RO.

Bits [3:0]

Reserved, UNKNOWN.

Accessing EDDFR

EDDFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD28	EDDFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are RO.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are IMPDEF.

2025-12-10 16:11:30, 2025-12_rel

EDDFR1, External Debug Feature Register 1

The EDDFR1 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

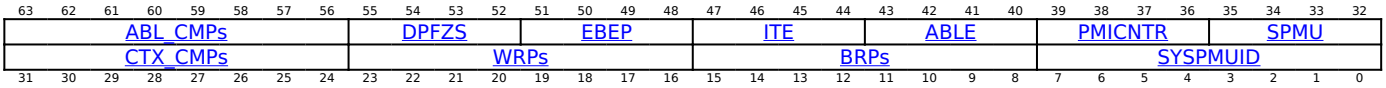
Configuration

There are no configuration notes.

Attributes

EDDFR1 is a 64-bit register.

Field descriptions



ABL_CMPs, bits [63:56]
When FEAT_ABLE is implemented:

Number of breakpoints that support address linking, minus 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABL_CMPs	Meaning
0x00..0x3F	Number of breakpoints that support address linking minus 1.

All other values are reserved.

The number of breakpoints that support address linking is never more than either the number of breakpoints or the number of watchpoints.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.ABL_CMPs.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DPFZS, bits [55:52]

This field either has the same value as ID_AA64DFR1_EL1.DPFZS or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

EBEP, bits [51:48]

This field either has the same value as ID_AA64DFR1_EL1.EBEP or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ITE, bits [47:44]

This field either has the same value as ID_AA64DFR1_EL1.ITE or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ABLE, bits [43:40]

Address Breakpoint Linking Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ABLE	Meaning
0b0000	Address Breakpoint Linking Extension not implemented.
0b0001	Address Breakpoint Linking Extension implemented.

All other values are reserved.

FEAT_BWE implements the address range breakpoints and mismatch breakpoints part of the functionality identified by the value 0b0001.

FEAT_ABLE implements the functionality identified by the value 0b0001.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.ABLE.

Access to this field is RO.

PMICNTR, bits [39:36]

This field either has the same value as ID_AA64DFR1_EL1.PMICNTR or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SPMU, bits [35:32]

This field either has the same value as ID_AA64DFR1_EL1.SPMU or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CTX_CMPs, bits [31:24]

Context-aware breakpoints.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CTX_CMPs	Meaning
0x00	EDDFR.CTX_CMPs is the number of context-aware breakpoints, minus 1.
0x01..0x3F	Number of context-aware breakpoints minus 1.

All other values are reserved.

The value of this field is never greater than EDDFR1.BRPs.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.CTX_CMPs.

Access to this field is RO.

WRPs, bits [23:16]

Watchpoints.

WRPs	Meaning
0x00	EDDFR.WRPs is the number of watchpoints, minus 1.
0x01..0x3F	Number of watchpoints minus 1.

All other values are reserved.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.WRPs.

BRPs, bits [15:8]

Breakpoints.

BRPs	Meaning
0x00	EDDFR.BRPs is the number of breakpoints, minus 1.
0x01..0x3F	Number of breakpoints minus 1.

All other values are reserved.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR1_EL1.BRPs.

SYSPMUID, bits [7:0]

This field either has the same value as ID_AA64DFR1_EL1.SYSPMUID or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDDFR1

EDDFR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD48	EDDFR1

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), and (!IsZero(EDDFR1()) or !OSLockStatus()), accesses to this register are RO.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are IMPDEF.

2025-12-10 16:11:30, 2025-12_rel

EDDFR2, External Debug Feature Register 2

The EDDFR2 characteristics are:

Purpose

Provides top-level information about the debug system in AArch64.

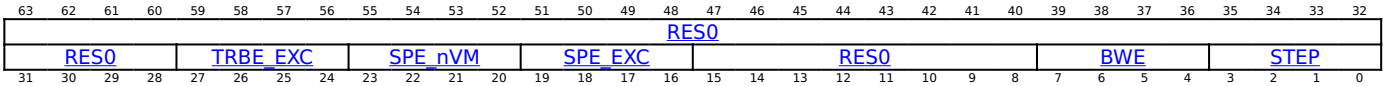
Configuration

There are no configuration notes.

Attributes

EDDFR2 is a 64-bit register.

Field descriptions



Bits [63:28]

Reserved, RES0.

TRBE_EXC, bits [27:24]

This field either has the same value as ID_AA64DFR2_EL1.TRBE_EXC or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SPE_nVM, bits [23:20]

This field either has the same value as ID_AA64DFR2_EL1.SPE_nVM or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SPE_EXC, bits [19:16]

This field either has the same value as ID_AA64DFR2_EL1.SPE_EXC or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [15:8]

Reserved, RES0.

BWE, bits [7:4]

Breakpoints and watchpoint enhancements.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BWE	Meaning
0b0000	This field does not indicate whether DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0001	DBGBCR<n>_EL1.MASK and address mismatch breakpoints are implemented.
0b0010	As 0b0001, and address mismatch watchpoints are implemented.

All other values are reserved.

FEAT_BWE implements the functionality identified by the value 0b0001.

FEAT_BWE2 implements the functionality identified by the value 0b0010.

When this field is 0b0000, ID_AA64DFR1_EL1.ABLE might indicate the presence of support for DBGBCR<n>_EL1.MASK and address mismatch breakpoints.

From Armv9.5, the value 0b0001 is not permitted.

In an implementation that supports AArch64, this field has the same value as ID_AA64DFR2_EL1.BWE.

Access to this field is RO.

STEP, bits [3:0]

This field either has the same value as ID_AA64DFR2_EL1.STEP or reads as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDDFR2

EDDFR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD50	EDDFR2

Accessible as follows:

- When IsCorePowered(), !DoubleLockStatus(), and (!IsZero(EDDFR2()) or !OSLockStatus()), accesses to this register are RO.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are IMPDEF.

2025-12-10 16:11:30, 2025-12_rel

EDECCR, External Debug Exception Catch Control Register

The EDECCR characteristics are:

Purpose

Controls Exception Catch debug events. For more information, see 'Exception Catch debug event'.

Configuration

External register EDECCR bits [31:0] are architecturally mapped to AArch64 System register OSECCR_EL1[31:0].

External register EDECCR bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

EDECCR is in the Core power domain.

Attributes

EDECCR is a 32-bit register.

Field descriptions

Bits [31:23]

Reserved, RES0.

RLR2, bit [22]
When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLE2.

RLR2	Meaning
0b0	If EDECCR.RLE2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2.
0b1	If EDECCR.RLE2 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL2. If EDECCR.RLE2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLR1, bit [21]
When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLE1.

RLR1	Meaning
0b0	If EDECCR.RLE1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1.
0b1	If EDECCR.RLE1 is 0, then Exception Catch debug events are enabled for exception returns to Realm EL1. If EDECCR.RLE1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLR0, bit [20]
When FEAT_RME is implemented:

Controls exception catch on exception return to Realm EL0.

RLR0	Meaning
0b0	Exception Catch debug events are disabled for Realm EL0.
0b1	Exception Catch debug events are enabled for exception returns to Realm EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [19]

Reserved, RES0.

RLE2, bit [18]
When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL2. Also controls exception catch on exception return to Realm EL2 in conjunction with EDECCR.RLR2.

RLE2	Meaning
0b0	If EDECCR.RLR2 is 0, then Exception Catch debug events are disabled for Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL2.
0b1	If EDECCR.RLR2 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL2. If EDECCR.RLR2 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLE1, bit [17]
When FEAT_RME is implemented:

Controls exception catch on exception entry to Realm EL1. Also controls exception catch on exception return to Realm EL1 in conjunction with EDECCR.RLR1.

RLE1	Meaning
0b0	If EDECCR.RLR1 is 0, then Exception Catch debug events are disabled for Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception returns to Realm EL1.
0b1	If EDECCR.RLR1 is 0, then Exception Catch debug events are enabled for exception entry and exception return to Realm EL1. If EDECCR.RLR1 is 1, then Exception Catch debug events are enabled for exception entry to Realm EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RLE0, bit [16]

Access to this field is RES0 .

NSR3, bit [15]

Access to this field is RES0 .

NSR2, bit [14]
When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSE2.

NSR2	Meaning
0b0	If EDECCR.NSE2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2.
0b1	If EDECCR.NSE2 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL2. If EDECCR.NSE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSR1, bit [13]
When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSE1.

NSR1	Meaning
0b0	If EDECCR.NSE1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1.
0b1	If EDECCR.NSE1 is 0, then Exception Catch debug events are enabled for exception returns to Non-secure EL1. If EDECCR.NSE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSR0, bit [12]
When FEAT_Debugv8p2 is implemented and Non-secure EL0 is implemented:

Controls exception catch on exception return to Non-secure EL0.

NSR0	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Non-secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR3, bit [11]
When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception return to EL3 in conjunction with EDECCR.SE3.

SR3	Meaning
0b0	If EDECCR.SE3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3.
0b1	If EDECCR.SE3 is 0, then Exception Catch debug events are enabled for exception returns to EL3. If EDECCR.SE3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR2, bit [10]
When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SE2.

SR2	Meaning
0b0	If EDECCR.SE2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2.
0b1	If EDECCR.SE2 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL2. If EDECCR.SE2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR1, bit [9]
When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SE1.

SR1	Meaning
0b0	If EDECCR.SE1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1.
0b1	If EDECCR.SE1 is 0, then Exception Catch debug events are enabled for exception returns to Secure EL1. If EDECCR.SE1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SR0, bit [8]
When FEAT_Debugv8p2 is implemented and Secure EL0 is implemented:

Controls exception catch on exception return to Secure EL0.

SR0	Meaning
0b0	Exception Catch debug events are disabled for Secure EL0.
0b1	Exception Catch debug events are enabled for exception returns to Secure EL0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE3, bit [7]

Access to this field is RES0 .

NSE2, bit [6]
When FEAT_Debugv8p2 is implemented and Non-secure EL2 is implemented:

Controls exception catch on exception entry to Non-secure EL2. Also controls exception catch on exception return to Non-secure EL2 in conjunction with EDECCR.NSR2.

NSE2	Meaning
0b0	If EDECCR.NSR2 is 0, then Exception Catch debug events are disabled for Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL2.
0b1	If EDECCR.NSR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL2. If EDECCR.NSR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When Non-secure EL2 is implemented:

Coarse-grained exception catch for Non-secure EL2. Controls Exception Catch debug events for Non-secure EL2.

NSE2	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL2.
0b1	Exception Catch debug events are enabled for Non-secure EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE1, bit [5]
When FEAT_Debugv8p2 is implemented and Non-secure EL1 is implemented:

Controls exception catch on exception entry to Non-secure EL1. Also controls exception catch on exception return to Non-secure EL1 in conjunction with EDECCR.NSR1.

NSE1	Meaning
0b0	If EDECCR.NSR1 is 0, then Exception Catch debug events are disabled for Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception returns to Non-secure EL1.
0b1	If EDECCR.NSR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Non-secure EL1. If EDECCR.NSR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Non-secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When Non-secure EL1 is implemented:

Coarse-grained exception catch for Non-secure EL1. Controls Exception Catch debug events for Non-secure EL1.

NSE1	Meaning
0b0	Exception Catch debug events are disabled for Non-secure EL1.
0b1	Exception Catch debug events are enabled for Non-secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NSE0, bit [4]

Access to this field is RES0 .

SE3, bit [3]
When FEAT_Debugv8p2 is implemented and EL3 is implemented:

Controls exception catch on exception entry to EL3. Also controls exception catch on exception return to EL3 in conjunction with EDECCR.SR3.

SE3	Meaning
0b0	If EDECCR.SR3 is 0, then Exception Catch debug events are disabled for EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception returns to EL3.
0b1	If EDECCR.SR3 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to EL3. If EDECCR.SR3 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to EL3.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When FEAT_Debugv8p2 is not implemented and EL3 is implemented:

Coarse-grained exception catch for EL3. Controls Exception Catch debug events for EL3.

SE3	Meaning
0b0	Exception Catch debug events are disabled for EL3.
0b1	Exception Catch debug events are enabled for EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SE2, bit [2]
When FEAT_Debugv8p2 is implemented and FEAT_SEL2 is implemented:

Controls exception catch on exception entry to Secure EL2. Also controls exception catch on exception return to Secure EL2 in conjunction with EDECCR.SR2.

SE2	Meaning
0b0	If EDECCR.SR2 is 0, then Exception Catch debug events are disabled for Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL2.
0b1	If EDECCR.SR2 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL2. If EDECCR.SR2 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL2.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SE1, bit [1]
When FEAT_Debugv8p2 is implemented and Secure EL1 is implemented:

Controls exception catch on exception entry to Secure EL1. Also controls exception catch on exception return to Secure EL1 in conjunction with EDECCR.SR1.

SE1	Meaning
0b0	If EDECCR.SR1 is 0, then Exception Catch debug events are disabled for Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception returns to Secure EL1.
0b1	If EDECCR.SR1 is 0, then Exception Catch debug events are enabled for exception entry, reset entry, and exception return to Secure EL1. If EDECCR.SR1 is 1, then Exception Catch debug events are enabled for exception entry and reset entry to Secure EL1.

Note

It is IMPLEMENTATION DEFINED whether a reset entry to an Exception level will generate an Exception Catch debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

When Secure EL1 is implemented:

Coarse-grained exception catch for Secure EL1. Controls Exception Catch debug events for Secure EL1.

SE1	Meaning
0b0	Exception Catch debug events are disabled for Secure EL1.
0b1	Exception Catch debug events are enabled for Secure EL1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SE0, bit [0]

Access to this field is RES0 .

Accessing EDECCR

EDECCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x098	EDECCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDECR, External Debug Execution Control Register

The EDECR characteristics are:

Purpose

Controls Halting debug events.

Configuration

When FEAT_DoPD is implemented, EDECR is in the Core power domain. Otherwise, EDECR is in the Debug power domain.

Attributes

EDECR is a 32-bit register.

Field descriptions

Bits [31:7]

Reserved, RES0.

TRBE, bit [6]
When FEAT_Debugv8p9 is implemented and FEAT_TRBE_EXT is implemented:

Trace Buffer External Debug Request Enable.

TRBE	Meaning
0b0	Trace Buffer External Debug Request disabled.
0b1	Trace Buffer External Debug Request enabled.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TRCE, bit [5]
When FEAT_ETEv1p3 is implemented and FEAT_Debugv8p9 is implemented:

ETE External Debug Request Enable.

TRCE	Meaning
0b0	ETE External Debug Request disabled.
0b1	ETE External Debug Request enabled.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

PME, bit [4]
When FEAT_Debugv8p9 is implemented and FEAT_PMUv3p9 is implemented:

PMU Overflow External Debug Request Enable.

PME	Meaning
0b0	PMU Overflow External Debug Request disabled.
0b1	PMU Overflow External Debug Request enabled.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [3]

Reserved, RES0.

SS, bit [2]

Halting step enable. Possible values of this field are:

SS	Meaning
0b0	Halting step debug event disabled.
0b1	Halting step debug event enabled.

If the value of EDECR.SS is changed when the PE is in Non-debug state, behavior is CONSTRAINED UNPREDICTABLE as described in 'Changing the value of EDECR.SS when not in Debug state'.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to '0'.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to '0'.

RCE, bit [1]
When FEAT_DoPD is not implemented:

Reset Catch Enable.

RCE	Meaning
0b0	Reset Catch debug event disabled.
0b1	Reset Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

OSUCE, bit [0]
When FEAT_DoPD is not implemented:

OS Unlock Catch Enable.

OSUCE	Meaning
0b0	OS Unlock Catch debug event disabled.
0b1	OS Unlock Catch debug event enabled.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Accessing EDECR

EDECR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x024	EDECR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDESR, External Debug Event Status Register

The EDESR characteristics are:

Purpose

Indicates the status of internally pending Halting debug events.

Configuration

EDESR is in the Core power domain.

Attributes

EDESR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

EC, bit [3]
When FEAT_Debugv8p8 is implemented:

Exception Catch debug event pending.

EC	Meaning
0b0	Exception Catch debug event is not pending.
0b1	Exception Catch debug event is pending.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

SS, bit [2]
When FEAT_DoPD is implemented:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Halting step debug event pending. Possible values of this field are:

SS	Meaning
0b0	Reading this means that a Halting step debug event is not pending. Writing this means no action.
0b1	Reading this means that a Halting step debug event is pending. Writing this clears the pending Halting step debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to the value in EDECR.SS.

RC, bit [1]

Reset Catch debug event pending. Possible values of this field are:

RC	Meaning
0b0	Reading this means that a Reset Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that a Reset Catch debug event is pending. Writing this clears the pending Reset Catch debug event.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_DoPD is implemented, this field resets to the value in CTIDEVCTL.RCE.
  - When FEAT_DoPD is not implemented, this field resets to the value in EDECR.RCE.

OSUC, bit [0]

OS Unlock Catch debug event pending. Possible values of this field are:

OSUC	Meaning
0b0	Reading this means that an OS Unlock Catch debug event is not pending. Writing this means no action.
0b1	Reading this means that an OS Unlock Catch debug event is pending. Writing this clears the pending OS Unlock Catch debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing EDESR

If a request to clear a pending Halting debug event is received at or about the time when halting becomes allowed, it is CONSTRAINED UNPREDICTABLE whether the event is taken.

If Core power is removed while a Halting debug event is pending, it is lost. However, it might become pending again when the Core is powered back on and Cold reset.

EDESR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x020	EDESR

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDHSR, External Debug Halting Syndrome Register

The EDHSR characteristics are:

Purpose

Holds syndrome information for a debug event.

Configuration

EDHSR is in the Core power domain.

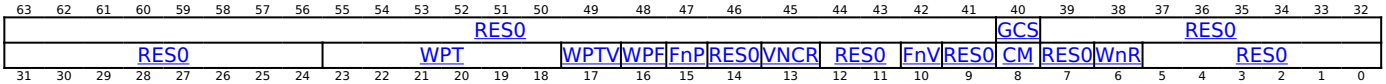
This register is present only when FEAT_EDHSR is implemented. Otherwise, direct accesses to EDHSR are RES0.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if EDSCR.STATUS is not 0b101011.

Attributes

EDHSR is a 64-bit register.

Field descriptions



Bits [63:41]

Reserved, RES0.

GCS, bit [40]
When FEAT_GCS is implemented and FEAT_Debugv8p9 is implemented:

Guarded control stack data access.

Indicates that the Watchpoint debug event is due to a Guarded control stack data access.

GCS	Meaning
0b0	The Watchpoint debug event is not due to a Guarded control stack data access.
0b1	The Watchpoint debug event is due to a Guarded control stack data access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:24]

Reserved, RES0.

WPT, bits [23:18]

Watchpoint number. When EDHSR.WPTV is 1, holds the index of a watchpoint that triggered the Watchpoint debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WPTV, bit [17]

Watchpoint number valid.

WPTV	Meaning	Applies when
0b0	EDHSR.WPT field is not valid, and holds an UNKNOWN value.	When FEAT_Debugv8p9 is not implemented
0b1	EDHSR.WPT field is valid, and holds the number of a watchpoint that triggered the Watchpoint debug event.	

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

WPF, bit [16]

Watchpoint might be false-positive.

WPF	Meaning	Applies when
0b0	The watchpoint matched an address or address range that was accessed by the instruction.	
0b1	The watchpoint matched an address or address range that might not have been accessed by the instruction.	When FEAT_SVE is implemented or FEAT_SME is implemented

Arm strongly recommends that this bit is set to 0, other than when one of the following instructions might generate a watchpoint match for an address or address range that the instruction does not access:

- An SVE contiguous vector load/store instruction, when the PE is in Streaming SVE mode.
- An SME load/store instruction.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FnP, bit [15]

EDWAR not Precise.

FnP	Meaning	Applies when
0b0	If the EDWAR is valid, it holds the virtual address of an access or sequence of contiguous accesses that triggered the Watchpoint debug event.	
0b1	If the EDWAR is valid, it holds any virtual address within the smallest implemented translation granule that contains the virtual address of an access or set of contiguous accesses that triggered the Watchpoint debug event.	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [14]

Reserved, RES0.

VNCR, bit [13]
When FEAT_Debugv8p9 is implemented:

VNCR_EL2 access. Indicates that the Watchpoint debug event came from use of VNCR_EL2 register by EL1 code.

VNCR	Meaning	Applies when
0b0	The Watchpoint debug event was not generated by the use of VNCR_EL2 by EL1 code.	
0b1	The Watchpoint debug event was generated by the use of VNCR_EL2 by EL1 code.	When FEAT_NV2 is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [12:11]

Reserved, RES0.

FnV, bit [10]

EDWAR not Valid.

FnV	Meaning	Applies when
0b0	EDWAR is valid.	
0b1	EDWAR is not valid, and holds an UNKNOWN value.	When FEAT_SME is implemented or FEAT_SVE is implemented

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

CM, bit [8]
When FEAT_Debugv8p9 is implemented:

Cache maintenance. Indicates whether the Watchpoint debug event came from a cache maintenance instruction.

CM	Meaning
0b0	The Watchpoint debug event was not generated by the execution of one of the System instructions identified in the description of value 1.
0b1	The Watchpoint debug event was generated by the execution of a cache maintenance instruction. The DC ZVA, DC GVA, and DC GZVA instructions are not cache maintenance instructions, and therefore do not cause this field to be set to 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [7]

Reserved, RES0.

WnR, bit [6]
When FEAT_Debugv8p9 is implemented:

Write not Read. Indicates whether the Watchpoint debug event was caused by an instruction writing to a memory location, or by an instruction reading from a memory location.

WnR	Meaning
0b0	Watchpoint debug event caused by an instruction reading from a memory location.
0b1	Watchpoint debug event caused by an instruction writing to a memory location.

For Watchpoint debug events on cache maintenance instructions, this field is set to 1.

For Watchpoint debug events from an atomic instruction, this field is set to 0 if a read of the location would have generated the Watchpoint debug event, otherwise it is set to 1.

If multiple watchpoints match on the same access, it is UNPREDICTABLE which watchpoint generates the Watchpoint debug event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:0]

Reserved, RES0.

Accessing EDHSR

EDHSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x038	EDHSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDITCTRL, External Debug Integration mode Control register

The EDITCTRL characteristics are:

Purpose

Enables the external debug to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the PE, for integration testing or topology detection.

Configuration

The power domain of EDITCTRL is IMPLEMENTATION DEFINED.

Implementation of this register is OPTIONAL.

Attributes

EDITCTRL is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection.

IME	Meaning
0b0	Normal operation.
0b1	Integration mode enabled.

The integration mode behavior is IMPLEMENTATION DEFINED.

The following resets apply:

- Whichever power domain the register is implemented in, this field resets to 0.
- Otherwise, the value of this field is unchanged.

Accessing EDITCTRL

EDITCTRL can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xF00	EDITCTRL

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register are IMPDEF.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDITR, External Debug Instruction Transfer Register

The EDITR characteristics are:

Purpose

Used in Debug state for passing instructions to the PE for execution.

Configuration

EDITR is in the Core power domain.

Attributes

EDITR is a 32-bit register.

Field descriptions

When FEAT_AA32 is implemented and in AArch32 state:

hw2, bits [31:16]

Second halfword of the T32 instruction to be executed on the PE. When EDITR contains a 16-bit T32 instruction, this field is ignored. For more information, see 'Behavior in Debug state'.

Note

The hw2 field is displayed on the left. This is not the usual convention for display of T32 instruction halfwords.

hw1, bits [15:0]

First halfword of the T32 instruction to be executed on the PE.

Note

The hw1 field is displayed on the right. This is not the usual convention for display of T32 instruction halfwords.

When FEAT_AA64 is implemented and in AArch64 state:

A64_Instruction, bits [31:0]

A64 instruction to be executed on the PE.

Accessing EDITR

If EDSCR.ITE == 0 when the PE exits Debug state on receiving a Restart request trigger event, the behavior of any instruction issued through the ITR in Normal access mode that has not completed execution is CONSTRAINED UNPREDICTABLE, and must do one of the following:

- It must complete execution in Debug state before the PE executes the restart sequence.
- It must complete execution in Non-debug state before the PE executes the restart sequence.
- It must be abandoned. This means that the instruction does not execute. Any registers or memory accessed by the instruction are left in an UNKNOWN state.

EDITR ignores writes if the PE is in Non-debug state.

EDITR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x084	EDITR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

EDLAR, External Debug Lock Access Register

The EDLAR characteristics are:

Purpose

Allows or disallows access to the external debug registers through a memory-mapped interface.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

When FEAT_DoPD is implemented, EDLAR is in the Core power domain. Otherwise, EDLAR is in the Debug power domain.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLAR is a 32-bit register.

Field descriptions

When Debug Software Lock is implemented:

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Otherwise:

Otherwise

Bits [31:0]

Reserved, RES0.

Accessing EDLAR

EDLAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	0xFB0	EDLAR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

EDLSR, External Debug Lock Status Register

The EDLSR characteristics are:

Purpose

Indicates the current status of the software lock for external debug registers.

The optional Software Lock provides a lock to prevent memory-mapped writes to the debug registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the debug registers. It does not, and cannot, prevent all accidental or malicious damage.

Configuration

When FEAT_DoPD is implemented, EDLSR is in the Core power domain. Otherwise, EDLSR is in the Debug power domain.

If FEAT_DoPD is implemented, Software Lock is not implemented by the architecturally-defined debug components of the PE.

Software uses EDLAR to set or clear the lock, and EDLSR to check the current status of the lock.

Attributes

EDLSR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

nTT, bit [2]

Not thirty-two bit access required. RAZ.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLK, bit [1]
When Debug Software Lock is implemented:

Software Lock status for this component. For an access to LSR that is not a memory-mapped access, or when Software Lock is not implemented, this field is RES0.

For memory-mapped accesses when Software Lock is implemented, possible values of this field are:

SLK	Meaning
0b0	Lock clear. Writes are permitted to this component's registers.
0b1	Lock set. Writes to this component's registers are ignored, and reads have no side effects.

The reset behavior of this field is:

- On a Cold reset, when FEAT_DoPD is implemented, this field resets to '1'.
- On an External debug reset, when FEAT_DoPD is not implemented, this field resets to '1'.

Otherwise:

Reserved, RAZ.

SLI, bit [0]

Software Lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SLI	Meaning
0b0	Software Lock not implemented or not memory-mapped access.
0b1	Software Lock implemented and memory-mapped access.

Access to this field is RO.

Accessing EDLSR

EDLSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
Debug	0xFB4	EDLSR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDPCSR, External Debug Program Counter Sample Register

The EDPCSR characteristics are:

Purpose

Holds a sampled instruction address value.

Configuration

EDPCSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDPCSR are RES0.

If FEAT_Debugv8p1 is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Note

FEAT_PCSRv8p2 implements the PC Sample-based Profiling Extension in the Performance Monitors registers space.

Attributes

EDPCSR is a 64-bit register.

Field descriptions

When FEAT_Debugv8p1 is not implemented or EDSCR.SC2 == '0':

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
EDPCSRhi																															
EDPCSRlo																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EDPCSRhi, bits [63:32]

PC Sample high word, EDPCSRhi. If EDVIDSR.HV == 0, then this field is RAZ, otherwise bits [63:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EDPCSRlo, bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

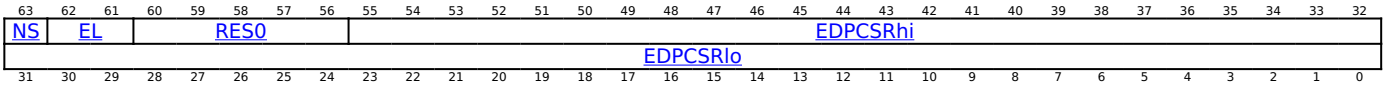
Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDVIDSR.{NS,E2,E3}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When FEAT_Debugv8p1 is implemented and EDSCR.SC2 == '1':



NS, bit [63]

Non-secure state sample. Indicates the Security state that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EL, bits [62:61]

Exception level status sample. Indicates the Exception level that is associated with the most recent EDPCSR sample or, when it is read as a single atomic 64-bit read, the current EDPCSR sample. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

EL	Meaning
0b00	Sample is from EL0.
0b01	Sample is from EL1.
0b10	Sample is from EL2.
0b11	Sample is from EL3.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [60:56]

Reserved, RES0.

EDPCSRhi, bits [55:32]

PC Sample high word, EDPCSRhi. Bits [55:32] of the sampled instruction address value. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

EDPCSRlo, bits [31:0]

PC Sample low word. EDPCSRlo, bits[31:0] of the sampled instruction address value.

EDPCSRlo reads as 0xFFFFFFFF when any of the following are true:

- The PE is in Debug state.
- PC Sample-based profiling is prohibited.

If a branch instruction has retired since the PE left reset state, then the first read of EDPCSR[31:0] is permitted but not required to return 0xFFFFFFFF.

EDPCSRlo reads as an UNKNOWN value when any of the following are true:

- The PE is in reset state.
- No branch instruction has retired since the PE left reset state, Debug state, or a state where PC Sample-based Profiling is prohibited.
- No branch instruction has retired since the last read of EDPCSR[31:0].

For the cases where a read of EDPCSR[31:0] returns 0xFFFFFFFF or an UNKNOWN value, the read has the side-effect of setting EDPCSRhi, EDCIDSR, and EDVIDSR to UNKNOWN values.

Otherwise, a read of EDPCSR[31:0] returns bits [31:0] of the sampled instruction address value and has the side-effect of indirectly writing to EDPCSRhi, EDCIDSR, and EDVIDSR. The translation regime that EDPCSR samples can be determined from EDPCSR.{NS,EL}.

For a read of EDPCSR[31:0] from the memory-mapped interface, if EDLSR.SLK == 1, meaning the OPTIONAL Software Lock is locked, then the side-effect of the access does not occur and EDPCSRhi, EDCIDSR, and EDVIDSR are unchanged.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDPCSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'

EDPCSR[63:32] and EDPCSR[31:0] are accessed at 32-bit memory mapped addresses that are not contiguous.

EDPCSR can be accessed through the external debug interface:

Component	Offset	Instance	Range
Debug	0x0A0	EDPCSR	31:0

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

Component	Offset	Instance	Range
Debug	0x0AC	EDPCSR	63:32

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDPFR, External Debug Processor Feature Register

The EDPFR characteristics are:

Purpose

Provides information about implemented PE features.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

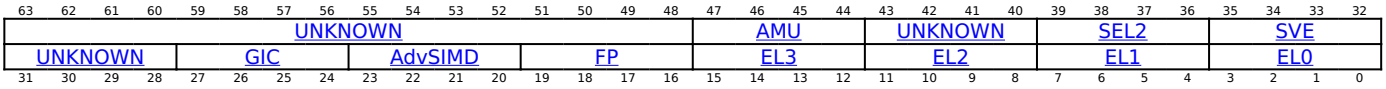
Configuration

There are no configuration notes.

Attributes

EDPFR is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, UNKNOWN.

AMU, bits [47:44]

Indicates support for Activity Monitors Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AMU	Meaning
0b0000	Activity Monitors Extension is not implemented.
0b0001	FEAT_AMUv1 is implemented.
0b0010	FEAT_AMUv1p1 is implemented. As 0b0001 and adds support for virtualization of the activity monitor event counters.

All other values are reserved.

FEAT_AMUv1 implements the functionality identified by the value 0b0001.

FEAT_AMUv1p1 implements the functionality identified by the value 0b0010.

In Armv8.0, the only permitted value is 0b0000.

In Armv8.4, the permitted values are 0b0000 and 0b0001.

From Armv8.6, the permitted values are 0b0000, 0b0001, and 0b0010.

Access to this field is RO.

Bits [43:40]

Reserved, UNKNOWN.

SEL2, bits [39:36]

Secure EL2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEL2	Meaning
0b0000	Secure EL2 is not implemented.
0b0001	Secure EL2 is implemented.

FEAT_SEL2 implements the functionality identified by the value 0b0001

All other values are reserved.

Access to this field is RO.

SVE, bits [35:32]

Scalable Vector Extension.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVE	Meaning
0b0000	SVE is not implemented.
0b0001	SVE is implemented.

FEAT_SVE implements the functionality identified by the value 0b0001.

All other values are reserved.

Access to this field is RO.

Bits [31:28]

Reserved, UNKNOWN.

GIC, bits [27:24]

System register GIC interface support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

GIC	Meaning
0b0000	GIC CPU interface system registers not implemented.
0b0001	System register interface to versions 3.0 and 4.0 of the GIC CPU interface is supported.
0b0011	System register interface to version 4.1 of the GIC CPU interface is supported.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.GIC.

Access to this field is RO.

AdvSIMD, bits [23:20]

Advanced SIMD.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AdvSIMD	Meaning
0b0000	Advanced SIMD is implemented, including support for the following SISD and SIMD operations: • Integer byte, halfword, word and doubleword element operations. • Single-precision and double-precision floating-point arithmetic. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Advanced SIMD is not implemented.

All other values are reserved.

This field must have the same value as the FP field.

The permitted values are:

- 0b0000 in an implementation with Advanced SIMD support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with Advanced SIMD support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without Advanced SIMD support.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.AdvSIMD.

Access to this field is RO.

FP, bits [19:16]

Floating-point.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FP	Meaning
0b0000	Floating-point is implemented, and includes support for: • Single-precision and double-precision floating-point types. • Conversions between single-precision and half-precision data types, and double-precision and half-precision data types.
0b0001	As for 0b0000, and also includes support for half-precision floating-point arithmetic.
0b1111	Floating-point is not implemented.

All other values are reserved.

This field must have the same value as the AdvSIMD field.

The permitted values are:

- 0b0000 in an implementation with floating-point support, that does not include the FEAT_FP16 extension.
- 0b0001 in an implementation with floating-point support, that includes the FEAT_FP16 extension.
- 0b1111 in an implementation without floating-point support.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.FP.

Access to this field is RO.

EL3, bits [15:12]

AArch64 EL3 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL3	Meaning
0b0000	EL3 is not implemented or cannot be executed in AArch64 state.
0b0001	EL3 can be executed in AArch64 state only.
0b0010	EL3 can be executed in both Execution states.

When the value of EDAA32PFR.EL3 is nonzero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL3.

Access to this field is RO.

EL2, bits [11:8]

AArch64 EL2 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL2	Meaning
0b0000	EL2 is not implemented or cannot be executed in AArch64 state.
0b0001	EL2 can be executed in AArch64 state only.
0b0010	EL2 can be executed in both Execution states.

When the value of EDAA32PFR.EL2 is nonzero, this field must be 0b0000.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL2.

Access to this field is RO.

EL1, bits [7:4]

AArch64 EL1 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL1	Meaning
0b0000	EL1 cannot be executed in AArch64 state. EL1 can be executed in AArch32 state only.
0b0001	EL1 can be executed in AArch64 state only.
0b0010	EL1 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL1.

Access to this field is RO.

EL0, bits [3:0]

AArch64 EL0 Exception level handling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EL0	Meaning
0b0000	EL0 cannot be executed in AArch64 state. EL0 can be executed in AArch32 state only.
0b0001	EL0 can be executed in AArch64 state only.
0b0010	EL0 can be executed in both Execution states.

All other values are reserved.

In an Armv8-A implementation that supports AArch64, this field returns the value of ID_AA64PFR0_EL1.EL0.

Access to this field is RO.

Accessing EDPFR

EDPFR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD20	EDPFR

Accessible as follows:

- When IsCorePowered() and !DoubleLockStatus(), accesses to this register are RO.
- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are IMPDEF.

2025-12-10 16:11:30, 2025-12_rel

EDPIDR0, External Debug Peripheral Identification Register 0

The EDPIDR0 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR0 is in the Core power domain. Otherwise, EDPIDR0 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - EDPIDR1.PART_1 contains part number bits [11:8].
  - EDPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - EDPIDR1.PART_1 contains part number bits [15:12].
  - EDPIDR0.PART_0 contains part number bits [11:4].
  - EDPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, EDPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR0

EDPIDR0 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE0	EDPIDR0

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDPIDR1, External Debug Peripheral Identification Register 1

The EDPIDR1 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR1 is in the Core power domain. Otherwise, EDPIDR1 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- EDPIDR1.DES_0: JEP106 identification code bits[3:0].
- EDPIDR2.DES_1: JEP106 identification code bits[6:4].
- EDPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - EDPIDR1.PART_1 contains part number bits [11:8].
  - EDPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - EDPIDR1.PART_1 contains part number bits [15:12].
  - EDPIDR0.PART_0 contains part number bits [11:4].
  - EDPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, EDPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR1

EDPIDR1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE4	EDPIDR1

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDPIDR2, External Debug Peripheral Identification Register 2

The EDPIDR2 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR2 is in the Core power domain. Otherwise, EDPIDR2 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- EDPIDR2.REVISION indicates the 4-bit revision number.
- EDPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- EDPIDR2.REVISION indicates the 4-bit major revision number.
- EDPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- EDPIDR2.REVISION contains part number bits [3:0].
- EDPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- EDPIDR1.DES_0: JEP106 identification code bits[3:0].
- EDPIDR2.DES_1: JEP106 identification code bits[6:4].
- EDPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR2

EDPIDR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFE8	EDPIDR2

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDPIDR3, External Debug Peripheral Identification Register 3

The EDPIDR3 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR3 is in the Core power domain. Otherwise, EDPIDR3 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- EDPIDR2.REVISION indicates the 4-bit revision number.
- EDPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- EDPIDR2.REVISION indicates the 4-bit major revision number.
- EDPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- EDPIDR2.REVISION contains part number bits [3:0].
- EDPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

EDPIDR3.CMOD might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component

modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

EDPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR3

EDPIDR3 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFEC	EDPIDR3

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDPIDR4, External Debug Peripheral Identification Register 4

The EDPIDR4 characteristics are:

Purpose

Provides information to identify an external debug component.

For more information, see 'About the Peripheral identification scheme'.

Configuration

When FEAT_DoPD is implemented, EDPIDR4 is in the Core power domain. Otherwise, EDPIDR4 is in the Debug power domain.

Implementation of this register is OPTIONAL.

This register is required for CoreSight compliance.

Attributes

EDPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]

Size of the component. Log_2 of the number of 4KB pages from the start of the component to the end of the component ID registers.

Reads as 0b0000.

Access to this field is RO.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- EDPIDR1.DES_0: JEP106 identification code bits[3:0].
- EDPIDR2.DES_1: JEP106 identification code bits[6:4].
- EDPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing EDPIDR4

EDPIDR4 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xFD0	EDPIDR4

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDPRCR, External Debug Power/Reset Control Register

The EDPRCR characteristics are:

Purpose

Controls the PE functionality related to powerup, reset, and powerdown.

Configuration

External register EDPRCR bit [0] is architecturally mapped to AArch64 System register DBGPRCR_EL1[0].

External register EDPRCR bit [0] is architecturally mapped to AArch32 System register DBGPRCR[0].

When FEAT_DoPD is implemented, EDPRCR is in the Core power domain. Otherwise, EDPRCR contains fields that are in the Core power domain and fields that are in the Debug power domain.

Attributes

EDPRCR is a 32-bit register.

Field descriptions

When FEAT_DoPD is implemented:

Bits [31:2]

Reserved, RES0.

CWRR, bit [1]
When FEAT_RME is implemented:

Access to this field is RAZ/WI.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if any the following are true:
  - OSLockStatus().
  - SoftwareLockStatus(addrdesc).
- Access to this field is RAZ/WI if all the following are true:
  - !ExternalSecureInvasiveDebugEnabled().
  - FEAT_Secure is implemented.

- Access to this field is RAZ/WI if all the following are true:
  - !ExternalInvasiveDebugEnabled().
  - FEAT_Secure is not implemented.
- Otherwise, access to this field is WO/RAZ.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the Cold reset value on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

On a Cold reset, if the powerup request is implemented and the powerup request has been asserted, this field is an IMPLEMENTATION DEFINED choice of 0 or 1. If the powerup request is not asserted, this field is set to 0.

Accessing this field has the following behavior:

- When OSLockStatus(), access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Bits [31:4]

Reserved, RES0.

COREPURQ, bit [3]

Core powerup request. Allows a debugger to request that the power controller power up the core, enabling access to the debug register in the Core power domain, and that the power controller emulates powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

COREPURQ	Meaning
0b0	Do not request power up of the Core power domain.
0b1	Request power up of the Core power domain, and emulation of powerdown.

In an implementation that includes the recommended external debug interface, this bit drives the DBGPWRUPREQ signal.

This field is in the Debug power domain and can be read and written when the Core power domain is powered off.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On an External debug reset, this field resets to '0'.

Accessing this field has the following behavior:

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RW.

Bit [2]

Reserved, RES0.

CWRR, bit [1]
When FEAT_RME is implemented:

Access to this field is RAZ/WI.

Otherwise:

Warm reset request.

The extent of the reset is IMPLEMENTATION DEFINED, but must be one of:

- The request is ignored.
- Only this PE is Warm reset.
- This PE and other components of the system, possibly including other PEs, are Warm reset.

Arm deprecates use of this bit, and recommends that implementations ignore the request.

CWRR	Meaning
0b0	No action.
0b1	Request Warm reset.

This field is in the Core power domain

In an implementation that includes the recommended external debug interface, this bit drives the DBGRSTREQ signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if any the following are true:
  - !IsCorePowered().
  - DoubleLockStatus().
  - OSLockStatus().
  - SoftwareLockStatus(addrdesc).
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_Secure is implemented.
  - !ExternalSecureInvasiveDebugEnabled().
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_Secure is not implemented.
  - !ExternalInvasiveDebugEnabled().
- Otherwise, access to this field is WO/RAZ.

CORENPDRQ, bit [0]

Core no powerdown request. Requests emulation of powerdown.

This request is typically passed to an external power controller. This means that whether a request causes power up is dependent on the IMPLEMENTATION DEFINED nature of the system. The power controller must not allow the Core power domain to switch off while this bit is 1.

CORENPDRQ	Meaning
0b0	If the system responds to a powerdown request, it powers down Core power domain.
0b1	If the system responds to a powerdown request, it does not powerdown the Core power domain, but instead emulates a powerdown of that domain.

When this bit reads as UNKNOWN, the PE ignores writes to this bit.

This field is in the Core power domain, and permitted accesses to this field map to the DBGPRCR.CORENPDRQ and DBGPRCR_EL1.CORENPDRQ fields.

In an implementation that includes the recommended external debug interface, this bit drives the DBGNOPWRDWN signal.

It is IMPLEMENTATION DEFINED whether this bit is reset to the value of EDPRCR.COREPURQ on exit from an IMPLEMENTATION DEFINED software-visible retention state. For more information about retention states, see 'Core power domain power states'.

Note

Writes to this bit are not prohibited by the IMPLEMENTATION DEFINED authentication interface. This means that a debugger can request emulation of powerdown regardless of whether invasive debug is permitted.

The reset behavior of this field is:

- On a Cold reset, this field resets to the value in EDPRCR.COREPURQ.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - !IsCorePowered().
  - DoubleLockStatus().
  - OSLockStatus().
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RW.

Accessing EDPRCR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

EDPRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x310	EDPRCR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDPRSR, External Debug Processor Status Register

The EDPRSR characteristics are:

Purpose

Holds information about the reset and powerdown state of the PE.

Configuration

When FEAT_DoPD is implemented, EDPRSR is in the Core power domain. Otherwise, EDPRSR contains fields that are in the Core power domain and fields that are in the Debug power domain.

If FEAT_DoPD is implemented, then all fields in this register are in the Core power domain.

Attributes

EDPRSR is a 32-bit register.

Field descriptions

Bits [31:17]

Reserved, RES0.

EPMADE, bit [16]
When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable Extended status. Together with EDPRSR.EPMAD, reports whether access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.{EPMAD, EPMADE} controls.

For a description of the values derived by evaluating EDPRSR.EPMAD and EDPRSR.EPMADE together, see EDPRSR.EPMAD.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

ETADE, bit [15]
When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable Extended status. Together with EDPRSR.ETAD, reports whether access to trace unit registers by an external debugger is prohibited by the MDCR_EL3.{ETAD, ETADE} controls.

For a description of the values derived by evaluating EDPRSR.ETAD and EDPRSR.ETADE together, see EDPRSR.ETAD.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

EDADE, bit [14]
When FEAT_RME is implemented:

External Debug Access Disable Extended status. Together with EDPRSR.EDAD, reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.{EDAD, EDADE} controls.

For a description of the values derived by evaluating EDPRSR.EDAD and EDPRSR.EDADE together, see EDPRSR.EDAD.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

STAD, bit [13]
When FEAT_TRC_EXT is implemented and FEAT_TRBE is implemented:

Sticky ETAD error. Set to 1 when a Non-secure external debug interface access to an external trace register returns an error because AllowExternalTraceAccess() == FALSE for the access.

STAD	Meaning
0b0	Since EDPRSR was last read, no external accesses to the trace unit registers have failed because AllowExternalTraceAccess() was FALSE for the access.
0b1	Since EDPRSR was last read, at least one external access to the trace unit registers has failed because AllowExternalTraceAccess() was FALSE for the access.

If IsCorePowered() == TRUE, the Core power domain is powered up, then, following a read of EDPRSR, then this bit clears to 0.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- Otherwise, access to this field is RC/WI.

Otherwise:

Reserved, RES0.

ETAD, bit [12]
When FEAT_RME is implemented, FEAT_TRC_EXT is implemented, and FEAT_TRBE is implemented:

External Trace Access Disable status. Together with EDPRSR.ETADE, reports whether access to trace unit registers by an external debugger is prohibited by the MDCR_EL3.{ETAD, ETADE} controls.

ETADE	ETAD	Meaning
0b0	0b0	No accesses from an external debugger to trace unit registers are prohibited.
0b0	0b1	Realm and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected.
0b1	0b0	Secure and Non-secure accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to trace unit registers are prohibited. Other accesses from an external debugger to trace unit registers are not affected.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- Otherwise, access to this field is RO.

When FEAT_TRC_EXT is implemented and FEAT_TRBE is implemented:

External Trace Access Disable status. Reports whether Non-secure access to trace unit registers by an external debugger is prohibited by the MDCR_EL3.ETAD control.

ETAD	Meaning
0b0	External Non-secure trace unit accesses not affected. AllowExternalTraceAccess() == TRUE for a Non-secure access.
0b1	External Non-secure trace unit accesses are prohibited. AllowExternalTraceAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

SDR, bit [11]

Sticky Debug Restart. Set to 1 when the PE exits Debug state.

SDR	Meaning
0b0	The PE has not restarted since EDPRSR was last read.
0b1	The PE has restarted since EDPRSR was last read.

Note

If a reset occurs when the PE is in Debug state, the PE exits Debug state. SDR is UNKNOWN on Warm reset, meaning a debugger must also use the SR bit to determine whether the PE has left Debug state.

If the Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RC/WI.

SPMAD, bit [10]
When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

Sticky EPMAD error. Set to 1 if an external debug interface access to a Performance Monitors register returns an error because AllowExternalPMUAccess() == FALSE.

SPMAD	Meaning
0b0	No Non-secure external debug interface accesses to the external Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the external Performance Monitors register has failed and returned an error because AllowExternalPMUAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RC/WI.

When FEAT_PMUv3_EXT is implemented:

Sticky EPMAD error.

SPMAD	Meaning
0b0	No external debug interface accesses to the Performance Monitors registers have failed because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the Performance Monitors registers has failed and returned an error because AllowExternalPMUAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented, and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- When OSLockStatus(), access to this field is UNKNOWN/WI.
- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RC/WI.

Otherwise:

Reserved, RES0.

EPMAD, bit [9]
When FEAT_RME is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable status. Together with EDPRSR.EPMADE, reports whether access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.{EPMAD, EPMADE} controls.

See MDCR_EL3.EPMAD for the list of affected external Performance Monitor registers.

EPMADE	EPMAD	Meaning
0b0	0b0	No accesses from an external debugger to affected Performance Monitor registers are prohibited.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected Performance Monitor registers are prohibited. Other accesses from an external debugger to affected Performance Monitor registers are not affected.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- Otherwise, access to this field is RO.

When FEAT_Debugv8p4 is implemented and FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable status. Reports whether Non-secure access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.EPMAD control.

See MDCR_EL3.EPMAD for the list of affected external Performance Monitor registers.

EPMAD	Meaning
0b0	External Non-secure access to Performance Monitor registers not affected. AllowExternalPMUAccess() == TRUE for a Non-secure access.
0b1	External Non-secure access to affected Performance Monitor registers is prohibited. AllowExternalPMUAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

When FEAT_PMUv3_EXT is implemented:

External Performance Monitors Access Disable status. Reports whether access to Performance Monitor registers by an external debugger is prohibited by the MDCR_EL3.EPMAD control.

See MDCR_EL3.EPMAD for the list of affected external Performance Monitor registers.

EPMAD	Meaning
0b0	External access to Performance Monitor registers not affected. AllowExternalPMUAccess() == TRUE.
0b1	External access to affected Performance Monitor registers is prohibited. AllowExternalPMUAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- When OSLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

When FEAT_PMUv3 is implemented:

Reserved, UNKNOWN.

Otherwise:

Reserved, RES0.

SDAD, bit [8]
When FEAT_Debugv8p4 is implemented:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
0b0	No Non-secure external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.
0b1	At least one Non-secure external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE for the access since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Otherwise:

Sticky EDAD error. Set to 1 if an external debug interface access to a debug register returns an error because AllowExternalDebugAccess() == FALSE.

SDAD	Meaning
0b0	No external debug interface accesses to the debug registers have failed because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.
0b1	At least one external debug interface access to the debug registers has failed and returned an error because AllowExternalDebugAccess() == FALSE since EDPRSR was last read.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().

        - EDPRSR.R == '1'.
    - When DoubleLockStatus(), access to this field is UNKNOWN/WI.
    - Access to this field is UNKNOWN/WI if all the following are true:
        - OSLockStatus().
        - external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess(addrdesc) == FALSE.
    - Otherwise, access to this field is RO.

EDAD, bit [7]
When FEAT_RME is implemented:

External Debug Access Disable status. Together with EDPRSR.EDADE, reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.{EDAD, EDADE} controls.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDADE	EDAD	Meaning
0b0	0b0	No accesses from an external debugger to affected debug registers are prohibited.
0b0	0b1	Realm and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected.
0b1	0b0	Secure and Non-secure accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected.
0b1	0b1	Secure, Non-secure, and Realm accesses from an external debugger to affected debug registers are prohibited. Other accesses from an external debugger to affected debug registers are not affected.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
    - FEAT_DoPD is not implemented and !IsCorePowered().
    - EDPRSR.R == '1'.
- Otherwise, access to this field is RO.

When FEAT_Debugv8p4 is implemented:

External Debug Access Disable status. Reports whether Non-secure access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.EDAD control.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDAD	Meaning
0b0	External Non-secure access to debug registers not affected. AllowExternalDebugAccess() == TRUE for a Non-secure access.
0b1	External Non-secure access to affected debug registers is prohibited. AllowExternalDebugAccess() == FALSE for a Non-secure access.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
    - FEAT_DoPD is not implemented and !IsCorePowered().
    - EDPRSR.R == '1'.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

When FEAT_Debugv8p2 is implemented:

External Debug Access Disable status. Reports whether access to breakpoint registers, watchpoint registers, and OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.EDAD control.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDAD	Meaning
0b0	External access to debug registers not affected. AllowExternalDebugAccess() == TRUE.
0b1	External access to affected debug registers is prohibited. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Access to this field is UNKNOWN/WI if all the following are true:
  - OSLockStatus().
  - external debug writes to OSLAR_EL1 do not return an error when AllowExternalDebugAccess(addrdesc) == FALSE.
- Otherwise, access to this field is RO.

Otherwise:

External Debug Access Disable status. Reports whether access to breakpoint registers, watchpoint registers, and optionally OSLAR_EL1 by an external debugger is prohibited by the MDCR_EL3.EDAD control.

See MDCR_EL3.EDAD for the list of affected external debug registers.

EDAD	Meaning
0b0	External access to debug registers not affected. AllowExternalDebugAccess() == TRUE.
0b1	External access to affected debug registers is prohibited. AllowExternalDebugAccess() == FALSE.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

DLK, bit [6]
When FEAT_Debugv8p4 is implemented:

This field is RES0.

When FEAT_Debugv8p2 is implemented and FEAT_DoubleLock is implemented:

Double Lock. From Armv8.2, use of this field is deprecated.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - !IsCorePowered().
  - DoubleLockStatus().
- Otherwise, access to this field is RAZ/WI.

When FEAT_DoubleLock is implemented:

Double Lock.

This field returns the result of the pseudocode function DoubleLockStatus().

If the Core power domain is powered up and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether:

- EDPRSR.PU reads as 1, EDPRSR.DLK reads as 1, and EDPRSR.SPD is UNKNOWN.
- EDPRSR.PU reads as 0, EDPRSR.DLK is UNKNOWN, and EDPRSR.SPD reads as 0.

This field is in the Core power domain.

DLK	Meaning
0b0	DoubleLockStatus() returns FALSE.
0b1	DoubleLockStatus() returns TRUE and the Core power domain is powered up.

Accessing this field has the following behavior:

- When !IsCorePowered(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RES0.

OSLK, bit [5]

OS Lock status bit.

A read of this bit returns the value of OSLSR_EL1.OSLK.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - EDPRSR.R == '1'.
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

HALTED, bit [4]

Halted status bit.

HALTED	Meaning
0b0	PE is in Non-debug state.
0b1	PE is in Debug state.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- Otherwise, access to this field is RO.

SR, bit [3]

Sticky core Reset status bit.

SR	Meaning
0b0	The non-debug logic of the PE is not in reset state and has not been reset since the last time EDPRSR was read.
0b1	The non-debug logic of the PE is in reset state or has been reset since the last time EDPRSR was read.

If EDPRSR.PU reads as 1 and EDPRSR.R reads as 0, which means that the Core power domain is in a powerup state and that the non-debug logic of the PE is not in reset state, then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

This field is in the Core power domain.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- When DoubleLockStatus(), access to this field is UNKNOWN/WI.

- When SoftwareLockStatus(addrdesc), access to this field is RO.
- Otherwise, access to this field is RC/WI.

R, bit [2]

PE Reset status bit.

R	Meaning
0b0	The non-debug logic of the PE is not in reset state.
0b1	The non-debug logic of the PE is in reset state.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'.

This field is in the Core power domain.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - FEAT_DoPD is not implemented and !IsCorePowered().
  - DoubleLockStatus().
- Otherwise, access to this field is RO.

SPD, bit [1]

Sticky core Powerdown status bit.

If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, then:

- If FEAT_Debugv8p2 is implemented, this bit reads as 0.
- If FEAT_Debugv8p2 is not implemented, this bit might read as 0 or 1.

For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

SPD	Meaning
0b0	If EDPRSR.PU is 0, it is not known whether the state of the debug registers in the Core power domain is lost. If EDPRSR.PU is 1, the state of the debug registers in the Core power domain has not been lost.
0b1	The state of the debug registers in the Core power domain has been lost.

If the Core power domain is powered up, then, following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, this bit clears to 0.
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether this bit clears to 0 or is unchanged.

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

When FEAT_DoPD is not implemented and the Core power domain is in either retention or powerdown state, the value of EDPRSR.SPD is IMPLEMENTATION DEFINED. For more information, see 'EDPRSR.SPD when the Core domain is in either retention or powerdown state'.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_DoPD is not implemented.
  - !IsCorePowered().
- Access to this field is UNKNOWN/WI if all the following are true:
  - IsCorePowered().
  - DoubleLockStatus().
- Otherwise, access to this field is RC/WI.

PU, bit [0]
When FEAT_DoPD is implemented:

Core powerup status bit.

Access to this field is RAO/WI.

When FEAT_Debugv8p2 is implemented:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
0b0	Either the Core power domain is in a low-power or powerdown state, or FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, meaning the debug registers in the Core power domain cannot be accessed.
0b1	The Core power domain is in a powerup state, and either FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, meaning the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information, see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'

Access to this field is RO.

Otherwise:

Core Powerup status bit. Indicates whether the debug registers in the Core power domain can be accessed.

PU	Meaning
0b0	Core power domain is in a low-power or powerdown state where the debug registers in the Core power domain cannot be accessed.
0b1	Core power domain is in a powerup state where the debug registers in the Core power domain can be accessed.

If FEAT_DoubleLock is implemented, the PE is in reset state, and the PE entered reset state with the OS Double Lock locked this bit has a CONSTRAINED UNPREDICTABLE value. For more information see 'EDPRSR.{DLK, R} and reset state'

EDPRSR.{DLK, SPD, PU} describe whether registers in the Core power domain can be accessed, and whether their state has been lost since the last time the register was read. For more information, see 'EDPRSR.{DLK, SPD, PU} and the Core power domain'.

When the Core power domain is powered-up and DoubleLockStatus() == TRUE, then the value of EDPRSR.PU is IMPLEMENTATION DEFINED. See the description of the DLK bit for more information.

If FEAT_DoubleLock is implemented, the Core power domain is powered up, and DoubleLockStatus() == TRUE, it is IMPLEMENTATION DEFINED whether this bit reads as 0 or 1.

Access to this field is RO.

Accessing EDPRSR

On permitted accesses to the register, other access controls affect the behavior of some fields. See the field descriptions for more information.

If the Core power domain is powered up (EDPRSR.PU == 1), then following a read of EDPRSR:

- If FEAT_DoubleLock is not implemented or DoubleLockStatus() == FALSE, then:
  - EDPRSR.{SDR, SPMAD, SDAD, SPD} are cleared to 0.
  - EDPRSR.SR is cleared to 0 if the non-debug logic of the PE is not in reset state (EDPRSR.R == 0).
- If FEAT_DoubleLock is implemented and DoubleLockStatus() == TRUE, it is CONSTRAINED UNPREDICTABLE whether or not this clearing occurs.

If FEAT_DoPD is not implemented and the Core power domain is powered down (EDPRSR.PU == 0), then:

- EDPRSR.{SDR, SPMAD, SDAD, SR} are all UNKNOWN, and are either reset or restored on being powered up.
- EDPRSR.SPD is not cleared following a read of EDPRSR. See the SPD bit description for more information.

The clearing of bits is an indirect write to EDPRSR.

EDPRSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x314	EDPRSR

Accessible as follows:

- When FEAT_DoPD is implemented and !IsCorePowered(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDRCR, External Debug Reserve Control Register

The EDRCR characteristics are:

Purpose

This register is used to allow imprecise entry to Debug state and clear sticky bits in EDSCR.

Configuration

EDRCR is in the Core power domain.

Attributes

EDRCR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

CBRRQ, bit [4]

Allow imprecise entry to Debug state. The actions on writing to this bit are:

CBRRQ	Meaning
0b0	No action.
0b1	Allow imprecise entry to Debug state, for example by canceling pending bus accesses.

Setting this bit to 1 allows a debugger to request imprecise entry to Debug state. An External Debug Request debug event must be pending before the debugger sets this bit to 1.

This feature is optional. If this feature is not implemented, writes to this bit are ignored.

CSPA, bit [3]

Clear Sticky Pipeline Advance. This bit is used to clear the EDSCR.PipeAdv bit to 0. The actions on writing to this bit are:

CSPA	Meaning
0b0	No action.
0b1	Clear the EDSCR.PipeAdv bit to 0.

CSE, bit [2]

Clear Sticky Error. Used to clear the EDSCR cumulative error bits to 0. The actions on writing to this bit are:

CSE	Meaning
0b0	No action.
0b1	Clear the EDSCR.{TXU, RXO, ERR} bits, and, if the PE is in Debug state, the EDSCR.ITO bit, to 0.

Bits [1:0]

Reserved, RES0.

Accessing EDRCR

EDRCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x090	EDRCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are WI.
- Otherwise, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

EDSCR, External Debug Status and Control Register

The EDSCR characteristics are:

Purpose

Main control register for the debug implementation.

Configuration

External register EDSCR bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to AArch64 System register MDSCR_EL1[31:29, 27:26, 23:21, 19, 14, 6] when FEAT_AA64 is implemented.

External register EDSCR bits [31:29, 27:26, 23:21, 19, 14, 6] are architecturally mapped to AArch32 System register DBGDSCRext[31:29, 27:26, 23:21, 19, 14, 6].

External register EDSCR bits [30:29] are architecturally mapped to AArch64 System register MDCCSR_EL0[30:29] when FEAT_AA64 is implemented.

External register EDSCR bits [30:29] are architecturally mapped to AArch32 System register DBGDSCRint[30:29].

EDSCR is in the Core power domain.

Attributes

EDSCR is a 32-bit register.

Field descriptions

TFO, bit [31]
When FEAT_TRF is implemented:

Trace Filter Override. Overrides the Trace Filter controls allowing the external debugger to trace any visible Exception level.

TFO	Meaning
0b0	Trace Filter controls are not affected.
0b1	Trace Filter controls in TRFCR_EL1 and TRFCR_EL2 are ignored. Trace Filter controls TRFCR and HTRFCR are ignored.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

This bit is ignored by the PE when any of the following is true:

- ExternalSecureNoninvasiveDebugEnabled() is FALSE and the Effective value of MDCR_EL3.STE is 1.
- FEAT_RME is implemented, ExternalRealmNoninvasiveDebugEnabled() is FALSE, and the Effective value of MDCR_EL3.RLTE is 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

RXfull, bit [30]

DTRRX full.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

TXfull, bit [29]

DTRTX full.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

ITO, bit [28]

ITR overrun. Set to 0 on entry to Debug state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

RXO, bit [27]

DTRRX overrun.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

TXU, bit [26]

DTRTX underrun.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

PipeAdv, bit [25]

Pipeline Advance. Indicates that software execution is progressing.

PipeAdv	Meaning
0b0	No progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.
0b1	Progress has been made by the PE since the last time this field was cleared to zero by writing 1 to EDRCR.CSPA.

The architecture does not define precisely when this field is set to 1. It requires only that this happen periodically in Non-debug state to indicate that software execution is progressing. For example, a PE might set this field to 1 each time the PE retires one or more instructions, or at periodic intervals during the progression of an instruction.

When FEAT_MOPS is implemented, CPY, CPYF, SET, and SETG are examples of instructions that periodically make forward progress.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Access to this field is RO.

ITE, bit [24]

ITR empty.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

INTdis, bits [23:22]
When FEAT_RME is implemented:

Interrupt and SError exception disable. Disables taking interrupts and SError exceptions in Non-debug state.

INTdis	Meaning
0b00	This bit has no effect on the masking of interrupts and SError exceptions.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure state are masked. If ExternalRootInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Root state are masked. If ExternalRealmInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Realm state are masked.

Note

This control affects both physical and virtual interrupts and SError exceptions.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

- MDSCR_EL1.
- DBGDSCRext.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_RME is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00'.

When FEAT_Debugv8p4 is implemented:

Interrupt and SError exception disable. Disables taking interrupts and SError exceptions in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts and SError exceptions is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure state are masked.

Note

This control affects both physical and virtual interrupts and SError exceptions.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

- MDSCR_EL1.
- DBGDSCRext.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

When FEAT_Debugv8p4 is implemented, bit[23] of this register is RES0.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00'.

Otherwise:

Interrupt and SError exception disable. Disables taking interrupts and SError exceptions in Non-debug state.

INTdis	Meaning
0b00	Masking of interrupts and SError exceptions is controlled by PSTATE and interrupt routing controls.
0b01	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure EL1 are masked.
0b10	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure EL1 are masked.
0b11	If ExternalInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Non-secure state are masked. If ExternalSecureInvasiveDebugEnabled() is TRUE, then all interrupts and SError exceptions taken to Secure state are masked.

Note

This control affects both physical and virtual interrupts and SError exceptions.

When OSLSR_EL1.OSLK is 1, this field can be indirectly read and written through the following System registers:

- MDSCR_EL1.
- DBGDSCRext.

The Effective value of this field is 0b00 when ExternalInvasiveDebugEnabled() is FALSE.

Support for the values 0b01 and 0b10 is IMPLEMENTATION DEFINED. If these values are not supported, they are reserved. If programmed with a reserved value, the PE behaves as if EDSCR.INTdis has been programmed with a defined value, other than for a direct read of EDSCR, and the value returned by a read of EDSCR.INTdis is UNKNOWN.

The reset behavior of this field is:

- On a Cold reset, this field resets to '00'.

TDA, bit [21]

Traps accesses to the following debug System registers:

- AArch64: DBGBCR<n>_EL1, DBGBVR<n>_EL1, DBGWCR<n>_EL1, DBGWVR<n>_EL1.
- AArch32: DBGBCR<n>, DBGBVR<n>, DBGBXVR<n>, DBGWCR<n>, DBGWVR<n>.

TDA	Meaning
0b0	Accesses to debug System registers do not generate a Software Access Debug event.
0b1	Accesses to debug System registers generate a Software Access Debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

MA, bit [20]

Memory access mode. Controls the use of Memory access mode for accessing ITR and the DCC. This bit is ignored if in Non-debug state and set to zero on entry to Debug state.

Possible values of this field are:

MA	Meaning
0b0	Normal access mode.
0b1	Memory access mode.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

SC2, bit [19]
When FEAT_PCSRv8 is implemented, EL2 is implemented, FEAT_Debugv8p1 is implemented, and FEAT_PCSRv8p2 is not implemented:

Sample CONTEXTIDR_EL2. Controls whether the PC Sample-based Profiling Extension samples CONTEXTIDR_EL2 or VTTBR_EL2.VMID.

SC2	Meaning
0b0	Sample VTTBR_EL2.VMID.
0b1	Sample CONTEXTIDR_EL2.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NS, bit [18]
When FEAT_RME is implemented:

Non-secure status. Together with the NSE field, gives the current Security state:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Otherwise:

Non-secure status. In Debug state, gives the current Security state:

NS	Meaning
0b0	Secure state.
0b1	Non-secure state.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

Bit [17]

Reserved, RES0.

SDD, bit [16]
When FEAT_RME is implemented:

EL3 debug disabled.

On entry to Debug state:

- If entering from EL3, SDD is set to 0.
- Otherwise, SDD is set to the inverse of ExternalRootInvasiveDebugEnabled().

In Debug state, the value of SDD does not change, even if ExternalRootInvasiveDebugEnabled() changes.

In Non-debug state, SDD returns the inverse of ExternalRootInvasiveDebugEnabled(), regardless of the current Security state of the PE.

Access to this field is RO.

When FEAT_Secure is implemented:

Secure debug disabled.

On entry to Debug state:

- If entering in Secure state, then SDD is set to 0.
- If entering in Non-secure state, then SDD is set to the inverse of ExternalSecureInvasiveDebugEnabled().

In Debug state, the value of the SDD bit does not change, even if ExternalSecureInvasiveDebugEnabled() changes.

In Non-debug state, SDD returns the inverse of ExternalSecureInvasiveDebugEnabled(), regardless of the current Security state of the PE. If the authentication signals that control ExternalSecureInvasiveDebugEnabled() change, then a context synchronization event is required to guarantee their effect.

Access to this field is RO.

Otherwise:

Reserved, RES1.

NSE, bit [15]
When FEAT_RME is implemented:

Together with the NS field, this field gives the current Security state.

For a description of the values derived by evaluating NS and NSE together, see EDSCR.NS.

In Non-debug state, this bit is UNKNOWN.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HDE, bit [14]

Halting debug enable.

HDE	Meaning
0b0	Halting disabled for Breakpoint, Watchpoint and Halt Instruction debug events.
0b1	Halting enabled for Breakpoint, Watchpoint and Halt Instruction debug events.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

RW, bits [13:10]

Exception level Execution state status. In Debug state, each bit gives the current Execution state of each Exception level.

RW	Meaning	Applies when
0b1111	Any of the following: • The PE is in Non-debug state. • The PE is at EL0 using AArch64. • The PE is not at EL0, and EL1 is using AArch64. If implemented and enabled in the current Security state, EL2 and EL3 are using AArch64.	
0b1110	The PE is in Debug state at EL0. EL0 is using AArch32. EL1 is using AArch64. If implemented and enabled in the current Security state, EL2 and EL3 are using AArch64.	When FEAT_AA32 is implemented
0b110x	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is enabled in the current Security state and is using AArch64. If implemented, EL3 is using AArch64.	When FEAT_AA32 is implemented and EL2 is implemented
0b10xx	The PE is in Debug state. EL0 and EL1 are using AArch32. EL2 is not implemented, disabled in the current Security state, or using AArch32. EL3 is using AArch64.	When FEAT_AA32 is implemented and EL3 is implemented
0b0xxx	The PE is in Debug state. All Exception levels are using AArch32.	When FEAT_AA32 is implemented

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is RAO/WI.
- Otherwise, access to this field is RO.

EL, bits [9:8]

Exception level. In Debug state, gives the current Exception level of the PE.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

A, bit [7]

SError exception pending. In Debug state, indicates whether an SError exception is pending:

- If EL2 is enabled in the current Security state, the PE is executing at EL0 or EL1, HCR_EL2.TGE is 0 and either HCR_EL2.AMO is 1 or FEAT_DoubleFault2 is implemented and the Effective value of HCRX_EL2.TMEA is 1, a virtual SError exception.
- Otherwise, if FEAT_E3DSE is implemented, the PE is executing at EL0, EL1, or EL2, and SCR_EL3.EnDSE is 1, a delegated SError exception.
- Otherwise, a physical SError exception.

A	Meaning
0b0	No SError exception pending.
0b1	SError exception pending.

A debugger can read EDSCR to check whether an SError exception is pending without having to execute further instructions. A pending SError might indicate data from target memory is corrupted.

Accessing this field has the following behavior:

- When the PE is in Non-debug state, access to this field is UNKNOWN/WI.
- Otherwise, access to this field is RO.

ERR, bit [6]

Cumulative error flag. This bit is set to 1 following exceptions in Debug state and on any signaled overrun or underrun on the DTR or EDITR.

When OSLSR_EL1.OSLK is 1, this bit can be indirectly read and written through MDSCR_EL1 and DBGDSCRext.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Access to this field is RO.

STATUS, bits [5:0]

On entering Debug state, the PE sets this field to indicate the reason for halting.

STATUS	Meaning
0b000001	PE is restarting, exiting Debug state.
0b000010	PE is in Non-debug state.
0b000111	Breakpoint.
0b010011	External debug request.
0b011011	Halting step, normal.
0b011111	Halting step, exclusive.
0b100011	OS Unlock Catch.
0b100111	Reset Catch.
0b101011	Watchpoint.
0b101111	HLT instruction.
0b110011	Software access to debug register.
0b110111	Exception Catch.
0b111011	Halting step, no syndrome.

All other values are reserved.

The PE resets into Non-debug state. However, if the PE enters Debug state immediately after reset, then the reset value is overwritten with the reason for halting.

The reset behavior of this field is:

- On a Cold reset, this field resets to '000010'.

Access to this field is RO.

Accessing EDSCR

EDSCR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x088	EDSCR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- When SoftwareLockStatus(addrdesc), accesses to this register are RO.
- Otherwise, accesses to this register are RW.

EDSCR2, External Debug Status and Control Register 2

The EDSCR2 characteristics are:

Purpose

Main control register 2 for the debug implementation.

Configuration

External register EDSCR2 bits [3, 1] are architecturally mapped to AArch64 System register MDSCR_EL1[35, 33].

EDSCR2 is in the Core power domain.

This register is present only when FEAT_Debugv8p9 is implemented or FEAT_TRBE_EXT is implemented. Otherwise, direct accesses to EDSCR2 are RES0.

Attributes

EDSCR2 is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

EHBWE, bit [3]
When FEAT_Debugv8p9 is implemented:

Extended Halting Breakpoint and Watchpoint Enable. Enables use of additional breakpoints or watchpoints.

EHBWE	Meaning
0b0	Halting disabled for Breakpoint and Watchpoint debug events generated by each breakpoint <n> and Watchpoint <n>, where n is greater than or equal to 16.
0b1	Breakpoints and Watchpoint debug events are not affected by this mechanism.

When OSLSR_EL1.OSLK is 1, this field can be read and written through the MDSCR_EL1 System register.

It is IMPLEMENTATION DEFINED whether this field is implemented or is RES0 when 16 or fewer breakpoints are implemented, 16 or fewer watchpoints are implemented, and MDSELR_EL1 is implemented as RAZ/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

TTA, bit [1]
When FEAT_TRBE_EXT is implemented or FEAT_ETEv1p3 is implemented:

Trap Trace Accesses.

Traps access to the following System registers:

AArch64: TRBBASER_EL1, TRBIDR_EL1, TRBLIMITR_EL1, TRBMAR_EL1, TRBMPAM_EL1, TRBPTR_EL1, TRBSR_EL1, TRBTRG_EL1, TRCACATR<n>, TRCACVR<n>, TRCAUTHSTATUS, TRCAUXCTLR, TRCBBCTLR, TRCCCCTLR, TRCCIDCCTLR0, TRCCIDCCTLR1, TRCCIDCVR<n>, TRCCLAIMCLR, TRCCLAIMSET, TRCCNTCTLR<n>, TRCCNTRLDVR<n>, TRCCNTVR<n>, TRCCONFIGR, TRCDEVARCH, TRCDEVID, TRCEVENTCTL0R, TRCEVENTCTL1R, TRCEXTINSELR<n>, TRCIDR0, TRCIDR1, TRCIDR2, TRCIDR3, TRCIDR4, TRCIDR5, TRCIDR6, TRCIDR7, TRCIDR8, TRCIDR9, TRCIDR10, TRCIDR11, TRCIDR12, TRCIDR13, TRCIMSPEC0, TRCIMSPEC<n>, TRCITEEDCR, TRCOSLSR, TRCPRGCTLR, TRCQCTLR, TRCRSCTLR<n>, TRCRSR, TRCSEQEVR<n>,

TRCSEQRSTEVR, TRCSEQSTR, TRCSSCCR<n>, TRCSSCSR<n>, TRCSSPCICR<n>, TRCSTALLCTLR, TRCSTATR, TRCSYNCPR, TRCTRACEIDR, TRCTSCTLR, TRCVICTLR, TRCVIIECTLR, TRCVIPCSSCTLR, TRCVISSCTLR, TRCVMIDCCTLR0, TRCVMIDCCTLR1, and TRCVMIDCVR<n>.

TTA	Meaning
0b0	Accesses to trace System registers do not generate a Software Access debug event.
0b1	Accesses to trace System registers generate a Software Access debug event, if OSLSR_EL1.OSLK is 0 and if halting is allowed.

When OSLSR_EL1.OSLK is 1, this field can be read and written through the MDSCR_EL1 System register.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing EDSCR2

EDSCR2 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x028	EDSCR2

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

EDVIDSR, External Debug Virtual Context Sample Register

The EDVIDSR characteristics are:

Purpose

Contains sampled values captured on reading EDPCSR[31:0].

Configuration

EDVIDSR is in the Core power domain.

This register is present only when FEAT_PCSRv8 is implemented and FEAT_PCSRv8p2 is not implemented. Otherwise, direct accesses to EDVIDSR are RES0.

If FEAT_Debugv8p1 is implemented, the format of this register differs depending on the value of EDSCR.SC2.

Implemented only if the OPTIONAL PC Sample-based Profiling Extension is implemented in the external debug registers space.

When FEAT_PCSRv8 is implemented in the external debug registers space, if EL2 is not implemented and EL3 is not implemented, it is IMPLEMENTATION DEFINED whether EDVIDSR is implemented.

Note

FEAT_PCSRv8p2 implements the FEAT_PCSRv8 in the Performance Monitors registers space.

Attributes

EDVIDSR is a 32-bit register.

Field descriptions

When FEAT_Debugv8p1 is not implemented or EDSCR.SC2 == '0':

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
NS	E2	E3	HV	RES0												VMID[15:8]								VMID							

This format applies in all Armv8.0 implementations.

NS, bit [31]

Non-secure state sample. Indicates the Security state associated with the most recent EDPCSR sample.

If EL3 is not implemented, this bit indicates the Effective value of SCR.NS.

NS	Meaning
0b0	Sample is from Secure state.
0b1	Sample is from Non-secure state.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

E2, bit [30]
When EL2 is implemented:

Exception level 2 status sample. Indicates whether the most recent EDPCSR sample was associated with EL2.

E2	Meaning
0b0	Sample is not from EL2.
0b1	Sample is from EL2.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E3, bit [29]
When EL3 is implemented and FEAT_AA64 is implemented:

Exception level 3 status sample. Indicates whether the most recent EDPCSR sample was associated with EL3 using AArch64.

E3	Meaning
0b0	Sample is not from EL3 using AArch64.
0b1	Sample is from EL3 using AArch64.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HV, bit [28]

EDPCSRhi (EDPCSR[63:32]) valid. Indicates whether bits [63:32] of the most recent EDPCSR sample might be nonzero:

HV	Meaning
0b0	Bits[63:32] of the most recent EDPCSR sample are zero.
0b1	Bits[63:32] of the most recent EDPCSR sample might be nonzero.

An EDVIDSR.HV value of 1 does not mean that the value of EDPCSRhi is nonzero. An EDVIDSR.HV value of 0 is a hint that EDPCSRhi (EDPCSR[63:32]) does not need to be read.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Bits [27:16]

Reserved, RES0.

VMID[15:8], bits [15:8]
When FEAT_VMID16 is implemented and EL2 is implemented:

Extension to VMID[7:0]. For more information, see VMID[7:0].

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VMID, bits [7:0]
When EL2 is implemented:

VMID sample. The VMID associated with the most recent EDPCSRlo (EDPCSR[31:0]) sample. When the most recent EDPCSR sample was generated:

- This field is RES0 if any of the following apply:
  - The PE is executing in Secure state.
  - The PE is executing at EL2.
- Otherwise:
  - If EL2 is using AArch64 and either FEAT_VMID16 is not implemented or VTCR_EL2.VS is 1, this field is set to VTTBR_EL2.VMID.
  - If EL2 is using AArch64, FEAT_VMID16 is implemented, and VTCR_EL2.VS is 0, PMVIDSR.VMID[7:0] is set to VTTBR_EL2.VMID[7:0] and PMVIDSR.VMID[15:8] is RES0.
  - If EL2 is using AArch32, this field is set to VTTBR.VMID.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When EL2 is implemented, FEAT_Debugv8p1 is implemented, and EDSCR.SC2 == '1':

CONTEXTIDR_EL2, bits [31:0]

Context ID. The value of CONTEXTIDR_EL2 that is associated with the most recent EDPCSR sample. When the most recent EDPCSR sample is generated:

- If the PE is not executing at EL3, EL2 is using AArch64, and EL2 is enabled in the current Security state, then this field is set to the Context ID sampled from CONTEXTIDR_EL2.
- Otherwise, this field is set to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDVIDSR

IMPLEMENTATION DEFINED extensions to external debug might make the value of this register UNKNOWN, see 'Permitted behavior that might make the PC Sample-based profiling registers UNKNOWN'.

EDVIDSR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x0A8	EDVIDSR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

EDWAR, External Debug Watchpoint Address Register

The EDWAR characteristics are:

Purpose

Returns the virtual data address being accessed when a Watchpoint Debug Event was triggered.

Configuration

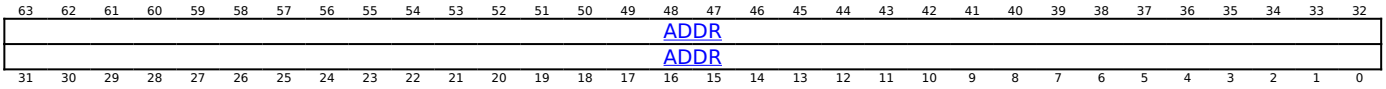
EDWAR is in the Core power domain.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if EDSCR.STATUS is not 0b101011.

Attributes

EDWAR is a 64-bit register.

Field descriptions



ADDR, bits [63:0]

Watchpoint address. The data virtual address being accessed when a Watchpoint Debug Event was triggered and caused entry to Debug state. This address must be within a naturally-aligned block of memory of power-of-two size no larger than the DC ZVA block size.

The value of this register is UNKNOWN if the PE is in Non-debug state, or if Debug state was entered other than for a Watchpoint debug event.

The value of EDWAR[63:32] is UNKNOWN if Debug state was entered for a Watchpoint debug event taken from AArch32 state.

The EDWAR is subject to the same alignment rules as the reporting of a watchpointed address in the FAR. See 'Exception syndrome information and preferred return address'.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing EDWAR

EDWAR can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0x030	EDWAR

Accessible as follows:

- When DoubleLockStatus(), or !IsCorePowered(), or OSLockStatus(), accesses to this register generate an error response.
- Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRACR, Access Configuration Register

The ERRACR characteristics are:

Purpose

Controls visibility of error records.

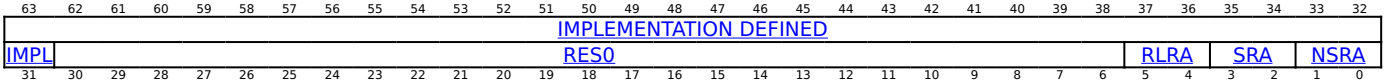
Configuration

This register is present only when (Root state is implemented or Secure state is implemented) and an implementation implements ERRACR. Otherwise, direct accesses to ERRACR are RES0.

Attributes

ERRACR is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED access control bits.

IMPL, bit [31]

IMPL	Meaning
0b1	Indicates ERRACR is present.

Access to this field is RAO/WI.

Bits [30:6]

Reserved, RES0.

RLRA, bits [5:4]
When FEAT_RME is implemented and the error record group allows configuration of Secure and Realm register accesses:

Realm Restricted Access. Controls Realm access to error records and interrupt configuration registers in the error record group.

RLRA	Meaning
0b00	Realm access is disabled. All error record, ERR<irq>CR<m>, and ERRIRQSR registers are RAZ/WI to Realm accesses.
0b01	Realm read access is enabled. Realm writes are ignored.
0b11	Realm read/write access is allowed. If the error record group supports MSIs, generated MSIs are always Non-secure.

All other values are reserved.

This control applies to all error record registers (ERR<n>*, including fault injection registers ERR<n>PFG* if implemented), and interrupt configuration registers (ERR<irq>CR<m> and ERRIRQSR, if implemented) in the error record group. The effect on any IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

When Realm access to error records is disabled, a Realm read of ERRGSR will return the error record status for the error records that cannot be accessed.

When Realm access is fully or partially disabled, the effect on Realm accesses to IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

Note

Realm access to error records is enabled from reset.

The reset domain and value of this field is IMPLEMENTATION DEFINED, and depends on the security policy of the component implementing this register.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RAZ/WI.

SRA, bits [3:2]
When Secure state is implemented, FEAT_RME is implemented, and the error record group allows configuration of Secure and Realm register accesses:

Secure Restricted Access. Controls Secure access to error records and interrupt configuration registers in the error record group.

SRA	Meaning
0b00	Secure access is disabled. All error record, ERR<irq>CR<m>, and ERRIRQSR registers are RAZ/WI to Secure accesses.
0b01	Secure read access is enabled. Secure writes are ignored.
0b11	Secure read/write access is allowed.

All other values are reserved.

This control applies to all error record registers (ERR<n>*, including fault injection registers ERR<n>PFG* if implemented), and interrupt configuration registers (ERR<irq>CR<m> and ERRIRQSR, if implemented) in the error record group. The effect on any IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

When Secure access to error records is disabled, a Secure read of ERRGSR will return the error record status for the error records that cannot be accessed.

When Secure access is fully or partially disabled, the effect on Secure accesses to IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

Note

Secure access to error records is enabled from reset.

The reset domain and value of this field is IMPLEMENTATION DEFINED, and depends on the security policy of the component implementing this register.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RAZ/WI.

NSRA, bits [1:0]

Non-secure Restricted Access. Controls Non-secure access to error records and interrupt configuration registers in the error record group.

NSRA	Meaning
0b00	Non-secure access is disabled. All error record, ERR<irq>CR<m>, and ERRIRQSR registers are RAZ/WI to Non-secure accesses.
0b01	Non-secure read access is enabled. Non-secure writes are ignored.
0b11	Non-secure read/write access is allowed. If the error record group supports MSIs, generated MSIs are always Non-secure.

All other values are reserved.

This control applies to all error record registers (ERR<n>*, including fault injection registers ERR<n>PFG* if implemented), and interrupt configuration registers (ERR<irq>CR<m> and ERRIRQSR, if implemented) in the error record group. The effect on any IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

When Non-secure access to error records is disabled, a Non-secure read of ERRGSR will return the error record status for the error records that cannot be accessed.

When Non-secure access is fully or partially disabled, the effect on Non-secure accesses to IMPLEMENTATION DEFINED registers is IMPLEMENTATION DEFINED.

Note

Non-secure access to error records is enabled from reset.

If FEAT_RME is implemented and ERRACR.{RLRA, SRA} are not implemented, then ERRACR.NSRA applies to all Security states other than Root.

The reset domain and value of this field is IMPLEMENTATION DEFINED, and depends on the security policy of the component implementing this register.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.
- On a Cold reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing ERRACR

This section shows the offset of ERRACR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRACR.

ERRACR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE40	ERRACR

Accessible as follows:

- When (FEAT_RME is implemented and an access is not Root) or an access is Non-secure, accesses to this register are RAZ/WI.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRCIDR0, Component Identification Register 0

The ERRCIDR0 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_0, bits [7:0]

Component identification preamble, segment 0.

Reads as 0x0D.

Access to this field is RO.

Accessing ERRCIDR0

This section shows the offset of ERRCIDR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR0.

ERRCIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFF0	ERRCIDR0

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRCIDR1, Component Identification Register 1

The ERRCIDR1 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class.

CLASS	Meaning
0b1111	Generic peripheral with IMPLEMENTATION DEFINED register layout.

Other values are defined by the CoreSight Architecture.

This field reads as 0xF.

Access to this field is RO.

PRMBL_1, bits [3:0]

Component identification preamble, segment 1.

Reads as 0b0000.

Access to this field is RO.

Accessing ERRCIDR1

This section shows the offset of ERRCIDR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR1.

ERRCIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFF4	ERRCIDR1

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRCIDR2, Component Identification Register 2

The ERRCIDR2 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_2, bits [7:0]

Component identification preamble, segment 2.

Reads as 0x05.

Access to this field is RO.

Accessing ERRCIDR2

This section shows the offset of ERRCIDR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR2.

ERRCIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFF8	ERRCIDR2

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRCIDR3, Component Identification Register 3

The ERRCIDR3 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRCIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Component identification preamble, segment 3.

Reads as 0xB1.

Access to this field is RO.

Accessing ERRCIDR3

This section shows the offset of ERRCIDR3 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCIDR3.

ERRCIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFFC	ERRCIDR3

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRCRICR0, Critical Error Interrupt Configuration Register 0

The ERRCRICR0 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR0 are RES0.

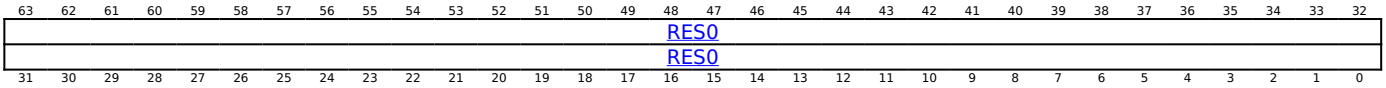
ERRCRICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR0 is a 64-bit register.

Field descriptions

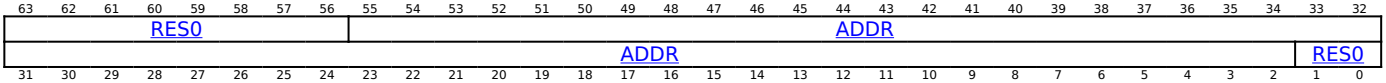
When the Critical Error Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [63:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Critical Error Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRCRICR0.ADDR << 2) is the address that the component writes to when signaling the Critical Error Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

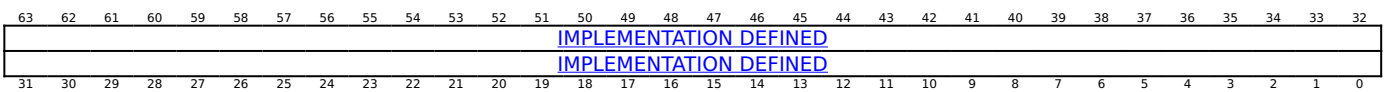
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR0

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRCRICR0 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRCRICR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCRICR0.

ERRCRICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEA0	ERRCRICR0

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRCRICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRCRICR1, Critical Error Interrupt Configuration Register 1

The ERRCRICR1 characteristics are:

Purpose

Critical Error Interrupt configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR1 are RES0.

ERRCRICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR1 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:

Bits [31:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Critical Error Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR1

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRCRICR1 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRCRICR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCRICR1.

ERRCRICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEA8	ERRCRICR1

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRCRICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

ERRCRICR2, Critical Error Interrupt Configuration Register 2

The ERRCRICR2 characteristics are:

Purpose

Critical Error Interrupt control and configuration register.

Configuration

This register is present only when (the Critical Error Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRCRICR2 are RES0.

ERRCRICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRCRICR2 is a 32-bit register.

Field descriptions

When the Critical Error Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Interrupts enable. Enables generation of interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [6:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Critical Error Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]
When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Message signaled interrupts are always enabled.

NSMSI, bit [6]
When the component supports configuring the physical address space for message signaled interrupts:

Non-secure message signaled interrupt. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When an access is Non-secure, access to this field is RO.
- When an access is Realm, access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

The physical address space for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]
When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRCRICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]
When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRCRICR2

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRCRICR2 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRCRICR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRCRICR2.

ERRCRICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEAC	ERRCRICR2

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRCRICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRDEVAFF, Device Affinity Register

The ERRDEVAFF characteristics are:

Purpose

For a group of error records that has affinity with a single PE or a group of PEs, ERRDEVAFF is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the group of error records has affinity with a single PE, the affinity level is 0, then ERRDEVAFF reads the same value as MPIDR_EL1, and ERRDEVAFF.F0V reads-as-one to indicate affinity level 0.
- If the group of error records has affinity with a group of PEs, the affinity level is 1, 2, or 3, then parts of ERRDEVAFF reads the same value as parts of MPIDR_EL1, and the rest of ERRDEVAFF indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1, then all of the following are true:

- All the PEs in the group have the same values in MPIDR_EL1.{Aff3,Aff2}, and these values are equal to ERRDEVAFF.{Aff3,Aff2}.
- ERRDEVAFF.Aff1 is nonzero and not 0x80, and ERRDEVAFF.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the group of error records has affinity with is indicated by the least-significant set bit in ERRDEVAFF.Aff1. In this example, if ERRDEVAFF.Aff1[2:0] is 0b100, then the group of error records has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == ERRDEVAFF.Aff1[7:3].

Depending on the IMPLEMENTATION DEFINED nature of the system, it might be possible that ERRDEVAFF is read before system firmware has configured the group of error records or the PE or group of PEs that the group of error records has affinity with. When this is the case, ERRDEVAFF reads as zero.

If RAS System Architecture v1.1 is not implemented, then ERRDEVAFF can only describe a group of error records that is affine with a single PE or all the PEs at an affinity level.

Configuration

This register is present only when the group of error records has affinity with a PE or cluster of PEs and an implementation implements ERRDEVAFF. Otherwise, direct accesses to ERRDEVAFF are RES0.

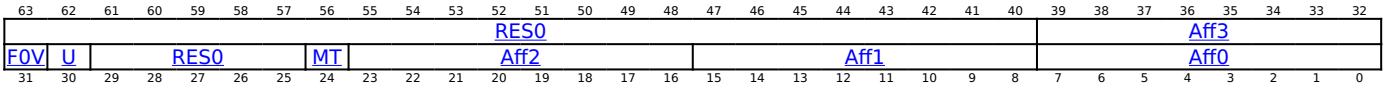
ERRDEVAFF is implemented only as part of a memory-mapped group of error records.

Arm deprecates use of this register by software

Attributes

ERRDEVAFF is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

F0V, bit [31]

Indicates that the ERRDEVAFF.Aff0 field is valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F0V	Meaning
0b0	ERRDEVAFF.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
0b1	ERRDEVAFF.Aff0 is valid, and the PE affinity is at level 0.

Access to this field is RO.

U, bit [30]
When ERRDEVAFF.F0V == '1':

Uniprocessor. The MPIDR_EL1.U field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]
When ERRDEVAFF.F0V == '1':

Multithreaded. The MPIDR_EL1.MT field, viewed from the highest Exception level of the associated PE.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]
When !IsZero(ERRDEVAFF.[Aff1,Aff0,F0V]):

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff2	Meaning
0bxxxxxxx1	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:2] is the value of MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	PE affinity is the subset of level 2 where ERRDEVAFF.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.
0x80	PE affinity is at level 3.

Access to this field is RO.

Aff1, bits [15:8]
When !IsZero(ERRDEVAFF.[Aff0,F0V]):

PE affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff1	Meaning
0x00	PE affinity is above level 2 or a subset of level 2.
0bxxxxxxx1	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:1] is the value of MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:2] is the value of MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7:6] is the value of MPIDR_EL1.Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	PE affinity is the subset of level 1 where ERRDEVAFF.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.
0x80	PE affinity is at level 2.

Access to this field is RO.

Aff0, bits [7:0]
When ERRDEVAFF.F0V == '1':

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff0	Meaning
0x00	PE affinity is above level 1 or a subset of level 1.
0bxxxxxxx1	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7:6] is the value of MPIDR_EL1.Aff0[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	PE affinity is the subset of level 0 where ERRDEVAFF.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.
0x80	PE affinity is at level 1.

Access to this field is RO.

Accessing ERRDEVAFF

This section shows the offset of ERRDEVAFF when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRDEVAFF.

ERRDEVAFF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFA8	ERRDEVAFF

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRDEVARCH, Device Architecture Register

The ERRDEVARCH characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVARCH is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVARCH is a 32-bit register.

Field descriptions

ARCHITECT, bits [31:21]

Defines the architect of the component. For RAS, this is Arm Limited.

Bits [31:28] are the JEP106 continuation code, 0b0100.

Bits [27:21] are the JEP106 identification code, 0b0111011.

Reads as 0b01000111011.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Indicates that the ERRDEVARCH register is present.

Reads as 0b1.

Access to this field is RO.

REVISION, bits [19:16]
When UInt(ERRDEVARCH.ARCHPART) == 0xA00 and ERRDEVARCH.ARCHVER == '0000':

Revision. Defines the architecture revision of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

REVISION	Meaning
0b0000	RAS System Architecture, error record group v1.0.
0b0001	RAS System Architecture, error record group v1.1. As 0b0000 and also: • Simplifies ERR<n>STATUS. • Adds support for additional ERR<n>MISC<m> registers. • Adds support for the optional RAS Timestamp Extension. • Adds support for the optional Common Fault Injection Model Extension.

All other values are reserved.

Access to this field is RO.

When UInt(ERRDEVARCH.ARCHPART) == 0xA00 and ERRDEVARCH.ARCHVER == '0001':

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture, error record group v2.0.

All other values are reserved.

Access to this field is RO.

When UInt(ERRDEVARCH.ARCHPART) == 0xA08 and ERRDEVARCH.ARCHVER == '0000':

Revision. Defines the architecture revision of the component.

REVISION	Meaning
0b0000	RAS System Architecture, fault injection group v1.0.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

ARCHVER, bits [15:12]
When UInt(ERRDEVARCH.ARCHPART) == 0xA00:

Architecture Version. Defines the architecture version of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHVER	Meaning
0b0000	RAS System Architecture, error record group v1.
0b0001	RAS System Architecture, error record group v2. As 0b0000 and also: • Adds an optional access control register, ERRACR. • Adds an optional control for disabling error counters. • Adds optional fault handling interrupt controls for Deferred errors. • Adds support for continuation and proxy error records. • Adds support for implementing Common Fault Injection Mechanism registers in a separate page from the error record registers. • Adds support for simple interrupt configuration registers. • Defines fields in ERRDEVID that describe these properties.

All other values are reserved.

ERRDEVARCH.ARCHVER and ERRDEVARCH.ARCHPART are also defined as a single field, ERRDEVARCH.ARCHID, so that ERRDEVARCH.ARCHVER is ERRDEVARCH.ARCHID[15:12].

Access to this field is RO.

When UInt(ERRDEVARCH.ARCHPART) == 0xA08:

Architecture Version. Defines the architecture version of the component.

ARCHVER	Meaning
0b0000	RAS System Architecture, fault injection group v1.

All other values are reserved.

ERRDEVARCH.ARCHVER and ERRDEVARCH.ARCHPART are also defined as a single field, ERRDEVARCH.ARCHID, so that ERRDEVARCH.ARCHVER is ERRDEVARCH.ARCHID[15:12].

Access to this field is RO.

Otherwise:

Reserved, RES0.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ARCHPART	Meaning
0xA00	RAS System Architecture, error record group.
0xA08	RAS System Architecture, fault injection group.

ERRDEVARCH.ARCHVER and ERRDEVARCH.ARCHPART are also defined as a single field, ERRDEVARCH.ARCHID, so that ERRDEVARCH.ARCHPART is ERRDEVARCH.ARCHID[11:0].

Access to this field is RO.

Accessing ERRDEVARCH

This section shows the offset of ERRDEVARCH when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRDEVARCH.

ERRDEVARCH can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFBC	ERRDEVARCH

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRDEVID, Device Configuration Register

The ERRDEVID characteristics are:

Purpose

Provides discovery information for the component.

Configuration

ERRDEVID is implemented only as part of a memory-mapped group of error records.

Attributes

ERRDEVID is a 32-bit register.

Field descriptions

Bits [31:22]

Reserved, RES0.

PFG, bit [21]
When RAS System Architecture v2 is implemented:

Common Fault Injection Mechanism. Describes whether any Common Fault Injection Mechanism registers are implemented in the same page as this register.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PFG	Meaning
0b0	Any Common Fault Injection Mechanism registers are implemented in the same page as this register.
0b1	Any Common Fault Injection Mechanism registers are implemented in a separate fault injection group page.

Note

The value of this field does not indicate that any Common Fault Injection Mechanism registers are implemented by the nodes in this error record group. Software must use ERR<n>FR to discover whether each node implements Common Fault Injection Mechanism registers.

Accessing this field has the following behavior:

- When ERRDEVID is part of a fault injection group, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

Otherwise:

Reserved, RAZ.

Bit [20]

Reserved, RES0.

IRQCR, bits [19:16]

Interrupt configuration registers. Describes whether the interrupt configuration registers are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

IRQCR	Meaning
0b0000	It is IMPLEMENTATION DEFINED whether any interrupt configuration registers are implemented.
0b0001	An IMPLEMENTATION DEFINED form of interrupt configuration registers are implemented.
0b0010	The recommended layout form of interrupt configuration registers are implemented, for simple interrupts.
0b0011	The recommended layout form of interrupt configuration registers are implemented, for message-signaled interrupts.
0b1111	Interrupt configuration registers are not implemented.

All other values are reserved.

Accessing this field has the following behavior:

- When ERRDEVID is part of a fault injection group, access to this field is RAZ/WI.
- Otherwise, access to this field is RO.

NUM, bits [15:0]

Highest numbered index of the error records in this group, plus one. Each implemented record is owned by a node. A node might own multiple records.

This manual describes a group of error records accessed via a standard 4KB memory-mapped peripheral. For a 4KB peripheral, up to 24 error records can be accessed if the Common Fault Injection Model is implemented, and up to 56 otherwise.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing ERRDEVID

This section shows the offset of ERRDEVID when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRDEVID.

ERRDEVID can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFC8	ERRDEVID

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRERICR0, Error Recovery Interrupt Configuration Register 0

The ERRERICR0 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR0 are RES0.

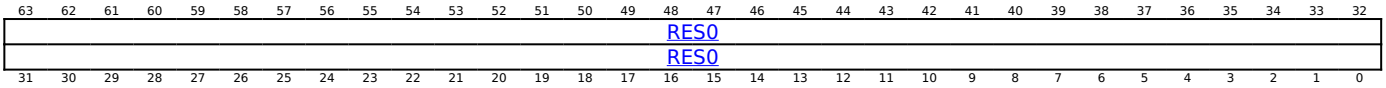
ERRERICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR0 is a 64-bit register.

Field descriptions

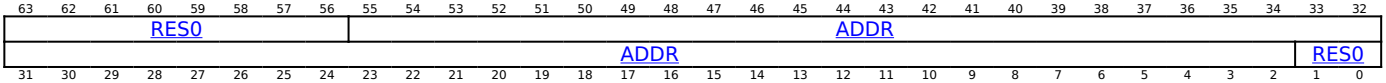
When the Error Recovery Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [63:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Error Recovery Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRERICR0.ADDR << 2) is the address that the component writes to when signaling the Error Recovery Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

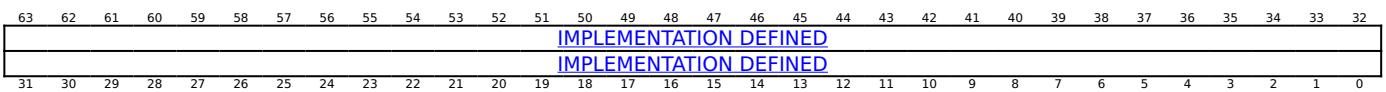
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR0

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRERICR0 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRERICR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRERICR0.

ERRERICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE90	ERRERICR0

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRERICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRERICR1, Error Recovery Interrupt Configuration Register 1

The ERRERICR1 characteristics are:

Purpose

Error Recovery Interrupt configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR1 are RES0.

ERRERICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR1 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:

Bits [31:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Error Recovery Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR1

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRERICR1 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRERICR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRERICR1.

ERRERICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE98	ERRERICR1

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRERICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

ERRERICR2, Error Recovery Interrupt Configuration Register 2

The ERRERICR2 characteristics are:

Purpose

Error Recovery Interrupt control and configuration register.

Configuration

This register is present only when (the Error Recovery Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRERICR2 are RES0.

ERRERICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRERICR2 is a 32-bit register.

Field descriptions

When the Error Recovery Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Interrupts enable. Enables generation of interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [6:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Error Recovery Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]
When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Message signaled interrupts are always enabled.

NSMSI, bit [6]
When the component supports configuring the physical address space for message signaled interrupts:

Non-secure message signaled interrupt. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When an access is Non-secure, access to this field is RO.
- When an access is Realm, access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

The physical address space for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]
When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRERICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]
When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRERICR2

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRERICR2 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRERICR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRERICR2.

ERRERICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE9C	ERRERICR2

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRERICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRFHICR0, Fault Handling Interrupt Configuration Register 0

The ERRFHICR0 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR0 are RES0.

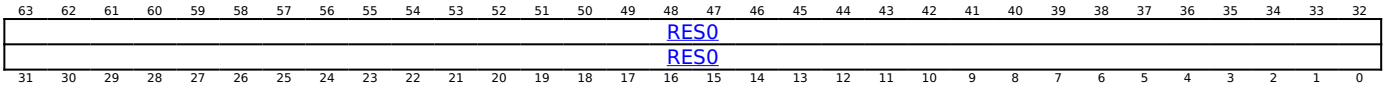
ERRFHICR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR0 is a 64-bit register.

Field descriptions

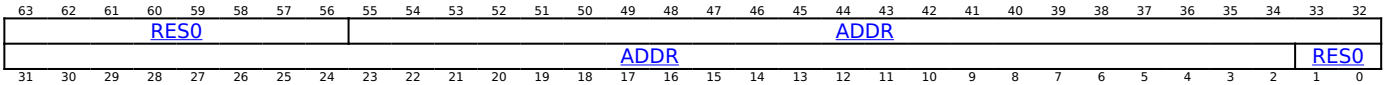
When the Fault Handling Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:



Bits [63:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Fault Handling Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:56]

Reserved, RES0.

ADDR, bits [55:2]

Message Signaled Interrupt address. (ERRFHICR0.ADDR << 2) is the address that the component writes to when signaling the Fault Handling Interrupt. Bits [1:0] of the address are always zero.

The physical address size supported by the component is IMPLEMENTATION DEFINED. Unimplemented high-order physical address bits are RES0.

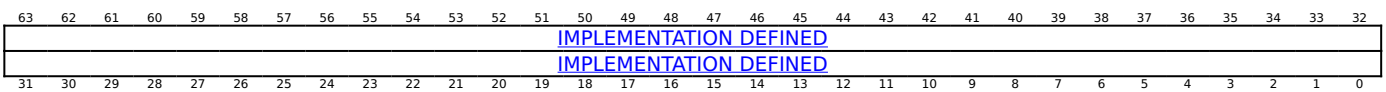
The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Bits [1:0]

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR0

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRFHICR0 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRFHICR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRFHICR0.

ERRFHICR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE80	ERRFHICR0

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRFHICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRFHICR1, Fault Handling Interrupt Configuration Register 1

The ERRFHICR1 characteristics are:

Purpose

Fault Handling Interrupt configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR1 are RES0.

ERRFHICR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR1 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:

Bits [31:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Fault Handling Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:

DATA, bits [31:0]

Payload for the message signaled interrupt.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR1

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRFHICR1 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRFHICR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRFHICR1.

ERRFHICR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE88	ERRFHICR1

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRFHICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

ERRFHICR2, Fault Handling Interrupt Configuration Register 2

The ERRFHICR2 characteristics are:

Purpose

Fault Handling Interrupt control and configuration register.

Configuration

This register is present only when (the Fault Handling Interrupt is implemented or the implementation does not use the recommended layout for the ERRIRQCR registers) and interrupt configuration registers are implemented. Otherwise, direct accesses to ERRFHICR2 are RES0.

ERRFHICR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRFHICR2 is a 32-bit register.

Field descriptions

When the Fault Handling Interrupt is implemented, the implementation uses the recommended layout for the ERRIRQCR registers, and the implementation uses simple interrupts:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]

Interrupts enable. Enables generation of interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [6:0]

Reserved, RES0.

When the implementation uses message-signaled interrupts, the Fault Handling Interrupt is implemented, and the implementation uses the recommended layout for the ERRIRQCR registers:

Bits [31:8]

Reserved, RES0.

IRQEN, bit [7]
When the component supports disabling message signaled interrupts:

Message signaled interrupt enable. Enables generation of message signaled interrupts.

IRQEN	Meaning
0b0	Disabled.
0b1	Enabled.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Message signaled interrupts are always enabled.

NSMSI, bit [6]
When the component supports configuring the physical address space for message signaled interrupts:

Non-secure message signaled interrupt. Defines the physical address space for message signaled interrupts.

NSMSI	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- When an access is Non-secure, access to this field is RO.
- When an access is Realm, access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

The physical address space for message signaled interrupts is IMPLEMENTATION DEFINED.

SH, bits [5:4]
When the component supports configuring the Shareability domain for message signaled interrupts:

Shareability. Defines the Shareability domain for message signaled interrupts.

SH	Meaning
0b00	Not shared.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when ERRFHICR2.MemAttr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

The Shareability domain for message signaled interrupts is IMPLEMENTATION DEFINED.

MemAttr, bits [3:0]
When the component supports configuring the memory type for message signaled interrupts:

Memory type. Defines the memory type and attributes for message signaled interrupts.

MemAttr	Meaning
0b0000	Device-nGnRnE memory.
0b0001	Device-nGnRE memory.
0b0010	Device-nGRE memory.
0b0011	Device-GRE memory.
0b0101	Normal memory, Inner Non-cacheable, Outer Non-cacheable.
0b0110	Normal memory, Inner Write-Through, Outer Non-cacheable.
0b0111	Normal memory, Inner Write-Back, Outer Non-cacheable.
0b1001	Normal memory, Inner Non-cacheable, Outer Write-Through.
0b1010	Normal memory, Inner Write-Through, Outer Write-Through.
0b1011	Normal memory, Inner Write-Back, Outer Write-Through.
0b1101	Normal memory, Inner Non-cacheable, Outer Write-Back.
0b1110	Normal memory, Inner Write-Through, Outer Write-Back.
0b1111	Normal memory, Inner Write-Back, Outer Write-Back.

All other values are reserved.

Note

This is the same format as the VMSAv8-64 stage 2 memory region attributes.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

The memory type used for message signaled interrupts is IMPLEMENTATION DEFINED.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

Accessing ERRFHICR2

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRFHICR2 are IMPLEMENTATION DEFINED.

This section shows the offset of ERRFHICR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRFHICR2.

ERRFHICR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE8C	ERRFHICR2

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRFHICR2.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRGSR<m>, Error Group <m> Status Register, n = 0 - 13

The ERRGSR<m> characteristics are:

Purpose

Shows the status for the records in the group.

Configuration

This register is present only when FEAT_RASSAv1 is implemented. Otherwise, direct accesses to ERRGSR<m> are RES0.

ERRGSR is implemented only as part of a memory-mapped group of error records.

If FEAT_RASSA_4KB_GRP is implemented, then a single ERRGSR register is implemented.

Attributes

ERRGSR<m> is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

S<n>, bit [n], for n = 63 to 0

If FEAT_RASSA_4KB_GRP is implemented, the status for error record <n>. A read-only copy of ERR<n>STATUS.V.

If FEAT_RASSA_16KB_GRP is implemented or FEAT_RASSA_64KB_GRP is implemented, the status for error record <m×64+n>. A read-only copy of ERR<m×64+n>STATUS.V.

S<n>	Meaning
0b0	No error.
0b1	One or more errors.

Accessing this field has the following behavior:

- Access to this field is RES0 if all the following are true:
  - FEAT_RASSA_4KB_GRP is implemented.
  - n >= 56.
- Access to this field is RES0 if all the following are true:
  - FEAT_RASSA_4KB_GRP is implemented.
  - the Common Fault Injection Model is implemented by any error record in the group.
  - n >= 24.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_RASSA_4KB_GRP is implemented.
  - error record n is not implemented.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_RASSA_16KB_GRP is implemented or FEAT_RASSA_64KB_GRP is implemented.
  - error record (m * 64) + n is not implemented.
- Access to this field is RAZ/WI if all the following are true:
  - RAS System Architecture v2 is not implemented.
  - error record n does not support this type of reporting.
- Otherwise, access to this field is RO.

Accessing ERRGSR<m>

This section shows the offset of ERRGSR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRGSR<n>.

ERRGSR<m> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE00 + (64 * m)	ERRGSR<m>

Accesses to this register are RO.

ERRIIDR, Implementation Identification Register

The ERRIIDR characteristics are:

Purpose

Defines the implementer of the component.

Configuration

This register is present only when RAS System Architecture v1p1 is implemented. Otherwise, direct accesses to ERRIIDR are RES0.

Attributes

ERRIIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

If ERRPIDR0 and ERRPIDR1 are implemented, ERRPIDR0.PART_0 matches bits [7:0] of ERRIIDR.ProductID and ERRPIDR1.PART_1 matches bits [11:8] of ERRIIDR.ProductID.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

This field distinguishes product variants or major revisions of the product.

If ERRPIDR2 is implemented, ERRPIDR2.REVISION matches ERRIIDR.Variant.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

This field distinguishes minor revisions of the product.

If ERRPIDR3 is implemented, ERRPIDR3.REVAND matches ERRIIDR.Revision.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the RAS component.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for ERRIIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

If ERRPIDR4 is implemented, ERRPIDR4.DES_2 matches bits [11:8] of this field.

If ERRPIDR2 is implemented, ERRPIDR2.DES_1 matches bits [6:4] of this field.

If ERRPIDR1 is implemented, ERRPIDR1.DES_0 matches bits [3:0] of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing ERRIIDR

This section shows the offset of ERRIIDR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIIDR.

ERRIIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE10	ERRIIDR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRIMPDEF<n>, IMPLEMENTATION DEFINED Register <n>, n = 0 - 191

The ERRIMPDEF<n> characteristics are:

Purpose

IMPLEMENTATION DEFINED RAS extensions.

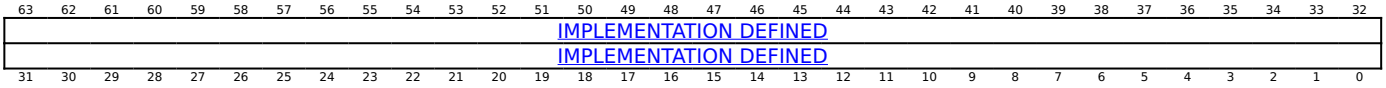
Configuration

This register is present only when the Common Fault Injection Model Extension is not implemented, the Fault Injection Group is not implemented, ((FEAT_RASSA_4KB_GRP is implemented and UInt(ERRDEVID.NUM) <= 32), or (FEAT_RASSA_16KB_GRP is implemented and UInt(ERRDEVID.NUM) <= 128), or (FEAT_RASSA_64KB_GRP is implemented and UInt(ERRDEVID.NUM) <= 512)), and an implementation implements ERRIMPDEF<n>. Otherwise, direct accesses to ERRIMPDEF<n> are RES0.

Attributes

ERRIMPDEF<n> is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIMPDEF<n>

This section shows the offset of ERRIMPDEF<n> when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIMPDEF<n>.

ERRIMPDEF<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x800 + (8 * n)	ERRIMPDEF<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRIRQCR<n>, Generic Error Interrupt Configuration Register <n>, n = 0 - 15

The ERRIRQCR<n> characteristics are:

Purpose

The ERRIRQCR<n> registers are reserved for IMPLEMENTATION DEFINED interrupt configuration registers.

The architecture provides a recommended layout for the ERRIRQCR<n> registers. These registers are named:

- ERRFHICR0, ERRFHICR1, and ERRFHICR2 for the fault handling interrupt controls.
- ERRERICR0, ERRERICR1, and ERRERICR2 for the error recovery interrupt controls.
- ERRCRICR0, ERRCRICR1, and ERRCRICR2 for the critical error interrupt controls.
- ERRIRQSR for the status register.

This section describes the generic, IMPLEMENTATION DEFINED, format.

Configuration

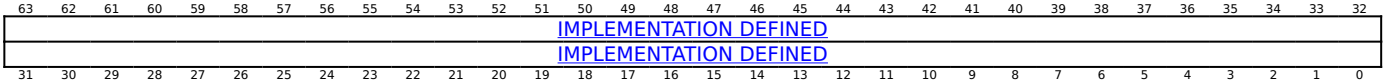
This register is present only when the interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQCR<n> are RES0.

ERRIRQCR<n> is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQCR<n> is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED controls. The content of these registers is IMPLEMENTATION DEFINED.

Accessing ERRIRQCR<n>

This section shows the offset of ERRIRQCR<n> when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIRQCR<n>.

ERRIRQCR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xE80 + (8 * n)	ERRIRQCR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRIRQSR, Error Interrupt Status Register

The ERRIRQSR characteristics are:

Purpose

Interrupt status register.

Configuration

This register is present only when interrupt configuration registers are implemented. Otherwise, direct accesses to ERRIRQSR are RES0.

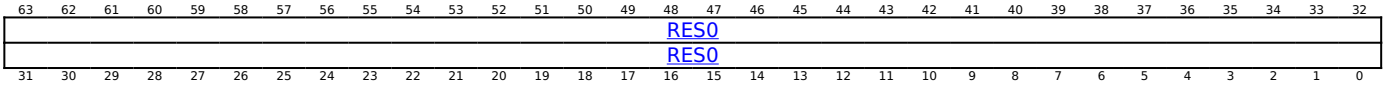
ERRIRQSR is implemented only as part of a memory-mapped group of error records.

Attributes

ERRIRQSR is a 64-bit register.

Field descriptions

When the implementation uses the recommended layout for the ERRIRQCR registers and the implementation uses simple interrupts:

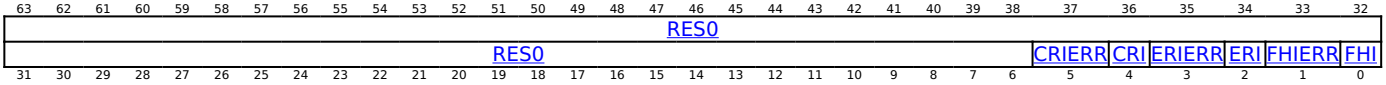


Bits [63:0]

Reserved, RES0.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

When the implementation uses message-signaled interrupts and the implementation uses the recommended layout for the ERRIRQCR registers:



Bits [63:6]

Reserved, RES0.

CRIERR, bit [5]
When the Critical Error Interrupt is implemented:

Critical Error Interrupt Error.

CRIERR	Meaning
0b0	Critical Error Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Critical Error Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

CRI, bit [4]
When the Critical Error Interrupt is implemented:

Critical Error Interrupt write in progress.

CRI	Meaning
0b0	Critical Error Interrupt write not in progress.
0b1	Critical Error Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.

ERIERR, bit [3]
When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt Error.

ERIERR	Meaning
0b0	Error Recovery Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Error Recovery Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

ERI, bit [2]
When the Error Recovery Interrupt is implemented:

Error Recovery Interrupt write in progress.

ERI	Meaning
0b0	Error Recovery Interrupt write not in progress.
0b1	Error Recovery Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.

FHIERR, bit [1]
When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt Error.

FHIERR	Meaning
0b0	Fault Handling Interrupt write has not returned an error since this field was last cleared to zero.
0b1	Fault Handling Interrupt write has returned an error since this field was last cleared to zero.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

FHI, bit [0]
When the Fault Handling Interrupt is implemented:

Fault Handling Interrupt write in progress.

FHI	Meaning
0b0	Fault Handling Interrupt write not in progress.
0b1	Fault Handling Interrupt write in progress.

Software must not disable an interrupt whilst the write is in progress.

Note

This field does not indicate whether an interrupt is active, but rather whether a write triggered by the interrupt is in progress.

To determine whether an interrupt is active, software must examine the individual ERR<n>STATUS registers.

Access to this field is RO.

Otherwise:

Reserved, RES0.

When the implementation does not use the recommended layout for the ERRIRQCR registers:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
IMPLEMENTATION DEFINED																															
IMPLEMENTATION DEFINED																															
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing ERRIRQSR

If the implementation does not use the recommended layout for the ERRIRQCR registers then accesses to ERRIRQSR are IMPLEMENTATION DEFINED.

This section shows the offset of ERRIRQSR when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRIRQSR.

ERRIRQSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xEF8	ERRIRQSR

Accessible as follows:

- When the implementation uses message-signaled interrupts, (an access is Non-secure or an access is Realm), the implementation uses the recommended layout for the ERRIRQCR registers, and ERRIRQSR.NSMSI configures the physical address space for message-signaled interrupts as Secure, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>ADDR, Error Record <n> Address Register, n = 0 - 65534

The ERR<n>ADDR characteristics are:

Purpose

If an address is associated with a detected error, then it is written to ERR<n>ADDR when the error is recorded. It is IMPLEMENTATION DEFINED how the recorded address maps to the software-visible physical address. Software might have to reconstruct the actual physical addresses using the identity of the node and knowledge of the system.

Configuration

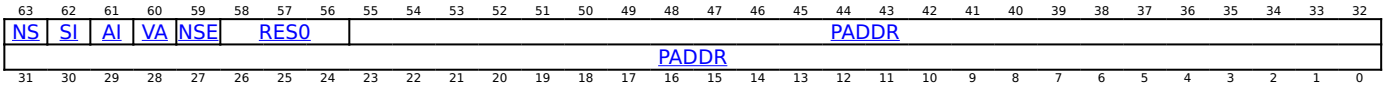
This register is present only when FEAT_RAS is implemented, error record n is implemented, and error record n includes an address associated with an error. Otherwise, direct accesses to ERR<n>ADDR are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

Attributes

ERR<n>ADDR is a 64-bit register.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

Non-secure attribute. With ERR<n>ADDR.NSE, indicates the physical address space of the recorded location.

NS	Meaning
0b0	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Root address.
0b1	When ERR<n>ADDR.NSE == 0: ERR<n>ADDR.PADDR is a Non-secure address. When ERR<n>ADDR.NSE == 1: ERR<n>ADDR.PADDR is a Realm address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure attribute.

NS	Meaning
0b0	ERR<n>ADDR.PADDR is a Secure address.
0b1	ERR<n>ADDR.PADDR is a Non-secure address.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

SI, bit [62]
When FEAT_RME is implemented:

Secure Incorrect. Indicates whether ERR<n>ADDR.{NS, NSE} are valid.

SI	Meaning
0b0	ERR<n>ADDR.{NS, NSE} are correct. That is, they match the software's view of the physical address space for the recorded location.
0b1	ERR<n>ADDR.{NS, NSE} might not be correct, and might not match the software's view of the physical address space for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Secure Incorrect. Indicates whether ERR<n>ADDR.NS is valid.

SI	Meaning
0b0	ERR<n>ADDR.NS is correct. That is, it matches the software's view of the Non-secure attribute for the recorded location.
0b1	ERR<n>ADDR.NS might not be correct, and might not match the software's view of the Non-secure attribute for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

AI, bit [61]

Address Incorrect. Indicates whether ERR<n>ADDR.PADDR is a valid physical address that is known to match the software's view of the physical address for the recorded location.

AI	Meaning
0b0	ERR<n>ADDR.PADDR is a valid physical address. That is, it matches the software's view of the physical address for the recorded location.
0b1	ERR<n>ADDR.PADDR might not be a valid physical address, and might not match the software's view of the physical address for the recorded location.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

VA, bit [60]

Virtual Address. Indicates whether ERR<n>ADDR.PADDR field is a virtual address.

VA	Meaning
0b0	ERR<n>ADDR.PADDR is not a virtual address.
0b1	ERR<n>ADDR.PADDR is a virtual address.

No context information is provided for the virtual address. When ERR<n>ADDR.VA is recorded as 1, ERR<n>ADDR.{NS, SI, AI} are recorded as {0, 1, 1} and, if FEAT_RME is implemented, ERR<n>ADDR.NSE is recorded as 0.

Support for this field is optional. If this field is not implemented and ERR<n>ADDR.PADDR field is a virtual address, then ERR<n>ADDR.{NS, SI, AI} read as {0, 1, 1} and, if FEAT_RME is implemented, ERR<n>ADDR.NSE reads as 0.

It is IMPLEMENTATION DEFINED whether this field is read-only or read/write.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [59]
When FEAT_RME is implemented:

Physical Address Space. Together with ERR<n>ADDR.NS, indicates the address space for ERR<n>ADDR.PADDR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:56]

Reserved, RES0.

PADDR, bits [55:0]

Physical Address. Address of the recorded location. If the physical address size implemented by this component is smaller than the size of this field, then high-order bits are unimplemented and either RES0 or have a fixed read-only IMPLEMENTATION DEFINED value. Low-order address bits might also be unimplemented and RES0, for example, if the physical address is always aligned to the size of a protection granule.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>ADDR

ERR<n>ADDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x018 + (64 * n)	ERR<n>ADDR

Accessible as follows:

- When the node that owns error record n implements the Common Fault Injection Model Extension, ERRPFGF[FirstRecordOfNode(n)].AV == '0', and ERR<n>STATUS.AV == '1', accesses to this register are RO.
- When the node that owns error record n does not implement the Common Fault Injection Model Extension and ERR<n>STATUS.AV == '1', accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>CTLR, Error Record <n> Control Register, n = 0 - 65534

The ERR<n>CTLR characteristics are:

Purpose

The error control register contains enable bits for the node that writes to this record:

- Enabling error detection and correction.
- Enabling the critical error, error recovery, and fault handling interrupts.
- Enabling in-band error response for uncorrected errors.

For each bit, if the node does not support the feature, then the bit is RES0. The definition of each record is IMPLEMENTATION DEFINED.

Configuration

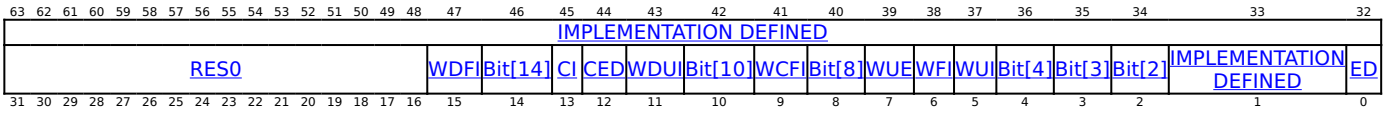
This register is present only when FEAT_RAS is implemented, error record n is implemented, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>CTLR are RES0.

ERR<n>FR contains additional information about the node.

Attributes

ERR<n>CTLR is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

Bits [31:16]

Reserved, RES0.

WDFI, bit [15]
When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == '11':

Fault handling interrupt for Deferred errors on writes enable, with ERR<n>CTLR.WFI.

When enabled by ERR<n>CTLR.{WDFI, WFI}:

- The fault handling interrupt is generated for errors recorded as Deferred error on writes.
- If the corresponding fault handling interrupt control for corrected error events, ERR<n>CTLR.WCFI, is not implemented, then the fault handling interrupt is generated for corrected error events on writes.

WDFI	Meaning
0b0	When ERR<n>CTLR.WFI == 0, Fault handling interrupt not generated for Deferred errors on writes. When ERR<n>CTLR.WFI == 1, Fault handling interrupt generated for Deferred errors on writes.
0b1	When ERR<n>CTLR.WFI == 0, Fault handling interrupt generated for Deferred errors on writes. When ERR<n>CTLR.WFI == 1, Fault handling interrupt not generated for Deferred errors on writes.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[14]
When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == '10':

DFI, bit [14]

Fault handling interrupt for Deferred errors enable, with ERR<n>CTLR.FI.

When ERR<n>FR.DFI == 0b10, this control applies to errors on both reads and writes.

When enabled by ERR<n>CTLR.{DFI, FI}:

- The fault handling interrupt is generated for all errors recorded as Deferred error.
- If the fault handling interrupt control for corrected error events, ERR<n>CTLR.CFI, is not implemented, then the fault handling interrupt is generated for all corrected error events.

DFI	Meaning
0b0	When ERR<n>CTLR.FI == 0, Fault handling interrupt not generated for Deferred errors. When ERR<n>CTLR.FI == 1, Fault handling interrupt generated for Deferred errors.
0b1	When ERR<n>CTLR.FI == 0, Fault handling interrupt generated for Deferred errors. When ERR<n>CTLR.FI == 1, Fault handling interrupt not generated for Deferred errors.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When RAS System Architecture v2 is implemented and ERR<n>FR.DFI == '11':

RDFI, bit [14]

Fault handling interrupt for Deferred errors on reads enable, with ERR<n>CTLR.RFI.

When enabled by ERR<n>CTLR.{RDFI, RFI}:

- The fault handling interrupt is generated for errors recorded as Deferred error on reads.
- If the corresponding fault handling interrupt control for corrected error events, ERR<n>CTLR.RCFI, is not implemented, then the fault handling interrupt is generated for corrected error events on reads.

RDFI	Meaning
0b0	When ERR<n>CTLR.RFI == 0, Fault handling interrupt not generated for Deferred errors on reads. When ERR<n>CTLR.RFI == 1, Fault handling interrupt generated for Deferred errors on reads.
0b1	When ERR<n>CTLR.RFI == 0, Fault handling interrupt generated for Deferred errors on reads. When ERR<n>CTLR.RFI == 1, Fault handling interrupt not generated for Deferred errors on reads.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [13]
When ERR<n>FR.CI == '10':

Critical error interrupt enable. When enabled, the critical error interrupt is generated for a critical error condition.

CI	Meaning
0b0	Critical error interrupt not generated for critical errors. Critical errors are treated as Uncontained errors.
0b1	Critical error interrupt generated for critical errors.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CED, bit [12]
When RAS System Architecture v2 is implemented, ERR<n>FR.CEC != '000', and ERR<n>FR.CED == '1':

Disable generation of corrected error events from error counters.

CED	Meaning
0b0	Corrected error events are generated by the error counter or counters.
0b1	Corrected error events are generated when a Corrected error is recorded.

See ERR<n>CTLR.CFI for more information on corrected error events.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WDUI, bit [11]
When ERR<n>FR.DUI == '11':

Error recovery interrupt for Deferred errors on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on writes.

WDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on writes.
0b1	Error recovery interrupt generated for Deferred errors on writes.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[10]
When ERR<n>FR.DUI == '10':

DUI, bit [10]

Error recovery interrupt for Deferred errors enable.

When ERR<n>FR.DUI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Deferred error.

DUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors.
0b1	Error recovery interrupt generated for Deferred errors.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.DUI == '11':

RDUI, bit [10]

Error recovery interrupt for Deferred errors on reads enable.

When enabled, the error recovery interrupt is generated for errors recorded as Deferred error on reads.

RDUI	Meaning
0b0	Error recovery interrupt not generated for Deferred errors on reads.
0b1	Error recovery interrupt generated for Deferred errors on reads.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WCFI, bit [9]
When ERR<n>FR.CFI == '11':

Fault handling interrupt for corrected error events on writes enable.

When enabled, the fault handling interrupt is generated for corrected error events on writes.

WCFI	Meaning
0b0	Fault handling interrupt not generated for corrected error events on writes.
0b1	Fault handling interrupt generated for corrected error events on writes.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[8]
When ERR<n>FR.CFI == '10':

CFI, bit [8]

Fault handling interrupt for corrected error events enable.

When ERR<n>FR.CFI == 0b10, this control applies to errors on both reads and writes.

When enabled, the fault handling interrupt is generated for all corrected error events.

CFI	Meaning
0b0	Fault handling interrupt not generated for corrected error events.
0b1	Fault handling interrupt generated for corrected error events.

If the node implements a corrected error counter or counters, and either ERR<n>CTLR.CED is not implemented or ERR<n>CTLR.CED is 0, then a corrected error event is defined as follows:

- A corrected error event occurs when a counter overflows and sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a software write sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a counter overflows and the overflow flag was previously set to 1.

Otherwise, a corrected error event occurs when the error record records an error as a Corrected error.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.CFI == '11':

RCFI, bit [8]

Fault handling interrupt for corrected error events on reads enable.

When enabled, the fault handling interrupt is generated for corrected error events on reads.

RCFI	Meaning
0b0	Fault handling interrupt not generated for corrected error events on reads.
0b1	Fault handling interrupt generated for corrected error events on reads.

If the node implements a corrected error counter or counters, and either ERR<n>CTLR.CED is not implemented or ERR<n>CTLR.CED is 0, then a corrected error event is defined as follows:

- A corrected error event occurs when a counter overflows and sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a software write sets a counter overflow flag to 1.
- It is UNPREDICTABLE whether a corrected error event occurs when a counter overflows and the overflow flag was previously set to 1.

Otherwise, a corrected error event occurs when the error record records an error as a Corrected error.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUE, bit [7]
When ERR<n>FR.UE == '11':

In-band error response on writes enable.

When enabled, responses to writes that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

WUE	Meaning
0b0	In-band error response for uncorrected errors on writes disabled.
0b1	In-band error response for uncorrected errors on writes enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WFI, bit [6]
When ERR<n>FR.FI == '11':

Fault handling interrupt on writes enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as Uncorrected error on writes.
- If the corresponding fault handling interrupt control for Deferred errors, ERR<n>CTLR.WDFI, is not implemented, then the fault handling interrupt is generated for errors recorded as Deferred error on writes.
- If the corresponding fault handling interrupt controls for Deferred errors and corrected error events, ERR<n>CTLR.{WDFI, WCFI}, are not implemented, then the fault handling interrupt is generated for corrected error events on writes.

WFI	Meaning
0b0	Fault handling interrupt on writes disabled.
0b1	Fault handling interrupt on writes enabled.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WUI, bit [5]
When ERR<n>FR.UI == '11':

Uncorrected error recovery interrupt on writes enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on writes.

WUI	Meaning
0b0	Error recovery interrupt on writes disabled.
0b1	Error recovery interrupt on writes enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[4]
When ERR<n>FR.UE == '10':

UE, bit [4]

In-band error response enable.

When ERR<n>FR.UE == 0b10, this control applies to errors arising from both reads and writes.

When enabled, responses to transactions that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

UE	Meaning
0b0	In-band error response for uncorrected errors disabled.
0b1	In-band error response for uncorrected errors enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UE == '11':

RUE, bit [4]

In-band error response on reads enable.

When enabled, responses to reads that detect an error that is not corrected and is not deferred are signaled with an in-band error response (External abort).

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

RUE	Meaning
0b0	In-band error response for uncorrected errors on reads disabled.
0b1	In-band error response for uncorrected errors on reads enabled.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[3]
When ERR<n>FR.FI == '10':

FI, bit [3]

Fault handling interrupt enable.

When ERR<n>FR.FI == 0b10, this control applies to errors on both reads and writes.

When enabled:

- The fault handling interrupt is generated for all errors recorded as Uncorrected error.
- If the fault handling interrupt control for Deferred errors, ERR<n>CTLR.DFI, is not implemented, then the fault handling interrupt is generated for all errors recorded as Deferred error.
- If the fault handling interrupt controls for Deferred errors and corrected error events, ERR<n>CTLR.{DFI, CFI}, are not implemented, then the fault handling interrupt is generated for all corrected error events.

FI	Meaning
0b0	Fault handling interrupt disabled.
0b1	Fault handling interrupt enabled.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.FI == '11':

RFI, bit [3]

Fault handling interrupt on reads enable.

When enabled:

- The fault handling interrupt is generated for errors recorded as Uncorrected error on reads.
- If the corresponding fault handling interrupt control for Deferred errors, ERR<n>CTLR.RDFI, is not implemented, then the fault handling interrupt is generated for errors recorded as Deferred error on reads.
- If the corresponding fault handling interrupt controls for Deferred errors and corrected error events, ERR<n>CTLR.{RDFI, RCFI}, are not implemented, then the fault handling interrupt is generated for corrected error events on reads.

RFI	Meaning
0b0	Fault handling interrupt on reads disabled.
0b1	Fault handling interrupt on reads enabled.

See ERR<n>CTLR.CFI for more information on corrected error events.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit[2]
When ERR<n>FR.UI == '10':

UI, bit [2]

Uncorrected error recovery interrupt enable.

When ERR<n>FR.UI == 0b10, this control applies to errors arising from both reads and writes.

When enabled, the error recovery interrupt is generated for all errors recorded as Uncorrected error.

UI	Meaning
0b0	Error recovery interrupt disabled.
0b1	Error recovery interrupt enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

When ERR<n>FR.UI == '11':

RUI, bit [2]

Uncorrected error recovery interrupt on reads enable.

When enabled, the error recovery interrupt is generated for errors recorded as Uncorrected error on reads.

RUI	Meaning
0b0	Error recovery interrupt on reads disabled.
0b1	Error recovery interrupt on reads enabled.

The interrupt is generated even if the error syndrome is discarded because the error record already records a higher priority error.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMPLEMENTATION DEFINED, bit [1]

Reserved for IMPLEMENTATION DEFINED controls. Must permit SBZP write policy for software.

ED, bit [0]
When ERR<n>FR.ED == '10':

Error reporting and logging enable. When disabled, the node behaves as if error detection and correction are disabled, and no errors are recorded or signaled by the node. Arm recommends that, when disabled, correct error detection and correction codes are written for writes, unless disabled by an IMPLEMENTATION DEFINED control for error injection.

ED	Meaning
0b0	Error reporting disabled.
0b1	Error reporting enabled.

It is IMPLEMENTATION DEFINED whether the node fully disables error detection and correction when reporting is disabled. That is, even with error reporting disabled, the node might continue to silently correct errors. Uncorrected errors might result in corrupt data being silently propagated by the node.

Note

If this node requires initialization after Cold reset to prevent signaling false errors, then Arm recommends this field is set to 0 on Cold reset, meaning errors are not reported from Cold reset. This allows boot software to initialize a node without signaling errors. Software can enable error reporting after the node is initialized. Otherwise, the Cold reset value is IMPLEMENTATION DEFINED. If the Cold reset value is 1, the reset values of other controls in this register are also IMPLEMENTATION DEFINED and should not be UNKNOWN.

The reset behavior of this field is:

- On an Error recovery reset, when RAS System Architecture v2 is implemented and ERR<n>FR.SRV == '1', this field resets to '0'.
- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERR<n>FR.SRV == '1', this field resets to '0'.
  - Otherwise, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>CTLR

ERR<n>CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x008 + (64 * n)	ERR<n>CTLR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>FR, Error Record <n> Feature Register, n = 0 - 65534

The ERR<n>FR characteristics are:

Purpose

Defines whether error record <n> is the first record owned by a node:

- If error record <n> is the first error record owned by a node, then ERR<n>FR.ED is not 0b00.
- If error record <n> is not the first error record owned by a node, then ERR<n>FR.ED is 0b00.

If error record <n> is the first record owned by the node, defines which of the common architecturally-defined features are implemented by the node and, of the implemented features, which are software programmable.

Configuration

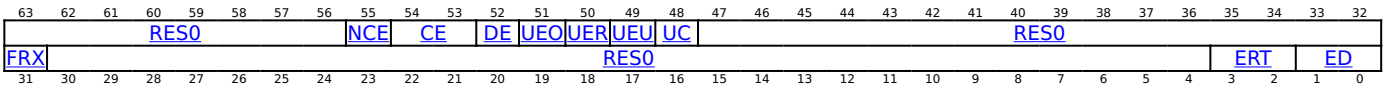
This register is present only when FEAT_RAS is implemented. Otherwise, direct accesses to ERR<n>FR are RES0.

Attributes

ERR<n>FR is a 64-bit register.

Field descriptions

When error record n is not implemented or error record n is not the first error record in the node:



Bits [63:56]

Reserved, RES0.

NCE, bit [55]
When ERR<n>FR.FRX == '1' and ERRFR[FirstRecordOfNode(n)].CEC != '000':

No countable errors. Describes whether this error record supports recording countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCE	Meaning
0b0	Records countable errors.
0b1	Does not record countable errors.

When ERRFR[FirstRecordOfNode(n)].CEC != 0b000, at least one error record owned by the node records countable errors.

Access to this field is RO.

Otherwise:

Reserved, RES0.

CE, bits [54:53]
When ERR<n>FR.FRX == '1':

Corrected Error recording. Describes the types of Corrected errors the error record can record, if any.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DE, bit [52]
When ERR<n>FR.FRX == '1':

Deferred Error recording. Describes whether the error record supports recording Deferred errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Access to this field is RO.

Otherwise:

Reserved, RES0.

UEO, bit [51]
When ERR<n>FR.FRX == '1':

Latent or Restartable Error recording. Describes whether the error record supports recording Latent or Restartable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

Access to this field is RO.

Otherwise:

Reserved, RES0.

UER, bit [50]
When ERR<n>FR.FRX == '1':

Signaled or Recoverable Error recording. Describes whether the error record supports recording Signaled or Recoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

Access to this field is RO.

Otherwise:

Reserved, RES0.

UEU, bit [49]
When ERR<n>FR.FRX == '1':

Unrecoverable Error recording. Describes whether the error record supports recording Unrecoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

Access to this field is RO.

Otherwise:

Reserved, RES0.

UC, bit [48]
When ERR<n>FR.FRX == '1':

Uncontainable Error recording. Describes whether the error record supports recording Uncontainable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [47:32]

Reserved, RES0.

FRX, bit [31]
When error record n is implemented, RAS System Architecture v2 is implemented, and ERR<n>FR.ERT == '00':

Feature Register extension. Defines whether ERR<n>FR[63:48] describe architecturally-defined properties of this error record, including the supported error types.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FRX	Meaning
0b0	ERR<n>FR[63:48] are RES0.
0b1	ERR<n>FR[63:48] are defined by the architecture.

If ERR<n>FR.FRX is 0, error record <n> is implemented, and ERRFR[FirstRecordOfNode(n)].FRX is 1, then ERRFR[FirstRecordOfNode(n)][63:48] describe the architecturally-defined properties of all error records owned by the node.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [30:4]

Reserved, RES0.

ERT, bits [3:2]
When RAS System Architecture v2 is implemented:

Error Record Type. Defines the type of error record.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ERT	Meaning
0b00	Error record <n> not implemented or is a normal record that is not the first error record of the node.
0b01	Error record <n> is a continuation record of the previous error record, <n-1>.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

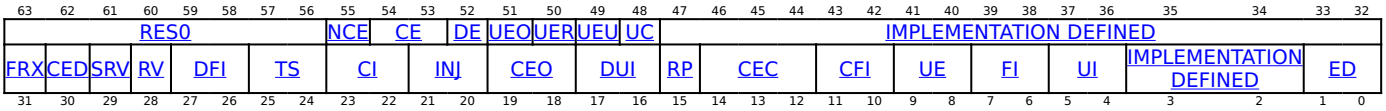
ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not the first error record owned the node.

ED	Meaning
0b00	Error record <n> is not implemented or is not the first error record owned by the node.

Access to this field is RO.

When error record n is the first error record in the node:



Bits [63:56]
When ERR<n>FR.FRX == '1':

Reserved, RES0.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

NCE, bit [55]
When RAS System Architecture v2 is implemented, ERR<n>FR.FRX == '1', and ERR<n>FR.CEC != '000':

No countable errors. Describes whether this error record supports recording countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NCE	Meaning
0b0	Records countable errors.
0b1	Does not record countable errors.

When ERR<n>FR.CEC != 0b000, at least one error record owned by the node records countable errors.

Access to this field is RO.

When ERR<n>FR.FRX == '1':

Reserved, RES0.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

CE, bits [54:53]
When ERR<n>FR.FRX == '1':

Corrected Error recording. Describes the types of Corrected errors the node can record, if any.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CE	Meaning
0b00	Does not record Corrected errors.
0b01	Records only transient or persistent Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to either 0b01 or 0b11.
0b10	Records only non-specific Corrected errors. That is, Corrected errors recorded by setting ERR<n>STATUS.CE to 0b10.
0b11	Records all types of Corrected error.

Access to this field is RO.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

DE, bit [52]
When ERR<n>FR.FRX == '1':

Deferred Error recording. Describes whether the node supports recording Deferred errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DE	Meaning
0b0	Does not record Deferred errors.
0b1	Records Deferred errors.

Access to this field is RO.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEO, bit [51]
When ERR<n>FR.FRX == '1':

Latent or Restartable Error recording. Describes whether the node supports recording Latent or Restartable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEO	Meaning
0b0	Does not record Latent or Restartable errors.
0b1	Records Latent or Restartable errors.

Access to this field is RO.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UER, bit [50]
When ERR<n>FR.FRX == '1':

Signaled or Recoverable Error recording. Describes whether the node supports recording Signaled or Recoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UER	Meaning
0b0	Does not record Signaled or Recoverable errors.
0b1	Records Signaled or Recoverable errors.

Access to this field is RO.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UEU, bit [49]
When ERR<n>FR.FRX == '1':

Unrecoverable Error recording. Describes whether the node supports recording Unrecoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEU	Meaning
0b0	Does not record Unrecoverable errors.
0b1	Records Unrecoverable errors.

Access to this field is RO.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

UC, bit [48]
When ERR<n>FR.FRX == '1':

Uncontainable Error recording. Describes whether the node supports recording Uncontainable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UC	Meaning
0b0	Does not record Uncontainable errors.
0b1	Records Uncontainable errors.

Access to this field is RO.

Otherwise:

Reserved for identifying IMPLEMENTATION DEFINED controls.

IMPLEMENTATION DEFINED, bits [47:32]

Reserved for identifying IMPLEMENTATION DEFINED controls.

FRX, bit [31]
When RAS System Architecture v1p1 is implemented:

Feature Register extension.

Defines whether ERR<n>FR[63:48] describe architecturally-defined properties of this error record or node, including the supported error types, or describe IMPLEMENTATION DEFINED properties.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FRX	Meaning
0b0	ERR<n>FR[63:48] are IMPLEMENTATION DEFINED.
0b1	ERR<n>FR[63:48] are defined by the architecture.

When ERR<n>FR.FRX is 1:

- If RAS System Architecture v2 is implemented and ERR<m>FR.FRX is 1 for other error records <m> owned by the same node, then ERR<n>FR[63:48] describe the architecturally-defined properties of error record <n> only, and ERR<m>FR[63:48] describe the properties for error record <m>.
- Otherwise, ERR<n>FR[63:48] describe the architecturally-defined properties of all error records owned by the node.

Access to this field is RO.

Otherwise:

Reserved, RES0.

CED, bit [30]
When RAS System Architecture v2 is implemented and ERR<n>FR.CEC != '000':

Error counter disable. Indicates whether the node implements a control to disable any implemented Corrected error counters.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CED	Meaning
0b0	Error counter disable control is not implemented and the error counter(s) are always enabled. ERR<n>CTLR.CED is RES0.
0b1	Enabling and disabling of error counter(s) is supported and controlled by ERR<n>CTLR.CED.

Access to this field is RO.

Otherwise:

Reserved, RES0.

SRV, bit [29]
When RAS System Architecture v2 is implemented:

Status Reset Value. Indicates how node <n> and each error record <m> owned by node <n> is reset.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SRV	Meaning
0b0	Node <n> and each error record <m> owned by node <n> are reset as follows: • ERR<m>STATUS.{AV, V, MV} are set to {0, 0, 0} on a Cold reset and preserved on Error Recovery reset. • ERR<n>CTLR.ED is set to an IMPLEMENTATION DEFINED value on a Cold reset and preserved on Error Recovery reset.
0b1	Node <n> and each error record <m> owned by node <n> are reset as follows: • ERR<m>STATUS.{AV, V, MV} are set to architecturally UNKNOWN values on a Cold reset and preserved on Error Recovery reset. • ERR<n>CTLR.ED is set to 0 on both Cold reset and Error Recovery reset.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

RV, bit [28]
When RAS System Architecture v2 is implemented:

Reset Valid. Indicates whether each error record <m> implemented by the node includes the Reset Valid flags, ERR<m>STATUS.{RV, RV2}.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RV	Meaning
0b0	ERR<m>STATUS.{RV, RV2} are RES0.
0b1	ERR<m>STATUS.{RV, RV2} are R/W1C bits. See ERR<m>STATUS.{RV, RV2} for more information.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DFI, bits [27:26]
When RAS System Architecture v2 is implemented and !(ERR<n>FR.FI IN {'0x'}):

Fault handling interrupt for deferred errors control. Indicates whether the enabling and disabling of fault handling interrupts on deferred errors is supported by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on deferred errors. ERR<n>CTLR.DFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DFI.
0b11	Enabling and disabling of fault handling interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDFI for writes and ERR<n>CTLR.RDFI for reads.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

TS, bits [25:24]

Timestamp Extension. Indicates whether, for each error record <m> owned by this node, ERR<m>MISC3 is used as the timestamp register, and, if it is, the timebase used by the timestamp.

The value of this field is an IMPLEMENTATION DEFINED choice of:

TS	Meaning
0b00	Does not support a timestamp register.
0b01	Implements a timestamp register in ERR<n>MISC3 for each error record <m> owned by the node. The timestamp uses the same timebase as the system Generic Timer. Note For an error record that has an affinity to a PE, this is the same timer that is visible through CNTPCT_EL0 at the highest Exception level on that PE.
0b10	Implements a timestamp register in ERR<m>MISC3 for each error record <m> owned by the node. The timestamp uses an IMPLEMENTATION DEFINED timebase.

All other values are reserved.

Access to this field is RO.

CI, bits [23:22]

Critical error interrupt. Indicates whether the critical error interrupt and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CI	Meaning
0b00	Does not support the critical error interrupt. ERR<n>CTLR.CI is RES0.
0b01	Critical error interrupt is supported and always enabled. ERR<n>CTLR.CI is RES0.
0b10	Critical error interrupt is supported and controllable using ERR<n>CTLR.CI.

All other values are reserved.

Access to this field is RO.

INJ, bits [21:20]

Fault Injection Extension. Indicates whether the Common Fault Injection Model Extension is implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INJ	Meaning
0b00	Does not support the Common Fault Injection Model Extension.
0b01	Supports the Common Fault Injection Model Extension. See ERR<n>PFGF for more information.

All other values are reserved.

Access to this field is RO.

CEO, bits [19:18]
When ERR<n>FR.CEC != '000':

Corrected Error overwrite. Indicates the behavior of the node when a second or subsequent Corrected error is recorded and a first Corrected error has previously been recorded by an error record <m> owned by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CEO	Meaning
0b00	Keeps the previous error syndrome.
0b01	If ERR<m>STATUS.OF is 1 before the Corrected error is counted, then the error record keeps the previous syndrome. Otherwise the previous syndrome is overwritten.

All other values are reserved.

The second or subsequent Corrected error is counted by the Corrected error counter, regardless of the value of this field. If counting the error causes unsigned overflow of the counter, then ERR<m>STATUS.OF is set to 1.

This means that, if no other error is subsequently recorded that overwrites the syndrome:

- If ERR<n>FR.CEO is 0b00, the error record holds the syndrome for the first recorded Corrected error.
- If ERR<n>FR.CEO is 0b01, the error record holds the syndrome for the most recently recorded Corrected error before the counter overflows.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DUI, bits [17:16]
When ERR<n>FR.UI != '00':

Error recovery interrupt for deferred errors control. Indicates whether the enabling and disabling of error recovery interrupts on deferred errors is supported by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DUI	Meaning
0b00	Does not support the enabling and disabling of error recovery interrupts on deferred errors. ERR<n>CTLR.DUI is RES0.
0b10	Enabling and disabling of error recovery interrupts on deferred errors is supported and controllable using ERR<n>CTLR.DUI.
0b11	Enabling and disabling of error recovery interrupts on deferred errors is supported, and controllable using ERR<n>CTLR.WDUI for writes and ERR<n>CTLR.RDUI for reads.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

RP, bit [15]
When ERR<n>FR.CEC != '000':

Repeat counter. Indicates whether the node implements a second Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RP	Meaning
0b0	Implements a single Corrected error counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.
0b1	Implements a first (repeat) counter and a second (other) counter in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors. The repeat counter is the same size as the primary error counter.

Access to this field is RO.

Otherwise:

Reserved, RES0.

CEC, bits [14:12]

Corrected Error Counter. Indicates whether the node implements the standard format Corrected error counter mechanisms in ERR<m>MISC0 for each error record <m> owned by the node that can record countable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CEC	Meaning
0b000	Does not implement the standard format Corrected error counter model.
0b010	Implements an 8-bit Corrected error counter in ERR<m>MISC0[39:32] for each error record <m> owned by the node that can record countable errors.
0b100	Implements a 16-bit Corrected error counter in ERR<m>MISC0[47:32] for each error record <m> owned by the node that can record countable errors.

All other values are reserved.

Note

Implementations might include other error counter models, or might include the standard format model and not indicate this in ERR<n>FR.

Access to this field is RO.

CFI, bits [11:10]
When !(ERR<n>FR.FI IN {'0x'}):

Fault handling interrupt for corrected errors control. Indicates whether the enabling and disabling of fault handling interrupts on corrected errors is supported by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CFI	Meaning
0b00	Does not support the enabling and disabling of fault handling interrupts on corrected errors. ERR<n>CTLR.CFI is RES0.
0b10	Enabling and disabling of fault handling interrupts on corrected errors is supported and controllable using ERR<n>CTLR.CFI.
0b11	Enabling and disabling of fault handling interrupts on corrected errors is supported, and controllable using ERR<n>CTLR.WCFI for writes and ERR<n>CTLR.RCFI for reads.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

UE, bits [9:8]

In-band error response (External abort). Indicates whether the in-band error response and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UE	Meaning
0b00	Does not support the in-band error response. ERR<n>CTLR.UE is RES0.
0b01	In-band error response is supported and always enabled. ERR<n>CTLR.UE is RES0.
0b10	In-band error response is supported and controllable using ERR<n>CTLR.UE.
0b11	In-band error response is supported, and controllable using ERR<n>CTLR.WUE for writes and ERR<n>CTLR.RUE for reads.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as Deferred error, but is not deferred to the Requester, will signal an in-band error response to the Requester.

Access to this field is RO.

FI, bits [7:6]

Fault handling interrupt. Indicates whether the fault handling interrupt and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FI	Meaning
0b00	Does not support the fault handling interrupt. ERR<n>CTLR.FI is RES0.
0b01	Fault handling interrupt is supported and always enabled. ERR<n>CTLR.FI is RES0.
0b10	Fault handling interrupt is supported and controllable using ERR<n>CTLR.FI.
0b11	Fault handling interrupt is supported, and controllable using ERR<n>CTLR.WFI for writes and ERR<n>CTLR.RFI for reads.

Access to this field is RO.

UI, bits [5:4]

Error recovery interrupt for uncorrected errors. Indicates whether the error handling interrupt and associated controls are implemented by the node.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UI	Meaning
0b00	Does not support the error handling interrupt. ERR<n>CTLR.UI is RES0.
0b01	Error handling interrupt is supported and always enabled. ERR<n>CTLR.UI is RES0.
0b10	Error handling interrupt is supported and controllable using ERR<n>CTLR.UI.
0b11	Error handling interrupt is supported, and controllable using ERR<n>CTLR.WUI for writes and ERR<n>CTLR.RUI for reads.

Access to this field is RO.

IMPLEMENTATION DEFINED, bits [3:2]

IMPLEMENTATION DEFINED.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is a normal record and the first record owned the node, and whether the node implements the controls for enabling and disabling error reporting and logging.

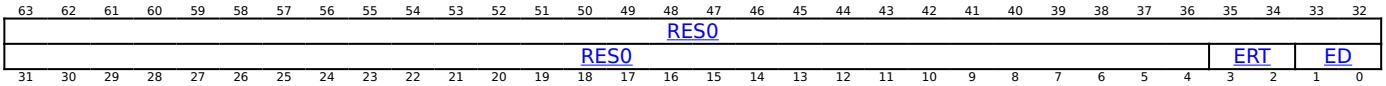
The value of this field is an IMPLEMENTATION DEFINED choice of:

ED	Meaning
0b01	Error reporting and logging always enabled. ERR<n>CTLR.ED is RES0.
0b10	Error reporting and logging is controllable using ERR<n>CTLR.ED.

All other values are reserved.

Access to this field is RO.

When RAS System Architecture v2 is implemented and error record <n> is a proxy for a RAS agent:



Bits [63:4]

Reserved, RES0.

ERT, bits [3:2]

Error Record Type. Defines the type of error record.

ERT	Meaning
0b01	Error record is a proxy for a RAS agent.

All other values are reserved.

Access to this field is RO.

ED, bits [1:0]

Error reporting and logging. Indicates error record <n> is not a true error record.

ED	Meaning
0b11	Error record <n> is not an error record.

Access to this field is RO.

Accessing ERR<n>FR

ERR<n>FR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x000 + (64 * n)	ERR<n>FR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>MISC0, Error Record <n> Miscellaneous Register 0, n = 0 - 65534

The ERR<n>MISC0 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record <n> implements a standard format Corrected error counter or counters (ERRFR[FirstRecordOfNode(n)].CEC != 0b000), then it is IMPLEMENTATION DEFINED whether error record <n> can record countable errors, and:

- If error record <n> records countable errors, then ERR<n>MISC0 implements the standard format Corrected error counter or counters for error record <n>.
- If error record <n> does not record countable errors, then it is recommended that the fields in ERR<n>MISC0 defined for the standard format counter or counters are RES0. That is, the fields behave like counters that never count.

Configuration

This register is present only when FEAT_RAS is implemented and error record n is implemented. Otherwise, direct accesses to ERR<n>MISC0 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC0, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Note

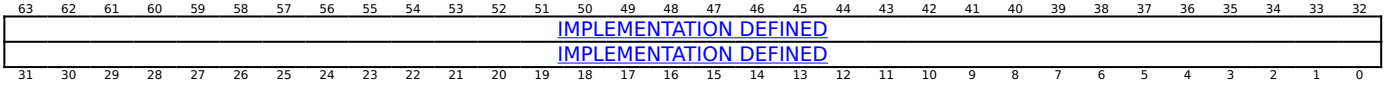
Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC0 is a 64-bit register.

Field descriptions

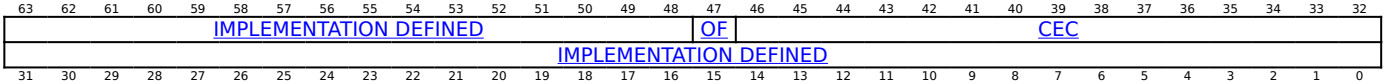
When ERRFR[FirstRecordOfNode(n)].CEC == '000' or error record n does not record countable errors:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == '100', ERRFR[FirstRecordOfNode(n)].RP == '0', and error record n records countable errors:



IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OF, bit [47]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [46:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

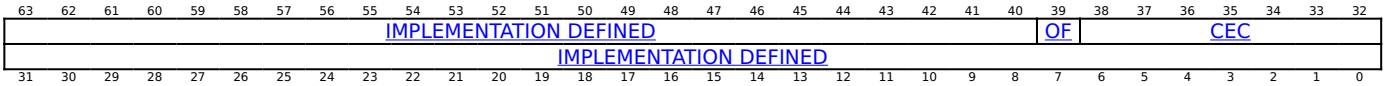
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == '010', ERRFR[FirstRecordOfNode(n)].RP == '0', and error record n records countable errors:



IMPLEMENTATION DEFINED, bits [63:40]

IMPLEMENTATION DEFINED syndrome.

OF, bit [39]

Sticky overflow bit. Set to 1 when ERR<n>MISC0.CEC is incremented and wraps through zero.

OF	Meaning
0b0	Counter has not overflowed.
0b1	Counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CEC, bits [38:32]

Corrected error count. Incremented for each Corrected error. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are counted.

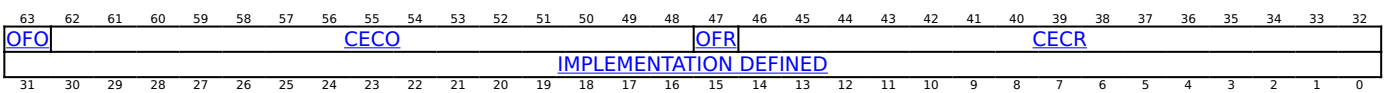
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == '100', ERRFR[FirstRecordOfNode(n)].RP == '1', and error record n records countable errors:



OFO, bit [63]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [62:48]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [47]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [46:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

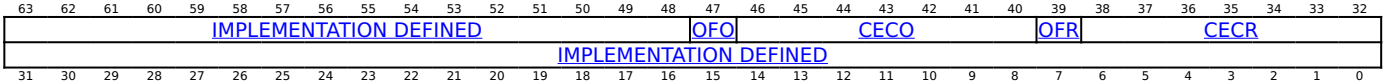
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

When ERRFR[FirstRecordOfNode(n)].CEC == '010', ERRFR[FirstRecordOfNode(n)].RP == '1', and error record n records countable errors:



IMPLEMENTATION DEFINED, bits [63:48]

IMPLEMENTATION DEFINED syndrome.

OFO, bit [47]

Sticky overflow bit, other. Set to 1 when ERR<n>MISC0.CECO is incremented and wraps through zero.

OFO	Meaning
0b0	Other counter has not overflowed.
0b1	Other counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECO, bits [46:40]

Corrected error count, other. Incremented for each countable error that is not accounted for by incrementing ERR<n>MISC0.CECR.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

OFR, bit [39]

Sticky overflow bit, repeat. Set to 1 when ERR<n>MISC0.CECR is incremented and wraps through zero.

OFR	Meaning
0b0	Repeat counter has not overflowed.
0b1	Repeat counter has overflowed.

A direct write that modifies this field might indirectly set ERR<n>STATUS.OF to an UNKNOWN value and a direct write to ERR<n>STATUS.OF that clears it to zero might indirectly set this field to an UNKNOWN value.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

CECR, bits [38:32]

Corrected error count, repeat. Incremented for the first countable error, which also records other syndrome for the error, and subsequently for each countable error that matches the recorded other syndrome. Corrected errors are countable errors. It is IMPLEMENTATION DEFINED and might be UNPREDICTABLE whether Deferred and Uncorrected errors are countable errors.

Note

For example, the other syndrome might include the set and way information for an error detected in a cache. This might be recorded in the IMPLEMENTATION DEFINED ERR<n>MISC<m> fields on a first Corrected error. ERR<n>MISC0.CECR is then incremented for each subsequent Corrected Error in the same set and way.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC0

Reads from ERR<n>MISC0 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x020 + (64 * n)	ERR<n>MISC0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>MISC1, Error Record <n> Miscellaneous Register 1, n = 0 - 65534

The ERR<n>MISC1 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when FEAT_RAS is implemented and error record n is implemented. Otherwise, direct accesses to ERR<n>MISC1 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC1, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

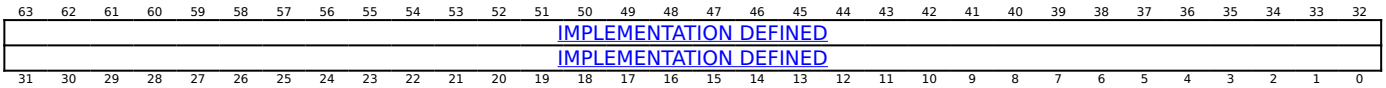
Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC1

Reads from ERR<n>MISC1 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x028 + (64 * n)	ERR<n>MISC1

Accesses to this register are RW.

ERR<n>MISC2, Error Record <n> Miscellaneous Register 2, n = 0 - 65534

The ERR<n>MISC2 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

Configuration

This register is present only when FEAT_RAS is implemented and ((an implementation implements ERR<n>MISC2 or RAS System Architecture v1p1 is implemented) and error record n is implemented). Otherwise, direct accesses to ERR<n>MISC2 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC2, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Arm recommends that if RAS System Architecture v1.1 is not implemented, then ERR<n>MISC2 does not require zeroing to return the record to a quiescent state.

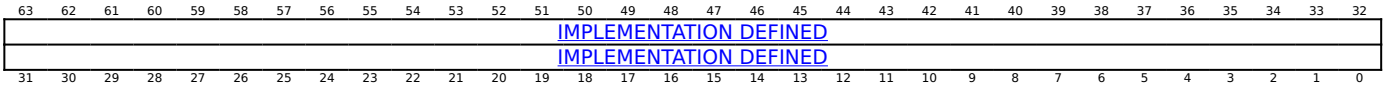
Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC2 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC2

Reads from ERR<n>MISC2 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x030 + (64 * n)	ERR<n>MISC2

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>MISC3, Error Record <n> Miscellaneous Register 3, n = 0 - 65534

The ERR<n>MISC3 characteristics are:

Purpose

IMPLEMENTATION DEFINED error syndrome register. The miscellaneous syndrome registers might contain:

- Information to locate where the error was detected.
- If the error was detected within a FRU, the identity of the FRU.
- A Corrected error counter or counters.
- Other state information not present in the corresponding status and address registers.

If the node that owns error record n supports the RAS Timestamp Extension (ERRFR[FirstRecordOfNode(n)].TS != 0b00), then ERR<n>MISC3 contains the timestamp value for error record n when the error was detected. Otherwise the contents of ERR<n>MISC3 are IMPLEMENTATION DEFINED.

Configuration

This register is present only when FEAT_RAS is implemented and ((an implementation implements ERR<n>MISC3 or RAS System Architecture v1p1 is implemented) and error record n is implemented). Otherwise, direct accesses to ERR<n>MISC3 are RES0.

ERRFR[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record, then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>MISC3, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Arm recommends that if RAS System Architecture v1.1 is not implemented, then ERR<n>MISC3 does not require zeroing to return the record to a quiescent state.

Note

Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>MISC3 is a 64-bit register.

Field descriptions

When ERRFR[FirstRecordOfNode(n)].TS != '00':

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED syndrome.

Accessing ERR<n>MISC3

Reads from ERR<n>MISC3 return an IMPLEMENTATION DEFINED value and writes have IMPLEMENTATION DEFINED behavior.

If the Common Fault Injection Mechanism is implemented by the node that owns this error record, and ERRPFGF[FirstRecordOfNode(n)].MV is 1, then some parts of this register are read/write when ERR<n>STATUS.MV is 0. See ERR<n>PFGF.MV for more information.

For other parts of this register, or if the Common Fault Injection Mechanism is not implemented, then Arm recommends that:

- Miscellaneous syndrome for multiple errors, such as a corrected error counter, is read/write.
- When ERR<n>STATUS.MV is 1, the miscellaneous syndrome specific to the most recently recorded error ignores writes.

Note

These recommendations allow a counter to be reset in the presence of a persistent error, while preventing specific information, such as that identifying a FRU, from being lost if an error is detected while the previous error is being logged.

ERR<n>MISC3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x038 + (64 * n)	ERR<n>MISC3

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>PFGCDN, Error Record <n> Pseudo-fault Generation Countdown Register, n = 0 - 65534

The ERR<n>PFGCDN characteristics are:

Purpose

Generates one of the errors enabled in the corresponding ERR<n>PFGCTL register.

Configuration

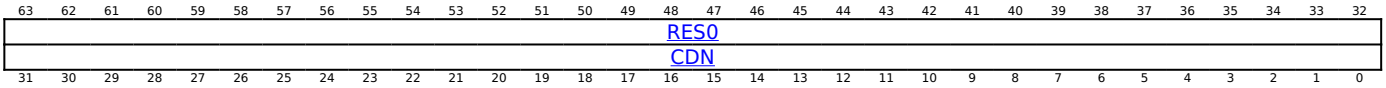
This register is present only when FEAT_RAS is implemented, error record n is implemented, the node that owns error record n implements the Common Fault Injection Model Extension, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>PFGCDN are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCDN is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

CDN, bits [31:0]

Countdown value.

This field is copied to Error Generation Counter when either:

- Software writes 1 to ERR<n>PFGCTL.CDNEN.
- The Error Generation Counter decrements to zero and ERR<n>PFGCTL.R is 1.

While ERR<n>PFGCTL.CDNEN is 1 and the Error Generation Counter is nonzero, the counter decrements by 1 for each cycle at an IMPLEMENTATION DEFINED clock rate. When the counter reaches zero, one of the errors enabled in the ERR<n>PFGCTL register is generated.

Note

The current Error Generation Counter value is not visible to software.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing ERR<n>PFGCDN

This section shows the offset of ERR<n>PFGCDN in an error record group when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, or ERR<n>PFGCDN is accessed in a fault injection group, see 'RAS memory-mapped register views' for the offset of ERR<n>PFGCDN.

ERR<n>PFGCDN can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x810 + (64 * n)	ERR<n>PFGCDN

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>PFGCTL, Error Record <n> Pseudo-fault Generation Control Register, n = 0 - 65534

The ERR<n>PFGCTL characteristics are:

Purpose

Enables controlled fault generation.

Configuration

This register is present only when FEAT_RAS is implemented, error record n is implemented, the node that owns error record n implements the Common Fault Injection Model Extension, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>PFGCTL are RES0.

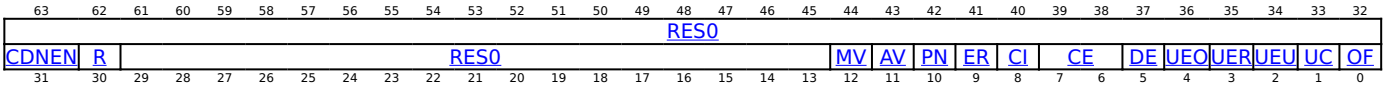
ERR<n>PFGF describes the Common Fault Injection features implemented by the node.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGCTL is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

CDNEN, bit [31]

Countdown Enable. Controls transfers of the value held in ERR<n>PFGCDN to the Error Generation Counter and enables this counter.

CDNEN	Meaning
0b0	The Error Generation Counter is disabled.
0b1	The Error Generation Counter is enabled. On a write of 1 to this field, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

R, bit [30]
When ERR<n>PFGF.R == '1':

Restart. Controls whether the Error Generation Counter restarts or stops counting on reaching zero.

R	Meaning
0b0	On reaching zero, the Error Generation Counter will stop counting.
0b1	On reaching zero, the Error Generation Counter is set to ERR<n>PFGCDN.CDN.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:13]

Reserved, RES0.

MV, bit [12]
When ERR<n>PFGF.MV == '1':

Miscellaneous syndrome. The value written to ERR<n>STATUS.MV when an injected error is recorded.

MV	Meaning
0b0	ERR<n>STATUS.MV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.MV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the node always sets ERR<n>STATUS.MV to 1 when an injected error is recorded, access to this field is RAO/WI.

When the node always sets ERR<n>STATUS.MV to 1 when an injected error is recorded and this field is RAO/WI:

Reserved, RAO/WI.

Otherwise:

Reserved, RES0.

AV, bit [11]
When ERR<n>PFGF.AV == '1':

Address syndrome. The value written to ERR<n>STATUS.AV when an injected error is recorded.

AV	Meaning
0b0	ERR<n>STATUS.AV is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.AV is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to an architecturally UNKNOWN value.

When the node always sets ERR<n>STATUS.AV to 1 when an injected error is recorded, access to this field is RAO/WI.

When the node always sets ERR<n>STATUS.AV to 1 when an injected error is recorded and this field is RAO/WI:

Reserved, RAO/WI.

Otherwise:

Reserved, RES0.

PN, bit [10]
When ERR<n>PFGF.PN == '1':

Poison flag. The value written to ERR<n>STATUS.PN when an injected error is recorded.

PN	Meaning
0b0	ERR<n>STATUS.PN is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.PN is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [9]
When ERR<n>PFGF.ER == '1':

Error Reported flag. The value written to ERR<n>STATUS.ER when an injected error is recorded.

ER	Meaning
0b0	ERR<n>STATUS.ER is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.ER is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CI, bit [8]
When ERR<n>PFGF.CI == '1':

Critical Error flag. The value written to ERR<n>STATUS.CI when an injected error is recorded.

CI	Meaning
0b0	ERR<n>STATUS.CI is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.CI is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CE, bits [7:6]
When ERR<n>PFGF.CE != '00':

Corrected Error generation enable. Controls the type of injected Corrected error generated by the fault injection feature of the node.

CE	Meaning	Applies when
0b00	An injected Corrected error will not be generated by the fault injection feature of the node.	
0b01	An injected non-specific Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b10 when the injected error is recorded.	When ERR<n>PFGF.CE == '01'
0b10	An injected transient Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b01 when the injected error is recorded.	When ERR<n>PFGF.CE == '11'
0b11	An injected persistent Corrected error is generated in the fault injection state. ERR<n>STATUS.CE is set to 0b11 when the injected error is recorded.	When ERR<n>PFGF.CE == '11'

The set of permitted values for this field is defined by ERR<n>PFGF.CE.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DE, bit [5]
When ERR<n>PFGF.DE == '1':

Deferred Error generation enable. Controls whether an injected Deferred error is generated by the fault injection feature of the node.

DE	Meaning
0b0	An injected Deferred error will not be generated by the fault generation feature of the node.
0b1	An injected Deferred error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEO, bit [4]
When ERR<n>PFGF.UEO == '1':

Latent or Restartable Error generation enable. Controls whether an injected Latent or Restartable error is generated by the fault injection feature of the node.

UEO	Meaning
0b0	An injected Latent or Restartable error will not be generated by the fault generation feature of the node.
0b1	An injected Latent or Restartable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UER, bit [3]
When ERR<n>PFGF.UER == '1':

Signaled or Recoverable Error generation enable. Controls whether an injected Signaled or Recoverable error is generated by the fault injection feature of the node.

UER	Meaning
0b0	An injected Signaled or Recoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Signaled or Recoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEU, bit [2]
When ERR<n>PFGF.UEU == '1':

Unrecoverable Error generation enable. Controls whether an injected Unrecoverable error is generated by the fault injection feature of the node.

UEU	Meaning
0b0	An injected Unrecoverable error will not be generated by the fault generation feature of the node.
0b1	An injected Unrecoverable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UC, bit [1]
When ERR<n>PFGF.UC == '1':

Uncontainable Error generation enable. Controls whether an injected Uncontainable error is generated by the fault injection feature of the node.

UC	Meaning
0b0	An injected Uncontainable error will not be generated by the fault generation feature of the node.
0b1	An injected Uncontainable error is generated in the fault injection state.

The node enters the fault injection state when the Error Generation Counter decrements to zero. It is IMPLEMENTATION DEFINED whether the injected error is generated when the error is generated on an access to the component in the fault injection state and the data is not consumed.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

OF, bit [0]
When ERR<n>PFGF.OF == '1':

Overflow flag. The value written to ERR<n>STATUS.OF when an injected error is recorded.

OF	Meaning
0b0	ERR<n>STATUS.OF is set to 0 when an injected error is recorded.
0b1	ERR<n>STATUS.OF is set to 1 when an injected error is recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing ERR<n>PFGCTL

This section shows the offset of ERR<n>PFGCTL in an error record group when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, or ERR<n>PFGCTL is accessed in a fault injection group, see 'RAS memory-mapped register views' for the offset of ERR<n>PFGCTL.

ERR<n>PFGCTL can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x808 + (64 * n)	ERR<n>PFGCTL

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>PFGF, Error Record <n> Pseudo-fault Generation Feature Register, n = 0 - 65534

The ERR<n>PFGF characteristics are:

Purpose

Defines which common architecturally-defined fault generation features are implemented.

Configuration

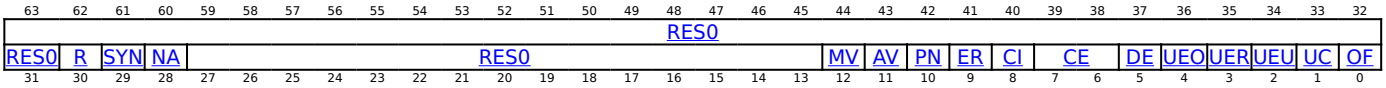
This register is present only when FEAT_RAS is implemented, error record n is implemented, the node that owns error record n implements the Common Fault Injection Model Extension, and error record n is the first error record in the node. Otherwise, direct accesses to ERR<n>PFGF are RES0.

ERR<n>FR describes the features implemented by the node.

Attributes

ERR<n>PFGF is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

R, bit [30]

Restartable. Support for Error Generation Counter restart mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

R	Meaning
0b0	The node does not support this feature. ERR<n>PFGCTL.R is RES0.
0b1	Error Generation Counter restart mode is implemented and is controlled by ERR<n>PFGCTL.R. ERR<n>PFGCTL.R is a read/write field.

Access to this field is RO.

SYN, bit [29]

Syndrome. Fault syndrome injection.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SYN	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.{IERR, SERR} to IMPLEMENTATION DEFINED values. ERR<n>STATUS.{IERR, SERR} are UNKNOWN when ERR<n>STATUS.V is 0.
0b1	When an injected error is recorded, the node does not update the ERR<n>STATUS.{IERR, SERR} fields. ERR<n>STATUS.{IERR, SERR} are writable when ERR<n>STATUS.V is 0.

Note

If ERR<n>PFGF.SYN is 1 then software can write specific values into the ERR<n>STATUS.{IERR, SERR} fields when setting up a fault injection event. The sets of values that can be written to these fields is IMPLEMENTATION DEFINED.

Access to this field is RO.

NA, bit [28]

No access required. Defines whether this component fakes detection of the error on an access to the component or spontaneously in the fault injection state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NA	Meaning
0b0	The component fakes detection of the error on an access to the component.
0b1	The component fakes detection of the error spontaneously in the fault injection state.

Access to this field is RO.

Bits [27:13]

Reserved, RES0.

MV, bit [12]

Miscellaneous syndrome.

Defines whether software can control all or part of the syndrome recorded in the ERR<n>MISC<m> registers when an injected error is recorded.

It is IMPLEMENTATION DEFINED which ERR<n>MISC<m> syndrome fields, if any, are updated by the node when an injected error is recorded. Some syndrome fields might always be updated by the node when an error, including an injected error, is recorded. For example, a corrected error counter might always be updated when any countable error, including a injected countable error, is recorded.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MV	Meaning
0b0	When an injected error is recorded, the node might update the ERR<n>MISC<m> registers: • If any syndrome is recorded by the node in the ERR<n>MISC<m> registers, then ERR<n>STATUS.MV is set to 1. • Otherwise, ERR<n>STATUS.MV is unchanged. If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV might be RAO/WI. Otherwise ERR<n>PFGCTL.MV is RES0.
0b1	When an injected error is recorded, the node might update some, but not all ERR<n>MISC<m> syndrome fields: • If any syndrome is recorded by the node in the ERR<n>MISC<m> registers, then ERR<n>STATUS.MV is set to 1. • Otherwise, ERR<n>STATUS.MV is set to ERR<n>PFGCTL.MV. ERR<n>MISC<m> syndrome fields that are not updated by the node are writable when ERR<n>STATUS.MV is 0. If the node always sets ERR<n>STATUS.MV to 1 when recording an injected error then ERR<n>PFGCTL.MV is RAO/WI. Otherwise ERR<n>PFGCTL.MV is a read/write field.

If ERR<n>PFGF.MV is 1, software can write specific additional syndrome values into the ERR<n>MISC<m> registers when setting up a fault injection event. The permitted values that can be written to these registers are IMPLEMENTATION DEFINED.

Access to this field is RO.

AV, bit [11]

Address syndrome. Defines whether software can control the address recorded in ERR<n>ADDR when an injected error is recorded.

The value of this field is an IMPLEMENTATION DEFINED choice of:

AV	Meaning
0b0	When an injected error is recorded, the node might record an address in ERR<n>ADDR. If an address is recorded in ERR<n>ADDR, then ERR<n>STATUS.AV is set to 1. Otherwise, ERR<n>ADDR and ERR<n>STATUS.AV are unchanged. If the node always records an address and sets ERR<n>STATUS.AV to 1 when recording an injected error then ERR<n>PFGCTL.AV might be RAO/WI. Otherwise ERR<n>PFGCTL.AV is RES0.
0b1	When an injected error is recorded, the node does not update ERR<n>ADDR and does one of: • Sets ERR<n>STATUS.AV to ERR<n>PFGCTL.AV. ERR<n>PFGCTL.AV is a read/write field. • Sets ERR<n>STATUS.AV to 1. ERR<n>PFGCTL.AV is RAO/WI. ERR<n>ADDR is writable when ERR<n>STATUS.AV is 0.

If ERR<n>PFGF.AV is 1 then software can write a specific address value into ERR<n>ADDR when setting up a fault injection event.

Access to this field is RO.

PN, bit [10]
When the node supports this flag:

Poison flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.PN status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PN	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.PN to 1. ERR<n>PFGCTL.PN is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.PN is set to ERR<n>PFGCTL.PN. ERR<n>PFGCTL.PN is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.PN bit.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

ER, bit [9]
When the node supports this flag:

Error Reported flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.ER status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ER	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.ER according to the architecture-defined rules for setting the ER field. ERR<n>PFGCTL.ER is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.ER is set to ERR<n>PFGCTL.ER. This behavior replaces the architecture-defined rules for setting the ER bit. ERR<n>PFGCTL.ER is a read/write field.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

CI, bit [8]
When the node supports this flag:

Critical Error flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.CI status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CI	Meaning
0b0	When an injected error is recorded, it is IMPLEMENTATION DEFINED whether the node sets ERR<n>STATUS.CI to 1. ERR<n>PFGCTL.CI is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.CI is set to ERR<n>PFGCTL.CI. ERR<n>PFGCTL.CI is a read/write field.

This behavior replaces the architecture-defined rules for setting the ERR<n>STATUS.CI bit.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

CE, bits [7:6]
When the node supports this type of error:

Corrected Error generation. Describes the types of Corrected error that the fault generation feature of the node can generate.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CE	Meaning
0b00	The fault generation feature of the node does not generate Corrected errors. ERR<n>PFGCTL.CE is RES0.
0b01	The fault generation feature of the node allows generation of a non-specific Corrected error, that is, a Corrected error that is recorded by setting ERR<n>STATUS.CE to 0b10. ERR<n>PFGCTL.CE is a read/write field. The values 0b10 and 0b11 in ERR<n>PFGCTL.CE are reserved.
0b11	The fault generation feature of the node allows generation of transient or persistent Corrected errors, that is, Corrected errors that are recorded by setting ERR<n>STATUS.CE to 0b01 or 0b11 respectively. ERR<n>PFGCTL.CE is a read/write field. The value 0b01 in ERR<n>PFGCTL.CE is reserved.

All other values are reserved.

If ERR<n>FR.FRX is 1 then ERR<n>FR.CE indicates whether the node supports this type of error.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

DE, bit [5]
When the node supports this type of error:

Deferred Error generation. Describes whether the fault generation feature of the node can generate Deferred errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DE	Meaning
0b0	The fault generation feature of the node does not generate Deferred errors. ERR<n>PFGCTL.DE is RES0.
0b1	The fault generation feature of the node allows generation of Deferred errors. ERR<n>PFGCTL.DE is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.DE indicates whether the node supports this type of error.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

UEO, bit [4]
When the node supports this type of error:

Latent or Restartable Error generation. Describes whether the fault generation feature of the node can generate Latent or Restartable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEO	Meaning
0b0	The fault generation feature of the node does not generate Latent or Restartable errors. ERR<n>PFGCTL.UEO is RES0.
0b1	The fault generation feature of the node allows generation of Latent or Restartable errors. ERR<n>PFGCTL.UEO is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UEO indicates whether the node supports this type of error.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

UER, bit [3]
When the node supports this type of error:

Signaled or Recoverable Error generation. Describes whether the fault generation feature of the node can generate Signaled or Recoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UER	Meaning
0b0	The fault generation feature of the node does not generate Signaled or Recoverable errors. ERR<n>PFGCTL.UER is RES0.
0b1	The fault generation feature of the node allows generation of Signaled or Recoverable errors. ERR<n>PFGCTL.UER is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UER indicates whether the node supports this type of error.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

UEU, bit [2]
When the node supports this type of error:

Unrecoverable Error generation. Describes whether the fault generation feature of the node can generate Unrecoverable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UEU	Meaning
0b0	The fault generation feature of the node does not generate Unrecoverable errors. ERR<n>PFGCTL.UEU is RES0.
0b1	The fault generation feature of the node allows generation of Unrecoverable errors. ERR<n>PFGCTL.UEU is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UEU indicates whether the node supports this type of error.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

UC, bit [1]
When the node supports this type of error:

Uncontainable Error generation. Describes whether the fault generation feature of the node can generate Uncontainable errors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UC	Meaning
0b0	The fault generation feature of the node does not generate Uncontainable errors. ERR<n>PFGCTL.UC is RES0.
0b1	The fault generation feature of the node allows generation of Uncontainable errors. ERR<n>PFGCTL.UC is a read/write field.

If ERR<n>FR.FRX is 1 then ERR<n>FR.UC indicates whether the node supports this type of error.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

OF, bit [0]
When the node supports this flag:

Overflow flag. Describes how the fault generation feature of the node sets the ERR<n>STATUS.OF status flag.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OF	Meaning
0b0	When an injected error is recorded, the node sets ERR<n>STATUS.OF according to the architecture-defined rules for setting the OF field. ERR<n>PFGCTL.OF is RES0.
0b1	When an injected error is recorded, ERR<n>STATUS.OF is set to ERR<n>PFGCTL.OF. This behavior replaces the architecture-defined rules for setting the OF bit. ERR<n>PFGCTL.OF is a read/write field.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

Accessing ERR<n>PFGF

This section shows the offset of ERR<n>PFGF in an error record group when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, or ERR<n>PFGF is accessed in a fault injection group, see 'RAS memory-mapped register views' for the offset of ERR<n>PFGF.

ERR<n>PFGF can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x800 + (64 * n)	ERR<n>PFGF

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERR<n>STATUS, Error Record <n> Primary Status Register, n = 0 - 65534

The ERR<n>STATUS characteristics are:

Purpose

When RAS System Architecture v2 is implemented, error record <n> might be one of the following:

- A continuation record containing more information about the error recorded in error record <n-1>. In this case, ERR<n>STATUS contains a subset of the values of a normal error record status register.
- A proxy for a different RAS agent. In this case, ERR<n>STATUS reports the status of the RAS agent.

Otherwise, ERR<n>STATUS contains status information for error record <n>, including:

- Whether any error has been detected (valid).
- Whether any detected error was not corrected, and returned to a Requester.
- Whether any detected error was not corrected and deferred.
- Whether an error record has been discarded because additional errors have been detected before the first error was handled by software (overflow).
- Whether any error has been reported.
- Whether the other error record registers contain valid information.
- Whether the error was reported because poison data was detected or because a corrupt value was detected by an error detection code.
- A primary error code.
- An IMPLEMENTATION DEFINED extended error code.

Within this register:

- ERR<n>STATUS.{AV, V, MV} are valid bits that define whether error record <n> registers are valid.
- ERR<n>STATUS.{UE, OF, CE, DE, UET} encode the types of error or errors recorded.
- ERR<n>STATUS.{CI, ER, PN, IERR, SERR} are syndrome fields.

Configuration

This register is present only when FEAT_RAS is implemented and error record n is implemented. Otherwise, direct accesses to ERR<n>STATUS are RES0.

ERRFRPFGF[FirstRecordOfNode(n)] describes the features implemented by the node that owns error record <n>. FirstRecordOfNode(n) is the index of the first error record owned by the same node as error record <n>. If the node owns a single record then FirstRecordOfNode(n) = n.

For IMPLEMENTATION DEFINED fields in ERR<n>STATUS, writing zero returns the error record to an initial quiescent state.

In particular, if any IMPLEMENTATION DEFINED syndrome fields might generate a Fault Handling or Error Recovery Interrupt request, writing zero is sufficient to deactivate the Interrupt request.

Fields that are read-only, nonzero, and ignore writes are compliant with this requirement.

Note

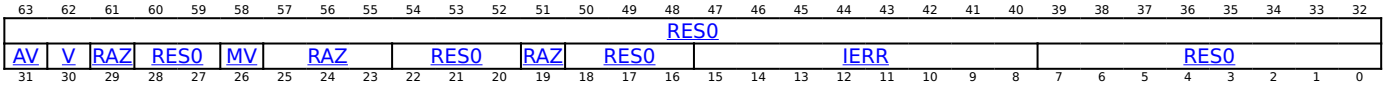
Arm recommends that any IMPLEMENTATION DEFINED syndrome field that can generate a Fault Handling, Error Recovery, Critical, or IMPLEMENTATION DEFINED, interrupt request is disabled at Cold reset and is enabled by software writing an IMPLEMENTATION DEFINED nonzero value to an IMPLEMENTATION DEFINED field in ERRCTLR[FirstRecordOfNode(n)].

Attributes

ERR<n>STATUS is a 64-bit register.

Field descriptions

When RAS System Architecture v2 is implemented, ERR<n>FR.ED == '00', and ERR<n>FR.ERT == '01':



Continuation record.

Bits [63:32]

Reserved, RES0.

AV, bit [31]
When error record n includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an additional address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == '1', this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. Additional syndrome has been recorded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == '1', this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is W1C.

Bit [29]

Reserved, RAZ.

Bits [28:27]

Reserved, RES0.

MV, bit [26]
When error record <n> includes additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == '1', this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

Bits [25:23]

Reserved, RAZ.

Bits [22:20]

Reserved, RES0.

Bit [19]

Reserved, RAZ.

Bits [18:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED additional error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

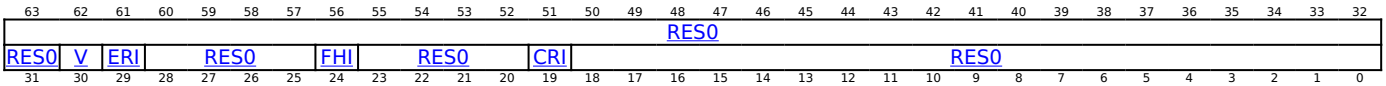
Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - ERR<n>STATUS.V == '0'.
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
- Access to this field is UNKNOWN/WI if all the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERRPFGF[FirstRecordOfNode(n)].SYN == '0'.
- Otherwise, access to this field is RW.

Bits [7:0]

Reserved, RES0.

When RAS System Architecture v2 is implemented, ERR<n>FR.ED == '11', and ERR<n>FR.ERT == '01':



Proxy for a RAS agent.

Bits [63:31]

Reserved, RES0.

V, bit [30]

RAS agent error status.

V	Meaning
0b0	RAS agent error status is not asserted.
0b1	RAS agent error status is asserted.

Access to this field is RO.

ERI, bit [29]

RAS agent Error Recovery condition.

ERI	Meaning
0b0	RAS agent error recovery condition is false.
0b1	RAS agent error recovery condition is true.

Access to this field is RO.

Bits [28:25]

Reserved, RES0.

FHI, bit [24]

RAS agent Fault Handling condition.

FHI	Meaning
0b0	RAS agent fault handling condition is false.
0b1	RAS agent fault handling condition is true.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

CRI, bit [19]

RAS agent criticial error condition.

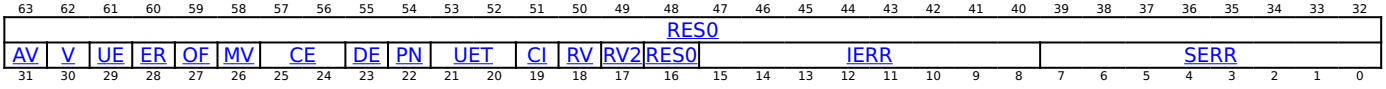
CRI	Meaning
0b0	RAS agent criticial error condition is false.
0b1	RAS agent criticial error condition is true.

Access to this field is RO.

Bits [18:0]

Reserved, RES0.

When RAS System Architecture v1p1 is implemented:



Normal record, from FEAT_RASSAv1p1.

Bits [63:32]

Reserved, RES0.

AV, bit [31]
When error record n includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == '1', this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == '1', this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is W1C.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

ER, bit [28]
When in-band error responses can be returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, can signal an in-band error response to the Requester, causing this field to be set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERR<n>STATUS.[DE,UE] == '00'.
- Otherwise, access to this field is W1C.

When in-band error responses are never returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

Note

An in-band error response signaled by the component might be masked and not generate any exception.

It is IMPLEMENTATION DEFINED whether an uncorrected error that is deferred and recorded as a Deferred error, but is not deferred to the Requester, can signal an in-band error response to the Requester, causing this field to be set to 1.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERR<n>STATUS.UE == '0'.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- A Corrected error counter is implemented, an error is counted, and the counter overflows.
- ERR<n>STATUS.V was previously 1, a Corrected error counter is not implemented, and a Corrected error is recorded.
- ERR<n>STATUS.V was previously 1, and a type of error other than a Corrected error is recorded.

Otherwise, this field is unchanged when an error is recorded.

If a Corrected error counter is implemented, then:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to zero might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	Since this field was last cleared to zero, no error syndrome has been discarded and, if a Corrected error counter is implemented, it has not overflowed.
0b1	Since this field was last cleared to zero, at least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

MV, bit [26]
When error record <n> includes additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset:
  - When RAS System Architecture v2 is implemented and ERRFR[FirstRecordOfNode(n)].SRV == '1', this field resets to an architecturally UNKNOWN value.
  - Otherwise, this field resets to '0'.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.

◦ ERR<n>STATUS.[DE,UE] == '00'.
- Otherwise, access to this field is W1C.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

UER can mean either Signaled or Recoverable error, and UEO can mean either Latent or Restartable error.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERR<n>STATUS.UE == '0'.
- Otherwise, access to this field is W1C.

CI, bit [19]

Critical Error. Indicates whether a critical error condition has been recorded.

CI	Meaning
0b0	No critical error condition.
0b1	Critical error condition.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

RV, bit [18]
When RAS System Architecture v2 is implemented:

Reset Valid. When ERR<n>STATUS.V is 1, indicating the error record is valid, this field indicates whether the error was recorded before or after the most recent Error Recovery reset.

RV	Meaning
0b0	If the error record is valid then one or more errors have been recorded after the last Error Recovery reset. This error or errors might have overwritten lower priority errors recorded before the last Error Recovery reset.
0b1	If the error record is valid then one or more errors were recorded before the last Error Recovery reset.

This field is set to 0 when an error is recorded and either the fault overwrites the error syndrome, or the error record was previously not valid.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '1'.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

RV2, bit [17]
When RAS System Architecture v2 is implemented:

Reset Valid 2. When ERR<n>STATUS.{V, RV} is {1, 1}, indicating the error record is valid and one or more errors were recorded before the last Error Recovery reset, this field indicates whether any lower severity errors have been recorded after the Error Recovery reset that did not overwrite the syndrome.

RV2	Meaning
0b0	If the error record is valid then one or more errors were recorded after the last Error Recovery reset that did not overwrite the error syndrome. This includes errors that did not overwrite a previously recorded error syndrome.
0b1	If the error record is valid then one or more errors were recorded before the last Error Recovery reset.

This field is set to 0 when an error is recorded, including when the fault does not overwrite a previously recorded syndrome.

The reset behavior of this field is:

- On an Error recovery reset, this field resets to '1'.

Access to this field is W1C.

Otherwise:

Reserved, RES0.

Bit [16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
  - ERR<n>STATUS.V == '0'.
- Access to this field is UNKNOWN/WI if all the following are true:
  - ERRPFGF[FirstRecordOfNode(n)].SYN == '0'.
  - ERR<n>STATUS.V == '0'.
- Otherwise, access to this field is RW.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are data registers.
0x11	Internal control register. For example, parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.

0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

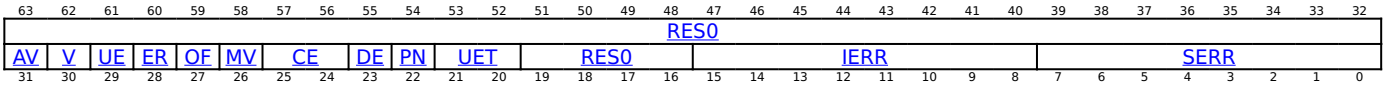
The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
  - ERR<n>STATUS.V == '0'.
- Access to this field is UNKNOWN/WI if all the following are true:
  - ERRPFGF[FirstRecordOfNode(n)].SYN == '0'.
  - ERR<n>STATUS.V == '0'.
- Otherwise, access to this field is RW.

Otherwise:



Normal record, when FEAT_RASSAv1p1 is not implemented.

Bits [63:32]

Reserved, RES0.

AV, bit [31]
When error record n includes an address associated with an error:

Address Valid.

AV	Meaning
0b0	ERR<n>ADDR not valid.
0b1	ERR<n>ADDR contains an address associated with the highest priority error recorded by this record.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.[DE,UE] == '00'.
  - ERR<n>STATUS.CE != '00'.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE == '0'.
  - ERR<n>STATUS.DE != '0'.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.

- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

V, bit [30]

Status Register Valid.

V	Meaning
0b0	ERR<n>STATUS not valid.
0b1	ERR<n>STATUS valid. At least one error has been recorded.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.CE != '00'.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.DE != '0'.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

UE, bit [29]

Uncorrected Error.

UE	Meaning
0b0	No errors have been detected, or all detected errors have been either corrected or deferred.
0b1	At least one detected error was not corrected and not deferred.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.OF == '1'.
  - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

ER, bit [28]
When in-band error responses can be returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERR<n>STATUS.[DE,UE] == '00'.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE == '0'.
  - ERR<n>STATUS.DE != '0'.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

When in-band error responses are never returned for a Deferred error:

Error Reported.

ER	Meaning
0b0	No in-band error response (External abort) signaled to the Requester making the access or other transaction.
0b1	An in-band error response was signaled by the component to the Requester making the access or other transaction. This can be because any of the following are true: • The ERRCTLR[FirstRecordOfNode(n)].UE field, or applicable one of the ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE} fields, is implemented and was 1 when an error was detected and not corrected. • The ERRCTLR[FirstRecordOfNode(n)].{WUE, RUE, UE} fields are not implemented and the component always reports errors.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERR<n>STATUS.UE == '0'.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

OF, bit [27]

Overflow.

Indicates that multiple errors have been detected. This field is set to 1 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 1.
- A Deferred error is detected, ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE != 0b00. ERR<n>STATUS.CE might be updated for the new Corrected error.
- A Corrected error counter is implemented, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is set to 1 when one of the following occurs:

- A Deferred error is detected and ERR<n>STATUS.UE == 1.
- A Corrected error is detected, no Corrected error counter is implemented, and ERR<n>STATUS.{UE, DE} != {0, 0}.
- A Corrected error counter is implemented, ERR<n>STATUS.{UE, DE} != {0, 0}, and the counter overflows.

It is IMPLEMENTATION DEFINED whether this field is cleared to 0 when one of the following occurs:

- An Uncorrected error is detected and ERR<n>STATUS.UE == 0.
- A Deferred error is detected, ERR<n>STATUS.UE == 0, and ERR<n>STATUS.DE == 0.
- A Corrected error is detected, ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and ERR<n>STATUS.CE == 0b00.

The IMPLEMENTATION DEFINED clearing of this field might also depend on the value of the other error status fields.

If a Corrected error counter is implemented, then:

- A direct write that modifies the counter overflow flag indirectly might set this field to an UNKNOWN value.
- A direct write to this field that clears this field to 0 might indirectly set the counter overflow flag to an UNKNOWN value.

OF	Meaning
0b0	If ERR<n>STATUS.UE == 1, then no error syndrome for an Uncorrected error has been discarded. If ERR<n>STATUS.UE == 0 and ERR<n>STATUS.DE == 1, then no error syndrome for a Deferred error has been discarded. If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, and a Corrected error counter is implemented, then the counter has not overflowed. If ERR<n>STATUS.UE == 0, ERR<n>STATUS.DE == 0, ERR<n>STATUS.CE != 0b00, and no Corrected error counter is implemented, then no error syndrome for a Corrected error has been discarded. Note This field might have been set to 1 when an error syndrome was discarded and later cleared to 0 when a higher priority syndrome was recorded.
0b1	At least one error syndrome has been discarded or, if a Corrected error counter is implemented, it might have overflowed.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Otherwise, access to this field is W1C.

MV, bit [26]
When error record <n> includes additional information for an error:

Miscellaneous Registers Valid.

MV	Meaning
0b0	ERR<n>MISC<m> not valid.
0b1	The contents of the ERR<n>MISC<m> registers contain additional information for an error recorded by this record.

Note

If the ERR<n>MISC<m> registers can contain additional information for a previously recorded error, then the contents must be self-describing to software or a user. For example, certain fields might relate only to Corrected errors, and other fields only to the most recent error that was not discarded.

The reset behavior of this field is:

- On a Cold reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.[DE,UE] == '00'.
  - ERR<n>STATUS.CE != '00'.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE == '0'.
  - ERR<n>STATUS.DE != '0'.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

CE, bits [25:24]

Corrected Error.

CE	Meaning
0b00	No errors were corrected.
0b01	At least one transient error was corrected.
0b10	At least one error was corrected.
0b11	At least one persistent error was corrected.

The mechanism by which a component or node detects whether a Corrected error is transient or persistent is IMPLEMENTATION DEFINED. If no such mechanism is implemented, then the node sets this field to 0b10 when a corrected error is recorded.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.OF == '1'.
  - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

DE, bit [23]

Deferred Error.

DE	Meaning
0b0	No errors were deferred.
0b1	At least one error was not corrected and deferred.

Support for deferring errors is IMPLEMENTATION DEFINED.

When clearing ERR<n>STATUS.V to 0, if this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When ERR<n>STATUS.V == '0', access to this field is UNKNOWN/WI.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.OF == '1'.
  - ERR<n>STATUS.OF is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

PN, bit [22]

Poison.

PN	Meaning
0b0	Uncorrected error or Deferred error recorded because a corrupt value was detected, for example, by an error detection code (EDC), or Corrected error recorded.
0b1	Uncorrected error or Deferred error recorded because a poison value was detected.

If this field is nonzero, then Arm recommends that software write 1 to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing both ERR<n>STATUS.{DE, UE} to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERR<n>STATUS.[DE,UE] == '00'.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.[DE,UE] == '00'.
  - ERR<n>STATUS.CE != '00'.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE == '0'.
  - ERR<n>STATUS.DE != '0'.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

UET, bits [21:20]

Uncorrected Error Type. Describes the state of the component after detecting or consuming an Uncorrected error.

UET	Meaning
0b00	Uncorrected error, Uncontainable error (UC).
0b01	Uncorrected error, Unrecoverable error (UEU).
0b10	Uncorrected error, Latent or Restartable error (UEO).
0b11	Uncorrected error, Signaled or Recoverable error (UER).

UER can mean either Signaled or Recoverable error, and UEO can mean either Latent or Restartable error.

If this field is nonzero, then Arm recommends that software write ones to this field to clear this field to zero, when any of:

- Clearing ERR<n>STATUS.V to 0.
- Clearing ERR<n>STATUS.UE to 0.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if any the following are true:
  - ERR<n>STATUS.V == '0'.
  - ERR<n>STATUS.UE == '0'.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.[DE,UE] == '00'.
  - ERR<n>STATUS.CE != '00'.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE == '0'.
  - ERR<n>STATUS.DE != '0'.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is W1C.

Bits [19:16]

Reserved, RES0.

IERR, bits [15:8]

IMPLEMENTATION DEFINED error code. Used with any primary error code ERR<n>STATUS.SERR value. Further IMPLEMENTATION DEFINED information can be placed in the ERR<n>MISC<m> registers.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
  - ERR<n>STATUS.V == '0'.
- Access to this field is UNKNOWN/WI if all the following are true:
  - ERRPFGF[FirstRecordOfNode(n)].SYN == '0'.
  - ERR<n>STATUS.V == '0'.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.[DE,UE] == '00'.
  - ERR<n>STATUS.CE != '00'.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE == '0'.

        - ERR<n>STATUS.DE != '0'.
        - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
    - Access to this field is RO if all the following are true:
        - ERR<n>STATUS.UE != '0'.
        - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
    - Otherwise, access to this field is RW.

SERR, bits [7:0]

Architecturally-defined primary error code. The primary error code might be used by a fault handling agent to triage an error without requiring device-specific code. For example, to count and threshold corrected errors in software, or generate a short log entry.

SERR	Meaning
0x00	No error.
0x01	IMPLEMENTATION DEFINED error.
0x02	Data value from (non-associative) internal memory. For example, ECC from on-chip SRAM or buffer.
0x03	IMPLEMENTATION DEFINED pin. For example, nSEI pin.
0x04	Assertion failure. For example, consistency failure.
0x05	Error detected on internal data path. For example, parity on ALU result.
0x06	Data value from associative memory. For example, ECC error on cache data.
0x07	Address/control value from associative memory. For example, ECC error on cache tag.
0x08	Data value from a TLB. For example, ECC error on TLB data.
0x09	Address/control value from a TLB. For example, ECC error on TLB tag.
0x0A	Data value from producer. For example, parity error on write data bus.
0x0B	Address/control value from producer. For example, parity error on address bus.
0x0C	Data value from (non-associative) external memory. For example, ECC error in SDRAM.
0x0D	Illegal address (software fault). For example, access to unpopulated memory.
0x0E	Illegal access (software fault). For example, byte write to word register.
0x0F	Illegal state (software fault). For example, device not ready.
0x10	Internal data register. For example, parity on a SIMD&FP register. For a PE, all general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are data registers.
0x11	Internal control register. For example, parity on a System register. For a PE, all registers other than general-purpose, stack pointer, SIMD&FP, SVE, and SME registers are control registers.
0x12	Error response from Completer of access. For example, error response from cache write-back.
0x13	External timeout. For example, timeout on interaction with another component.
0x14	Internal timeout. For example, timeout on interface within the component.
0x15	Deferred error from Completer not supported at Requester. For example, poisoned data received from the Completer of an access by a Requester that cannot defer the error further.
0x16	Deferred error from Requester not supported at Completer. For example, poisoned data received from the Requester of an access by a Completer that cannot defer the error further.

0x17	Deferred error from Completer passed through. For example, poisoned data received from the Completer of an access and returned to the Requester.
0x18	Deferred error from Requester passed through. For example, poisoned data received from the Requester of an access and deferred to the Completer.
0x19	Error recorded by PCIe error logs. Indicates that the component has recorded an error in a PCIe error log. This might be the PCIe device status register, AER, DVSEC, or other mechanisms defined by PCIe.
0x1A	Other internal error. For example, parity error on internal state of the component that is not covered by another primary error code.

All other values are reserved.

The implemented set of valid values that this field can take is IMPLEMENTATION DEFINED. If any value not in this set is written to this register, then the value read back from this field is UNKNOWN.

Note

This means that one or more bits of this field might be implemented as fixed read-as-zero or read-as-one values.

The reset behavior of this field is:

- On a Cold reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is UNKNOWN/WI if all the following are true:
  - the node that owns error record n does not implement the Common Fault Injection Model Extension.
  - ERR<n>STATUS.V == '0'.
- Access to this field is UNKNOWN/WI if all the following are true:
  - ERRPFGF[FirstRecordOfNode(n)].SYN == '0'.
  - ERR<n>STATUS.V == '0'.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.DE == '0'.
  - ERR<n>STATUS.UE == '0'.
  - ERR<n>STATUS.CE != '00'.
  - ERR<n>STATUS.CE is not being cleared to 0b00 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE == '0'.
  - ERR<n>STATUS.DE != '0'.
  - ERR<n>STATUS.DE is not being cleared to 0b0 in the same write.
- Access to this field is RO if all the following are true:
  - ERR<n>STATUS.UE != '0'.
  - ERR<n>STATUS.UE is not being cleared to 0b0 in the same write.
- Otherwise, access to this field is RW.

Accessing ERR<n>STATUS

ERR<n>STATUS.{AV, V, UE, ER, OF, MV, CE, DE, PN, UET, CI} are write-one-to-clear (W1C) fields, meaning writes of zero are ignored, and a write of one or all-ones to the field clears the field to zero. ERR<n>STATUS.{IERR, SERR} are read/write (RW) fields, although the set of implemented valid values is IMPLEMENTATION DEFINED. See also ERR<n>PFGF.SYN.

After reading ERR<n>STATUS, software must clear the valid fields in the register to allow new errors to be recorded. However, between reading the register and clearing the valid fields, a new error might have overwritten the register. To prevent this error being lost by software, the register prevents updates to fields that might have been updated by a new error.

When RAS System Architecture v1.0 is implemented:

- Writes to ERR<n>STATUS.{UE, DE, CE} are ignored if ERR<n>STATUS.OF is 1 and is not being cleared to 0.
- Writes to ERR<n>STATUS.V are ignored if any of ERR<n>STATUS.{UE, DE, CE} are nonzero and are not being cleared to zero.
- Writes to ERR<n>STATUS.{AV, MV} and the ERR<n>STATUS.{ER, PN, UET, IERR, SERR} syndrome fields are ignored if the highest priority nonzero error status field is not being cleared to zero. The error status fields in priority order from highest to lowest, are ERR<n>STATUS.UE, ERR<n>STATUS.DE, and ERR<n>STATUS.CE.

When RAS System Architecture v1.1 is implemented, a write to the register is ignored if all of:

- Any of ERR<n>STATUS.{V, UE, OF, CE, DE} are nonzero before the write.
- The write does not clear the nonzero ERR<n>STATUS.{V, UE, OF, CE, DE} fields to zero by writing ones to the applicable field or fields.

Some of the fields in ERR<n>STATUS are also defined as UNKNOWN where certain combinations of ERR<n>STATUS.{V, DE, UE} are zero. The rules for writes to ERR<n>STATUS allow a node to implement such a field as a fixed read-only value.

For example, when RAS System Architecture v1.1 is implemented, a write to ERR<n>STATUS when ERR<n>STATUS.V is 1 results in either ERR<n>STATUS.V field being cleared to zero, or ERR<n>STATUS.V not changing. Since all fields in ERR<n>STATUS, other than ERR<n>STATUS.{AV, V, MV}, usually read as UNKNOWN values when ERR<n>STATUS.V is zero, this means those fields can be implemented as read-only if applicable.

To ensure correct and portable operation, when software is clearing the valid fields in the register to allow new errors to be recorded, Arm recommends that software performs the following sequence of operations in order:

1. Read ERR<n>STATUS and determine which fields need to be cleared to zero.
2. In a single write to ERR<n>STATUS:
    - Write ones to all the W1C fields that are nonzero in the read value.
    - Write zero to all the W1C fields that are zero in the read value.
    - Write zero to all the RW fields.
3. Read back ERR<n>STATUS after the write to confirm no new fault has been recorded.

Otherwise, these fields might not have the correct value when a new fault is recorded.

ERR<n>STATUS can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0x010 + (64 * n)	ERR<n>STATUS

Accessible as follows:

- When ERR<n>STATUS.V != '0', ERR<n>STATUS.V is not being cleared to 0b0 in the same write, and RAS System Architecture v1p1 is implemented, accesses to this register are RO.
- When ERR<n>STATUS.UE != '0', ERR<n>STATUS.UE is not being cleared to 0b0 in the same write, and RAS System Architecture v1p1 is implemented, accesses to this register are RO.
- When ERR<n>STATUS.OF != '0', ERR<n>STATUS.OF is not being cleared to 0b0 in the same write, and RAS System Architecture v1p1 is implemented, accesses to this register are RO.
- When ERR<n>STATUS.CE != '00', ERR<n>STATUS.CE is not being cleared to 0b00 in the same write, and RAS System Architecture v1p1 is implemented, accesses to this register are RO.
- When ERR<n>STATUS.DE != '0', ERR<n>STATUS.DE is not being cleared to 0b0 in the same write, and RAS System Architecture v1p1 is implemented, accesses to this register are RO.
- Otherwise, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

ERRPIDR0, Peripheral Identification Register 0

The ERRPIDR0 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR0 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR0 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

PART_0, bits [7:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - ERRPIDR1.PART_1 contains part number bits [11:8].
  - ERRPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - ERRPIDR1.PART_1 contains part number bits [15:12].
  - ERRPIDR0.PART_0 contains part number bits [11:4].
  - ERRPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, ERRPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing ERRPIDR0

This section shows the offset of ERRPIDR0 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRPIDR0.

ERRPIDR0 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFE0	ERRPIDR0

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRPIDR1, Peripheral Identification Register 1

The ERRPIDR1 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR1 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR1 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

DES_0, bits [7:4]

Designer, JEP106 identification code, bits [3:0].

The JEP106 identification and continuation codes are stored as follows:

- ERRPIDR1.DES_0: JEP106 identification code bits[3:0].
- ERRPIDR2.DES_1: JEP106 identification code bits[6:4].
- ERRPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PART_1, bits [3:0]

Part number, which is selected by the designer of the component and stored as follows:

- For a component with a 12-bit part number:
  - ERRPIDR1.PART_1 contains part number bits [11:8].
  - ERRPIDR0.PART_0 contains part number bits [7:0].
- For a component with a 16-bit part number:
  - ERRPIDR1.PART_1 contains part number bits [15:12].
  - ERRPIDR0.PART_0 contains part number bits [11:4].
  - ERRPIDR2.REVISION contains part number bits [3:0].

When a 12-bit part number is used, ERRPIDR2.REVISION indicates revision information.

The choice of using a 12-bit part number or 16-bit part number is specific to the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing ERRPIDR1

This section shows the offset of ERRPIDR1 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRPIDR1.

ERRPIDR1 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFE4	ERRPIDR1

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRPIDR2, Peripheral Identification Register 2

The ERRPIDR2 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR2 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR2 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Indicates either the revision of the component, or a portion of the part number of the component.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- ERRPIDR2.REVISION indicates the 4-bit revision number.
- ERRPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- ERRPIDR2.REVISION indicates the 4-bit major revision number.
- ERRPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- ERRPIDR2.REVISION contains part number bits [3:0].
- ERRPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Previous versions of this specification named this field PART_2 when the component uses a 16-bit part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

JEDEC, bit [3]

JEDEC-assigned JEP106 implementer code is used.

Reads as 0b1.

Access to this field is RO.

DES_1, bits [2:0]

Designer, JEP106 identification code, bits [6:4].

The JEP106 identification and continuation codes are stored as follows:

- ERRPIDR1.DES_0: JEP106 identification code bits[3:0].
- ERRPIDR2.DES_1: JEP106 identification code bits[6:4].
- ERRPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing ERRPIDR2

This section shows the offset of ERRPIDR2 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRPIDR2.

ERRPIDR2 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFE8	ERRPIDR2

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRPIDR3, Peripheral Identification Register 3

The ERRPIDR3 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR3 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR3 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

REVAND, bits [7:4]

Indicates either the revision of the component, or whether the component has been modified.

Where the component has a single 4-bit revision number, the revision number is an incremental value starting at zero for the first revision of the component.

Where the component has separate major and minor revision numbers, the major and minor revision numbers are each incremental values starting at zero for the first revision of the component. For each minor revision of the component, the minor revision number increments monotonically. For each major revision of the component, the major revision number increments monotonically and the minor revision begins again at zero.

For a component with a 12-bit part number with a single 4-bit revision number:

- ERRPIDR2.REVISION indicates the 4-bit revision number.
- ERRPIDR3.REVAND indicates component modifications.

For a component with a 12-bit part number with separate major and minor revision numbers:

- ERRPIDR2.REVISION indicates the 4-bit major revision number.
- ERRPIDR3.REVAND indicates the 4-bit minor revision number.

For a component with a 16-bit part number:

- ERRPIDR2.REVISION contains part number bits [3:0].
- ERRPIDR3.REVAND indicates the 4-bit revision number.

The choice of which style of revision information is used is specific to the designer of the component, and might also be specific to each individual component with a different part number.

Where REVAND indicates component modifications, this indicates modifications such as errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

ERRPIDR3.CMOD might also indicate component modifications.

Previous versions of this specification named this field REVISION when the component uses a 16-bit part number.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

CMOD, bits [3:0]

Indicates whether the component has been modified from its original behavior. Examples of modifications include errata fixes or metal fixes after implementation. Usually this value would be zero unless a modification has been performed. If the field is required for indicating component modifications, Arm recommends that component designers ensure that it can be changed by a metal fix, for example by driving it from registers that reset to zero.

A value of 0b0000 means the component is not modified from the original design.

Any other value means the component has been modified in an IMPLEMENTATION DEFINED way.

For any two components with the same Unique Component Identifier:

- If the value of the CMOD fields of both components equals zero, the components are identical.
- If the CMOD fields of both components have the same nonzero value, it does not necessarily mean that they have the same modifications.
- If the value of the CMOD field of either of the two components is nonzero, they might not be identical, even though they have the same Unique Component Identifier.

ERRPIDR3.REVAND might also indicate component modifications.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing ERRPIDR3

This section shows the offset of ERRPIDR3 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRPIDR3.

ERRPIDR3 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFEC	ERRPIDR3

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

ERRPIDR4, Peripheral Identification Register 4

The ERRPIDR4 characteristics are:

Purpose

Provides discovery information about the component.

Configuration

Implementation of this register is OPTIONAL.

ERRPIDR4 is implemented only as part of a memory-mapped group of error records.

Attributes

ERRPIDR4 is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

SIZE, bits [7:4]
When RAS System Architecture v2 is implemented:

Size of the component.

SIZE	Meaning
0b0000	FEAT_RASSA_4KB is implemented.
0b0010	FEAT_RASSA_16KB is implemented.
0b0100	FEAT_RASSA_64KB is implemented.

All other values are reserved.

Otherwise:

Size of the component.

SIZE	Meaning
0b0000	One of the following is true: • The component uses a single 4KB block. • The component uses an IMPLEMENTATION DEFINED number of 4KB blocks.
0b0001..0b1111	The component occupies $2^{\text{ERRPIDR4.SIZE}}$ 4KB blocks.

DES_2, bits [3:0]

Designer, JEP106 continuation code.

The JEP106 identification and continuation codes are stored as follows:

- ERRPIDR1.DES_0: JEP106 identification code bits[3:0].
- ERRPIDR2.DES_1: JEP106 identification code bits[6:4].
- ERRPIDR4.DES_2: JEP106 continuation code.

These codes indicate the designer of the component and not the implementer, except where the two are the same. To obtain a number, or to see the assignment of these codes, contact JEDEC http://www.jedec.org.

A JEP106 identification and continuation code takes the following form:

- A sequence of zero or more numbers, all having the value 0x7F.
- A following 8-bit number, that is not 0x7F, and where bit[7] is an odd parity bit.

The parity bit in the JEP106 identification code is not included.

Note

For example, Arm Limited is assigned the code 0x7F 0x7F 0x7F 0x7F 0x3B.

- The continuation code is the number of times 0x7F appears before the final number. For example, a component designed by Arm Limited has the code 0x4.
- The identification code is bits[6:0] of the final number. For example, a component designed by Arm Limited has the code 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing ERRPIDR4

This section shows the offset of ERRPIDR4 when FEAT_RASSA_4KB_GRP is implemented. If FEAT_RASSA_16KB_GRP or FEAT_RASSA_64KB_GRP is implemented, see 'RAS memory-mapped register views' for the offset of ERRPIDR4.

ERRPIDR4 can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
RAS	0xFD0	ERRPIDR4

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICC_ABPR, CPU Interface Aliased Binary Point Register

The GICC_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_ABPR are RES0.

In systems that support two Security states:

- This register is an alias of the Non-secure copy of GICC_BPR.
- Non-secure accesses to this register return a shifted value of the binary point.
- If ICC_CTLR_EL3.CBPR_EL1NS == 1, Secure accesses to this register access ICC_BPR0_EL1.

Attributes

GICC_ABPR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_ABPR

This register is used only when System register access is not enabled. When System register access is enabled, the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_ABPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x001C	GICC_ABPR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICC_AEOIR, CPU Interface Aliased End Of Interrupt Register

The GICC_AEOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified Group 1 interrupt and, if the appropriate GICC_CTLR.EOImodeS or GICC_CTLR.EOImodeNS field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AEOIR are RES0.

When GICD_CTLR.DS==0, this register is an alias of the Non-secure view of GICC_EOIR. A Secure access to this register is identical to a Non-secure access to GICC_EOIR.

Attributes

GICC_AEOIR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AEOIR

A write to this register must correspond to the most recently acknowledged Group 1 interrupt. If a value other than the last value read from GICC_AIAR is written to this register, the effect is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR1_EL1 provides equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AEOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0024	GICC_AEOIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are WO.
- When an access is Secure, accesses to this register are WO.
- When an access is Non-secure, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICC_AHPPIR, CPU Interface Aliased Highest Priority Pending Interrupt Register

The GICC_AHPPIR characteristics are:

Purpose

If the highest priority pending interrupt is in Group 1, this register provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AHPPIR are RES0.

If GICD_CTLR.DS==0, this register is an alias of the Non-secure view of GICC_HPPIR. A Secure access to this register is identical to a Non-secure access to GICC_HPPIR.

Attributes

GICC_AHPPIR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR1_EL1 provides equivalent functionality.

If the highest priority pending interrupt is in Group 0, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AHPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0028	GICC_AHPPIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

GICC_AIAR, CPU Interface Aliased Interrupt Acknowledge Register

The GICC_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_AIAR are RES0.

When GICD_CTLR.DS==0, this register is an alias of the Non-secure view of GICC_IAR. A Secure access to this register is identical to a Non-secure access to GICC_IAR.

Attributes

GICC_AIAR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_AIAR

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_AIAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0020	GICC_AIAR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICC_APR<n>, CPU Interface Active Priorities Registers, n = 0 - 3

The GICC_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_APR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When GICD_CTLR.DS == 0, these registers are Banked, and Non-secure accesses do not affect Secure operation. The Secure copies of these registers hold active priorities for Group 0 interrupts, and the Non-secure copies provide a Non-secure view of the active priorities for Group 1 interrupts.

GICC_APR1 is implemented only in implementations that support 6 or more bits of priority. GICC_APR2 and GICC_APR3 are implemented only in implementations that support 7 bits of priority.

When GICD_CTLR.DS==1, these registers hold the active priorities for Group 0 interrupts, and the active priorities for Group 1 interrupts are held by the GICC_NSAPR<n> registers.

Attributes

GICC_APR<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00000000`.

Accessing GICC_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, ICC_AP0R<n>_EL1.
  - For Group 1, ICC_AP1R<n>_EL1.
- In AArch32:
  - For Group 0, ICC_AP0R<n>.
  - For Group 1, ICC_AP1R<n>.

GICC_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x00D0 + (4 * n)	GICC_APR<n>

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICC_BPR, CPU Interface Binary Point Register

The GICC_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_BPR are RES0.

In systems that support two Security states:

- This register is Banked.
- The Secure instance of this register determines Group 0 interrupt preemption.
- The Non-secure instance of this register determines Group 1 interrupt preemption.

In systems that support only one Security state, when GICC_CTLR.CBPR == 0, this register determines only Group 0 interrupt preemption.

When GICC_CTLR.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICC_BPR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field. The following list describes how this field determines the interrupt priority bits assigned to the group priority field:

- 'Secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for the processing of Group 1 interrupts in a GIC implementation that supports interrupt grouping, when GICC_CTLR.CBPR == 0.
- 'Non-secure ICC_BPR1_EL1 Binary Point when CBPR == 0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069), for all other cases.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

Note

Aliasing the Non-secure GICC_BPR as GICC_ABPR in a multiprocessor system permits a PE that can make only Secure accesses to configure the preemption setting for Group 1 interrupts by accessing GICC_ABPR.

Accessing GICC_BPR

This register is used only when System register access is not enabled. When System register access is enabled this register is RAZ/WI, and the System registers ICC_BPR0_EL1 and ICC_BPR1_EL1 provide equivalent functionality.

GICC_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0008	GICC_BPR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

GICC_CTLR, CPU Interface Control Register

The GICC_CTLR characteristics are:

Purpose

Controls the CPU interface, including enabling of interrupt groups, interrupt signal bypass, binary point registers used, and separation of priority drop and interrupt deactivation.

Note

If the GIC implementation supports two Security states, independent EOI controls are provided for accesses from each Security state. Secure accesses handle both Group 0 and Group 1 interrupts, and Non-secure accesses handle Group 1 interrupts only.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_CTLR are RES0.

In a GIC implementation that supports two Security states:

- This register is Banked.
- The register bit assignments are different in the Secure and Non-secure copies.

Attributes

GICC_CTLR is a 32-bit register.

Field descriptions

When GICD_CTLR.DS==0, Non-secure access:

Bits [31:10]

Reserved, RES0.

EOImodeNS, bit [9]

Controls the behavior of Non-secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeNS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [8:7]

Reserved, RES0.

IRQBypDisGrp1, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FIQBypDisGrp1, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bits [4:1]

Reserved, RES0.

EnableGrp1, bit [0]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When GICD_CTLR.DS==0, Secure access:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
RES0																					EOImodeNS	EOImodeS	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0	FIQBypDisGrp0	CBPR	FIQEn	RES0		EnableGrp1	Enable

Bits [31:11]

Reserved, RES0.

EOImodeNS, bit [10]

Controls the behavior of Non-secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeNS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EOImodeS, bit [9]

Controls the behavior of Secure accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImodeS	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR.EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQBypDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQBypDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICC_BPR determines preemption for Group 0 interrupts only. GICC_ABPR determines preemption for Group 1 interrupts.
0b1	GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point, incremented by 1, and saturated to 0b111.
- Non-secure writes of GICC_BPR are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

When GICD_CTLR.DS == '1':

31:10	9	8	7	6	5	4	3	2	1	0
RES0	EOImode	IRQBypDisGrp1	FIQBypDisGrp1	IRQBypDisGrp0	FIQBypDisGrp0	CBPR	FIQEn	RES0	EnableGrp1	EnableGrp0

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior of accesses to GICC_EOIR, GICC_AEOIR, and GICC_DIR.

EOImode	Meaning
0b0	GICC_EOIR and GICC_AEOIR provide both priority drop and interrupt deactivation functionality. Accesses to GICC_DIR are UNPREDICTABLE.
0b1	GICC_EOIR and GICC_AEOIR provide priority drop functionality only. GICC_DIR provides interrupt deactivation functionality.

Note

An implementation is permitted to make this bit RAO/WI.

This field shares state with GICC_CTLR.EOImodeS.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

IRQBypDisGrp1, bit [8]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 1:

IRQBypDisGrp1	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FIQBypDisGrp1, bit [7]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 1:

FIQBypDisGrp1	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DFB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

IRQBypDisGrp0, bit [6]

When the signaling of IRQs by the CPU interface is disabled, this field partly controls whether the bypass IRQ signal is signaled to the PE for Group 0:

IRQBypDisGrp0	Meaning
0b0	The bypass IRQ signal is signaled to the PE.
0b1	The bypass IRQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FIQBypDisGrp0, bit [5]

When the signaling of FIQs by the CPU interface is disabled, this field partly controls whether the bypass FIQ signal is signaled to the PE for Group 0:

FIQBypDisGrp0	Meaning
0b0	The bypass FIQ signal is signaled to the PE.
0b1	The bypass FIQ signal is not signaled to the PE.

If System register access is enabled for EL3 and ICC_SRE_EL3.DIB == 1, this field is RAO/WI.

If System register access is enabled for EL1, this field is ignored.

If an implementation does not support legacy interrupts, this bit is permitted to be RAO/WI.

For more information, see 'Interrupt bypass support' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

CBPR, bit [4]

Controls whether GICC_BPR provides common control of preemption to Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICC_BPR determines preemption for Group 0 interrupts only. GICC_ABPR determines preemption for Group 1 interrupts.
0b1	GICC_BPR determines preemption for both Group 0 and Group 1 interrupts.

This field is an alias of ICC_CTLR_EL3.CBPR_EL1NS.

In a GIC that supports two Security states, when CBPR == 1:

- A Non-secure read of GICC_BPR returns the value of Secure GICC_BPR.Binary_Point, incremented by 1, and saturated to 0b111.

- Non-secure writes of GICC_BPR are ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

FIQEn, bit [3]

Controls whether the CPU interface signals Group 0 interrupts to a target PE using the FIQ or IRQ signal:

FIQEn	Meaning
0b0	Group 0 interrupts are signaled using the IRQ signal.
0b1	Group 0 interrupts are signaled using the FIQ signal.

Group 1 interrupts are signaled using the IRQ signal only.

If an implementation supports two Security states, this bit is permitted to be RAO/WI.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Bit [2]

Reserved, RES0.

EnableGrp1, bit [1]

This Non-secure field enables the signaling of Group 1 interrupts by the CPU interface to a target PE:

EnableGrp1	Meaning
0b0	Group 1 interrupt signaling is disabled.
0b1	Group 1 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EnableGrp0, bit [0]

Enables the signaling of Group 0 interrupts by the CPU interface to a target PE:

EnableGrp0	Meaning
0b0	Group 0 interrupt signaling is disabled.
0b1	Group 0 interrupt signaling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing GICC_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR and ICC_MCTLR provide equivalent functionality.
- For AArch64 implementations, ICC_CTLR_EL1 and ICC_CTLR_EL3 provide equivalent functionality.

GICC_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0000	GICC_CTLR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICC_DIR, CPU Interface Deactivate Interrupt Register

The GICC_DIR characteristics are:

Purpose

When interrupt priority drop is separated from interrupt deactivation, a write to this register deactivates the specified interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_DIR are RES0.

Attributes

GICC_DIR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register have an effect only in the following cases:

- When GICD_CTLR.DS == 1, if GICC_CTLR.EOImode == 1.
- In GIC implementations that support two Security states:
  - If the access is Secure and GICC_CTLR.EOImodeS == 1.
  - If the access is Non-secure and GICC_CTLR.EOImodeNS == 1.

The following writes must be ignored:

- Writes to this register when the corresponding EOImode field in GICC_CTLR == 0. In systems that support system error generation, an implementation might generate a system error.
- Writes to this register when the corresponding EOImode field in GICC_CTLR == 0 and the corresponding interrupt is not active. In systems that support system error generation, an implementation might generate a system error. In implementations using the GIC Stream Protocol Interface, these writes correspond to a Deactivate packet for an interrupt that is not active. For more information, see 'Deactivate (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If the corresponding EOImode field in GICC_CTLR is 1 and this register is written to without a corresponding write to GICC_EOIR or GICC_AEOIR, the interrupt is deactivated but the bit corresponding to it in the active priorities registers remains set.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_DIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x1000	GICC_DIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are WO.
- When an access is Secure, accesses to this register are WO.
- When an access is Non-secure, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICC_EOIR, CPU Interface End Of Interrupt Register

The GICC_EOIR characteristics are:

Purpose

A write to this register performs priority drop for the specified interrupt and, if the appropriate GICC_CTLR.EOImodeS or GICC_CTLR.EOImodeNS field == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_EOIR are RES0.

If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AEOIR is an alias of the Non-secure view of this register.

For Secure writes when GICD_CTLR.DS==0, or for Secure and Non-secure writes when GICD_CTLR.DS==1, the register provides functionality for Group 0 interrupts.

For Non-secure writes when GICD_CTLR.DS==1, the register provides functionality for Group 1 interrupts.

Attributes

GICC_EOIR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to GICC_EOIR. The value written to GICC_EOIR must be the INTID from GICC_IAR. Reads of INTIDs 1020-1023 do not require matching writes.

Note

Arm recommends that software preserves the entire register value read from GICC_IAR, and writes that value back to GICC_EOIR on completion of interrupt processing.

For nested interrupts, the order of writes to this register must be the reverse of the order of interrupt acknowledgment. Behavior is UNPREDICTABLE if:

- This ordering constraint is not maintained.
- The value written to this register does not match an active interrupt, or the ID of a spurious interrupt.
- The value written to this register does not match the last valid interrupt value read from GICC_IAR.

For general information about the effect of writes to end of interrupt registers, and about the possible separation of the priority drop and interrupt deactivate operations, see 'Interrupt lifecycle' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If GICD_CTLR.DS==0:

- GICC_CTLR.EOImodeS controls the behavior of Secure accesses to GICC_EOIR and GICC_AEOIR.
- GICC_CTLR.EOImodeNS controls the behavior of Non-secure accesses to GICC_EOIR and GICC_AEOIR.

Accessing GICC_EOIR

The following writes must be ignored:

- Writes of INTIDs 1020-1023.
- Secure writes corresponding to Group 1 interrupts. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Secure active priority (in the Secure copy of GICC_APR<n>) will be reset if the highest active priority is Secure. System behavior is UNPREDICTABLE.
- Non-secure writes corresponding to Group 0 interrupts when GICC_CTLR.EOImodeS == 1. In systems that support system error generation, an implementation might generate a system error. In this case, GIC behavior is predictable, and the highest Non-secure active priority (in the Non-secure copy of GICC_APR<n>) will be reset if the highest active priority is Non-secure. System behavior is UNPREDICTABLE.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 and ICC_EOIR1 provide equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 and ICC_EOIR1_EL1 provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_EOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0010	GICC_EOIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are WO.
- When an access is Secure, accesses to this register are WO.
- When an access is Non-secure, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICC_HPPIR, CPU Interface Highest Priority Pending Interrupt Register

The GICC_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending interrupt on the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_HPPIR are RES0.

If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AHPPIR is an alias of the Non-secure view of this register.

Attributes

GICC_HPPIR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Accessing GICC_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR0 and ICC_HPPIR1 provide equivalent functionality.
- For AArch64 implementations, ICC_HPPIR0_EL1 and ICC_HPPIR1_EL1 provide equivalent functionality.

If the highest priority pending interrupt is in Group 0, a Non-secure read of this register returns the special INTID 1023.

For Secure reads when GICD_CTLR.DS==0, or for Secure and Non-secure reads when GICD_CTLR.DS==1, returns the special INTID 1022 if the highest priority pending interrupt is in Group 1.

If no interrupts are in the pending state, a read of this register returns the special INTID 1023.

Interrupt identifiers corresponding to an interrupt group that is not enabled are ignored.

If the highest priority pending interrupt is a direct interrupt that is both individually enabled in the Distributor and part of an interrupt group that is enabled in the Distributor, and the interrupt group is disabled in the CPU interface for this PE, this register returns the special INTID 1023.

For more information about pending interrupts that are not considered when determining the highest priority pending interrupt, see 'Preemption' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_HPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0018	GICC_HPPIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICC_IAR, CPU Interface Interrupt Acknowledge Register

The GICC_IAR characteristics are:

Purpose

Provides the INTID of the signaled interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IAR are RES0.

This register is available in all configurations of the GIC. If GICD_CTLR.DS==0:

- This register is Common.
- GICC_AIAR is an alias of the Non-secure view of this register.

The format of the INTID is governed by whether affinity routing is enabled for a Security state.

Attributes

GICC_IAR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

INTID, bits [23:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

A read of this register returns the INTID of the highest priority pending interrupt for the CPU interface. The read returns a spurious INTID of 1023 if any of the following apply:

- Forwarding of interrupts by the Distributor to the CPU interface is disabled.
- Signaling of interrupts by the CPU interface to the connected PE is disabled.
- There are no pending interrupts on the CPU interface with sufficient priority for the interface to signal it to the PE.

When the GIC returns a valid INTID to a read of this register it treats the read as an acknowledge of that interrupt. In addition, it changes the interrupt status from pending to active, or to active and pending if the pending state of the interrupt persists. Normally, the pending state of an interrupt persists only if the interrupt is level-sensitive and remains asserted.

For every read of a valid INTID from GICC_IAR, the connected PE must perform a matching write to GICC_EOIR.

Note

- Arm recommends that software preserves the entire register value read from this register, and writes that value back to GICC_EOIR on completion of interrupt processing.
- For SPIs, although multiple target PEs might attempt to read this register at any time, only one PE can obtain a valid INTID. For more information, see 'Activation' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing GICC_IAR

When GICD_CTLR.DS==1, if the highest priority pending interrupt is in Group 1, the special INTID 1022 is returned.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 0, Non-secure reads return the special INTID 1023.

In GIC implementations that support two Security states, if the highest priority pending interrupt is in Group 1, Secure reads return the special INTID 1022.

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR0 and ICC_IAR1 provide equivalent functionality.
- For AArch64 implementations, ICC_IAR0_EL1 and ICC_IAR1_EL1 provide equivalent functionality.

When affinity routing is enabled for a Security state, it is a programming error to use memory-mapped registers to access the GIC.

GICC_IAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x000C	GICC_IAR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICC_IIDR, CPU Interface Identification Register

The GICC_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_IIDR are RES0.

Attributes

GICC_IIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture_version	Meaning
0b0001	GICv1.
0b0010	GICv2.
0b0011	FEAT_GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
0b0100	FEAT_GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.

Other values are reserved.

Access to this field is RO.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the CPU interface.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for GICC_IIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICC_IIDR

GICC_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x00FC	GICC_IIDR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICC_NSAPR<n>, CPU Interface Non-secure Active Priorities Registers, n = 0 - 3

The GICC_NSAPR<n> characteristics are:

Purpose

Provides information about Group 1 interrupt active priorities.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_NSAPR<n> are RES0.

The contents of these registers are IMPLEMENTATION DEFINED with the one architectural requirement that the value 0x00000000 is consistent with no interrupts being active.

When GICD_CTLR.DS==0, these registers are RAZ/WI to Non-secure accesses.

GICC_NSAPR1 is implemented only in implementations that support 6 or more bits of priority. GICC_NSAPR2 and GICC_NSAPR3 are implemented only in implementations that support 7 bits of priority.

Attributes

GICC_NSAPR<n> is a 32-bit register.

Field descriptions

IMPLEMENTATION DEFINED, bits [31:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00000000`.

Accessing GICC_NSAPR<n>

GICC_NSAPR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x00E0 + (4 * n)	GICC_NSAPR<n>

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICC_PMR, CPU Interface Priority Mask Register

The GICC_PMR characteristics are:

Purpose

This register provides an interrupt priority filter. Only interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_PMR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_PMR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels, some bits might be RAZ/WI as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICC_PMR

If the GIC implementation supports two Security states:

- Non-secure accesses to this register can only read or write values corresponding to the lower half of the priority range.
- If a Secure write has programmed the register with a value that corresponds to a value in the upper half of the priority range, then:
  - Any Non-secure read of the register returns 0x00, regardless of the value held in the register.
  - Non-secure writes are ignored.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICC_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0004	GICC_PMR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

GICC_RPR, CPU Interface Running Priority Register

The GICC_RPR characteristics are:

Purpose

This register indicates the running priority of the CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_RPR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICC_RPR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICC_RPR

If there is no active interrupt on the CPU interface, the idle priority value is returned.

If the GIC implementation supports two Security states, a Non-secure read of the Priority field returns:

- 0x00 if the field value is less than 0x80.
- The Non-secure view of the Priority value if the field value is 0x80 or more.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Software cannot determine the number of implemented priority bits from this register.

GICC_RPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x0014	GICC_RPR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICC_STATUSR, CPU Interface Status Register

The GICC_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented. Otherwise, direct accesses to GICC_STATUSR are RES0.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent functionality might be provided by appropriate traps and exceptions.

Attributes

GICC_STATUSR is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

ASV, bit [4]

Attempted security violation.

ASV	Meaning
0b0	Normal operation.
0b1	A Non-secure access to a Secure register has been detected.

Note

This bit is not set to 1 for registers where any of the fields are Non-secure.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICC_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

If this register is implemented, GICV_STATUSR must also be implemented.

GICC_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC CPU interface	0x002C	GICC_STATUSR (S)

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.

Component	Offset	Instance
GIC CPU interface	0x002C	GICC_STATUSR (NS)

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICD_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_CLRSPI_NSR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

Additional information

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is less than 0b10.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICD_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0048	GICD_CLRSPI_NSR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICD_CLRSPI_SR, Clear Secure SPI Pending Register

The GICD_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register is WI.

Attributes

GICD_CLRSPI_SR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

Additional information

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_CLRSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0058	GICD_CLRSPI_SR

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are WI.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are WO.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are WO.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are WI.

2025-12-10 16:11:30, 2025-12_rel

GICD_CPENDSGIR<n>, SGI Clear-Pending Registers, n = 0 - 3

The GICD_CPENDSGIR<n> characteristics are:

Purpose

Removes the pending state from an SGI.

A write to this register changes the state of a pending SGI to inactive, and the state of an active and pending SGI to active.

Configuration

Four SGI clear-pending registers are implemented. Each register contains eight clear-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_CPENDSGIR<n> is a 32-bit register.

Field descriptions

SGI_clear_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Removes the pending state from SGI number 4n + x for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

SGI_clear_pending_bits<x>	Meaning
0x00	If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.
0x01	If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, removes the pending state from the SGI for the corresponding PE.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For SGI ID m, generated by processing element C writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_CPENDSGIR<n> number is given by n = m DIV 4.
- The offset of the required register is (0xF10 + (4n)).
- The offset of the required field within the register GICD_CPENDSGIR<n> is given by m MOD 4.
- The required bit in the 8-bit SGI clear-pending field m is bit C.

Accessing GICD_CPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_CPENDSGIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0F10 + (4 * n)	GICD_CPENDSGIR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_CTLR, Distributor Control Register

The GICD_CTLR characteristics are:

Purpose

Enables interrupts and affinity routing.

Configuration

The format of this register depends on the Security state of the access and the number of Security states supported, which is specified by GICD_CTLR.DS.

Attributes

GICD_CTLR is a 32-bit register.

Field descriptions

When access is Secure, in a system that supports two Security states:

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

RWP	Meaning
0b0	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
0b1	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks writes to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>.

Updates to other register fields are not tracked by this field.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:8]

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

E1NWF	Meaning
0b0	A PE that is asleep cannot be picked for 1 of N interrupts.
0b1	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security.

DS	Meaning
0b0	Non-secure accesses are not permitted to access and modify registers that control Group 0 interrupts.
0b1	Non-secure accesses are permitted to access and modify registers that control Group 0 interrupts.

If DS is written from 0 to 1 when GICD_CTLR.ARE_S == 1, then GICD_CTLR.ARE for the single Security state is RAO/WI.

If the Distributor only supports a single Security state, this bit is RAO/WI.

If the Distributor supports two Security states, it IMPLEMENTATION DEFINED whether this bit is programmable or implemented as RAZ/WI.

When this field is set to 1, all accesses to GICD_CTLR access the single Security state view, and all bits are accessible.

When set to 1, this field can only be cleared by a hardware reset.

Writing this bit from 0 to 1 is UNPREDICTABLE if any of the following is true:

- GICD_CTLR.EnableGrp0==1.
- GICD_CTLR.EnableGrp1S==1.
- GICD_CTLR.EnableGrp1NS==1.
- One or more INTID is in the Active or Active and Pending state.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

ARE_NS, bit [5]

Affinity Routing Enable, Non-secure state.

ARE_NS	Meaning
0b0	Affinity routing disabled for Non-secure state.
0b1	Affinity routing enabled for Non-secure state.

When affinity routing is enabled for the Secure state, this field is RAO/WI.

Changing the ARE_NS settings from 0 to 1 is UNPREDICTABLE except when GICD_CTLR.EnableGrp1 Non-secure == 0.

Changing the ARE_NS settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backward compatibility for Non-secure state is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

ARE_S, bit [4]

Affinity Routing Enable, Secure state.

ARE_S	Meaning
0b0	Affinity routing disabled for Secure state.
0b1	Affinity routing enabled for Secure state.

Changing the ARE_S setting from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp0==0.
- GICD_CTLR.EnableGrp1S==0.
- GICD_CTLR.EnableGrp1NS==0.

Changing the ARE_S settings from 1 to 0 is UNPREDICTABLE.

If GICv2 backward compatibility for Secure state is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Bit [3]

Reserved, RES0.

EnableGrp1S, bit [2]

Enable Secure Group 1 interrupts.

EnableGrp1S	Meaning
0b0	Secure Group 1 interrupts are disabled.
0b1	Secure Group 1 interrupts are enabled.

If GICD_CTLR.ARE_S == 0, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1NS, bit [1]

Enable Non-secure Group 1 interrupts.

EnableGrp1NS	Meaning
0b0	Non-secure Group 1 interrupts are disabled.
0b1	Non-secure Group 1 interrupts are enabled.

Note

This field also controls whether LPIs are forwarded to the PE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

When access is Non-secure, in a system that supports two Security states:

RWP, bit [31]

This bit is a read-only alias of the Secure GICD_CTLR.RWP bit.

Bits [30:5]

Reserved, RES0.

ARE_NS, bit [4]

This bit is a read/write alias of the Secure GICD_CTLR.ARE_NS bit.

If GICv2 backward compatibility for Non-secure state is not implemented, this field is RAO/WI.

Bits [3:2]

Reserved, RES0.

EnableGrp1A, bit [1]

If ARE_NS == 1, then this bit is a read/write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 0, then this bit is RES0.

EnableGrp1, bit [0]

If ARE_NS == 0, then this bit is a read/write alias of the Secure GICD_CTLR.EnableGrp1NS bit.

If ARE_NS == 1, then this bit is RES0.

When in a system that supports only a single Security state:

RWP, bit [31]

Register Write Pending. Read only. Indicates whether a register write is in progress or not:

RWP	Meaning
0b0	No register write in progress. The effects of previous register writes to the affected register fields are visible to all logical components of the GIC architecture, including the CPU interfaces.
0b1	Register write in progress. The effects of previous register writes to the affected register fields are not guaranteed to be visible to all logical components of the GIC architecture, including the CPU interfaces, as the effects of the changes are still being propagated.

This field tracks updates to:

- GICD_CTLR[2:0], the Group Enables, for transitions from 1 to 0 only.
- GICD_CTLR[7:4], the ARE bits, E1NWF bit and DS bit.
- GICD_ICENABLER<n>, the bits that allow disabling of SPIs.

Updates to other register fields are not tracked by this field.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:9]

Reserved, RES0.

nASSGIreq, bit [8]
When GICD_TYPER2.nASSGIcap == '1':

Controls whether SGIs have an active state.

This bit is WI when any of GICD_CTLR.{EnableGrp0,EnableGrp1} is 1.

nASSGIreq	Meaning
0b0	SGIs have an active state and must be deactivated.
0b1	SGIs do not have an active state and do not require deactivation.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

E1NWF, bit [7]

Enable 1 of N Wakeup Functionality.

It is IMPLEMENTATION DEFINED whether this bit is programmable, or RAZ/WI.

If it is implemented, then it has the following behavior:

E1NWF	Meaning
0b0	A PE that is asleep cannot be picked for 1 of N interrupts.
0b1	A PE that is asleep can be picked for 1 of N interrupts as determined by IMPLEMENTATION DEFINED controls.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

DS, bit [6]

Disable Security. This field is RAO/WI.

Bit [5]

Reserved, RES0.

ARE, bit [4]

Affinity Routing Enable.

ARE	Meaning
0b0	Affinity routing disabled.
0b1	Affinity routing enabled.

Changing the ARE settings from 0 to 1 is UNPREDICTABLE except when all of the following apply:

- GICD_CTLR.EnableGrp1==0.
- GICD_CTLR.EnableGrp0==0.

Changing ARE from 1 to 0 is UNPREDICTABLE.

If GICv2 backward compatibility is not implemented, this field is RAO/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Bits [3:2]

Reserved, RES0.

EnableGrp1, bit [1]

Enable Group 1 interrupts.

EnableGrp1	Meaning
0b0	Group 1 interrupts disabled.
0b1	Group 1 interrupts enabled.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enable Group 0 interrupts.

EnableGrp0	Meaning
0b0	Group 0 interrupts are disabled.
0b1	Group 0 interrupts are enabled.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_CTLR

If an interrupt is pending within a CPU interface when the corresponding GICD_CTLR.EnableGrpX bit is written from 1 to 0 the interrupt must be retrieved from the CPU interface.

Note

This might have no effect on the forwarded interrupt if it has already been activated. When a write changes the value of ARE for a Security state or the value of the DS bit, the format used for interpreting the remaining bits provided in the write data is the format that applied before the write takes effect.

GICD_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0000	GICD_CTLR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ICACTIVER<n>, Interrupt Clear-Active Registers, n = 0 - 31

The GICD_ICACTIVER<n> characteristics are:

Purpose

Deactivates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICACTIVER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICACTIVER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICACTIVER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICACTIVER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Clear_active_bit25	Clear_active_bit24

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression 0x00000000.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICACTIVER is (0x380 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ICACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, the bits corresponding to SGIs and PPIs in that Security state are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The effect of a write must be visible in finite time.

GICD_ICACTIVER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Distributor	Dist_base	0x0380 + (4 * n)	GICD_ICACTIVER<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ICACTIVER<n>E, Interrupt Clear-Active Registers (extended SPI range), n = 0 - 31

The GICD_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ICACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Clear_active_bit25	Clear_active_bit24

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICACTIVER<n>E is (0x1C00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

The effect of a write must be visible in finite time.

GICD_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1C00 + (4 * n)	GICD_ICACTIVER<n>E

Accesses to this register are RW.

GICD_ICENABLER<n>, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n> characteristics are:

Purpose

Disables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICENABLER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICENABLER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24
Clear_enable_bit31	Clear_enable_bit30	Clear_enable_bit29	Clear_enable_bit28	Clear_enable_bit27	Clear_enable_bit26	Clear_enable_bit25	Clear_enable_bit

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICENABLER is (0x180 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Note

Writing a 1 to a GICD_ICENABLER<n> bit only disables the forwarding of the corresponding interrupt from the Distributor to any CPU interface. It does not prevent the interrupt from changing state, for example becoming pending or active and pending if it is already active.

Accessing GICD_ICENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER<n> and GICD_ICENABLER<n> where n=0.

Completion of a write to this register does not guarantee that the effects of the write are visible throughout the affinity hierarchy. To ensure an enable has been cleared, software must write to the register with bits set to 1 to clear the required enables. Software must then poll GICD_CTLR.RWP until it has the value zero.

GICD_ICENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0180 + (4 * n)	GICD_ICENABLER<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 0 - 31

The GICD_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ICENABLER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICENABLER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICENABLER<n>E is a 32-bit register.

Field descriptions

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICENABLER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICENABLER<n>E is (0x1400 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1400 + (4 * n)	GICD_ICENABLER<n>E

Accesses to this register are RW.

GICD_ICFGR<n>, Interrupt Configuration Registers, n = 0 - 63

The GICD_ICFGR<n> characteristics are:

Purpose

Determines whether the corresponding interrupt is edge-triggered or level-sensitive.

Configuration

These registers are available in all GIC configurations. If the GIC implementation supports two Security states, these registers are Common.

GICD_ICFGR1 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICFGR1 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ICFGR<n>

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

For SGIs, Int_config fields are RO, meaning that GICD_ICFGR0 is RO.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Fields corresponding to unimplemented interrupts are RAZ/WI.

Attributes

GICD_ICFGR<n> is a 32-bit register.

Field descriptions

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

Int_config[0] (bit [2x]) is RES0.

For SGIs, this field always indicates edge-triggered.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>

For SPIs and PPIs, when GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICD_ICFGR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Distributor	Dist_base	0x0C00 + (4 * n)	GICD_ICFGR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ICFGR<n>E, Interrupt Configuration Registers (Extended SPI Range), n = 0 - 63

The GICD_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding SPI in the extended SPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ICFGR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_ICFGR<n>E is a 32-bit register.

Field descriptions

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit[2x]) is RES0.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICD_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICFGR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x3000 + (4 * n)	GICD_ICFGR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ICPENDR<n>, Interrupt Clear-Pending Registers, n = 0 - 31

The GICD_ICPENDR<n> characteristics are:

Purpose

Removes the pending state from the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ICPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ICPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ICPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ICPENDR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26	Clear_pending_bit25	Clear_

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, removes the pending state from interrupt number 32n + x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is an SGI. In this case, the write is ignored. The pending state of an SGI can be cleared using GICD_CPENDSGIR<n>. • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ICPENDR is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ICPENDR<n>

Clear-pending bits for SGIs are RO/WI.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ICPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be cleared by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ICPENDR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0280 + (4 * n)	GICD_ICPENDR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ICPENDR<n>E, Interrupt Clear-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ICPENDR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICPENDR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ICPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26	Clear_pending_bit25	Clear_

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ICPENDR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ICPENDR<n>E is (0x1800 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ICPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1800 + (4 * n)	GICD_ICPENDR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IGROUPR<n>, Interrupt Group Registers, n = 0 - 31

The GICD_IGROUPR<n> characteristics are:

Purpose

Controls whether the corresponding interrupt is in Group 0 or Group 1.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IGROUPR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IGROUPR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IGROUPR<n> is a 32-bit register.

Field descriptions

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n> to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>.

If affinity routing is disabled for the Security state of an interrupt, then:

- The corresponding GICD_IGRPMODR<n> bit is RES0.
- For Secure interrupts, the interrupt is Secure Group 0.
- For Non-secure interrupts, the interrupt is Non-secure Group 1.

The reset behavior of this field is:

- On a GIC reset:
  - When n == 0, this field resets to an UNKNOWN value.
  - When n > 0, this field resets to '0'.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUP<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGROUP is (0x080 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_IGROUPR<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_IGROUPR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Accesses to GICD_IGROUPR0 when affinity routing is not enabled for a Security state access the same state as GICR_IGROUPR0, and must update Redistributor state associated with the PE performing the accesses. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGROUPR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0080 + (4 * n)	GICD_IGROUPR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IGROUPR<n>E, Interrupt Group Registers (extended SPI range), n = 0 - 31

The GICD_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding SPI in the extended SPI range is in Group 0 or Group 1.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_IGROUPR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGROUPR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLR.DS==0, this register is Secure.

Attributes

GICD_IGROUPR<n>E is a 32-bit register.

Field descriptions

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICD_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0:

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGROUPR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGROUPR<n>E is (0x1000 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1000 + (4 * n)	GICD_IGROUPR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IGRPMODR<n>, Interrupt Group Modifier Registers, n = 0 - 31

The GICD_IGRPMODR<n> characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n> registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- Secure Group 1.

Configuration

When GICD_CTLR.DS==0, these registers are Secure.

The number of implemented GICD_IGROUPR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

When GICD_CTLR.ARE_S==0 or GICD_CTLR.DS==1, the GICD_IGRPMODR<n> registers are RES0. An implementation can make these registers RAZ/WI in this case.

Attributes

GICD_IGRPMODR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_modifier_bit26	Group_modifier_bit25

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. When affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n> to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_IGRPMODR is (0x080 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

See GICD_IGROUPR<n> for information about the GICD_IGRPMODR0 reset value.

Accessing GICD_IGRPMODR<n>

When affinity routing is enabled for Secure state, GICD_IGRPMODR0 is RES0 and equivalent functionality is proved by GICR_IGRPMODR0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IGRPMODR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0D00 + (4 * n)	GICD_IGRPMODR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IGRPMODR<n>E, Interrupt Group Modifier Registers (extended SPI range), n = 0 - 31

The GICD_IGRPMODR<n>E characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICD_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_IGRPMODR<n>E are RES0.

GICD_IGRPMODR<n>E resets to 0x00000000.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1:

- The number of implemented GICD_IGRPMODR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.
- When GICD_CTLR.DS==0, this register is Secure.

Attributes

GICD_IGRPMODR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_modifier_bit26	Group_modifier_bit25

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICD_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IGRPMODR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_IGRPMODR<n>E is (0x3400 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGRPMODR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x3400 + (4 * n)	GICD_IGRPMODR<n>E

Accesses to this register are RW.

GICD_IIDR, Distributor Implementer Identification Register

The GICD_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICD_IIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the Distributor.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for GICD_IIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICD_IIDR

GICD_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Distributor	Dist_base	0x0008	GICD_IIDR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICD_INMIR<n>, Non-maskable Interrupt Registers, x = 0 to 31, n = 0 - 31

The GICD_INMIR<n> characteristics are:

Purpose

Holds whether the corresponding SPI has the non-maskable property.

Configuration

This register is present only when GICD_TYPER.NMI == '1'. Otherwise, direct accesses to GICD_INMIR<n> are RES0.

The number of implemented GICD_INMIR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

Attributes

GICD_INMIR<n> is a 32-bit register.

Field descriptions

NMI<x>, bit [x], for x = 31 to 0

Non-maskable property.

NMI<x>	Meaning
0b0	Interrupt does not have the non-maskable property.
0b1	Interrupt has the non-maskable property.

This bit is RES0 when the corresponding interrupt is configured as Group 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_INMI<n> number, n, is given by n = (m DIV 32).
- The offset of the required GICD_INMI is (0xF80 + (4*n)).
- The bit number of the required in this register is (m MOD 32).

Accessing GICD_INMIR<n>

For SGIs and PPIs:

- The field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_INMIR0.

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_INMIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0F80 + (4 * n)	GICD_INMIR<n>

Accesses to this register are RW.

GICD_INMIR<n>E, Non-maskable Interrupt Registers for Extended SPIs, x = 0 to 31, n = 0 - 31

The GICD_INMIR<n>E characteristics are:

Purpose

Holds whether the corresponding SPI in the extended SPI range has the non-maskable property.

Configuration

This register is present only when GICv3.1 is implemented and GICD_TYPER.NMI == '1'. Otherwise, direct accesses to GICD_INMIR<n>E are RES0.

When GICD_TYPER.ESPI is 0, these registers are RES0.

When GICD_TYPER.ESPI is 1: the number of implemented GICD_INMIR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_INMIR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9
NMI31	NMI30	NMI29	NMI28	NMI27	NMI26	NMI25	NMI24	NMI23	NMI22	NMI21	NMI20	NMI19	NMI18	NMI17	NMI16	NMI15	NMI14	NMI13	NMI12	NMI11	NMI10	NMI9

NMI<x>, bit [x], for x = 31 to 0

Non-maskable property.

NMI<x>	Meaning
0b0	Interrupt does not have the non-maskable property.
0b1	Interrupt has the non-maskable property.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

This bit is RES0 when the corresponding interrupt is configured as Group 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_INMIR<n>E number, n, is given by n = ((m-4096) DIV 32).
- The offset of the required GICD_INMIR<n>E is (0x3B00 + (4*n)).
- The bit number in this register is ((m-4096) MOD 32).

Accessing GICD_INMIR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IGROUPR<n>E, the corresponding bit is RES0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_INMIR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x3B00 + (4 * n)	GICD_INMIR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 254

The GICD_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt.

Configuration

These registers are available in all configurations of the GIC. When GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_IPRIORITYR<n> registers is 8*(GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_IPRIORITYR0 to GICD_IPRIORITYR7 are Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_IPRIORITYR0 to GICD_IPRIORITYR7 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_IPRIORITYR<n> is a 32-bit register.

Field descriptions

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00`.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00`.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00`.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00`.

Additional information

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by n = m DIV 4.
- The offset of the required GICD_IPRIORITYR<n> register is (0x400 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].

- Byte offset 2 refers to register bits [23:16].
- Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt:

- GICR_IPRIORITYR<n> is used instead of GICD_IPRIORITYR<n> where n = 0 to 7 (that is, for SGIs and PPIs).
- GICD_IPRIORITYR<n> is RAZ/WI where n = 0 to 7.

These registers are byte-accessible.

A register field corresponding to an unimplemented interrupt is RAZ/WI.

A GIC might implement fewer than eight priority bits, but must implement at least bits [7:4] of each field. In each field, unimplemented bits are RAZ/WI, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When GICD_CTLR.DS==0:

- A register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

It is IMPLEMENTATION DEFINED whether changing the value of a priority field changes the priority of an active interrupt.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0400 + (4 * n)	GICD_IPRIORITYR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IPRIORITYR<n>E, Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC., n = 0 - 255

The GICD_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended SPI supported by the GIC.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_IPRIORITYR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_IPRIORITYR<n>E registers is ((GICD_TYPER.ESPI_range+1)*8). Registers are numbered from 0.

Attributes

GICD_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_IPRIORITYR<n> number, n, is given by n = (m-4096) DIV 4.
- The offset of the required GICD_IPRIORITYR<n>E register is (0x2000 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing GICD_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICD_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x2000 + (4 * n)	GICD_IPRIORITYR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IROUTER<n>, Interrupt Routing Registers, n = 32 - 1019

The GICD_IROUTER<n> characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the SPI with INTID n.

Configuration

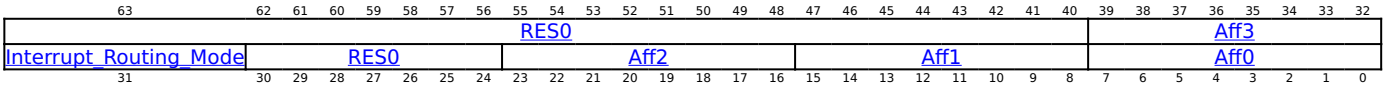
These registers are available in all configurations of the GIC. If the GIC implementation supports two Security states, these registers are Common.

The maximum value of n is given by (32*(GICD_TYPER.ITLinesNumber+1) - 1). GICD_IROUTER<n> registers where n=0 to 31 are reserved.

Attributes

GICD_IROUTER<n> is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

When GICD_TYPER.No1N is 1, 1 of N distribution is not supported. Setting this field to 1 is CONSTRAINED UNPREDICTABLE, the permitted behaviors are:

- The field behaves as if set to 0 for all purposes.
- The field behaves as if set to 0 for all purposes other than a direct-read of the register.
- The interrupt is treated as not targeting any PE.

When this bit is set to 1, GICD_IROUTER<n>.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n> register number, n, is given by n = m.
- The offset of the GICD_IROUTER<n> register is 0x6000 + 8n.

Accessing GICD_IROUTER<n>

These registers are used only when affinity routing is enabled. When affinity routing is not enabled:

- These registers are RES0. An implementation is permitted to make the register RAZ/WI in this case.
- The GICD_ITARGETSR<n> registers provide interrupt routing information.

Note

When affinity routing becomes enabled for a Security state (for example, following a reset or following a write to GICD_CTLR) the value of all writable fields in this register is UNKNOWN for that Security state. When the group of an interrupt changes so the ARE setting for the interrupt changes to 1, the value of this register is UNKNOWN for that interrupt.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any GICD_IROUTER<n> registers that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

Note

For each interrupt, a GIC implementation might support fewer than 256 values for an affinity level. In this case, some bits of the corresponding affinity level field might be RO. Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_IROUTER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x6000 + (8 * n)	GICD_IROUTER<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_IROUTER<n>E, Interrupt Routing Registers (Extended SPI Range), n = 0 - 1023

The GICD_IROUTER<n>E characteristics are:

Purpose

When affinity routing is enabled, provides routing information for the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_IROUTER<n>E are RES0.

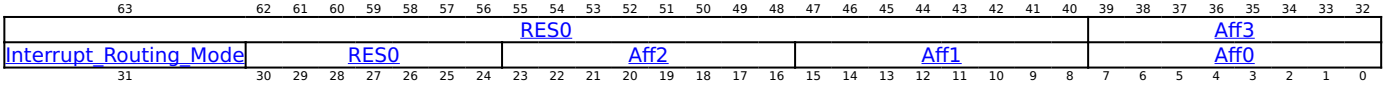
When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_IROUTER<n>E registers is (((GICD_TYPER.ESPI_range+1)*32)-1). Registers are numbered from 0.

Attributes

GICD_IROUTER<n>E is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Interrupt_Routing_Mode, bit [31]

Interrupt Routing Mode. Defines how SPIs are routed in an affinity hierarchy:

Interrupt_Routing_Mode	Meaning
0b0	Interrupts routed to the PE specified by a.b.c.d. In this routing, a, b, c, and d are the values of fields Aff3, Aff2, Aff1, and Aff0 respectively.
0b1	Interrupts routed to any PE defined as a participating node.

If GICD_IROUTER<n>E.IRM == 0 and the affinity path does not correspond to an implemented PE, then if the corresponding interrupt becomes pending behavior is CONSTRAINED UNPREDICTABLE:

- The interrupt is not forwarded to any PE, direct reads return the written value
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the UNKNOWN implemented PE
- The affinity path is treated as an UNKNOWN implemented PE, direct reads return the written value

When GICD_TYPER.No1N is 1, 1 of N distribution is not supported. Setting this field to 1 is CONSTRAINED UNPREDICTABLE, the permitted behaviors are:

- The field behaves as if set to 0 for all purposes.
- The field behaves as if set to 0 for all purposes other than a direct-read of the register.
- The interrupt is treated as not targeting any PE.

When this bit is set to 1, GICD_IROUTER<n>E.{Aff3, Aff2, Aff1, Aff0} are UNKNOWN.

Note

An implementation might choose to make the Aff<n> fields RO when this field is 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [30:24]

Reserved, RES0.

Aff2, bits [23:16]

Affinity level 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff1, bits [15:8]

Affinity level 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Aff0, bits [7:0]

Affinity level 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For an SPI with INTID m:

- The corresponding GICD_IROUTER<n>E register number, n, is given by n = m.
- The offset of the GICD_IROUTER<n>E register is 0x6000 + 8n.

Accessing GICD_IROUTER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_IROUTER<n>E, the register is RES0.

When GICD_CTLR.DS==0, a register that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_IROUTER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x8000 + (8 * n)	GICD_IROUTER<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ISACTIVER<n>, Interrupt Set-Active Registers, n = 0 - 31

The GICD_ISACTIVER<n> characteristics are:

Purpose

Activates the corresponding interrupt. These registers are used when saving and restoring GIC state.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISACTIVER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISACTIVER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISACTIVER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISACTIVER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit25	Set_active_bit24	Set_active_bit23	S

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number 32n + x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISACTIVER is (0x300 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

Accessing GICD_ISACTIVER<n>

When affinity routing is enabled for the Security state of an interrupt, bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISACTIVER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

The bit reads as one if the status of the interrupt is active or active and pending. GICD_ISPENDR<n> and GICD_ICPENDR<n> provide the pending status of the interrupt.

The effect of a write must be visible in finite time. Reading back the written value from either the Set-Active or Clear-Active registers guarantees that a deactivate from a CPU interface Ordered-after the read, will observe the effects of the write on the Active state of the interrupt.

GICD_ISACTIVER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0300 + (4 * n)	GICD_ISACTIVER<n>

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ISACTIVER<n>E, Interrupt Set-Active Registers (extended SPI range), n = 0 - 31

The GICD_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ISACTIVER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISACTIVER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit25	Set_active_bit24	Set_active_bit23	S

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISACTIVER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISACTIVER<n>E is (0x1A00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

The effect of a write must be visible in finite time. Reading back the written value from either the Set-Active or Clear-Active registers guarantees that a deactivate from a CPU interface Ordered-after the read, will observe the effects of the write on the Active state of the interrupt.

GICD_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1A00 + (4 * n)	GICD_ISACTIVER<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ISENABLER<n>, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n> characteristics are:

Purpose

Enables forwarding of the corresponding interrupt to the CPU interfaces.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISENABLER<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISENABLER0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISENABLER0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISENABLER<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
Set_enable_bit31	Set_enable_bit30	Set_enable_bit29	Set_enable_bit28	Set_enable_bit27	Set_enable_bit26	Set_enable_bit25	Set_enable_bit24	Set_enable_

Set_enable_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, controls the forwarding of interrupt number 32n + x to the CPU interfaces. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

For SGIs, the behavior of this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n> number, n, is given by n = m DIV 32.
- The offset of the required GICD_ISENABLER is (0x100 + (4*n)).
- The bit number of the required group modifier bit in this register is m MOD 32.

At start-up, and after a reset, a PE can use this register to discover which peripheral INTIDs the GIC supports. If GICD_CTLR.DS==0 in a system that supports EL3, the PE must do this for the Secure view of the available interrupts, and Non-secure software running on the PE must do this discovery after the Secure software has configured interrupts as Group 0/Secure Group 1 and Non-secure Group 1.

Accessing GICD_ISENABLER<n>

For SGIs and PPIs:

- When ARE is 1 for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case.
- Equivalent functionality is provided by GICR_ISENABLER0.

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 or Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether implemented SGIs are permanently enabled, or can be enabled and disabled by writes to GICD_ISENABLER<n> and GICD_ICENABLER<n> where n=0.

For SPIs and PPIs, each bit controls the forwarding of the corresponding interrupt from the Distributor to the CPU interfaces.

GICD_ISENABLER<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0100 + (4 * n)	GICD_ISENABLER<n>

Accesses to this register are RW.

GICD_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 0 - 31

The GICD_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding SPI in the extended SPI range to the CPU interfaces.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ISENABLER<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISENABLER<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISENABLER<n>E is a 32-bit register.

Field descriptions

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended SPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISENABLER<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISENABLER<n>E is (0x1200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1200 + (4 * n)	GICD_ISENABLER<n>E

Accesses to this register are RW.

GICD_ISPENDR<n>, Interrupt Set-Pending Registers, n = 0 - 31

The GICD_ISPENDR<n> characteristics are:

Purpose

Adds the pending state to the corresponding interrupt.

Configuration

These registers are available in all GIC configurations. If GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ISPENDR<n> registers is (GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ISPENDR0 is Banked for each connected PE with GICR_TYPER.Processor_Number < 8.

Accessing GICD_ISPENDR0 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ISPENDR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Set_pending_bit25	Set_pending_bit24

Set_pending_bit<x>, bit [x], for x = 31 to 0

For SPIs and PPIs, adds the pending state to interrupt number 32n + x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on any PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is an SGI. The pending state of an SGI can be set using GICD_SPENDSGIR<n>. • If the interrupt is not inactive and is not active. • If the interrupt is already pending because of a write to GICD_ISPENDR<n>. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression 0x00000000.

Accessing GICD_ISPENDR<n>

Set-pending bits for SGIs are read-only and ignore writes. The Set-pending bits for SGIs are provided as GICD_SPENDSGIR<n>.

When affinity routing is enabled for the Security state of an interrupt:

- Bits corresponding to SGIs and PPIs are RAZ/WI, and equivalent functionality for SGIs and PPIs is provided by GICR_ISPENDR0.
- Bits corresponding to Group 0 and Group 1 Secure interrupts can only be set by Secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

GICD_ISPENDR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Distributor	Dist_base	0x0200 + (4 * n)	GICD_ISPENDR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ISPENDR<n>E, Interrupt Set-Pending Registers (extended SPI range), n = 0 - 31

The GICD_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding SPI in the extended SPI range.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_ISPENDR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ISPENDR<n>E registers is (GICD_TYPER.ESPI_range+1). Registers are numbered from 0.

Attributes

GICD_ISPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24
Set_pending_bit31	Set_pending_bit30	Set_pending_bit29	Set_pending_bit28	Set_pending_bit27	Set_pending_bit26	Set_pending_bit25	Set_pending_bit24

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended SPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICD_ISPENDR<n>E. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ISPENDR<n>E number, n, is given by n = (m-4096) DIV 32.
- The offset of the required GICD_ISPENDR<n>E is (0x1600 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-4096) MOD 32.

Accessing GICD_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICD_ISPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure SPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICD_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x1600 + (4 * n)	GICD_ISPENDR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_ITARGETSR<n>, Interrupt Processor Targets Registers, n = 0 - 254

The GICD_ITARGETSR<n> characteristics are:

Purpose

When affinity routing is not enabled, holds the list of target PEs for the interrupt. That is, it holds the list of CPU interfaces to which the Distributor forwards the interrupt if it is asserted and has sufficient priority.

Configuration

These registers are available in all configurations of the GIC. When GICD_CTLR.DS==0, these registers are Common.

The number of implemented GICD_ITARGETSR<n> registers is 8*(GICD_TYPER.ITLinesNumber+1). Registers are numbered from 0.

GICD_ITARGETSR0 to GICD_ITARGETSR7 are Banked for each connected PEwith GICR_TYPER.Processor_Number < 8.

Accessing GICD_ITARGETSR0 to GICD_ITARGETSR7 from a PE with GICR_TYPER.Processor_Number > 7 is CONSTRAINED UNPREDICTABLE:

- Register is RAZ/WI.
- An UNKNOWN banked copy of the register is accessed.

Attributes

GICD_ITARGETSR<n> is a 32-bit register.

Field descriptions

PEs in the system number from 0, and each bit in a PE targets field refers to the corresponding PE. For example, a value of 0x3 means that the Pending interrupt is sent to PEs 0 and 1. For GICD_ITARGETSR0-GICD_ITARGETSR7, a read of any targets field returns the number of the PE performing the read.

CPU_targets_offset_3B, bits [31:24]

PE targets for an interrupt, at byte offset 3.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_2B, bits [23:16]

PE targets for an interrupt, at byte offset 2.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_1B, bits [15:8]

PE targets for an interrupt, at byte offset 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

CPU_targets_offset_0B, bits [7:0]

PE targets for an interrupt, at byte offset 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

The bits that are set to 1 in the PE targets field determine which PEs are targeted:

Value of PE targets field	Interrupt targets
0bxxxxxxx1	CPU interface 0
0bxxxxxx1x	CPU interface 1
0bxxxxx1xx	CPU interface 2
0bxxxx1xxx	CPU interface 3
0bxxx1xxxx	CPU interface 4
0bxx1xxxxx	CPU interface 5
0bx1xxxxxx	CPU interface 6
0b1xxxxxxx	CPU interface 7

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_ITARGETSR<n> number, n, is given by n = m DIV 4.
- The offset of the required GICD_ITARGETSR<n> register is (0x800 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Software can write to these registers at any time. Any change to a targets field value:

- Has no effect on any active interrupt. This means that removing a CPU interface from a targets list does not cancel an active state for interrupts on that CPU interface. There is no effect on interrupts that are active and pending until the active status is cleared, at which time it is treated as a pending interrupt.
- Has an effect on any pending interrupts. This means:
  - Enables the CPU interface to be chosen as a target for the pending interrupt using an IMPLEMENTATION DEFINED mechanism.
  - Removing a CPU interface from the target list of a pending interrupt removes the pending state of the interrupt on that CPU interface.

Accessing GICD_ITARGETSR<n>

These registers are used when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt, the target PEs for an interrupt are defined by GICD_IROUTER<n> and the associated byte in GICD_ITARGETSR<n> is RES0. An implementation is permitted to make the byte RAZ/WI in this case.

- These registers are byte-accessible.
- A register field corresponding to an unimplemented interrupt is RAZ/WI.
- A field bit corresponding to an unimplemented CPU interface is RAZ/WI.
- GICD_ITARGETSR0-GICD_ITARGETSR7 are read-only. Each field returns a value that corresponds only to the PE reading the register.
- It is IMPLEMENTATION DEFINED which, if any, SPIs are statically configured in hardware. The field for such an SPI is read-only, and returns a value that indicates the PE targets for the interrupt.
- If GICD_CTLR.DS==0, unless the GICD_NSACR<n> registers permit Non-secure software to control Group 0 and Secure Group 1 interrupts, any bits that correspond to Group 0 or Secure Group 1 interrupts are accessible only by Secure accesses and are RAZ/WI to Non-secure accesses.

In a single connected PE implementation, all interrupts target one PE, and these registers are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICD_ITARGETSR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0800 + (4 * n)	GICD_ITARGETSR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_NSACR<n>, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n> characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

The concept of selective enabling of Non-secure access to Group 0 and Secure Group 1 interrupts applies to SGIs and SPIs.

GICD_NSACR0 is a Banked register used for SGIs. A copy is provided for every PE that has a CPU interface and that supports this feature.

Attributes

GICD_NSACR<n> is a 32-bit register.

Field descriptions

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n> associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt. A Non-secure write access to GICD_SGIR is permitted to generate a Secure SGI for the corresponding interrupt. An implementation might also provide read access to clear-pending bits in GICD_ICPENDR<n> associated with the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n> registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n> and GICD_ICACTIVER<n> registers.
0b11	For GICD_NSACR0 this encoding is reserved and treated as 10. For all other GICD_NSACR<n> registers this encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_ITARGETSR<n> and GICD_IROUTER<n> fields associated with the corresponding interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n> number, n, is given by n = m DIV 16.
- The offset of the required GICD_NSACR<n> register is (0xE00 + (4*n)).

Note

Because each field in this register comprises two bits, GICD_NSACR0 controls access rights to SGI registers, GICD_NSACR1 controls access to PPI registers (and is always RAZ/WI), and all other GICD_NSACR<n> registers control access to SPI registers.

For compatibility with GICv2, writes to GICD_NSACR0 for a particular PE must be coordinated within the Distributor and must update GICR_NSACR for the Redistributor associated with that PE.

Accessing GICD_NSACR<n>

These registers are always used when affinity routing is not enabled. When affinity routing is enabled for the Secure state, GICD_NSACR0 is RES0 and GICR_NSACR provides equivalent functionality for SGIs.

These registers do not support PPIs, therefore GICD_NSACR1 is RAZ/WI.

GICD_NSACR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0E00 + (4 * n)	GICD_NSACR<n>

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are RAZ/WI.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are RW.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are RAZ/WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are RW.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

GICD_NSACR<n>E, Non-secure Access Control Registers, n = 0 - 63

The GICD_NSACR<n>E characteristics are:

Purpose

Enables Secure software to permit Non-secure software on a particular PE to create and control Group 0 interrupts.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICD_NSACR<n>E are RES0.

When GICD_TYPER.ESPI==0, these registers are RES0.

When GICD_TYPER.ESPI==1, the number of implemented GICD_ICFGR<n>E registers is ((GICD_TYPER.ESPI_range+1)*2). Registers are numbered from 0.

Attributes

GICD_NSACR<n>E is a 32-bit register.

Field descriptions

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Controls Non-secure access of the interrupt with ID 16n + x.

If the corresponding interrupt does not support configurable Non-secure access, the field is RAZ/WI.

Otherwise, the field is RW and determines the level of Non-secure control permitted if the interrupt is a Secure interrupt. If the interrupt is a Non-secure interrupt, this field is ignored.

The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	No Non-secure access is permitted to fields associated with the corresponding interrupt.
0b01	Non-secure read and write access is permitted to set-pending bits in GICD_ISPENDR<n>E associated with the corresponding interrupt. A Non-secure write access to GICD_SETSPI_NSR is permitted to set the pending state of the corresponding interrupt.
0b10	As 0b01, but adds Non-secure read and write access permission to fields associated with the corresponding interrupt in the GICD_ICPENDR<n>E registers. A Non-secure write access to GICD_CLRSPI_NSR is permitted to clear the pending state of the corresponding interrupt. Also adds Non-secure read access permission to fields associated with the corresponding interrupt in the GICD_ISACTIVER<n>E and GICD_ICACTIVER<n>E registers.
0b11	This encoding is treated as 0b10, but adds Non-secure read and write access permission to GICD_IROUTER<n>E fields associated with the corresponding interrupt.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_NSACR<n>E number, n, is given by n = (m - 4096) DIV 16.
- The offset of the required GICD_NSACR<n>E register is (0x3600 + (4*n)).

Accessing GICD_NSACR<n>E

GICD_NSACR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Distributor	Dist_base	0x3600 + (4 * n)	GICD_NSACR<n>E

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are RAZ/WI.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are RW.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are RAZ/WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are RW.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

GICD_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICD_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register provides functionality for all SPIs.

Attributes

GICD_SETSPI_NSR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

Additional information

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICD_SETSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0040	GICD_SETSPI_NSR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICD_SETSPI_SR, Set Secure SPI Pending Register

The GICD_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

If GICD_TYPER.MBIS == 0, this register is reserved.

When GICD_CTLR.DS == 1, this register is WI.

Attributes

GICD_SETSPI_SR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

The INTID of the SPI.

Additional information

The function of this register depends on whether the targeted SPI is configured to be an edge-triggered or level-sensitive interrupt:

- For an edge-triggered interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will stop being pending on activation, or if the pending state is removed by a write to GICD_CLRSPI_NSR, GICD_CLRSPI_SR, or GICD_ICPENDR<n>.
- For a level-sensitive interrupt, a write to GICD_SETSPI_NSR or GICD_SETSPI_SR adds the pending state to the targeted interrupt. It will remain pending until it is deasserted by a write to GICD_CLRSPI_NSR or GICD_CLRSPI_SR. If the interrupt is activated between having the pending state added and being deactivated, then the interrupt will be active and pending.

Accessing GICD_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICD_SETSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0050	GICD_SETSPI_SR

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are WI.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are WO.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are WO.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are WI.

2025-12-10 16:11:30, 2025-12_rel

GICD_SGIR, Software Generated Interrupt Register

The GICD_SGIR characteristics are:

Purpose

Controls the generation of SGIs.

Configuration

This register is available in all configurations of the GIC. If the GIC supports two Security states this register is Common.

Attributes

GICD_SGIR is a 32-bit register.

Field descriptions

Bits [31:26]

Reserved, RES0.

TargetListFilter, bits [25:24]

Determines how the Distributor processes the requested SGI.

TargetListFilter	Meaning
0b00	Forward the interrupt to the CPU interfaces specified by GICD_SGIR.CPUTargetList.
0b01	Forward the interrupt to all CPU interfaces except that of the PE that requested the interrupt.
0b10	Forward the interrupt only to the CPU interface of the PE that requested the interrupt.
0b11	Reserved.

CPUTargetList, bits [23:16]

When GICD_SGIR.TargetListFilter is 0b00, this field defines the CPU interfaces to which the Distributor must forward the interrupt.

Each bit of the field refers to the corresponding CPU interface. For example, CPUTargetList[0] corresponds to interface 0. Setting a bit to 1 indicates that the interrupt must be forwarded to the corresponding interface.

If this field is 0b00000000 when GICD_SGIR.TargetListFilter is 0b00, the Distributor does not forward the interrupt to any CPU interface.

NSATT, bit [15]

Specifies the required group of the SGI.

NSATT	Meaning
0b0	Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 0 on that interface.
0b1	Forward the SGI specified in the INTID field to a specified CPU interface only if the SGI is configured as Group 1 on that interface.

This field is writable only by a Secure access. Non-secure accesses can also generate Group 0 interrupts, if allowed to do so by GICD_NSACR0. Otherwise, Non-secure writes to GICD_SGIR generate an SGI only if the specified SGI is programmed as Group 1, regardless of the value of bit [15] of the write.

Bits [14:4]

Reserved, RES0.

INTID, bits [3:0]

The INTID of the SGI to forward to the specified CPU interfaces.

Accessing GICD_SGIR

This register is used only when affinity routing is not enabled. When affinity routing is enabled, this register is RES0.

It is IMPLEMENTATION DEFINED whether this register has any effect when the forwarding of interrupts by the Distributor is disabled by GICD_CTLR.

GICD_SGIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0F00	GICD_SGIR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICD_SPENDSGIR<n>, SGI Set-Pending Registers, n = 0 - 3

The GICD_SPENDSGIR<n> characteristics are:

Purpose

Adds the pending state to an SGI.

A write to this register changes the state of an inactive SGI to pending, and the state of an active SGI to active and pending.

Configuration

Four SGI set-pending registers are implemented. Each register contains eight set-pending bits for each of four SGIs, for a total of 16 possible SGIs.

In multiprocessor implementations, each PE has a copy of these registers.

Attributes

GICD_SPENDSGIR<n> is a 32-bit register.

Field descriptions

SGI_set_pending_bits<x>, bits [8x+7:8x], for x = 3 to 0

Adds the pending state to SGI number 4n + x for the PE corresponding to the bit number written to.

Reads and writes have the following behavior:

SGI_set_pending_bits<x>	Meaning
0x00	If read, indicates that the SGI from the corresponding PE is not pending and is not active and pending. If written, has no effect.
0x01	If read, indicates that the SGI from the corresponding PE is pending or is active and pending. If written, adds the pending state to the SGI for the corresponding PE.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For SGI ID m, generated by processing element C writing to the corresponding GICD_SGIR field, where DIV and MOD are the integer division and modulo operations:

- The corresponding GICD_SPENDSGIR<n> number is given by n = m DIV 4.
- The offset of the required register is (0xF20 + (4n)).
- The offset of the required field within the register GICD_SPENDSGIR<n> is given by m MOD 4.
- The required bit in the 8-bit SGI set-pending field m is bit C.

Accessing GICD_SPENDSGIR<n>

These registers are used only when affinity routing is not enabled. When affinity routing is enabled for the Security state of an interrupt then the bit associated with SGI in that Security state is RES0. An implementation is permitted to make the register RAZ/WI in this case.

A register bit that corresponds to an unimplemented SGI is RAZ/WI.

These registers are byte-accessible.

If the GIC implementation supports two Security states:

- A register bit that corresponds to a Group 0 interrupt is RAZ/WI to Non-secure accesses.
- Register bits corresponding to unimplemented PEs are RAZ/WI.

GICD_SPENDSGIR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Distributor	Dist_base	0x0F20 + (4 * n)	GICD_SPENDSGIR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICD_STATUSR, Error Reporting Status Register

The GICD_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICD_STATUSR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICD_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICD_STATUSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0010	GICD_STATUSR (S)

Accessible as follows:

- When an access is Secure, accesses to this register are RW.
- When FEAT_RME is implemented and an access is Root, accesses to this register are RW.

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0010	GICD_STATUSR (NS)

Accessible as follows:

- When an access is Non-secure, accesses to this register are RW.
- When FEAT_RME is implemented and an access is Realm, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

GICD_TYPER, Interrupt Controller Type Register

The GICD_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports. It indicates:

- Whether the GIC implementation supports two Security states.
- The maximum number of INTIDs that the GIC implementation supports.
- The number of PEs that can be used as interrupt targets.

Configuration

This register is available in all configurations of the GIC. When GICD_CTLR.DS==0, this register is Common.

Attributes

GICD_TYPER is a 32-bit register.

Field descriptions

ESPI_range, bits [31:27]
When GICD_TYPER.ESPI == '1':

Indicates the maximum INTID in the Extended SPI range.

Maximum Extended SPI INTID is (32*(ESPI_range + 1) + 4095).

The ESPI_range field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- GICD_IGROUPR<n>E.
- GICD_ISENABLER<n>E.
- GICD_ICENABLER<n>E.
- GICD_ISPENDR<n>E.
- GICD_ICPENDR<n>E.
- GICD_ISACTIVER<n>E.
- GICD_ICACTIVER<n>E.
- GICD_IPRIORITYR<n>E.
- GICD_ICFGR<n>E.
- GICD_IROUTER<n>E.
- GICD_IGRPMODR<n>E.

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ESPI_range.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

RSS, bit [26]

Range Selector Support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RSS	Meaning
0b0	The IRI supports targeted SGIs with affinity level 0 values of 0 - 15.
0b1	The IRI supports targeted SGIs with affinity level 0 values of 0 - 255.

Access to this field is RO.

No1N, bit [25]

Indicates whether 1 of N SPI interrupts are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

No1N	Meaning
0b0	1 of N SPI interrupts are supported.
0b1	1 of N SPI interrupts are not supported.

Access to this field is RO.

A3V, bit [24]

Affinity 3 valid. Indicates whether the Distributor supports nonzero values of Affinity level 3.

The value of this field is an IMPLEMENTATION DEFINED choice of:

A3V	Meaning
0b0	The Distributor only supports zero values of Affinity level 3.
0b1	The Distributor supports nonzero values of Affinity level 3.

Access to this field is RO.

IDbits, bits [23:19]

The number of interrupt identifier bits supported, minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

DVIS, bit [18]
When GICv4 is implemented:

Indicates whether the implementation supports Direct Virtual LPI injection.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DVIS	Meaning
0b0	The implementation does not support Direct Virtual LPI injection.
0b1	The implementation supports Direct Virtual LPI injection.

Access to this field is RO.

Otherwise:

Reserved, RES0.

LPIS, bit [17]

Indicates whether the implementation supports LPIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LPIS	Meaning
0b0	The implementation does not support LPIs.
0b1	The implementation supports LPIs.

Access to this field is RO.

MBIS, bit [16]

Indicates whether the implementation supports message-based interrupts by writing to Distributor registers.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MBIS	Meaning
0b0	The implementation does not support message-based interrupts by writing to Distributor registers. The GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, and GICD_SETSPI_SR registers are reserved.
0b1	The implementation supports message-based interrupts by writing to the GICD_CLRSPI_NSR, GICD_SETSPI_NSR, GICD_CLRSPI_SR, or GICD_SETSPI_SR registers.

Access to this field is RO.

num_LPIs, bits [15:11]

Number of supported LPIs.

- 0b00000 Number of LPIs as indicated by GICD_TYPER.IDbits.
- All other values Number of LPIs supported is $2^{(num\_LPIs+1)}$.
  - Available LPI INTIDs are 8192..(8192 + $2^{(num\_LPIs+1)}$ - 1).
  - This field cannot indicate a maximum LPI INTID greater than that indicated by GICD_TYPER.IDbits.

When the supported INTID width is less than 14 bits, this field is RES0 and no LPIs are supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SecurityExtn, bit [10]

Indicates whether the GIC implementation supports two Security states:

When GICD_CTLR.DS == 1, this field is RAZ.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SecurityExtn	Meaning
0b0	The GIC implementation supports only a single Security state.
0b1	The GIC implementation supports two Security states.

Access to this field is RO.

NMI, bit [9]

Non-maskable Interrupts.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NMI	Meaning
0b0	Non-maskable interrupt property not supported.
0b1	Non-maskable interrupt property is supported.

Access to this field is RO.

ESPI, bit [8]

Extended SPI.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ESPI	Meaning
0b0	Extended SPI range not implemented.
0b1	Extended SPI range implemented.

Access to this field is RO.

CPUNumber, bits [7:5]

Reports the number of PEs that can be used when affinity routing is not enabled, minus 1.

These PEs must be numbered contiguously from zero, but the relationship between this number and the affinity hierarchy from MPIDR is IMPLEMENTATION DEFINED. If the implementation does not support ARE being zero, this field is 000.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ITLinesNumber, bits [4:0]

For the INTID range 32 to 1019, indicates the maximum SPI supported.

If the value of this field is N, the maximum SPI INTID is 32(N+1) minus 1. For example, 00011 specifies that the maximum SPI INTID is 127.

Regardless of the range of INTIDs defined by this field, interrupt IDs 1020-1023 are reserved for special purposes.

A value of 0 indicates no SPIs are supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Additional information

The ITLinesNumber field only indicates the maximum number of SPIs that the GIC implementation might support. This value determines the number of instances of the following interrupt registers:

- GICD_IGROUPR<n>.
- GICD_ISENABLER<n>.
- GICD_ICENABLER<n>.
- GICD_ISPENDR<n>.
- GICD_ICPENDR<n>.
- GICD_ISACTIVER<n>.
- GICD_ICACTIVER<n>.
- GICD_IPRIORITYR<n>.
- GICD_ITARGETSR<n>.
- GICD_ICFGR<n>.
- GICD_IROUTER<n>.
- GICD_IGRPMODR<n>.

The GIC architecture does not require a GIC implementation to support a continuous range of SPI interrupt IDs. Software must check which SPI INTIDs are supported, up to the maximum value indicated by GICD_TYPER.ITLinesNumber.

Accessing GICD_TYPER

GICD_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x0004	GICD_TYPER

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICD_TYPER2, Interrupt Controller Type Register 2

The GICD_TYPER2 characteristics are:

Purpose

Provides information about which features the GIC implementation supports.

Configuration

When GICD_CTLR.DS == 0, this register is Common.

Attributes

GICD_TYPER2 is a 32-bit register.

Field descriptions

Bits [31:9]

Reserved, RES0.

nASSGIcap, bit [8]

Indicates whether SGIs can be configured to not have an active state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

nASSGIcap	Meaning
0b0	SGIs have an active state.
0b1	SGIs can be globally configured not to have an active state.

This bit is RES0 on implementations that support two Security states.

Access to this field is RO.

VIL, bit [7]
When GICv4.1 is implemented:

Indicates whether 16 bits of vPEID are implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VIL	Meaning
0b0	GIC supports 16-bit vPEID.
0b1	GIC supports GICD_TYPER2.VID + 1 bits of vPEID.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

VID, bits [4:0]
When GICv4.1 is implemented:

When GICD_TYPER2.VIL == 1, the number of bits is equal to the bits of vPEID minus one.

When GICD_TYPER2.VIL == 0, this field is RES0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Accessing GICD_TYPER2

GICD_TYPER2 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	Dist_base	0x000C	GICD_TYPER2

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICH_APR<n>, Active Priorities Registers, n = 0 - 3

The GICH_APR<n> characteristics are:

Purpose

These registers track which preemption levels are active in the virtual CPU interface, and indicate the current active priority. Corresponding bits are set to 1 in this register when an interrupt is acknowledged, based on GICH_LR<n>.Priority, and the least significant bit set is cleared on EOI.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_APR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The number of registers required depends on how many bits are implemented in GICH_LR<n>.Priority:

- When 5 priority bits are implemented, 1 register is required (GICH_APR0).
- When 6 priority bits are implemented, 2 registers are required (GICH_APR0, GICH_APR1).
- When 7 priority bits are implemented, 4 registers are required (GICH_APR0, GICH_APR1, GICH_APR2, GICH_APR3).

Unimplemented registers are RAZ/WI.

Attributes

GICH_APR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Active priorities. Possible values of each bit are:

P<x>	Meaning
0b0	There is no interrupt active at the priority corresponding to that bit.
0b1	There is an interrupt active at the priority corresponding to that bit.

The correspondence between priorities and bits depends on the number of bits of priority that are implemented.

If 5 bits of priority are implemented (bits [7:3] of priority), then there are 32 priority groups, and the active state of these priorities are held in GICH_APR0 in the bits corresponding to Priority[7:3].

If 6 bits of priority are implemented (bits [7:2] of priority), then there are 64 priority groups, and:

- The active state of priorities 0 - 124 are held in GICH_APR0 in the bits corresponding to 0:Priority[6:2].
- The active state of priorities 128 - 252 are held in GICH_APR1 in the bits corresponding to 1:Priority[6:2].

If 7 bits of priority are implemented (bits [7:1] of priority), then there are 128 priority groups, and:

- The active state of priorities 0 - 62 are held in GICH_APR0 in the bits corresponding to 00:Priority[5:1].
- The active state of priorities 64 - 126 are held in GICH_APR1 in the bits corresponding to 01:Priority[5:1].
- The active state of priorities 128 - 190 are held in GICH_APR2 in the bits corresponding to 10:Priority[5:1].
- The active state of priorities 192 - 254 are held in GICH_APR3 in the bits corresponding to 11:Priority[5:1].

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x00000000`.

Accessing GICH_APR<n>

These registers are used only when System register access is not enabled. When System register access is enabled the following registers provide equivalent functionality:

- In AArch64:
  - For Group 0, ICH_AP0R<n>_EL2.
  - For Group 1, ICH_AP1R<n>_EL2.

- In AArch32:
  - For Group 0, ICH_AP0R<n>.
  - For Group 1, ICH_AP1R<n>.

GICH_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x00F0 + (4 * n)	GICH_APR<n>

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICH_EISR, End Interrupt Status Register

The GICH_EISR characteristics are:

Purpose

Indicates which List registers have outstanding EOI maintenance interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_EISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_EISR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

EOI maintenance interrupt status for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n> does not have an EOI maintenance interrupt.
0b1	GICH_LR<n> has an EOI maintenance interrupt that has not been handled.

For any GICH_LR<n> register, the corresponding status bit is set to 1 if all of the following are true:

- GICH_LR<n>.State is 0b00.
- GICH_LR<n>.HW == 0.
- GICH_LR<n>.EOI == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_EISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_EISR provides equivalent functionality.
- For AArch64 implementations, ICH_EISR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RAZ.

GICH_EISR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0020	GICH_EISR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICH_ELRSR, Empty List Register Status Register

The GICH_ELRSR characteristics are:

Purpose

Indicates which List registers contain valid interrupts.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_ELRSR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_ELRSR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

Status<n>, bit [n], for n = 15 to 0

Status bit for List register <n>:

Status<n>	Meaning
0b0	GICH_LR<n>, if implemented, contains a valid interrupt. Using this List register can result in overwriting a valid interrupt.
0b1	GICH_LR<n> does not contain a valid interrupt. The List register is empty and can be used without overwriting a valid interrupt or losing an EOI maintenance interrupt.

For any GICH_LR<n> register, the corresponding status bit is set to 1 if GICH_LR<n>.State is 0b00 and either:

- GICH_LR<n>.HW == 1.
- GICH_LR<n>.EOI == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to the expression `0x0001`.

Accessing GICH_ELRSR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_ELRSR provides equivalent functionality.
- For AArch64 implementations, ICH_ELRSR_EL2 provides equivalent functionality.

Bits corresponding to unimplemented List registers are RES0.

GICH_ELRSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0030	GICH_ELRSR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICH_HCR, Hypervisor Control Register

The GICH_HCR characteristics are:

Purpose

Controls the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_HCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_HCR is a 32-bit register.

Field descriptions

EOICount, bits [31:27]

Counts the number of EOIs received that do not have a corresponding entry in the List registers. The virtual CPU interface increments this field automatically when a matching EOI is received. EOIs that do not clear a bit in GICH_APR<n> do not cause an increment. If an EOI occurs when the value of this field is 31, then the field wraps to 0.

The maintenance interrupt is asserted whenever this field is nonzero and GICH_HCR.LRENPIE == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [26:8]

Reserved, RES0.

VGrp1DIE, bit [7]

VM Group 1 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp1DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp1EIE, bit [6]

VM Group 1 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 1 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp1EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp1 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0DIE, bit [5]

VM Group 0 Disabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is disabled:

VGrp0DIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VGrp0EIE, bit [4]

VM Group 0 Enabled Interrupt Enable.

Enables the signaling of a maintenance interrupt while signaling of Group 0 interrupts from the virtual CPU interface to the connected virtual machine is enabled:

VGrp0EIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled when GICV_CTLR.EnableGrp0 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NPIE, bit [3]

No Pending Interrupt Enable.

Enables the signaling of a maintenance interrupt while no pending interrupts are present in the List registers:

NPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while the List registers contain no interrupts in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LRENPIE, bit [2]

List Register Entry Not Present Interrupt Enable.

Enables the signaling of a maintenance interrupt while the virtual CPU interface does not have a corresponding valid List register for an EOI request:

LRENPIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	Maintenance interrupt signaled while GICH_HCR.EOICount is not 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

UIE, bit [1]

Underflow Interrupt Enable.

Enables the signaling of a maintenance interrupt when the List registers are either empty or hold only one valid entry.

UIE	Meaning
0b0	Maintenance interrupt disabled.
0b1	A maintenance interrupt is signaled if zero or one of the List register entries are marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

En, bit [0]

Enable.

Global enable bit for the virtual CPU interface.

En	Meaning
0b0	Virtual CPU interface operation is disabled.
0b1	Virtual CPU interface operation is enabled.

When this field is 0:

- The virtual CPU interface does not signal any maintenance interrupts.
- The virtual CPU interface does not signal any virtual interrupts.
- A read of GICV_IAR or GICV_AIAR returns a spurious interrupt ID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

The VGrp1DIE, VGrp1EIE, VGrp0DIE, and VGrp0EIE fields permit the hypervisor to track the virtual CPU interfaces that are enabled. The hypervisor can then route interrupts that have multiple targets correctly and efficiently, without having to read the virtual CPU interface status.

See 'Maintenance interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069) and GICH_MISR for more information.

Accessing GICH_HCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_HCR provides equivalent functionality.
- For AArch64 implementations, ICH_HCR_EL2 provides equivalent functionality.

GICH_HCR.En must be set to 1 for any virtual or maintenance interrupt to be asserted.

GICH_HCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0000	GICH_HCR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

GICH_LR<n>, List Registers, n = 0 - 15

The GICH_LR<n> characteristics are:

Purpose

These registers provide context information for the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_LR<n> are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

A maximum of 16 List registers can be provided. GICH_VTR.ListRegs defines the number implemented. Unimplemented List registers are RAZ/WI.

Attributes

GICH_LR<n> is a 32-bit register.

Field descriptions

HW, bit [31]

Indicates whether this virtual interrupt is a hardware interrupt, meaning that it corresponds to a physical interrupt. Deactivation of the virtual interrupt also causes the deactivation of the physical interrupt corresponding to the INTID:

HW	Meaning
0b0	This interrupt is triggered entirely in software. No notification is sent to the Distributor when the virtual interrupt is deactivated.
0b1	A hardware interrupt. A deactivate interrupt request is sent to the Distributor when the virtual interrupt is deactivated, using GICH_LR<n>.pINTID to indicate the physical interrupt identifier. If GICV_CTLR.EOImode == 0, this request corresponds to a write to GICV_EOIR or GICV_AEOIR, otherwise it corresponds to a write to GICV_DIR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Group, bit [30]

Indicates whether the interrupt is Group 0 or Group 1:

Group	Meaning
0b0	Group 0 virtual interrupt. GICV_CTLR.FIQEn determines whether it is signaled as a virtual IRQ or as a virtual FIQ, and GICV_CTLR.EnableGrp0 enables signaling of this interrupt to the virtual machine.
0b1	Group 1 virtual interrupt, signaled as a virtual IRQ. GICV_CTLR.EnableGrp1 enables signaling of this interrupt to the virtual machine.

Note

GICV_CTLR.CBPR controls whether GICV_BPR or GICV_ABPR determines if a pending Group 1 interrupt has sufficient priority to preempt current execution.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

State, bits [29:28]

The state of the interrupt. This field has one of the following values:

State	Meaning
0b00	Inactive
0b01	Pending
0b10	Active
0b11	Active and pending

The GIC updates these state bits as virtual interrupts proceed through the interrupt life cycle. Entries in the inactive state are ignored, except for the purpose of generating virtual maintenance interrupts.

Note

For hardware interrupts, the active and pending state is held in the Distributor rather than the virtual CPU interface. A hypervisor must only use the active and pending state for software originated interrupts, which are typically associated with virtual devices, or for SGIs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Priority, bits [27:23]

The priority of this interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [22:20]

Reserved, RES0.

pINTID, bits [19:10]

The function of this field depends on the value of GICH_LR<n>.HW.

When GICH_LR<n>.HW == 0:

- Bit [19] indicates whether the interrupt triggers an EOI maintenance interrupt. If this bit is 1, then when the interrupt identified by vINTID is deactivated, an EOI maintenance interrupt is asserted.
- Bits [18:13] are reserved, SBZ.
- If the vINTID field value corresponds to an SGI (that is, 0-15), bits [12:10] contain the number of the requesting PE. This appears in the corresponding field of GICV_IAR or GICV_AIAR. If the vINTID field value is not 0-15, this field must be cleared to 0.

When GICH_LR<n>.HW == 1:

- This field indicates the pINTID that the hypervisor forwards to the Distributor. This field is only required to implement enough bits to hold a valid value for the ID configuration. Any unused higher order bits are RAZ/WI.
- If the value of pINTID is 0-15 or 1020-1023, behavior is UNPREDICTABLE. If the value of pINTID is 16-31, this field applies to the PPI associated with this same PE as the virtual CPU interface requesting the deactivation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

vINTID, bits [9:0]

This INTID is returned to the VM when the interrupt is acknowledged through GICV_IAR. Each valid interrupt stored in the List registers must have a unique vINTID for that virtual CPU interface. If the value of vINTID is 1020-1023, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICH_LR<n>

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_LR<n> provides equivalent functionality.
- For AArch64 implementations, ICH_LR<n>_EL2 provides equivalent functionality.

GICH_LR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0100 + (4 * n)	GICH_LR<n>

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICH_MISR, Maintenance Interrupt Status Register

The GICH_MISR characteristics are:

Purpose

Indicates which maintenance interrupts are asserted.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_MISR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_MISR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

VGrp1D, bit [7]

vPE Group 1 Disabled.

VGrp1D	Meaning
0b0	vPE Group 1 Disabled maintenance interrupt not asserted.
0b1	vPE Group 1 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp1DIE == 1 and GICH_VMCR.VENG1 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp1E, bit [6]

vPE Group 1 Enabled.

VGrp1E	Meaning
0b0	vPE Group 1 Enabled maintenance interrupt not asserted.
0b1	vPE Group 1 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp1EIE == 1 and GICH_VMCR.VENG1 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0D, bit [5]

vPE Group 0 Disabled.

VGrp0D	Meaning
0b0	vPE Group 0 Disabled maintenance interrupt not asserted.
0b1	vPE Group 0 Disabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp0DIE == 1 and GICH_VMCR.VENG0 == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

VGrp0E, bit [4]

vPE Group 0 Enabled.

VGrp0E	Meaning
0b0	vPE Group 0 Enabled maintenance interrupt not asserted.
0b1	vPE Group 0 Enabled maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.VGrp0EIE == 1 and GICH_VMCR.VENG0 == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

NP, bit [3]

No Pending.

NP	Meaning
0b0	No Pending maintenance interrupt not asserted.
0b1	No Pending maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.NPIE == 1 and no List register is in the pending state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

LRENP, bit [2]

List Register Entry Not Present.

LRENP	Meaning
0b0	List Register Entry Not Present maintenance interrupt not asserted.
0b1	List Register Entry Not Present maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.LRENPIE == 1 and GICH_HCR.EOICount is nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

U, bit [1]

Underflow.

U	Meaning
0b0	Underflow maintenance interrupt not asserted.
0b1	Underflow maintenance interrupt asserted.

This maintenance interrupt is asserted when GICH_HCR.UIE == 1 and zero or one of the List register entries are marked as a valid interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

EOI, bit [0]

End Of Interrupt.

EOI	Meaning
0b0	End Of Interrupt maintenance interrupt not asserted.
0b1	End Of Interrupt maintenance interrupt asserted.

This maintenance interrupt is asserted when at least one bit in GICH_EISR == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Additional information

Note

A List register is in the pending state only if the corresponding GICH_LR<n> value is 0b01, that is, pending. The active and pending state is not included.

Accessing GICH_MISR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_MISR provides equivalent functionality.
- For AArch64 implementations, ICH_MISR_EL2 provides equivalent functionality.

A maintenance interrupt is asserted only if at least one bit is set to 1 in this register and if GICH_HCR.En == 1.

GICH_MISR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0010	GICH_MISR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICH_VMCR, Virtual Machine Control Register

The GICH_VMCR characteristics are:

Purpose

Enables the hypervisor to save and restore the virtual machine view of the GIC state. This register is updated when a virtual machine updates the virtual CPU interface registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VMCR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VMCR is a 32-bit register.

Field descriptions

VPMR, bits [31:24]

Virtual priority mask. The priority mask level for the CPU interface. If the priority of an interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

This alias field is updated when a VM updates GICV_PMR.Priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR0, bits [23:21]

Virtual Binary Point Register, Group 0. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 0 interrupt preemption, and also determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 1.

This alias field is updated when a VM updates GICV_BPR.Binary_Point.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VBPR1, bits [20:18]

Virtual Binary Point Register, Group 1. Defines the point at which the priority value fields split into two parts, the Group priority field and the subpriority field. The Group priority field determines Group 1 interrupt preemption if GICH_VMCR.VCBPR == 0.

This alias field is updated when a VM updates GICV_ABPR.Binary_Point.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [17:10]

Reserved, RES0.

VEOIM, bit [9]

Virtual EOImode. Possible values of this bit are:

VEOIM	Meaning
0b0	A write of an INTID to GICV_EOIR or GICV_AEOIR drops the priority of the interrupt with that INTID, and also deactivates that interrupt.
0b1	A write of an INTID to GICV_EOIR or GICV_AEOIR only drops the priority of the interrupt with that INTID. Software must write to GICV_DIR to deactivate the interrupt.

This alias field is updated when a VM updates GICV_CTLR.EOImode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

VCBPR, bit [4]

Virtual Common Binary Point Register. Possible values of this bit are:

VCBPR	Meaning
0b0	GICV_ABPR determines the preemption group for Group 1 interrupts.
0b1	GICV_BPR determines the preemption group for Group 1 interrupts.

This alias field is updated when a VM updates GICV_CTLR.CBPR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VFIQEn, bit [3]

Virtual FIQ enable. Possible values of this bit are:

VFIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

This alias field is updated when a VM updates GICV_CTLR.FIQEn.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VAckCtl, bit [2]

Virtual AckCtl. Possible values of this bit are:

VAckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an INTID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the INTID of the corresponding interrupt.

This alias field is updated when a VM updates GICV_CTLR.AckCtl.

This field is supported for backward compatibility with GICv2. Arm deprecates the use of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG1, bit [1]

Virtual interrupt enable, Group 1. Possible values of this bit are:

VENG1	Meaning
0b0	Group 1 virtual interrupts are disabled.
0b1	Group 1 virtual interrupts are enabled.

This alias field is updated when a VM updates GICV_CTLR.EnableGrp1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VENG0, bit [0]

Virtual interrupt enable, Group 0. Possible values of this bit are:

VENG0	Meaning
0b0	Group 0 virtual interrupts are disabled.
0b1	Group 0 virtual interrupts are enabled.

This alias field is updated when a VM updates GICV_CTLR.EnableGrp0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

Note

A List register is in the pending state only if the corresponding GICH_LR<n> value is 0b01, that is, pending. The active and pending state is not included.

Accessing GICH_VMCR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_VMCR provides equivalent functionality.
- For AArch64 implementations, ICH_VMCR_EL2 provides equivalent functionality.

GICH_VMCR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0008	GICH_VMCR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICH_VTR, Virtual Type Register

The GICH_VTR characteristics are:

Purpose

Indicates the number of implemented virtual priority bits and List registers.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICH_VTR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICH_VTR is a 32-bit register.

Field descriptions

PRIbits, bits [31:29]

The number of virtual priority bits implemented, minus one.

An implementation must implement at least 32 levels of virtual priority (5 priority bits).

PREbits, bits [28:26]

The number of virtual preemption bits implemented, minus one.

An implementation must implement at least 32 levels of virtual preemption priority (5 preemption bits).

The value of this field must be less than or equal to the value of GICH_VTR.PRIbits.

IDbits, bits [25:23]

The number of virtual interrupt identifier bits supported:

IDbits	Meaning
0b000	16 bits.
0b001	24 bits.

All other values are reserved.

SEIS, bit [22]

SEI support. Indicates whether the virtual CPU interface supports generation of SEIs:

SEIS	Meaning
0b0	The virtual CPU interface logic does not support generation of SEIs.
0b1	The virtual CPU interface logic supports generation of SEIs.

A3V, bit [21]

Affinity 3 valid. Possible values are:

A3V	Meaning
0b0	The virtual CPU interface logic only supports zero values of the Aff3 field in ICC_SGI0R_EL1, ICC_SGI1R_EL1, and ICC_ASGI1R_EL1.
0b1	The virtual CPU interface logic supports nonzero values of the Aff3 field in ICC_SGI0R_EL1, ICC_SGI1R_EL1, and ICC_ASGI1R_EL1.

Bits [20:5]

Reserved, RES0.

ListRegs, bits [4:0]

The number of implemented List registers, minus one.

Accessing GICH_VTR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICH_VTR provides equivalent functionality.
- For AArch64 implementations, ICH_VTR_EL2 provides equivalent functionality.

GICH_VTR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual interface control	0x0004	GICH_VTR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICM_CLRSPI_NSR, Clear Non-secure SPI Pending Register

The GICM_CLRSPI_NSR characteristics are:

Purpose

Removes the pending state from a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.CLR == '1'. Otherwise, direct accesses to GICM_CLRSPI_NSR are RES0.

When GICD_CTLR.DS == 1, this register provides functionality for all SPIs.

Attributes

GICM_CLRSPI_NSR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_CLRSPI_NSR.

Accessing GICM_CLRSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is less than 0b10.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can clear the pending state of any valid SPI.

GICM_CLRSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0048	GICM_CLRSPI_NSR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICM_CLRSPI_SR, Clear Secure SPI Pending Register

The GICM_CLRSPI_SR characteristics are:

Purpose

Removes the pending state from a valid SPI.

A write to this register changes the state of a pending SPI to inactive, and the state of an active and pending SPI to active.

Configuration

This register is present only when GICM_TYPER.SR == '1' and GICM_TYPER.CLR == '1'. Otherwise, direct accesses to GICM_CLRSPI_SR are RES0.

When GICD_CTLR.DS == 1, this register is WI.

Attributes

GICM_CLRSPI_SR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_CLRSPI_SR.

Accessing GICM_CLRSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is not pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_CLRSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0058	GICD_CLRSPI_SR

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are WI.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are WO.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are WO.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are WI.

2025-12-10 16:11:30, 2025-12_rel

GICM_IIDR, Distributor Implementer Identification Register

The GICM_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Distributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICM_IIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 code of the company that implemented the Distributor:

- Bits [11:8] are the JEP106 continuation code of the implementer. For an Arm implementation, this field is 0x4.
- Bit [7] is always 0.
- Bits [6:0] are the JEP106 identity code of the implementer. For an Arm implementation, bits [7:0] are therefore 0x3B.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICM_IIDR

GICM_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0FCC	GICM_IIDR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICM_SETSPI_NSR, Set Non-secure SPI Pending Register

The GICM_SETSPI_NSR characteristics are:

Purpose

Adds the pending state to a valid SPI if permitted by the Security state of the access and the GICD_NSACR<n> value for that SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

When GICD_CTLR.DS==1, this register provides functionality for all SPIs.

Attributes

GICM_SETSPI_NSR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_SETSPI_NSR.

Accessing GICM_SETSPI_NSR

Writes to this register have no effect if:

- The value written specifies a Secure SPI, the value is written by a Non-secure access, and the value of the corresponding GICD_NSACR<n> register is 0.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

Note

A Secure access to this register can set the pending state of any valid SPI.

GICM_SETSPI_NSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0040	GICM_SETSPI_NSR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICM_SETSPI_SR, Set Secure SPI Pending Register

The GICM_SETSPI_SR characteristics are:

Purpose

Adds the pending state to a valid SPI.

A write to this register changes the state of an inactive SPI to pending, and the state of an active SPI to active and pending.

Configuration

This register is present only when GICM_TYPER.SR == '1'. Otherwise, direct accesses to GICM_SETSPI_SR are RES0.

When GICD_CTLR.DS==1, this register is WI.

Attributes

GICM_SETSPI_SR is a 32-bit register.

Field descriptions

Bits [31:13]

Reserved, RES0.

INTID, bits [12:0]

This field is an alias of GICD_SETSPI_SR.

Accessing GICM_SETSPI_SR

Writes to this register have no effect if:

- The value is written by a Non-secure access.
- The value written specifies an invalid SPI.
- The SPI is already pending.

16-bit accesses to bits [15:0] of this register must be supported.

GICM_SETSPI_SR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0050	GICM_SETSPI_SR

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are WI.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are WO.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are WO.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are WI.

2025-12-10 16:11:30, 2025-12_rel

GICM_TYPER, Distributor MSI Type Register

The GICM_TYPER characteristics are:

Purpose

Provides information about what features the GIC implementation supports.

Configuration

This register is available in all configurations of the GIC. When GICD_CTLR.DS==0, this register is Common.

Attributes

GICM_TYPER is a 32-bit register.

Field descriptions

Valid, bit [31]

Reports whether GICM_TYPER content is valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Valid	Meaning
0b0	GICM_TYPER reports no information on the capabilities of the GICM frame, all other fields are RES0.
0b1	GICM_TYPER reports information on capabilities of GICM frame.

Access to this field is RO.

CLR, bit [30]

Reports whether MSI clear registers are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CLR	Meaning
0b0	MSI clear registers not implemented.
0b1	MSI clear registers implemented.

Access to this field is RO.

SR, bit [29]

Reports whether Secure aliases of MSI registers are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SR	Meaning
0b0	Secure aliases of MSI registers not implemented.
0b1	Secure aliases of MSI registers implemented.

Access to this field is RO.

INTID, bits [28:16]

INTID of the first SPI assigned to this GICM frame.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [15:11]

Reserved, RES0.

NumSPIs, bits [10:0]

Number of SPIs assigned to this GICM frame.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICM_TYPER

GICM_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Distributor	MSI_base	0x0004	GICM_TYPER

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICR_CLRLPIR, Clear LPI Pending Register

The GICR_CLRLPIR characteristics are:

Purpose

Clears the pending state of the specified LPI.

Configuration

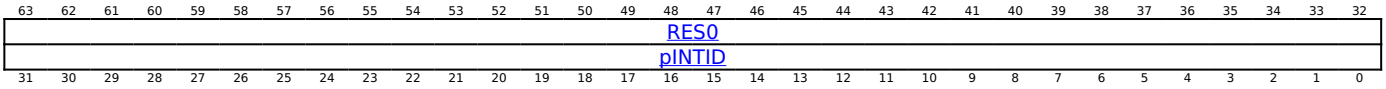
A copy of this register is provided for each Redistributor.

Attributes

GICR_CLRLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == '1':



Bits [63:32]

Reserved, RES0.

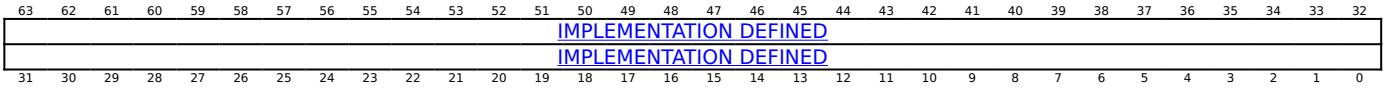
pINTID, bits [31:0]

The INTID of the physical LPI.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == '0':



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_CLRLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality of this register is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if any of the following apply:

- GICR_CTLR.EnableLPIs == 0.
- The pINTID value specifies an unimplemented LPI.
- The pINTID value specifies an LPI that is not pending.

GICR_CLRLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0048	GICR_CLRLPIR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICR_CTLR, Redistributor Control Register

The GICR_CTLR characteristics are:

Purpose

Controls the operation of a Redistributor, and enables the signaling of LPIs by the Redistributor to the connected PE.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_CTLR is a 32-bit register.

Field descriptions

UWP, bit [31]

Upstream Write Pending. Read-only. Indicates whether all upstream writes have been communicated to the Distributor.

UWP	Meaning
0b0	The effects of all upstream writes have been communicated to the Distributor, including any Generate SGI packets. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).
0b1	Not all the effects of upstream writes, including any Generate SGI packets, have been communicated to the Distributor. For more information, see 'Generate SGI (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Bits [30:27]

Reserved, RES0.

DPG1S, bit [26]

Disable Processor selection for Group 1 Secure interrupts. When GICR_TYPER.DPGS == 1:

DPG1S	Meaning
0b0	A Group 1 Secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Secure Group 1 interrupts are enabled.
0b1	A Group 1 Secure SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS==1, this field is RAZ/WI. In GIC implementations that support two Security states, this field is only accessible by Secure accesses, and is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S==0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

DPG1NS, bit [25]

Disable Processor selection for Group 1 Non-secure interrupts. When GICR_TYPER.DPGS == 1:

DPG1NS	Meaning
0b0	A Group 1 Non-secure SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Non-secure Group 1 interrupts are enabled.
0b1	A Group 1 Non-secure SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_NS==0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

DPG0, bit [24]

Disable Processor selection for Group 0 interrupts. When GICR_TYPER.DPGS == 1:

DPG0	Meaning
0b0	A Group 0 SPI configured to use the 1 of N distribution model can select this PE, if the PE is not asleep and if Group 0 interrupts are enabled.
0b1	A Group 0 SPI configured to use the 1 of N distribution model cannot select this PE.

When GICR_TYPER.DPGS == 0 this bit is RAZ/WI.

When GICD_CTLR.DS == 1, this field is always accessible. In GIC implementations that support two Security states, this field is RAZ/WI to Non-secure accesses.

It is IMPLEMENTATION DEFINED whether these bits affect the selection of PEs for interrupts using the 1 of N distribution model when GICD_CTLR.ARE_S == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Bits [23:4]

Reserved, RES0.

RWP, bit [3]

Register Write Pending. This bit indicates whether a register write for the current Security state is in progress or not.

RWP	Meaning
0b0	The effect of all previous writes to the following registers are visible to all agents in the system: • GICR_ICENABLER0 • GICR_CTLR.DPG1S • GICR_CTLR.DPG1NS • GICR_CTLR.DPG0 • GICR_CTLR, which clears EnableLPIs from 1 to 0. • In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.
0b1	The effect of all previous writes to the following registers are not guaranteed by the architecture to be visible to all agents in the system while the changes are still being propagated: • GICR_ICENABLER0 • GICR_CTLR.DPG1S • GICR_CTLR.DPG1NS • GICR_CTLR.DPG0 • GICR_CTLR, which clears EnableLPIs from 1 to 0. • In FEAT_GICv4p1, GICR_VPROPBASER, which clears Valid from 1 to 0.

IR, bit [2]

LPI invalidate registers supported.

This bit is read-only.

IR	Meaning
0b0	This bit does not indicate whether the GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented or not.
0b1	GICR_INVLPIR, GICR_INVALLR and GICR_SYNCR are implemented.

If GICR_TYPER.DirectLPI is 1 or GICR_TYPER.RVPEI is 1, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR are always implemented.

Arm recommends that implementations report GICR_CTLR.IR as 1 in these cases.

CES, bit [1]

Clear Enable Supported.

This bit is read-only.

CES	Meaning
0b0	The IRI does not indicate whether GICR_CTLR.EnableLPIs is RES1 once set.
0b1	GICR_CTLR.EnableLPIs is not RES1 once set.

Implementing GICR_CTLR.EnableLPIs as programmable and not reporting GICR_CLTR.CES == 1 is deprecated.

Implementing GICR_CTLR.EnableLPIs as RES1 once set is deprecated.

When GICR_CLTR.CES == 0, software cannot assume that GICR_CTLR.EnableLPIs is programmable without observing the bit being cleared to 0.

EnableLPIs, bit [0]

In implementations where affinity routing is enabled for the Security state:

EnableLPIs	Meaning
0b0	LPI support is disabled. Any doorbell interrupt generated as a result of a write to a virtual LPI register must be discarded, and any ITS translation requests or commands involving LPIs in this Redistributor are ignored.
0b1	LPI support is enabled.

Note

If GICR_TYPER.PLPIS == 0, this field is RES0. If GICD_CTLR.ARE_NS is written from 1 to 0 when this bit is 1, behavior is an IMPLEMENTATION DEFINED choice between clearing GICR_CTLR.EnableLPIs to 0 or maintaining its current value.

When affinity routing is not enabled for the Non-secure state, this bit is RES0.

When written from 0 to 1, the Redistributor loads the LPI Pending table from memory to check for any pending interrupts.

After it has been written to 1, it is IMPLEMENTATION DEFINED whether the bit becomes RES1 or can be cleared by to 0.

Where the bit remains programmable:

- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before writing GICR_PENDBASER or GICR_PROPBASER, otherwise behavior is UNPREDICTABLE.
- Software must observe GICR_CTLR.RWP==0 after clearing GICR_CTLR.EnableLPIs from 1 to 0 before setting GICR_CTLR.EnableLPIs to 1, otherwise behavior is UNPREDICTABLE.

Note

If one or more ITS is implemented, Arm strongly recommends that all LPIs are mapped to another Redistributor before GICR_CTLR.EnableLPIs is cleared to 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Additional information

The participation of a PE in the 1 of N distribution model for a given interrupt group is governed by the concatenation of GICR_WAKER.ProcessorSleep, the appropriate GICR_CTLR.DPG{1, 0} bit, and the PE interrupt group enable. The behavior options are:

PS	DPG{1S, 1NS, 0}	Enable	PE Behavior
0b0	0b0	0b0	The PE cannot be selected.
0b0	0b0	0b1	The PE can be selected.
0b0	0b1	*	The PE cannot be selected.
0b1	*	*	The PE cannot be selected when GICD_CTLR.E1NWF == 0. When GICD_CTLR.E1NWF == 1, the mechanism by which PEs are selected is IMPLEMENTATION DEFINED.

If an SPI using the 1 of N distribution model has been forwarded to the PE, and a write to GICR_CTLR occurs that changes the DPG bit for the interrupt group of the SPI, the IRI must attempt to select a different target PE for the SPI. This might have no effect on the forwarded SPI if it has already been activated.

Accessing GICR_CTLR

GICR_CTLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0000	GICR_CTLR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICACTIVER0, Interrupt Clear-Active Register 0

The GICR_ICACTIVER0 characteristics are:

Purpose

Deactivates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Clear_active_bit25	Clear_active_bit24

Clear_active_bit<x>, bit [x], for x = 31 to 0

Removes the active state from interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Accessing GICR_ICACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

The effect of a write must be visible in finite time.

GICR_ICACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0380	GICR_ICACTIVER0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICACTIVER<n>E, Interrupt Clear-Active Registers, n = 1 - 2

The GICR_ICACTIVER<n>E characteristics are:

Purpose

Removes the active state from the corresponding PPI.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_ICACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICACTIVER<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24
Clear_active_bit31	Clear_active_bit30	Clear_active_bit29	Clear_active_bit28	Clear_active_bit27	Clear_active_bit26	Clear_active_bit25	Clear_active_bit24	Cl

Clear_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the active state to interrupt number x. Reads and writes have the following behavior:

Clear_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, deactivates the corresponding interrupt, if the interrupt is active. If the interrupt is already deactivated, the write has no effect.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICACTIVER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICACTIVER<n>E is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ICACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

The effect of a write must be visible in finite time.

GICR_ICACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0380 + (4 * n)	GICR_ICACTIVER<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICENABLER0, Interrupt Clear-Enable Register 0

The GICR_ICENABLER0 characteristics are:

Purpose

Disables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER0 is a 32-bit register.

Field descriptions

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interfaces. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICENABLER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICENABLER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0180	GICR_ICENABLER0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICENABLER<n>E, Interrupt Clear-Enable Registers, n = 1 - 2

The GICR_ICENABLER<n>E characteristics are:

Purpose

Disables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_ICENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICENABLER<n>E is a 32-bit register.

Field descriptions

Clear_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Clear_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, disables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICENABLER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICENABLER<n>E is (0x180 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ICENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0180 + (4 * n)	GICR_ICENABLER<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICFGR0, Interrupt Configuration Register 0

The GICR_ICFGR0 characteristics are:

Purpose

Determines whether the corresponding SGI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR0 is a 32-bit register.

Field descriptions

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

SGIs are always edge-triggered.

When the interrupt is visible to the current Security state, a read of this bit always returns the correct value to indicate the interrupt triggering method.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR0

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C00	GICR_ICFGR0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICFGR1, Interrupt Configuration Register 1

The GICR_ICFGR1 characteristics are:

Purpose

Determines whether the corresponding PPI is edge-triggered or level-sensitive.

Configuration

A copy of this register is provided for each Redistributor.

For each supported PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Changing Int_config when the interrupt is individually enabled is UNPREDICTABLE.

Changing the interrupt configuration between level-sensitive and edge-triggered (in either direction) at a time when there is a pending interrupt will leave the interrupt in an UNKNOWN pending state.

Attributes

GICR_ICFGR1 is a 32-bit register.

Field descriptions

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config<x>	Meaning
0b00	Corresponding interrupt is level-sensitive.
0b10	Corresponding interrupt is edge-triggered.

Int_config[0] (bit [2x]) is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICFGR1

This register is used when affinity routing is enabled.

When affinity routing is disabled for the Security state of an interrupt, the field for that interrupt is RES0 and an implementation is permitted to make the field RAZ/WI in this case. Equivalent functionality is provided by GICD_ICFGR<n> with n=1.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

GICR_ICFGR1 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C04	GICR_ICFGR1

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICFGR<n>E, Interrupt configuration registers, n = 2 - 5

The GICR_ICFGR<n>E characteristics are:

Purpose

Determines whether the corresponding PPI in the extended PPI range is edge-triggered or level-sensitive.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_ICFGR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICFGR<n>E is a 32-bit register.

Field descriptions

Int_config<x>, bits [2x+1:2x], for x = 15 to 0

Indicates whether the interrupt is level-sensitive or edge-triggered.

Int_config[0] (bit [2x]) is RES0.

Int_config<x>	Meaning
0b00	The corresponding interrupt is level-sensitive.
0b10	The corresponding interrupt is edge-triggered.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For each supported extended PPI, it is IMPLEMENTATION DEFINED whether software can program the corresponding Int_config field.

Accessing GICR_ICFGR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICFGR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, a register bit that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICFGR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0C00 + (4 * n)	GICR_ICFGR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICPENDR0, Interrupt Clear-Pending Register 0

The GICR_ICPENDR0 characteristics are:

Purpose

Removes the pending state from the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26	Clear_pending_bit25	Clear_

Clear_pending_bit<x>, bit [x], for x = 31 to 0

Removes the pending state from interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICD_ISPENDR<n>. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ICPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ICPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ICENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ICPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0280	GICR_ICPENDR0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ICPENDR<n>E, Interrupt Clear-Pending Registers, n = 1 - 2

The GICR_ICPENDR<n>E characteristics are:

Purpose

Removes the pending state from the corresponding PPI.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_ICPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ICPENDR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	
Clear_pending_bit31	Clear_pending_bit30	Clear_pending_bit29	Clear_pending_bit28	Clear_pending_bit27	Clear_pending_bit26	Clear_pending_bit25	Clear_

Clear_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, removes the pending state to interrupt number x. Reads and writes have the following behavior:

Clear_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from pending to inactive, or from active and pending to active. This has no effect in the following cases: • If the interrupt is not pending and is not active and pending. • If the interrupt is a level-sensitive interrupt that is pending or active and pending for a reason other than a write to GICR_ISPENDR<n>E. In this case, if the interrupt signal continues to be asserted, the interrupt remains pending or active and pending.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ICPENDR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ICPENDR<n>E is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ICPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ICPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ICPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0280 + (4 * n)	GICR_ICPENDR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_IGROUPR0, Interrupt Group Register 0

The GICR_IGROUPR0 characteristics are:

Purpose

Controls whether the corresponding SGI or PPI is in Group 0 or Group 1.

Configuration

This register is available in all GIC configurations. If the GIC implementation supports two Security states, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR0 is a 32-bit register.

Field descriptions

31	30	29	28	27
Redistributor_group_status_bit31	Redistributor_group_status_bit30	Redistributor_group_status_bit29	Redistributor_group_status_bit28	Redistributor_grou

Redistributor_group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit. In this register:

- Bits [31:16] are group status bits for PPIs.
- Bits [15:0] are group status bits for SGIs.

Redistributor_group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

When GICD_CTLR.DS == 0, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR0 to form a 2-bit field that defines an interrupt group. The encoding of this field is at GICR_IGRPMODR0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

The considerations for the reset value of this register are the same as those for GICD_IGROUPR<n> with n=0.

Accessing GICR_IGROUPR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGROUPR<n> with n=0.

When GICD_CTLR.DS == 0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGROUPR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0080	GICR_IGROUPR0

Accesses to this register are RW.

GICR_IGROUPR<n>E, Interrupt Group Registers, n = 1 - 2

The GICR_IGROUPR<n>E characteristics are:

Purpose

Controls whether the corresponding PPI is in Group 0 or Group 1.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_IGROUPR<n>E are RES0.

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGROUPR<n>E is a 32-bit register.

Field descriptions

Group_status_bit<x>, bit [x], for x = 31 to 0

Group status bit.

Group_status_bit<x>	Meaning
0b0	When GICD_CTLR.DS==1, the corresponding interrupt is Group 0. When GICD_CTLR.DS==0, the corresponding interrupt is Secure.
0b1	When GICD_CTLR.DS==1, the corresponding interrupt is Group 1. When GICD_CTLR.DS==0, the corresponding interrupt is Non-secure Group 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

If affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGRPMODR<n>E to form a 2-bit field that defines an interrupt group. The encoding of this field is described in GICR_IGRPMODR<n>E.

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGROUPR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGROUPR<n>E is (0x080 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_IGROUPR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGROUPR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGROUPR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0080 + (4 * n)	GICR_IGROUPR<n>E

Accesses to this register are RW.

GICR_IGRPMODR0, Interrupt Group Modifier Register 0

The GICR_IGRPMODR0 characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR0 register, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_modifier_bit26	Group_modifier_bit25

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR0 to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IGRPMODR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR0, the corresponding bit is RES0 and equivalent functionality is provided by GICD_IGRPMODR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_IGRPMODR<n>.

When GICD_CTLR.ARE_S == 0 or GICD_CTLR.DS == 1, GICR_IGRPMODR0 is RES0. An implementation can make this register RAZ/WI in this case.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IGRPMODR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00	GICR_IGRPMODR0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_IGRPMODR<n>E, Interrupt Group Modifier Registers, n = 1 - 2

The GICR_IGRPMODR<n>E characteristics are:

Purpose

When GICD_CTLR.DS==0, this register together with the GICR_IGROUPR<n>E registers, controls whether the corresponding interrupt is in:

- Secure Group 0.
- Non-secure Group 1.
- When System register access is enabled, Secure Group 1.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_IGRPMODR<n>E are RES0.

When GICD_CTLR.DS==0, this register is Secure.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IGRPMODR<n>E is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25
Group_modifier_bit31	Group_modifier_bit30	Group_modifier_bit29	Group_modifier_bit28	Group_modifier_bit27	Group_modifier_bit26	Group_modifier_bit25

Group_modifier_bit<x>, bit [x], for x = 31 to 0

Group modifier bit. In implementations where affinity routing is enabled for the Security state of an interrupt, the bit that corresponds to the interrupt is concatenated with the equivalent bit in GICR_IGROUPR<n>E to form a 2-bit field that defines an interrupt group:

Group modifier bit	Group status bit	Definition	Short name
0b0	0b0	Secure Group 0	G0S
0b0	0b1	Non-secure Group 1	G1NS
0b1	0b0	Secure Group 1	G1S
0b1	0b1	Reserved, treated as Non-secure Group 1	-

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IGRPMODR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_IGRPMODR<n>E is (0xD00 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_IGRPMODR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_IGRPMODR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, the register is RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_IGRPMODR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0D00 + (4 * n)	GICR_IGRPMODR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_IIDR, Redistributor Implementer Identification Register

The GICR_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the Redistributor.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GICR_IIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the Redistributor.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for GICR_IIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICR_IIDR

GICR_IIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance

GIC Redistributor	RD_base	0x0004	GICR_IIDR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICR_INMIR0, Non-maskable Interrupt Register 0

The GICR_INMIR0 characteristics are:

Purpose

Controls whether the corresponding SGI or PPI has the non-maskable property.

Configuration

This register is present only when GICD_TYPER.NMI == '1'. Otherwise, direct accesses to GICR_INMIR0 are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_INMIR0 is a 32-bit register.

Field descriptions

nmi<x>, bit [x], for x = 31 to 0

Non-maskable property.

nmi<x>	Meaning
0b0	Interrupt does not have the non-maskable property.
0b1	Interrupt has the non-maskable property.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

This bit is RES0 when the corresponding interrupt is configured as Group 0.

Accessing GICR_INMIR0

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_INMIR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0F80	GICR_INMIR0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_INMIR<n>E, Non-maskable Interrupt Registers for Extended PPIs, x = 1 to 2., n = 1 - 2

The GICR_INMIR<n>E characteristics are:

Purpose

Controls whether the corresponding Extended PPI has the non-maskable property.

Configuration

This register is present only when GICv3.1 is implemented and GICD_TYPER.NMI == '1'. Otherwise, direct accesses to GICR_INMIR<n>E are RES0.

When GICR_TYPER.PPInum is 0b0000, these registers are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_INMIR<n>E is a 32-bit register.

Field descriptions

nmi<x>, bit [x], for x = 31 to 0

Non-maskable property.

nmi<x>	Meaning
0b0	Interrupt does not have the non-maskable property.
0b1	Interrupt has the non-maskable property.

This bit is RES0 when the corresponding interrupt is configured as Group 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

If affinity routing is disabled for the Security state of an interrupt, the bit is RES0.

Accessing GICR_INMIR<n>E

Bits corresponding to unimplemented interrupts are RAZ/WI.

When GICD_CTLR.DS==0, bits corresponding to Group 0 and Secure Group 1 interrupts are RAZ/WI to Non-secure accesses.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_INMIR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0F80 + (4 * n)	GICR_INMIR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_INVALLR, Redistributor Invalidate All Register

The GICR_INVALLR characteristics are:

Purpose

Invalidates any cached configuration data of all LPIs, causing the GIC to reload the interrupt configuration from the appropriate LPI Configuration table.

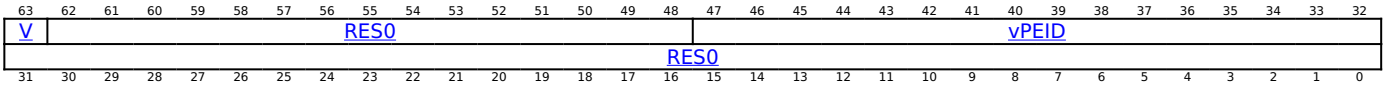
Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVALLR is a 64-bit register.

Field descriptions



V, bit [63]
When GICv4.1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
0b0	Invalidate is for a physical INTID.
0b1	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]
When GICv4.1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

Bits [31:0]

Reserved, RES0.

Additional information

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVALLR is received, the Redistributor must ensure it reloads its properties from memory. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVALLR

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if no physical LPIs are currently stored in the local Redistributor cache.

GICR_INVALLR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00B0	GICR_INVALLR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICR_INVLPIR, Redistributor Invalidate LPI Register

The GICR_INVLPIR characteristics are:

Purpose

Invalidates the cached configuration data of a specified LPI, causing the GIC to reload the interrupt configuration from the appropriate LPI Configuration table.

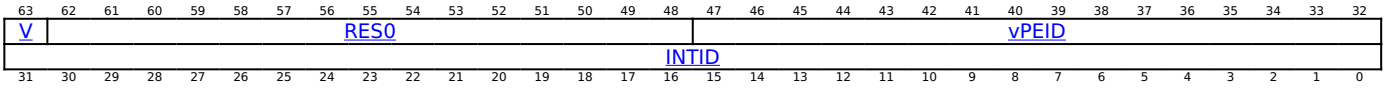
Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_INVLPIR is a 64-bit register.

Field descriptions



V, bit [63]
When GICv4.1 is implemented:

Indicates whether the INTID is virtual or physical.

V	Meaning
0b0	Invalidate is for a physical INTID.
0b1	Invalidate is for a virtual INTID.

Otherwise:

Reserved, RES0.

Bits [62:48]

Reserved, RES0.

vPEID, bits [47:32]
When GICv4.1 is implemented:

When GICR_INVLPIR.V == 0, this field is RES0

When GICR_INVLPIR.V == 1, this field is the target vPEID of the invalidate.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Otherwise:

Reserved, RES0.

INTID, bits [31:0]

The INTID of the LPI to be invalidated.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

Additional information

Note

If any LPI has been forwarded to the PE and a valid write to GICR_INVLPIR is received, the Redistributor must ensure it reloads its properties from memory and apply any changes by retrieving and reforwarding the LPI as required. This has no effect on the forwarded LPI if it has already been activated.

Accessing GICR_INVLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

Writes to this register have no effect if either:

- The specified LPI is not currently stored in the local Redistributor.
- The INTID field corresponds to an unimplemented LPI.

GICR_INVLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00A0	GICR_INVLPIR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICR_IPRIORITYR<n>, Interrupt Priority Registers, n = 0 - 7

The GICR_IPRIORITYR<n> characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each SGI and PPI supported by the GIC.

Configuration

A copy of these registers is provided for each Redistributor.

These registers are configured as follows:

- GICR_IPRIORITYR0-GICR_IPRIORITYR3 store the priority of SGIs.
- GICR_IPRIORITYR4-GICR_IPRIORITYR7 store the priority of PPIs.

Attributes

GICR_IPRIORITYR<n> is a 32-bit register.

Field descriptions

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_IPRIORITYR<n>

These registers are used when affinity routing is enabled for the Security state of the interrupt. When affinity routing is not enabled the bits corresponding to the interrupt are RAZ/WI and GICD_IPRIORITYR<n> provides equivalent functionality.

These registers are used for SGIs and PPIs only. Equivalent functionality for SPIs is provided by GICD_IPRIORITYR<n>.

These registers are byte-accessible.

When GICD_CTLR.DS == 0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.

- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in 'Software accesses of interrupt priority' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than one time. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0400 + (4 * n)	GICR_IPRIORITYR<n>

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_IPRIORITYR<n>E, Interrupt Priority Registers (extended PPI range), n = 8 - 23

The GICR_IPRIORITYR<n>E characteristics are:

Purpose

Holds the priority of the corresponding interrupt for each extended PPI supported by the GIC.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_IPRIORITYR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_IPRIORITYR<n>E is a 32-bit register.

Field descriptions

Priority_offset_3B, bits [31:24]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 3. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_2B, bits [23:16]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 2. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_1B, bits [15:8]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 1. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Priority_offset_0B, bits [7:0]

Interrupt priority value from an IMPLEMENTATION DEFINED range, at byte offset 0. Lower priority values correspond to greater priority of the interrupt. For an INTID configured as non-maskable, this field is RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For interrupt ID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_IPRIORITYR<n> number, n, is given by n = (m-1024) DIV 4.
- The offset of the required GICR_IPRIORITYR<n>E register is (0x400 + (4*n)).
- The byte offset of the required Priority field in this register is m MOD 4, where:
  - Byte offset 0 refers to register bits [7:0].
  - Byte offset 1 refers to register bits [15:8].
  - Byte offset 2 refers to register bits [23:16].
  - Byte offset 3 refers to register bits [31:24].

Accessing GICR_IPRIORITYR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0:

- A field that corresponds to a Group 0 or Secure Group 1 interrupt is RAZ/WI to Non-secure accesses.
- A Non-secure access to a field that corresponds to a Non-secure Group 1 interrupt behaves as described in Software accesses of interrupt priority.

Bits corresponding to unimplemented interrupts are RAZ/WI.

Note

Implementations must ensure that an interrupt that is pending at the time of the write uses either the old value or the new value and must ensure that the interrupt is neither lost nor handled more than once. The effect of the change must be visible in finite time.

GICR_IPRIORITYR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0400 + (4 * n)	GICR_IPRIORITYR<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ISACTIVER0, Interrupt Set-Active Register 0

The GICR_ISACTIVER0 characteristics are:

Purpose

Activates the corresponding SGI or PPI. These registers are used when saving and restoring GIC state.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER0 is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23
Set_active_bit31	Set_active_bit30	Set_active_bit29	Set_active_bit28	Set_active_bit27	Set_active_bit26	Set_active_bit25	Set_active_bit24	Set_active_bit23

Set_active_bit<x>, bit [x], for x = 31 to 0

Adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or is active and pending. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Accessing GICR_ISACTIVER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISACTIVER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISACTIVER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

The effect of a write must be visible in finite time. Reading back the written value from either the Set-Active or Clear-Active registers guarantees that a deactivate from a CPU interface Ordered-after the read, will observe the effects of the write on the Active state of the interrupt.

GICR_ISACTIVER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0300	GICR_ISACTIVER0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ISACTIVER<n>E, Interrupt Set-Active Registers, n = 1 - 2

The GICR_ISACTIVER<n>E characteristics are:

Purpose

Adds the active state to the corresponding PPI.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_ISACTIVER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISACTIVER<n>E is a 32-bit register.

Field descriptions

Set_active_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the active state to interrupt number x. Reads and writes have the following behavior:

Set_active_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not active, and is not active and pending. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is active, or active and pending on this PE. If written, activates the corresponding interrupt, if the interrupt is not already active. If the interrupt is already active, the write has no effect. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISACTIVER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISACTIVER<n>E is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ISACTIVER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISACTIVER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

The effect of a write must be visible in finite time. Reading back the written value from either the Set-Active or Clear-Active registers guarantees that a deactivate from a CPU interface Ordered-after the read, will observe the effects of the write on the Active state of the interrupt.

GICR_ISACTIVER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0300 + (4 * n)	GICR_ISACTIVER<n>E

Accesses to this register are RW.

GICR_ISENABLER0, Interrupt Set-Enable Register 0

The GICR_ISENABLER0 characteristics are:

Purpose

Enables forwarding of the corresponding SGI or PPI to the CPU interfaces.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER0 is a 32-bit register.

Field descriptions

Set_enable_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Accessing GICR_ISENABLER0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISENABLER<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISENABLER<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISENABLER0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0100	GICR_ISENABLER0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ISENABLER<n>E, Interrupt Set-Enable Registers, n = 1 - 2

The GICR_ISENABLER<n>E characteristics are:

Purpose

Enables forwarding of the corresponding PPI to the CPU interfaces.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_ISENABLER<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISENABLER<n>E is a 32-bit register.

Field descriptions

Set_enable_bit<x>, bit [x], for x = 31 to 0

For the extended PPI range, controls the forwarding of interrupt number x to the CPU interface. Reads and writes have the following behavior:

Set_enable_bit<x>	Meaning
0b0	If read, indicates that forwarding of the corresponding interrupt is disabled. If written, has no effect.
0b1	If read, indicates that forwarding of the corresponding interrupt is enabled. If written, enables forwarding of the corresponding interrupt. After a write of 1 to this bit, a subsequent read of this bit returns 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to the expression `0x00000000`.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISENABLER<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISENABLER<n>E is (0x100 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ISENABLER<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISENABLER<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISENABLER<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0100 + (4 * n)	GICR_ISENABLER<n>E

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ISPENDR0, Interrupt Set-Pending Register 0

The GICR_ISPENDR0 characteristics are:

Purpose

Adds the pending state to the corresponding SGI or PPI.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR0 is a 32-bit register.

Field descriptions

Set_pending_bit<x>, bit [x], for x = 31 to 0

For PPIs and SGIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICR_ISPENDR0. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_ISPENDR0

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR0, the corresponding bit is RAZ/WI and equivalent functionality is provided by GICD_ISPENDR<n> with n=0.

This register only applies to SGIs (bits [15:0]) and PPIs (bits [31:16]). For SPIs, this functionality is provided by GICD_ISPENDR<n>.

When GICD_CTLR.DS == 0, bits corresponding to Secure SGIs and PPIs are RAZ/WI to Non-secure accesses.

GICR_ISPENDR0 can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0200	GICR_ISPENDR0

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_ISPENDR<n>E, Interrupt Set-Pending Registers, n = 1 - 2

The GICR_ISPENDR<n>E characteristics are:

Purpose

Adds the pending state to the corresponding PPI.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_ISPENDR<n>E are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_ISPENDR<n>E is a 32-bit register.

Field descriptions

Set_pending_bit<x>, bit [x], for x = 31 to 0

For the extended PPIs, adds the pending state to interrupt number x. Reads and writes have the following behavior:

Set_pending_bit<x>	Meaning
0b0	If read, indicates that the corresponding interrupt is not pending on this PE. If written, has no effect.
0b1	If read, indicates that the corresponding interrupt is pending, or active and pending on this PE. If written, changes the state of the corresponding interrupt from inactive to pending, or from active to active and pending. This has no effect in the following cases: • If the interrupt is already pending because of a write to GICR_ISPENDR<n>E. • If the interrupt is already pending because the corresponding interrupt signal is asserted. In this case, the interrupt remains pending if the interrupt signal is deasserted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

For INTID m, when DIV and MOD are the integer division and modulo operations:

- The corresponding GICR_ISPENDR<n>E number, n, is given by n = (m-1024) DIV 32.
- The offset of the required GICR_ISPENDR<n>E is (0x200 + (4*n)).
- The bit number of the required group modifier bit in this register is (m-1024) MOD 32.

Accessing GICR_ISPENDR<n>E

When affinity routing is not enabled for the Security state of an interrupt in GICR_ISPENDR<n>E, the corresponding bit is RES0.

When GICD_CTLR.DS==0, bits corresponding to Secure PPIs are RAZ/WI to Non-secure accesses.

Bits corresponding to unimplemented interrupts are RAZ/WI.

GICR_ISPENDR<n>E can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0200 + (4 * n)	GICR_ISPENDR<n>E

Accesses to this register are RW.

GICR_MPAMIDR, Report maximum PARTID and PMG Register

The GICR_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_MPAMIDR are RES0.

A copy of this register is provided for each Redistributor.

When GICR_TYPER.MPAM==0, this register is RES0.

Attributes

GICR_MPAMIDR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICR_MPAMIDR

GICR_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0018	GICR_MPAMIDR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICR_NSACR, Non-secure Access Control Register

The GICR_NSACR characteristics are:

Purpose

Enables Secure software to permit Non-secure software to create SGIs targeting the PE connected to this Redistributor by writing to ICC_SGI1R_EL1, ICC_ASGI1R_EL1 or ICC_SGI0R_EL1.

For more information, see 'Forwarding an SGI to a target PE' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

For a description on when a write to ICC_SGI0R_EL1, ICC_SGI1R_EL1 or ICC_ASGI1R_EL1 is permitted to generate an interrupt, see 'Use of control registers for SGI forwarding' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Attributes

GICR_NSACR is a 32-bit register.

Field descriptions

NS_access<x>, bits [2x+1:2x], for x = 15 to 0

Configures the level of Non-secure access permitted when the SGI is in Secure Group 0 or Secure Group 1, as defined from GICR_IGROUPR0 and GICR_IGRPMODR0. A field is provided for each SGI. The possible values of each 2-bit field are:

NS_access<x>	Meaning
0b00	Non-secure writes are not permitted to generate Secure Group 0 SGIs or Secure Group 1 SGIs.
0b01	Non-secure writes are permitted to generate a Secure Group 0 SGI.
0b10	As 0b01, but additionally Non-secure writes to are permitted to generate a Secure Group 1 SGI.
0b11	Reserved. If the field is programmed to the reserved value, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the valid values. However, to maintain the principle that as the value increases additional accesses are permitted Arm strongly recommends that implementations treat this value as 0b10. It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the valid value chosen.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_NSACR

This register is used when affinity routing is enabled. When affinity routing is not enabled for the Security state of the interrupt, GICD_NSACR<n> with n=0 provides equivalent functionality.

This register does not support PPIs.

GICR_NSACR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	SGI_base	0x0E00	GICR_NSACR

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are RAZ/WI.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are RW.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are RAZ/WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are RW.

• When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

GICR_PARTIDR, Set PARTID and PMG Register

The GICR_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the Redistributor.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GICR_PARTIDR are RES0.

A copy of this register is provided for each Redistributor.

When GICR_TYPER.MPAM==0, this register is RES0.

Attributes

GICR_PARTIDR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when Redistributor accesses memory.

Bits not needed to represent PMG values in the range 0 to PMG_MAX are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '00000000'.

PARTID, bits [15:0]

PARTID value used when Redistributor accesses memory.

Bits not needed to represent PARTID values in the range 0 to PARTID_MAX are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0000000000000000'.

Accessing GICR_PARTIDR

GICR_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x001C	GICR_PARTIDR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_PENDBASER, Redistributor LPI Pending Table Base Address Register

The GICR_PENDBASER characteristics are:

Purpose

Specifies the base address of the LPI Pending table, and the Shareability and Cacheability of accesses to the LPI Pending table.

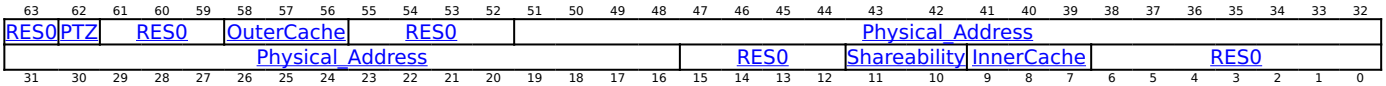
Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_PENDBASER is a 64-bit register.

Field descriptions



Bit [63]

Reserved, RES0.

PTZ, bit [62]

Pending Table Zero. Indicates to the Redistributor whether the LPI Pending table is zero when GICR_CTLR.EnableLPIs == 1.

This field is WO, and reads as 0.

PTZ	Meaning
0b0	The LPI Pending table is not zero, and contains live data.
0b1	The LPI Pending table is zero. Software must ensure the LPI Pending table is zero before this value is written.

Bits [61:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Pending table.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Pending table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Pending table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

Accessing GICR_PENDBASER

Having the GICR_PENDBASER OuterCache, Shareability or InnerCache fields programmed to different values on different Redistributors with GICR_CTLR.EnableLPIs == 1 in the system is UNPREDICTABLE.

Changing GICR_PENDBASER with GICR_CTLR.EnableLPIs == 1 is UNPREDICTABLE.

GICR_PENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0078	GICR_PENDBASER

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_PROPBASER, Redistributor Properties Base Address Register

The GICR_PROPBASER characteristics are:

Purpose

Specifies the base address of the LPI Configuration table, and the Shareability and Cacheability of accesses to the LPI Configuration table.

Configuration

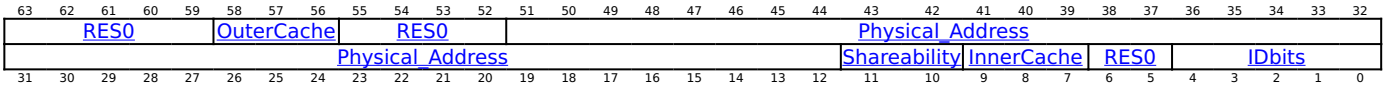
A copy of this register is provided for each Redistributor.

An implementation might make this register RO, for example to correspond to an LPI Configuration table in read-only memory.

Attributes

GICR_PROPBASER is a 64-bit register.

Field descriptions



Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the LPI Configuration table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the LPI Configuration table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of LPI INTID supported, minus one, by the LPI Configuration table starting at Physical_Address.

If the value of this field is larger than the value of GICD_TYPER.IDbits, the GICD_TYPER.IDbits value applies.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all physical LPIs are out of range.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_PROPBASER

It is IMPLEMENTATION DEFINED whether GICR_PROPBASER can be set to different values on different Redistributors. GICR_TYPER.CommonLPIAff identifies the Redistributors that must have GICR_PROPBASER set to the same values whenever GICR_CTLR.EnableLPIs == 1.

Setting different values in different copies of GICR_PROPBASER on Redistributors that are required to use a common LPI Configuration table when GICR_CTLR.EnableLPIs == 1 leads to UNPREDICTABLE behavior.

Other restrictions apply when a Redistributor caches information from GICR_PROPBASER. For more information, see 'LPI Configuration tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GICR_PROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0070	GICR_PROPBASER

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_SETLPIR, Set LPI Pending Register

The GICR_SETLPIR characteristics are:

Purpose

Generates an LPI by setting the pending state of the specified LPI.

Configuration

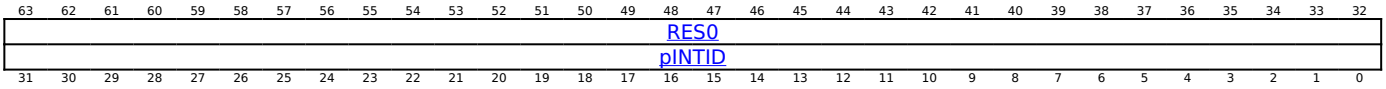
A copy of this register is provided for each Redistributor.

Attributes

GICR_SETLPIR is a 64-bit register.

Field descriptions

When GICR_TYPER.DirectLPI == '1':



Bits [63:32]

Reserved, RES0.

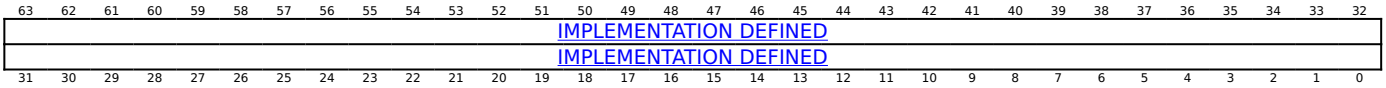
pINTID, bits [31:0]

The INTID of the physical LPI to be generated.

Note

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER.IDbits field. Unimplemented bits are RES0.

When GICR_TYPER.DirectLPI == '0':



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing GICR_SETLPIR

When written with a 32-bit write the data is zero-extended to 64 bits.

This register is mandatory in an implementation that supports LPIs and does not include an ITS. The functionality is IMPLEMENTATION DEFINED in an implementation that does include an ITS.

Writes to this register have no effect if either:

- The pINTID field corresponds to an LPI that is already pending.
- The pINTID field corresponds to an unimplemented LPI.
- GICR_CTLR.EnableLPIs == 0.

GICR_SETLPIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0040	GICR_SETLPIR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICR_STATUSR, Error Reporting Status Register

The GICR_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

A copy of this register is provided for each Redistributor.

If the GIC implementation supports two Security states this register is Banked to provide Secure and Non-secure copies.

Attributes

GICR_STATUSR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICR_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GICR_STATUSR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0010	GICR_STATUSR (S)

Accessible as follows:

- When an access is Secure, accesses to this register are RW.
- When FEAT_RME is implemented and an access is Root, accesses to this register are RW.

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0010	GICR_STATUSR (NS)

Accessible as follows:

- When an access is Non-secure, accesses to this register are RW.
- When FEAT_RME is implemented and an access is Realm, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_SYNCR, Redistributor Synchronize Register

The GICR_SYNCR characteristics are:

Purpose

Indicates completion of register based invalidate operations.

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_SYNCR is a 32-bit register.

Field descriptions

Bits [31:1]

Reserved, RES0.

Busy, bit [0]

Indicates completion of invalidation operations

Busy	Meaning
0b0	No operations are in progress.
0b1	A write is in progress to one or more of the following registers: • GICR_INVLPIR. • GICR_INVALLR. • GICv3, GICR_CLRLPIR.

This field tracks operations initiated on the same Redistributor.

Accessing GICR_SYNCR

When this register is accessed, it is optional that an implementation might wait until all operations are complete before returning a value, in which case GICR_SYNCR.Busy is always 0.

This register is mandatory when any of the following are true:

- GICR_TYPER.Direct is 1.
- GICR_CTLR.IR is 1.
- GICv4.1 is implemented.

Otherwise, the functionality is IMPLEMENTATION DEFINED.

GICR_SYNCR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x00C0	GICR_SYNCR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICR_TYPER, Redistributor Type Register

The GICR_TYPER characteristics are:

Purpose

Provides information about the configuration of this Redistributor.

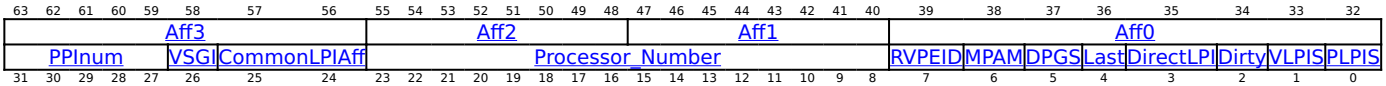
Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_TYPER is a 64-bit register.

Field descriptions



Aff3, bits [63:56]

The Affinity level 3 value for the Redistributor.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff2, bits [55:48]

The Affinity level 2 value for the Redistributor.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [47:40]

The Affinity level 1 value for the Redistributor.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [39:32]

The Affinity level 0 value for the Redistributor.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PPInum, bits [31:27]
When GICv3.1 is implemented:

The value derived from this field specifies the maximum PPI INTID that a GIC implementation can support. An implementation might not implement all PPIs up to this maximum.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PPInum	Meaning
0b00000	Maximum PPI INTID is 31.
0b00001	Maximum PPI INTID is 1087.
0b00010	Maximum PPI INTID is 1119.

All other values are reserved.

Access to this field is RO.

Otherwise:

Reserved, RES0.

VSGI, bit [26]
When GICv4.1 is implemented:

Indicates whether vSGIs are supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VSGI	Meaning
0b0	Direct injection of SGIs not supported.
0b1	Direct injection of SGIs supported.

Access to this field is RO.

Otherwise:

Reserved, RES0.

CommonLPIAff, bits [25:24]

Indicates the scope of the CommonLPIAff group.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CommonLPIAff	Meaning
0b00	All Redistributors are members of the same CommonLPIAff group.
0b01	All Redistributors with the same Aff3 value are members of the same CommonLPIAff group.
0b10	All Redistributors with the same Aff3.Aff2 value are members of the same CommonLPIAff group.
0b11	All Redistributors with the same Aff3.Aff2.Aff1 value are members of the same CommonLPIAff group.

Redistributors in the same CommonLPIAff group must use the same copy of the LPI Configuration table, and if GICv4.1 is implemented the same copy of the vPE Configuration table.

Access to this field is RO.

Processor_Number, bits [23:8]

A unique identifier for the PE. When GITS_TYPER.PTA == 0, an ITS uses this field to identify the interrupt target.

When affinity routing is disabled for a Security state, this field indicates which GICD_ITARGETSR<n> corresponds to this Redistributor.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

RVPEID, bit [7]
When GICv4.1 is implemented:

Indicates how the resident vPE is specified.

The value of this field is an IMPLEMENTATION DEFINED choice of:

RVPEID	Meaning
0b0	GICR_VPENDBASER records the address of the vPE's Virtual Pending Table.
0b1	GICR_VPENDBASER records vPEID.

Access to this field is RO.

Otherwise:

Reserved, RES0.

MPAM, bit [6]
When GICv3.1 is implemented:

MPAM

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM	Meaning
0b0	MPAM not supported.
0b1	MPAM supported.

Access to this field is RO.

Otherwise:

Reserved, RES0.

DPGS, bit [5]

Sets support for GICR_CTLR.DPG* bits.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DPGS	Meaning
0b0	GICR_CTLR.DPG* bits are not supported.
0b1	GICR_CTLR.DPG* bits are supported.

Access to this field is RO.

Last, bit [4]

Indicates whether this Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Last	Meaning
0b0	This Redistributor is not the highest-numbered Redistributor in a series of contiguous Redistributor pages.
0b1	This Redistributor is the highest-numbered Redistributor in a series of contiguous Redistributor pages.

Access to this field is RO.

DirectLPI, bit [3]

Indicates whether this Redistributor supports direct injection of LPIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

DirectLPI	Meaning
0b0	This Redistributor does not support direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are either not implemented, or have an IMPLEMENTATION DEFINED purpose.
0b1	This Redistributor supports direct injection of LPIs. The GICR_SETLPIR, GICR_CLRLPIR, GICR_INVLPIR, GICR_INVALLR, and GICR_SYNCR registers are implemented.

Access to this field is RO.

Dirty, bit [2]

Controls the functionality of GICR_VPENDBASER.Dirty.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Dirty	Meaning
0b0	GICR_VPENDBASER.Dirty is UNKNOWN when GICR_VPENDBASER.Valid == 1.
0b1	GICR_VPENDBASER.Dirty indicates when the Virtual Pending Table has been parsed when GICR_VPENDBASER.Valid is written from 0 to 1.

When GICR_TYPER.VLPIS == 0, this field is RES0.

Note

In GICv4p1 implementations this field is RES1.

Access to this field is RO.

VLPIS, bit [1]

Indicates whether the GIC implementation supports virtual LPIs and the direct injection of virtual LPIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VLPIS	Meaning
0b0	The implementation does not support virtual LPIs or the direct injection of virtual LPIs.
0b1	The implementation supports virtual LPIs and the direct injection of virtual LPIs.

Note

In GICv3 implementations this field is RES0.

Access to this field is RO.

PLPIS, bit [0]

Indicates whether the GIC implementation supports physical LPIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PLPIS	Meaning
0b0	The implementation does not support physical LPIs.
0b1	The implementation supports physical LPIs.

Access to this field is RO.

Accessing GICR_TYPER

GICR_TYPER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0008	GICR_TYPER

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICR_VPENDBASER, Virtual Redistributor LPI Pending Table Base Address Register

The GICR_VPENDBASER characteristics are:

Purpose

Specifies the base address of the memory that holds the virtual LPI Pending table for the currently scheduled virtual machine.

Configuration

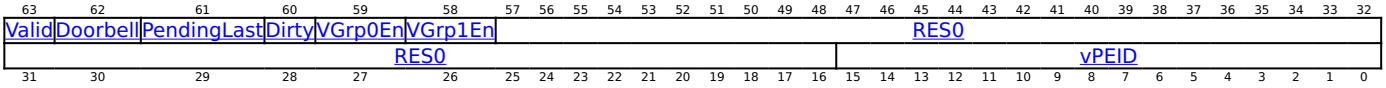
This register is present only when GICv4 is implemented or GICv4.1 is implemented. Otherwise, direct accesses to GICR_VPENDBASER are RES0.

Attributes

GICR_VPENDBASER is a 64-bit register.

Field descriptions

When GICv4.1 is implemented:



Valid, bit [63]

This bit controls whether a vPE is scheduled:

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

Setting GICR_VPENDBASER.Valid to 1 is UNPREDICTABLE if GICR_VPROPBASER.Valid == 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Doorbell, bit [62]

When GICR_VPENDBASER.Valid is written from 1 to 0, this bit controls whether a default doorbell interrupt is requested for the descheduled vPE.

Doorbell	Meaning
0b0	No default doorbell requested.
0b1	Default doorbell requested.

When GICR_VPENDBASER.Valid is written from 1 to 0, if there are outstanding enabled pending interrupts, then this bit is treated as 0.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1, then this bit is treated as 0.

When GICR_VPENDBASER.Valid == 1, reads return an UNKNOWN value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid is written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending and enabled interrupt for the last scheduled vPE.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

When GICR_VPENDBASER.Valid is written from 1 to 0, if GICR_VPENDBASER.PendingLast is written as 1, then this bit is set to an UNKNOWN value.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Dirty, bit [60]
When GICR_VPENDBASER.Valid == '1':

Read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table is complete.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 0 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Otherwise:

Read-only. Indicates whether a descheduling operation is in progress.

Dirty	Meaning
0b0	No descheduling operation in progress.
0b1	Descheduling operation in progress.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

VGrp0En, bit [59]

Enable virtual Group 0 interrupts.

VGrp0En	Meaning
0b0	Forwarding of virtual Group 0 interrupts disabled.
0b1	Forwarding of virtual Group 0 interrupts enabled.

Writing a new value to VGrp0En while GICR_VPENDBASER.Valid==1 is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

VGrp1En, bit [58]

Enable virtual Group 1 interrupts.

VGrp1En	Meaning
0b0	Forwarding of virtual Group 1 interrupts disabled.
0b1	Forwarding of virtual Group 1 interrupts enabled.

Writing a new value to VGrp1En while GICR_VPENDBASER.Valid==1 is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The virtual group enable is updated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Bits [57:16]

Reserved, RES0.

vPEID, bits [15:0]

When GICR_VPENDBASER.Valid == 1, ID of scheduled vPE.

When GICR_VPENDBASER.Valid == 1, if GICR_VPENDBASER.vPEID is set to a value greater than the configured vPEID width, the behavior of this field is CONSTRAINED UNPREDICTABLE:

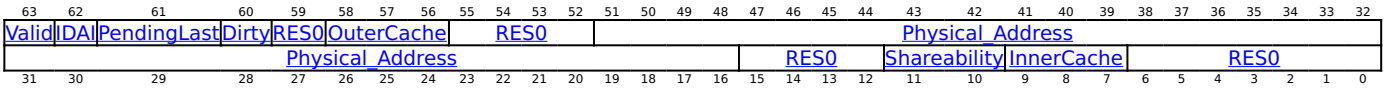
- GICR_VPENDBASER.vPEID is treated as having an UNKNOWN valid value for all purposes other than a direct read of the register.
- GICR_VPENDBASER.Valid is treated as being set to 0 for all purposes other than a direct read of the register.

Writing a new value to vPEID while GICR_VPENDBASER.Valid == 1 is CONSTRAINED UNPREDICTABLE:

- The update is ignored.
- The update is ignored for all purposes other than a direct read of the register.
- The new value is used.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields, unimplemented bits are RES0.

When GICv4 is implemented:



Valid, bit [63]

This bit controls whether the virtual LPI Pending table is valid.

Valid	Meaning
0b0	The virtual LPI Pending table is not valid. No vPE is scheduled.
0b1	The virtual LPI Pending table is valid. A vPE is scheduled.

Setting GICR_VPENDBASER.Valid == 1 when the associated CPU interface does not implement FEAT_GICv4 is UNPREDICTABLE.

Note

Software can determine whether a PE supports FEAT_GICv3 or FEAT_GICv4 by reading ID_AA64PFR0_EL1.

Writing a new value to any bit of GICR_VPENDBASER, other than GICR_VPENDBASER.Valid, when GICR_VPENDBASER.Valid==1 is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

IDAI, bit [62]

Implementation Defined Area Invalid. Indicates whether the IMPLEMENTATION DEFINED area in the virtual LPI Pending table is valid.

IDAI	Meaning
0b0	The IMPLEMENTATION DEFINED area is valid.
0b1	The IMPLEMENTATION DEFINED area is invalid and all pending interrupt information is held in the architecturally defined part of the virtual LPI Pending table.

For more information, see 'LPI Pending tables' and 'Virtual LPI Configuration tables and virtual LPI Pending tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

PendingLast, bit [61]

Indicates whether there are pending and enabled interrupts for the last scheduled vPE.

This value is set by the implementation when GICR_VPENDBASER.Valid has been written from 1 to 0 and is otherwise UNKNOWN.

PendingLast	Meaning
0b0	There are no pending and enabled interrupts for the last scheduled vPE.
0b1	There is at least one pending interrupt for the last scheduled vPE. It is IMPLEMENTATION DEFINED whether this bit is set when the only pending interrupts for the last scheduled vPE are not enabled. Arm deprecates setting PendingLast to 1 when the only pending interrupts for the last scheduled virtual machine are not enabled.

When the GICR_VPENDBASER.Valid bit is written from 0 to 1, this bit is RES1.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Dirty, bit [60]
When GICR_VPENDBASER.Valid == '0':

Indicates whether a descheduling operation is in progress.

This field is read-only.

Dirty	Meaning
0b0	No descheduling operation in progress.
0b1	Descheduling operation in progress.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty==1.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

When GICR_VPENDBASER.Valid == '1' and GICR_TYPER.Dirty == '1':

This field is read-only. Reports whether the Virtual Pending table has been parsed.

Dirty	Meaning
0b0	Parsing of the Virtual Pending Table has completed.
0b1	Parsing of the Virtual Pending Table has not completed.

Writing 1 to GICR_VPENDBASER.Valid is UNPREDICTABLE while GICR_VPENDBASER.Dirty == 1.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Otherwise:

This field is read-only. This fields is UNKNOWN.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Bit [59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to virtual LPI Pending tables of vPEs targeting this Redistributor.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the OuterCacheabilty attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:16]

Bits [51:16] of the physical address containing the virtual LPI Pending table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [15:12]

Reserved, RES0.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the virtual LPI Pending table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the Shareability attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the virtual LPI Pending table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The Cacheability, Outer Cacheability and Shareability fields are used for accesses to the virtual LPI Pending table of resident and non-resident vPEs.

If the InnerCacheabilty attribute of the virtual LPI Pending tables that are associated with vPEs targeting the same Redistributor are different, behavior is UNPREDICTABLE.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:0]

Reserved, RES0.

Accessing GICR_VPENDBASER

The effect of a write to this register is not guaranteed to be visible throughout the affinity hierarchy, as indicated by GICR_CTLR.RWP == 0.

GICR_VPENDBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0078	GICR_VPENDBASER

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_VPROPBASER, Virtual Redistributor Properties Base Address Register

The GICR_VPROPBASER characteristics are:

Purpose

In GICv4.0, specifies the base address of the memory that holds the virtual LPI Configuration table for the currently scheduled virtual machine.

In GICv4.1, specifies the base address of the memory that holds the vPE Configuration table.

Configuration

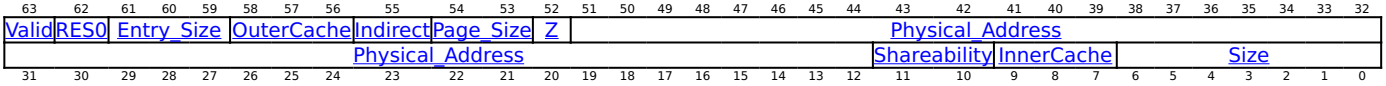
This register is present only when GICv4 is implemented or GICv4.1 is implemented. Otherwise, direct accesses to GICR_VPROPBASER are RES0.

Attributes

GICR_VPROPBASER is a 64-bit register.

Field descriptions

When GICv4.1 is implemented:



Valid, bit [63]

This bit controls whether the vPE Configuration Table is valid.

Valid	Meaning
0b0	The vPE Configuration table is not valid.
0b1	The vPE Configuration table is valid.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Bit [62]

Reserved, RES0.

Entry_Size, bits [61:59]

Specifies the number 64-bit doublewords per table entry, minus one.

This bit is read-only.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the table.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Indirect, bit [55]

This field indicates whether GICR_VPROPBASER specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages that contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

This field is RAZ/WI for GIC implementations that only support flat tables.

If the supported vPEID width indicated by GICD_TYPER2.VIL and GICD_TYPER2.VID, and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Page_Size, bits [54:53]

The following values indicate the size of page that the translation table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Z, bit [52]

When GICR_VPROPBASER.Valid is written from 0 to 1, GICR_VPROPBASER.Z indicates whether the vPE Configuration table is known to contain all zeros.

Z	Meaning
0b0	The vPE Configuration table is not zero, and contains live data.
0b1	The vPE Configuration table is zero.

Setting GICR_VPROPBASER.Z to 0 causes the IRI to reload configuration from memory

When GICR_VPROPBASER.Valid is written from 0 to 1, if GICR_VPROPBASER.Z==1 behavior is UNPREDICTABLE if the allocated memory does not contain all zeros.

This field is WO, and reads as 0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the vPE Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the vPE Configuration table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the vPE Configuration table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

Size, bits [6:0]

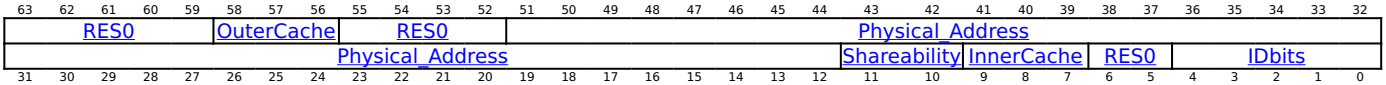
The number of pages of physical memory allocated to the table, minus one.

GICR_VPROPBASER.Page_Size specifies the size of each page.

The reset behavior of this field is:

- On a GIC reset, this field resets to an UNKNOWN value.

When GICv4 is implemented:



Bits [63:59]

Reserved, RES0.

OuterCache, bits [58:56]

Indicates the Outer Cacheability attributes of accesses to the LPI Configuration table.

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [55:52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the physical address containing the virtual LPI Configuration table.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the vPE Configuration table.

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [9:7]

Indicates the Inner Cacheability attributes of accesses to the vPE Configuration table.

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [6:5]

Reserved, RES0.

IDbits, bits [4:0]

The number of bits of virtual LPI INTID supported, minus one.

If the value of this field is less than 0b1101, indicating that the largest INTID is less than 8192 (the smallest LPI interrupt ID), the GIC will behave as if all virtual LPIs are out of range.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GICR_VPROPBASER

GICR_VPROPBASER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0070	GICR_VPROPBASER

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICR_VSGIPENDR, Redistributor virtual SGI pending state register

The GICR_VSGIPENDR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GICR_VSGIPENDR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIPENDR is a 32-bit register.

Field descriptions

Busy, bit [31]

ID of target vPEID

Busy	Meaning
0b0	Query of virtual SGI state not in progress.
0b1	Query of virtual SGI state in progress.

Bits [30:16]

Reserved, RES0.

Pending, bits [15:0]

Pending state of virtual SGIs for requested vPEID.

This field is UNKNOWN when GICR_VSGIPENDR.Busy == 1

Accessing GICR_VSGIPENDR

GICR_VSGIPENDR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0088	GICR_VSGIPENDR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICR_VSGIR, Redistributor virtual SGI pending state request register

The GICR_VSGIR characteristics are:

Purpose

Requests the pending state of virtual SGIs for a specified vPE.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GICR_VSGIR are RES0.

A copy of this register is provided for each Redistributor.

Attributes

GICR_VSGIR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

vPEID, bits [15:0]

ID of target vPE

Writing this field is CONSTRAINED UNPREDICTABLE when GICR_VSGIPENDR.Busy == 1, with either the write ignored or a new query started.

Writing a value greater than the configured vPEID width behavior is CONSTRAINED UNPREDICTABLE, with either:

- vPEID is treated as having an UNKNOWN valid value.
- The write is ignored.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Accessing GICR_VSGIR

GICR_VSGIR can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	VLPI_base	0x0080	GICR_VSGIR

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICR_WAKER, Redistributor Wake Register

The GICR_WAKER characteristics are:

Purpose

Permits software to control the behavior of the WakeRequest power management signal corresponding to the Redistributor. Power management operations follow the rules in 'Power management' in in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Configuration

A copy of this register is provided for each Redistributor.

Attributes

GICR_WAKER is a 32-bit register.

Field descriptions

31	30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3	2	1	0
IMPLEMENTATION DEFINED	RES0	ChildrenAsleep	ProcessorSleep	IMPLEMENTATION DEFINED

IMPLEMENTATION DEFINED, bit [31]

IMPLEMENTATION DEFINED.

Bits [30:3]

Reserved, RES0.

ChildrenAsleep, bit [2]

Read-only. Indicates whether the connected PE is quiescent:

ChildrenAsleep	Meaning
0b0	An interface to the connected PE might be active.
0b1	All interfaces to the connected PE are quiescent.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

ProcessorSleep, bit [1]

Indicates whether the Redistributor can assert the WakeRequest signal:

ProcessorSleep	Meaning
0b0	This PE is not in, and is not entering, a low power state.
0b1	The PE is either in, or is in the process of entering, a low power state. All interrupts that arrive at the Redistributor: • Assert a WakeRequest signal. • Are held in the pending state at the Redistributor, and are not communicated to the CPU interface. Note When ProcessorSleep == 1, the Redistributor must ensure that any interrupts that are pending on the CPU interface are released. For an implementation that is using the GIC Stream Protocol Interface: • A Quiesce command puts the interface between the Redistributor and the CPU interface in a quiescent state. For more information, see 'Quiesce (IRI)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069). • A Release command releases any interrupts that are pending on the CPU interface. For more information, see 'Release (ICC)' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Note

Before powering down a PE, software must set this bit to 1 and wait until ChildrenAsleep == 1. After powering up a PE, or following a failed powerdown, software must set this bit to 0 and wait until ChildrenAsleep == 0.

Changing ProcessorSleep from 1 to 0 when ChildrenAsleep is not 1 results in UNPREDICTABLE behavior.

Changing ProcessorSleep from 0 to 1 when the Enable for each interrupt group in the associated CPU interface is not 0 results in UNPREDICTABLE behavior.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

IMPLEMENTATION DEFINED, bit [0]

IMPLEMENTATION DEFINED.

Accessing GICR_WAKER

To ensure a Redistributor is quiescent, software must write to GICR_WAKER with ProcessorSleep == 1, then poll the register until ChildrenAsleep == 1.

Resetting the connected PE when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0, can lead to UNPREDICTABLE behavior in the IRI.

Resetting the IRI when GICR_WAKER.ProcessorSleep==0 or GICR_WAKER.ChildrenAsleep==0 can lead to UNPREDICTABLE behavior in the connected PE.

GICR_WAKER can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
GIC Redistributor	RD_base	0x0014	GICR_WAKER

Accessible as follows:

- When GICD_CTLR.DS == '1', accesses to this register are RW.
- When GICD_CTLR.DS == '0' and an access is Secure, accesses to this register are RW.
- When GICD_CTLR.DS == '0' and an access is Non-secure, accesses to this register are RAZ/WI.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Root, accesses to this register are RW.
- When GICD_CTLR.DS == '0', FEAT_RME is implemented, and an access is Realm, accesses to this register are RAZ/WI.

2025-12-10 16:11:30, 2025-12_rel

GICV_ABPR, Virtual Machine Aliased Binary Point Register

The GICV_ABPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 1 interrupt preemption.

This register corresponds to GICC_ABPR in the physical CPU interface.

Note

GICH_LR<n>.Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_ABPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_ABPR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to '000'.

Additional information

The Binary_Point field of this register is aliased to GICH_VMCR.VBPR1.

Accessing GICV_ABPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_BPR1 provides equivalent functionality.
- For AArch64 implementations, ICC_BPR1_EL1 provides equivalent functionality.

The value contained in this register is one greater than the actual applied binary point value, as described in 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This register is used for Group 1 interrupts when GICV_CTLR.CBPR == 0. GICV_BPR provides equivalent functionality for Group 0 interrupts, and for Group 1 interrupts when GICV_CTLR.CBPR == 1.

GICV_ABPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x001C	GICV_ABPR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

GICV_AEOIR, Virtual Machine Aliased End Of Interrupt Register

The GICV_AEOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 1 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AEOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AEOIR is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

A successful EOI request means that:

- The highest priority bit in GICH_APR<n> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR.EOImode bit == 0, the interrupt is deactivated in the corresponding List register. If the INTID corresponds to a hardware interrupt, the interrupt is also deactivated in the Distributor.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

A write to this register is UNPREDICTABLE if the INTID corresponds to a Group 0 interrupt. In addition, the following GICv2 UNPREDICTABLE cases require specific actions:

- If highest active priority is Group 0 and the identified interrupt is in the List Registers and it matches the highest active priority. When EL2 is using System registers and ICH_VTR_EL2.SEIS is 1, an IMPLEMENTATION DEFINED SEI might be generated, otherwise GICv3 implementations must ignore such writes.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the interrupt to be deactivated is an SGI (that is, the value of Physical_ID is between 0 and 15). GICv3 implementations must perform the deactivate operation. This means that a GICv3 implementation in legacy operation must ensure only a single SGI is active for a PE.
- If the identified interrupt is in the List Registers, and the HW bit is 1, and the corresponding pINTID field value is between 1020 and 1023, indicating a special purpose INTID. GICv3 implementations must not perform a deactivate operation but must still change the state of the List register as appropriate. When EL2 is using System registers and ICH_VTR_EL2.SEIS is 1, an implementation might generate a system error.

Accessing GICV_AEOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_EOIR provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AEOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0024	GICV_AEOIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are WO.
- When an access is Secure, accesses to this register are WO.
- When an access is Non-secure, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICV_AHPPIR, Virtual Machine Aliased Highest Priority Pending Interrupt Register

The GICV_AHPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 1 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register GICC_AHPPIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AHPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AHPPIR is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

A read of this register returns the spurious INTID 1023 if any of the following are true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
- The highest priority pending interrupt is in Group 0.

Accessing GICV_AHPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR1 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_HPPIR provides equivalent functionality for Group 0 interrupts.

The register does not return the INTID of an interrupt that is active and pending.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AHPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0028	GICV_AHPPIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

GICV_AIAR, Virtual Machine Aliased Interrupt Acknowledge Register

The GICV_AIAR characteristics are:

Purpose

Provides the INTID of the signaled Group 1 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register GICC_AIAR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_AIAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_AIAR is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

The operation of this register is similar to the operation of GICV_IAR. When a vPE reads this register, the corresponding GICH_LR<n>.Group field is checked to determine whether the interrupt is in Group 0 or Group 1:

- If the interrupt is Group 0, the spurious INTID 1023 is returned and the interrupt is not acknowledged.
- If the interrupt is Group 1, the INTID is returned. The List register entry is updated to active state, and the appropriate bit in GICH_APR<n> is set to 1.

A read of this register returns the spurious INTID 1023 if any of the following are true:

- When the virtual CPU interface is enabled and GICH_HCR.En == 1:
  - There are no pending interrupts of sufficiently high priority value to be signaled to the PE.
  - The highest priority pending interrupt is in Group 0.
- Interrupt signaling by the virtual CPU interface is disabled.

Accessing GICV_AIAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR1 provides equivalent functionality.
- For AArch64 implementations, ICC_IAR1_EL1 provides equivalent functionality.

This register is used for Group 1 interrupts only. GICV_IAR provides equivalent functionality for Group 0 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_AIAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0020	GICV_AIAR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICV_APR<n>, Virtual Machine Active Priorities Registers, n = 0 - 3

The GICV_APR<n> characteristics are:

Purpose

Provides information about interrupt active priorities.

These registers correspond to the physical CPU interface registers GICC_APR<n>.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_APR<n> are RES0.

When System register access is disabled for EL2, these registers access GICH_APR<n>, and all active priorities for virtual machines are held in GICH_APR<n> regardless of interrupt group.

When System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2, and all active priorities for virtual machines are held in ICH_AP1R<n>_EL2 regardless of interrupt group.

Attributes

GICV_APR<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Provides information about active priorities for the virtual machine.

See GICH_APR<n> and ICH_AP1R<n>_EL2 for the correspondence between priorities and bits.

Accessing GICV_APR<n>

If System register access is not enabled for EL2, these registers access GICH_APR<n>. If System register access is enabled for EL2, these registers access ICH_AP1R<n>_EL2. All active priority mapped guests are held in the accessed registers, regardless of interrupt group.

GICV_APR<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x00D0 + (4 * n)	GICV_APR<n>

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICV_BPR, Virtual Machine Binary Point Register

The GICV_BPR characteristics are:

Purpose

Defines the point at which the priority value fields split into two parts, the group priority field and the subpriority field. The group priority field determines Group 0 interrupt preemption.

This register corresponds to GICC_BPR in the physical CPU interface.

Note

GICH_LR<n>.Group determines whether a virtual interrupt is Group 0 or Group 1.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_BPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

When GICV_CTLR.CBPR == 1, this register determines interrupt preemption for both Group 0 and Group 1 interrupts.

Attributes

GICV_BPR is a 32-bit register.

Field descriptions

Bits [31:3]

Reserved, RES0.

Binary_Point, bits [2:0]

Controls how the 8-bit interrupt priority field is split into a group priority field, that determines interrupt preemption, and a subpriority field.

For information about how this field determines the interrupt priority bits assigned to the group priority field, see 'ICC_BPR0_EL1 Binary Point for Group 1 interrupts when CBPR == 1, or for Group 0 interrupts' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Additional information

The Binary_Point field of this register is aliased to GICH_VMCR.VBPR0.

Accessing GICV_BPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_BPR0 provides equivalent functionality.
- For AArch64 implementations, ICC_BPR0_EL1 provides equivalent functionality.

GICV_BPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0008	GICV_BPR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

GICV_CTLR, Virtual Machine Control Register

The GICV_CTLR characteristics are:

Purpose

Controls the behavior of virtual interrupts.

This register corresponds to the physical CPU interface register GICC_CTLR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_CTLR are RES0.

This register is available when a GIC implementation supports interrupt virtualization.

Attributes

GICV_CTLR is a 32-bit register.

Field descriptions

Bits [31:10]

Reserved, RES0.

EOImode, bit [9]

Controls the behavior associated with the GICV_EOIR, GICV_AEOIR, and GICV_DIR registers:

EOImode	Meaning
0b0	Writes to GICV_EOIR and GICV_AEOIR perform priority drop and deactivate interrupt operations simultaneously. Behavior on a write to GICV_DIR is unpredictable. When it has completed processing the interrupt, the virtual machine writes to GICV_EOIR or GICV_AEOIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the physical Distributor.
0b1	Writes to GICV_EOIR and GICV_AEOIR perform priority drop operation only. Writes to GICV_DIR perform deactivate interrupt operation only. When it has completed processing the interrupt, the virtual machine writes to GICV_DIR to deactivate the interrupt. The write updates the List registers and causes the virtual CPU interface to signal the interrupt completion to the Distributor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [8:5]

Reserved, RES0.

CBPR, bit [4]

Controls whether GICV_BPR affects both Group 0 and Group 1 interrupts:

CBPR	Meaning
0b0	GICV_BPR affects Group 0 virtual interrupts only. GICV_ABPR affects Group 1 virtual interrupts only.
0b1	GICV_BPR affects both Group 0 and Group 1 virtual interrupts.

For more information, see 'Priority grouping' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQEn, bit [3]

FIQ Enable. Controls whether Group 0 virtual interrupts are presented as virtual FIQs:

FIQEn	Meaning
0b0	Group 0 virtual interrupts are presented as virtual IRQs.
0b1	Group 0 virtual interrupts are presented as virtual FIQs.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AckCtl, bit [2]

Arm deprecates use of this bit. Arm strongly recommends that software is written to operate with this bit always cleared to 0.

Acknowledge control. When the highest priority interrupt is Group 1, determines whether GICV_IAR causes the CPU interface to acknowledge the interrupt or returns the spurious identifier 1022, and whether GICV_HPPIR returns the interrupt ID or the special identifier 1022.

AckCtl	Meaning
0b0	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns an interrupt ID of 1022.
0b1	If the highest priority pending interrupt is Group 1, a read of GICV_IAR or GICV_HPPIR returns the interrupt ID of the corresponding interrupt.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp1, bit [1]

Enables the signaling of Group 1 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp1	Meaning
0b0	Signaling of Group 1 interrupts is disabled.
0b1	Signaling of Group 1 interrupts is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EnableGrp0, bit [0]

Enables the signaling of Group 0 virtual interrupts by the virtual CPU interface to the virtual machine:

EnableGrp0	Meaning
0b0	Signaling of Group 0 interrupts is disabled.
0b1	Signaling of Group 0 interrupts is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_CTLR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_CTLR provides equivalent functionality.

- For AArch64 implementations, ICC_CTLR_EL1 provides equivalent functionality.

GICV_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0000	GICV_CTLR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GICV_DIR, Virtual Machine Deactivate Interrupt Register

The GICV_DIR characteristics are:

Purpose

Deactivates a specified virtual interrupt in the GICH_LR<n> List registers.

This register corresponds to the physical CPU interface register GICC_DIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_DIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_DIR is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

When the virtual machine writes to this register, the specified interrupt in the List registers is changed from active to inactive, or from active and pending to pending. If the specified interrupt is present in the List registers but is not in either the active or active and pending states, the effect is UNPREDICTABLE. If the specified interrupt is not present in the List registers, GICH_HCR.EOICount is incremented, potentially generating a maintenance interrupt.

Note

If the specified interrupt is not present in the List registers, the virtual machine cannot recover the INTID. Therefore, the hypervisor must ensure that, when GICV_CTLR.EOImode == 1, no more than one active interrupt is transferred from the List registers into a software list. If more than one active interrupt that is not stored in the List registers exists, the hypervisor must handle accesses to GICV_DIR in software, typically by trapping these accesses.

If the corresponding GICH_LR<n>.HW == 1, indicating a hardware interrupt, then a deactivate request is sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, the request is ignored.

Note

Interrupt deactivation using this register is based on the provided INTID, with no requirement to deactivate interrupts in any particular order. A single register is therefore used to deactivate both Group 0 and Group 1 interrupts.

Accessing GICV_DIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_DIR provides equivalent functionality.
- For AArch64 implementations, ICC_DIR_EL1 provides equivalent functionality.

Writes to this register are valid only when GICV_CTLR.EOImode == 1. Writes to this register are otherwise UNPREDICTABLE.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_DIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x1000	GICV_DIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are WO.
- When an access is Secure, accesses to this register are WO.
- When an access is Non-secure, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICV_EOIR, Virtual Machine End Of Interrupt Register

The GICV_EOIR characteristics are:

Purpose

A write to this register performs a priority drop for the specified Group 0 virtual interrupt and, if GICV_CTLR.EOImode == 0, also deactivates the interrupt.

This register corresponds to the physical CPU interface register GICC_EOIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_EOIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_EOIR is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

The behavior of this register depends on the setting of GICV_CTLR.EOImode:

GICV_CTLR.EOImode	Behavior
0b0	Both the priority drop and the deactivate interrupt effects occur
0b1	Only the priority drop effect occurs.

A successful EOI request means that:

- The highest priority bit in GICH_APR<n> is cleared, causing the running priority to drop.
- If the appropriate GICV_CTLR.EOImode bit == 0, the interrupt is deactivated in the corresponding List register GICH_LR<n>. If GICH_LR<n>.HW == 1, indicating the INTID corresponds to a hardware interrupt, a deactivate request is also sent to the physical Distributor, identifying the physical INTID from the corresponding field in the List register. This effect is identical to a Non-secure write to GICC_DIR from the PE having that physical INTID. This means that if the corresponding physical interrupt is marked as Group 0, and GICD_CTLR.DS == 0, the deactivation request is ignored. See GICC_EOIR for more information.

Note

Only Group 1 interrupts can target the hypervisor, and therefore only Group 1 interrupts are deactivated in the Distributor.

Accessing GICV_EOIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_EOIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_EOIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AEOIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_EOIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0010	GICV_EOIR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are WO.
- When an access is Secure, accesses to this register are WO.
- When an access is Non-secure, accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GICV_HPPIR, Virtual Machine Highest Priority Pending Interrupt Register

The GICV_HPPIR characteristics are:

Purpose

Provides the INTID of the highest priority pending Group 0 virtual interrupt in the List registers.

This register corresponds to the physical CPU interface register GICC_HPPIR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_HPPIR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_HPPIR is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

Reads of the GICC_HPPIR that do not return a valid INTID return a spurious INTID, 1022 or 1023. See 'Special INTIDs' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Highest priority pending interrupt Group	GICV_HPPIR read	GICV_CTLR.AckCtl	Returned INTID
1	Non-secure	x	ID of Group 1 interrupt
1	Secure	0	1022
1	Secure	1	ID of Group 1 interrupt
0	Non-secure	x	1023
0	Secure	x	ID of Group 0 interrupt
No pending interrupts	x	x	1023

If the CPU interface supports only a single Security state, the entries that apply to Secure reads describe the behavior.

Accessing GICV_HPPIR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_HPPIR0 provides equivalent functionality.
- For AArch64 implementations, ICC_HPPIR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AHPPIR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_HPPIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICV_IAR, Virtual Machine Interrupt Acknowledge Register

The GICV_IAR characteristics are:

Purpose

Provides the INTID of the signaled Group 0 virtual interrupt. A read of this register by the PE acts as an acknowledge for the interrupt.

This register corresponds to the physical CPU interface register GICC_IAR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IAR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_IAR is a 32-bit register.

Field descriptions

Bits [31:25]

Reserved, RES0.

INTID, bits [24:0]

The INTID of the signaled interrupt.

Note

INTIDs 1020-1023 are reserved and convey additional information such as spurious interrupts.

When affinity routing is not enabled:

- Bits [23:13] are RES0.
- For SGIs, bits [12:10] identify the CPU interface corresponding to the source PE. For all other interrupts these bits are RES0.

Additional information

When the virtual machine writes to this register, the virtual CPU interface acknowledges the highest priority pending virtual interrupt and sets the state in the corresponding List register to active. The appropriate bit in the active priorities register GICH_APR<n> is set to 1.

If GICH_LR<n>.HW == 0, indicating that the interrupt is software-triggered, then bits [12:10] of GICH_LR<n> are returned in bits [12:10] of GICV_IAR. Otherwise bits [12:10] are RES0.

A read of this register returns the spurious INTID 1023 if either of the following is true:

- There are no pending interrupts of sufficiently high priority value to be signaled to the PE with the virtual CPU interface enabled and GICH_HCR.En == 1.
- Interrupt signaling by the virtual CPU interface is disabled.

A read of this register returns the spurious INTID 1022 if the highest priority pending interrupt is Group 1 and GICV_CTLR.AckCtl == 0.

Accessing GICV_IAR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_IAR0 provides equivalent functionality.
- For AArch64 implementations, ICC_IAR0_EL1 provides equivalent functionality.

This register is used for Group 0 interrupts only. GICV_AIAR provides equivalent functionality for Group 1 interrupts.

When affinity routing is enabled, it is a programming error to use memory-mapped registers to access the GIC.

GICV_IAR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x000C	GICV_IAR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICV_IIDR, Virtual Machine CPU Interface Identification Register

The GICV_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the virtual CPU interface.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_IIDR are RES0.

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states this register is Common.

Attributes

GICV_IIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:20]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture_version, bits [19:16]

The version of the GIC architecture that is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture_version	Meaning
0b0001	GICv1.
0b0010	GICv2.
0b0011	GICv3 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.
0b0100	GICv4 memory-mapped interface supported. Support for the System register interface is discoverable from PE registers ID_PFR1 and ID_AA64PFR0_EL1.

Other values are reserved.

Access to this field is RO.

Revision, bits [15:12]

Revision number for the CPU interface.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the CPU interface.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for GICV_IIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GICV_IIDR

GICV_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x00FC	GICV_IIDR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICV_PMR, Virtual Machine Priority Mask Register

The GICV_PMR characteristics are:

Purpose

This register provides a virtual interrupt priority filter. Only virtual interrupts with a higher priority than the value in this register are signaled to the PE.

Note

Higher interrupt priority corresponds to a lower value of the Priority field.

This register corresponds to the physical CPU interface register GICC_PMR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_PMR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

The Priority field of this register is aliased to GICH_VMCR.VMPR, to enable state to be switched easily between virtual machines during context-switching.

Attributes

GICV_PMR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The priority mask level for the virtual CPU interface. If the priority of the interrupt is higher than the value indicated by this field, the interface signals the interrupt to the PE.

If the GIC implementation supports fewer than 256 priority levels some bits might be RAZ/WI, as follows:

- For 128 supported levels, bit [0] = 0b0.
- For 64 supported levels, bits [1:0] = 0b00.
- For 32 supported levels, bits [2:0] = 0b000.
- For 16 supported levels, bits [3:0] = 0b0000.

For more information, see 'Interrupt prioritization' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing GICV_PMR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_PMR provides equivalent functionality.
- For AArch64 implementations, ICC_PMR_EL1 provides equivalent functionality.

GICV_PMR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0004	GICV_PMR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

GICV_RPR, Virtual Machine Running Priority Register

The GICV_RPR characteristics are:

Purpose

This register indicates the running priority of the virtual CPU interface.

This register corresponds to the physical CPU interface register GICC_RPR.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_RPR are RES0.

This register is available when the GIC implementation supports interrupt virtualization.

Attributes

GICV_RPR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

Priority, bits [7:0]

The current running priority on the virtual CPU interface. This is the group priority of the current active interrupt.

If there are no active interrupts on the CPU interface, or all active interrupts have undergone a priority drop, the value returned is the Idle priority.

The priority returned is the group priority as if the BPR was set to the minimum value.

Accessing GICV_RPR

This register is used only when System register access is not enabled. When System register access is enabled:

- For AArch32 implementations, ICC_RPR provides equivalent functionality.
- For AArch64 implementations, ICC_RPR_EL1 provides equivalent functionality.

Depending on the implementation, if no bits are set to 1 in GICH_APR<n>, indicating no active virtual interrupts in the virtual CPU interface, the priority reads as 0xFF or 0xF8 to reflect the number of supported interrupt priority bits defined by GICH_VTR.PRIbits.

GICV_RPR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x0014	GICV_RPR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RO.
- When an access is Secure, accesses to this register are RO.
- When an access is Non-secure, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GICV_STATUSR, Virtual Machine Error Reporting Status Register

The GICV_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.

Configuration

This register is present only when FEAT_GICv3_LEGACY is implemented and EL2 is implemented. Otherwise, direct accesses to GICV_STATUSR are RES0.

In systems where this register is implemented, Arm expects that when a virtual machine is scheduled, the hypervisor ensures that this register is cleared to 0. The hypervisor might check for illegal accesses when the virtual machine is unscheduled.

Attributes

GICV_STATUSR is a 32-bit register.

Field descriptions

Bits [31:4]

Reserved, RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GICV_STATUSR

This is an optional register. If the register is implemented, GICC_STATUSR must also be implemented. If the register is not implemented, the location is RAZ/WI.

This register is used only when System register access is not enabled. If System register access is enabled, this register is not updated. Equivalent function might be provided by appropriate traps and exceptions.

GICV_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC Virtual CPU interface	0x002C	GICV_STATUSR

Accessible as follows:

- When GICD_CTLR.DS == '0', accesses to this register are RW.
- When an access is Secure, accesses to this register are RW.
- When an access is Non-secure, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GITS_BASER<n>, ITS Table Descriptors, n = 0 - 7

The GITS_BASER<n> characteristics are:

Purpose

Specifies the base address and size of the ITS tables.

Configuration

A copy of this register is provided for each ITS table.

Bits [63:32] and bits [31:0] are accessible independently.

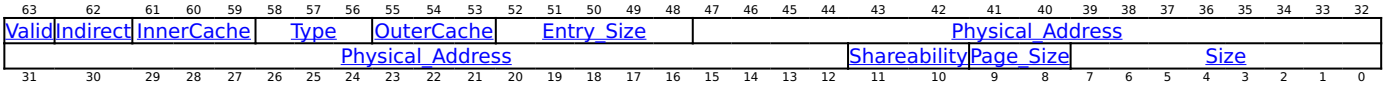
A maximum of 8 GITS_BASER<n> registers can be provided. Unimplemented registers are RES0.

When GITS_CTLR.Enabled == 1 or GITS_CTLR.Quiescent == 0, writing this register is UNPREDICTABLE.

Attributes

GITS_BASER<n> is a 64-bit register.

Field descriptions



Valid, bit [63]

Indicates whether software has allocated memory for the table:

Valid	Meaning
0b0	No memory is allocated for the table. The ITS discards any writes to the interrupt translation page when either: • GITS_BASER<n>.Type specifies any valid table entry type other than interrupt collections, that is, any value other than 0b100. • GITS_BASER<n>.Type specifies an interrupt collection and GITS_TYPER.HCC == 0.
0b1	Memory is allocated to the table.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Indirect, bit [62]

This field indicates whether an implemented register specifies a single, flat table or a two-level table where the first level contains a list of descriptors.

Indirect	Meaning
0b0	Single Level. The Size field indicates the number of pages used by the ITS to store data associated with each table entry.
0b1	Two Level. The Size field indicates the number of pages which contain an array of 64-bit descriptors to pages that are used to store the data associated with each table entry. A little endian memory order model is used.

For more information, see 'The ITS tables' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

This field is RAZ/WI for GIC implementations that only support flat tables. If the maximum width of the scaling factor that is identified by GITS_BASER<n>.Type and the smallest page size that is supported result in a single level table that requires multiple pages, then implementing this bit as RAZ/WI is DEPRECATED.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the table. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Type, bits [58:56]

Read only. Specifies the type of entity that requires entries in the corresponding table. The possible values of the field are:

Type	Meaning
0b000	Unimplemented. This register does not correspond to an ITS table.
0b001	Devices. This register corresponds to an ITS table that scales with the width of the DeviceID. Only a single GITS_BASER<n> register reports this type.
0b010	vPEs. FEAT_GICv4 only. This register corresponds to an ITS table that scales with the number of vPEs in the system. The table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of vPEs in the system. Only a single GITS_BASER<n> register reports this type.
0b100	Interrupt collections. This register corresponds to an ITS table that scales with the number of interrupt collections in the system. The table requires (ENTRY_SIZE * N) bytes of memory, where N is the number of interrupt collections. Not more than one GITS_BASER<n> register will report this type.

Other values are reserved.

For FEAT_GICv4p1, the registers are allocated as follows:

- GITS_BASER0.Type is 0b001 (Device).
- GITS_BASER1.Type is either 0b100 (Collection Table) or 0b000 (Unimplemented).
- GITS_BASER2.Type is either 0b010 (vPE) or 0b000 (Unimplemented).
- GITS_BASER<n>.Type, where 'n' is in the range 3 to 7, is 0b000 (Unimplemented).

For FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, Arm recommends that the GITS_BASER<n> use the same allocations.

Other allocations of Type values are deprecated.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the table. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Entry_Size, bits [52:48]

Read-only. Specifies the number of bytes per table entry, minus one.

Physical_Address, bits [47:12]

Physical Address. When Page_Size is 4KB or 16KB:

- Bits [51:48] of the base physical address are zero.
- This field provides bits[47:12] of the base physical address of the table.
- Bits[11:0] of the base physical address are zero.
- The address must be aligned to the size specified in the Page Size field. Otherwise the effect is CONSTRAINED UNPREDICTABLE, and can be one of the following:
  - Bits[X:12], where X is derived from the page size, are treated as zero.
  - The value of bits[X:12] are used when calculating the address of a table access.

When Page_Size is 64KB:

- Bits[47:16] of the register provide bits[47:16] of the base physical address of the table.
- Bits[15:12] of the register provide bits[51:48] of the base physical address of the table.
- Bits[15:0] of the base physical address are 0.

In implementations that support fewer than 52 bits of physical address, any unimplemented upper bits might be RAZ/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the table. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Page_Size, bits [9:8]

The size of page that the table uses:

Page_Size	Meaning
0b00	4KB.
0b01	16KB.
0b10	64KB.
0b11	Reserved. Treated as 0b10.

Note

If the GIC implementation supports only a single, fixed page size, this field might be RO.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Size, bits [7:0]

The number of pages of physical memory allocated to the table, minus one. GITS_BASER<n>.Page_Size specifies the size of each page.

If GITS_BASER<n>.Type == 0, this field is RAZ/WI.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Accessing GITS_BASER<n>

GITS_BASER<n> can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0100 + (8 * n)	GITS_BASER<n>

Accesses to this register are RW.

GITS_CBASER, ITS Command Queue Descriptor

The GITS_CBASER characteristics are:

Purpose

Specifies the base address and size of the ITS command queue.

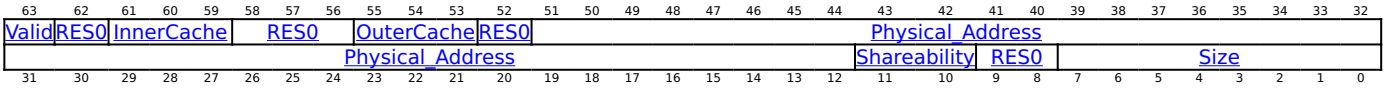
Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CBASER is a 64-bit register.

Field descriptions



Valid, bit [63]

Indicates whether software has allocated memory for the command queue:

Valid	Meaning
0b0	No memory is allocated for the command queue.
0b1	Memory is allocated to the command queue.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Bit [62]

Reserved, RES0.

InnerCache, bits [61:59]

Indicates the Inner Cacheability attributes of accesses to the command queue. The possible values of this field are:

InnerCache	Meaning
0b000	Device-nGnRnE.
0b001	Normal Inner Non-cacheable.
0b010	Normal Inner Cacheable Read-allocate, Write-through.
0b011	Normal Inner Cacheable Read-allocate, Write-back.
0b100	Normal Inner Cacheable Write-allocate, Write-through.
0b101	Normal Inner Cacheable Write-allocate, Write-back.
0b110	Normal Inner Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Inner Cacheable Read-allocate, Write-allocate, Write-back.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [58:56]

Reserved, RES0.

OuterCache, bits [55:53]

Indicates the Outer Cacheability attributes of accesses to the command queue. The possible values of this field are:

OuterCache	Meaning
0b000	Memory type defined in InnerCache field. For Normal memory, Outer Cacheability is the same as Inner Cacheability.
0b001	Normal Outer Non-cacheable.
0b010	Normal Outer Cacheable Read-allocate, Write-through.
0b011	Normal Outer Cacheable Read-allocate, Write-back.
0b100	Normal Outer Cacheable Write-allocate, Write-through.
0b101	Normal Outer Cacheable Write-allocate, Write-back.
0b110	Normal Outer Cacheable Read-allocate, Write-allocate, Write-through.
0b111	Normal Outer Cacheable Read-allocate, Write-allocate, Write-back.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bit [52]

Reserved, RES0.

Physical_Address, bits [51:12]

Bits [51:12] of the base physical address of the command queue. Bits [11:0] of the base address are 0.

In implementations supporting fewer than 52 bits of physical address, unimplemented upper bits are RES0.

If bits [15:12] are not all zeros, behavior is a CONSTRAINED UNPREDICTABLE choice:

- Bits [15:12] are treated as if all the bits are zero. The value read back from those bits is either the value written or zero.
- The result of the calculation of an address for a command queue read can be corrupted.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Shareability, bits [11:10]

Indicates the Shareability attributes of accesses to the command queue. The possible values of this field are:

Shareability	Meaning
0b00	Non-shareable.
0b01	Inner Shareable.
0b10	Outer Shareable.
0b11	Reserved. Treated as 0b00.

It is IMPLEMENTATION DEFINED whether this field has a fixed value or can be programmed by software. Implementing this field with a fixed value is deprecated.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [9:8]

Reserved, RES0.

Size, bits [7:0]

The number of 4KB pages of physical memory allocated to the command queue, minus one.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Additional information

The command queue is a circular buffer and wraps at Physical Address [47:0] + (4096 * (Size + 1)).

Note

When this register is successfully written, the value of GITS_CREADR is set to zero.

Accessing GITS_CBASER

When GITS_CTLR.Enabled == 1 or GITS_CTLR.Quiescent == 0, writing this register is UNPREDICTABLE.

GITS_CBASER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0080	GITS_CBASER

Accesses to this register are RW.

GITS_CREADR, ITS Read Register

The GITS_CREADR characteristics are:

Purpose

Specifies the offset from GITS_CBASER where the ITS reads the next ITS command.

Configuration

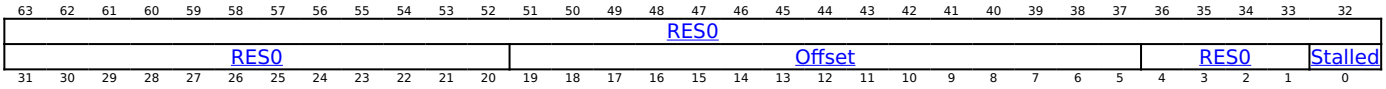
This register is cleared to 0 when a value is written to GITS_CBASER.

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CREADR is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from GITS_CBASER. Bits [4:0] of the offset are zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [4:1]

Reserved, RES0.

Stalled, bit [0]

Reports whether the processing of commands is stalled because of a command error.

Stalled	Meaning
0b0	ITS command queue is not stalled because of a command error.
0b1	ITS command queue is stalled because of a command error.

Additional information

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Accessing GITS_CREADR

GITS_CREADR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0090	GITS_CREADR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GITS_CTLR, ITS Control Register

The GITS_CTLR characteristics are:

Purpose

Controls the operation of an ITS.

Configuration

The ITS_Number (bits [7:4]) and bit [1] fields apply only in FEAT_GICv4 implementations, and are RES0 in FEAT_GICv3 implementations.

Attributes

GITS_CTLR is a 32-bit register.

Field descriptions

Quiescent, bit [31]

Read-only. Indicates completion of all ITS operations when GITS_CTLR.Enabled == 0.

Quiescent	Meaning
0b0	The ITS is not quiescent and cannot be powered down.
0b1	The ITS is quiescent and can be powered down.

For the ITS to be considered inactive, there must be no transactions in progress. In addition, all operations required to ensure that mapping data is consistent with external memory must be complete.

Note

In distributed GIC implementations, this bit is set to 1 only after the ITS forwards any operations that have not yet been completed to the Redistributors and receives confirmation that all such operations have reached the appropriate Redistributor.

In FEAT_GICv3, FEAT_GICv3p1, and FEAT_GICv4, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent is UNKNOWN.

In FEAT_GICv4p1, when GITS_CTLR.Enabled == 1, the value of GITS_CTLR.Quiescent reads as 1 until the write to Enabled has taken effect and then reads as 0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '1'.

Bits [30:9]

Reserved, RES0.

UMSIirq, bit [8]

Unmapped MSI reporting interrupt enable.

UMSIirq	Meaning
0b0	The ITS does not assert an interrupt signal when GITS_STATUSR.UMSI is 1.
0b1	The ITS asserts an interrupt signal when GITS_STATUSR.UMSI is 1.

If GITS_TYPER.UMSIirq is 0, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

ITS_Number, bits [7:4]

In FEAT_GICv3 implementations this field is RES0.

In FEAT_GICv4 implementations with more than one ITS instance, this field indicates the ITS number for use with 'VMOVP GICv4.0' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

When GITS_TYPER.VMOVP is 1, this field may be implemented as RES0.

If this field is programmable, changing this field when GITS_CTLR.Quiescent == 0 or GITS_CTLR.Enabled == 1 is UNPREDICTABLE.

It is IMPLEMENTATION DEFINED whether this field is programmable or RO.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

ImDe, bit [1]

In GICv3 implementations, this bit is RES0.

In GICv4 implementations, this bit is IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Enabled, bit [0]

Controls whether the ITS is enabled:

Enabled	Meaning
0b0	The ITS is not enabled. Writes to GITS_TRANSLATER are ignored and no further command queue entries are processed.
0b1	The ITS is enabled. Writes to GITS_TRANSLATER result in interrupt translations and the command queue is processed.

If a write to this register changes this field from 1 to 0, the ITS must ensure that both:

- Any caches containing mapping data are made consistent with external memory.
- GITS_CTLR.Quiescent == 0 until all caches are consistent with external memory.

Changing GITS_CTLR.Enabled from 0 to 1 when GITS_CTLR.Quiescent is 0 results in UNPREDICTABLE behavior.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0'.

Accessing GITS_CTLR

GITS_CTLR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0000	GITS_CTLR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GITS_CWRITER, ITS Write Register

The GITS_CWRITER characteristics are:

Purpose

Specifies the offset from GITS_CBASER where software writes the next ITS command.

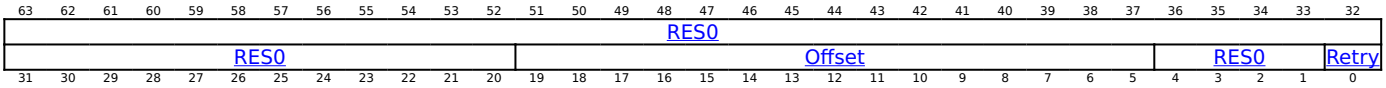
Configuration

Bits [63:32] and bits [31:0] are accessible separately.

Attributes

GITS_CWRITER is a 64-bit register.

Field descriptions



Bits [63:20]

Reserved, RES0.

Offset, bits [19:5]

Bits [19:5] of the offset from GITS_CBASER. Bits [4:0] of the offset are zero.

The reset behavior of this field is:

- On a GIC reset, this field resets to an architecturally UNKNOWN value.

Bits [4:1]

Reserved, RES0.

Retry, bit [0]

Writing this bit has the following effects:

Retry	Meaning
0b0	No effect on the processing commands by the ITS.
0b1	Restarts the processing of commands by the ITS if it stalled because of a command error. Note If the processing of commands is not stalled because of a command error, writing 1 to this bit has no effect.

When read, this bit is RES0.

Additional information

For more information, see 'The ITS command interface' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

If GITS_CWRITER is written with a value outside of the valid range specified by GITS_CBASER.Physical_Address and GITS_CBASER.Size, behavior is a CONSTRAINED UNPREDICTABLE choice, as follows:

- The command queue is considered invalid, and no further commands are processed until GITS_CWRITER is written with a value that is in the valid range.
- The value is treated as a valid UNKNOWN value.

An implementation might choose to report a system error in an IMPLEMENTATION DEFINED manner.

Accessing GITS_CWRITER

GITS_CWRITER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0088	GITS_CWRITER

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GITS_IIDR, ITS Identification Register

The GITS_IIDR characteristics are:

Purpose

Provides information about the implementer and revision of the ITS.

Configuration

This register is available in all configurations of the GIC. If the GIC implementation supports two Security states, this register is Common.

Attributes

GITS_IIDR is a 32-bit register.

Field descriptions

ProductID, bits [31:24]

Product Identifier.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

Variant, bits [19:16]

Variant number. Typically, this field is used to distinguish product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Revision number. Typically, this field is used to distinguish minor revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the ITS.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

Zero is not a valid JEP106 identification code, meaning a value of zero for GITS_IIDR indicates this register is not implemented.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GITS_IIDR

GITS_IIDR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GITS_MPAMIDR, Report maximum PARTID and PMG Register

The GITS_MPAMIDR characteristics are:

Purpose

Reports the maximum support PARTID and PMG values.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GITS_MPAMIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

Attributes

GITS_MPAMIDR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

PMGmax, bits [23:16]

Maximum PMG value supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PARTIDmax, bits [15:0]

Maximum PARTID value supported.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing GITS_MPAMIDR

GITS_MPAMIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0010

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GITS_MPIDR, Report ITS's affinity.

The GITS_MPIDR characteristics are:

Purpose

Reports ITS's affinity when the vPE Table is shared with Redistributors.

Configuration

This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GITS_MPIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.SVPET==0, this register is RES0.

Attributes

GITS_MPIDR is a 32-bit register.

Field descriptions

Aff3, bits [31:24]

The Affinity level 3 value for the ITS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff2, bits [23:16]

The Affinity level 2 value for the ITS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

The Affinity level 1 value for the ITS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [7:0]

Reserved, RES0.

Accessing GITS_MPIDR

GITS_MPIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0018

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GITS_PARTIDR, Set PARTID and PMG Register

The GITS_PARTIDR characteristics are:

Purpose

Sets the PARTID and PMG values used for memory accesses by the ITS.

Configuration

This register is present only when GICv3.1 is implemented. Otherwise, direct accesses to GITS_PARTIDR are RES0.

A copy of this register is provided for each ITS.

When GITS_TYPER.MPAM==0, this register is RES0.

Attributes

GITS_PARTIDR is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

PMG, bits [23:16]

PMG value used when ITS accesses memory.

Bits not needed to represent PMG values in the range 0 to PMG_MAX are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '00000000'.

PARTID, bits [15:0]

PARTID value used when ITS accesses memory.

Bits not needed to represent PARTID values in the range 0 to PARTID_MAX are RES0.

The reset behavior of this field is:

- On a GIC reset, this field resets to '0000000000000000'.

Accessing GITS_PARTIDR

GITS_PARTIDR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x0014

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GITS_SGIR, ITS SGI Register

The GITS_SGIR characteristics are:

Purpose

Written by software to signal a virtual SGI for translation by the ITS.

Configuration

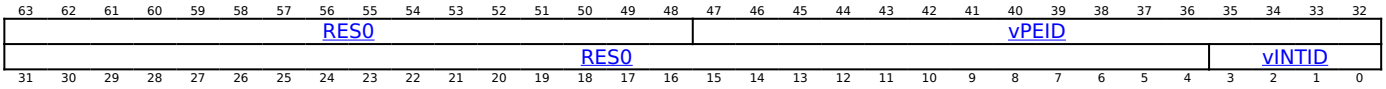
This register is present only when GICv4.1 is implemented. Otherwise, direct accesses to GITS_SGIR are RES0.

This register is provided only in FEAT_GICv4p1 implementations.

Attributes

GITS_SGIR is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

vPEID, bits [47:32]

ID of target vPEID.

The size of this field is IMPLEMENTATION DEFINED, and is specified by the GICD_TYPER2.VIL and GICD_TYPER2.VID fields. Unimplemented bits are RES0.

Bits [31:4]

Reserved, RES0.

vINTID, bits [3:0]

INTID of virtual SGI.

Accessing GITS_SGIR

64-bit access only.

GITS_SGIR can be accessed through the memory-mapped interfaces:

Component	Offset
GIC ITS control	0x20020

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GITS_STATUSR, ITS Error Reporting Status Register

The GITS_STATUSR characteristics are:

Purpose

Provides software with a mechanism to detect:

- Accesses to reserved locations.
- Writes to read-only locations.
- Reads of write-only locations.
- Unmapped MSIs.

Configuration

There are no configuration notes.

Attributes

GITS_STATUSR is a 32-bit register.

Field descriptions

Bits [31:10]

Reserved, RES0.

Syndrome, bits [9:6]

Syndrome for the MSI that set GITS_STATUSR.UMSI to 1.

Syndrome	Meaning
0b0000	Unknown reason.
0b0010	DeviceID out of range.
0b0011	DeviceID unmapped.
0b0100	EventID out of range.
0b0101	EventID unmapped.
0b0111	Collection unmapped.
0b1001	vPEID unmapped.

An implementation might not support reporting all syndromes, and might report 0b0000 for any cause.

This field is UNKNOWN when GITS_STATUSR.UMSI is 0.

Overflow, bit [5]

Reports whether an unmapped MSI has been received while GITS_STATUSR.UMSI is 1.

Overflow	Meaning
0b0	No unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.
0b1	At least one unmapped MSIs have been received since GITS_STATUSR.UMSI set to 1.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If GITS_TYPER.UMSI is 0, this field is RES0.

UMSI, bit [4]

Reports whether an unmapped MSI has been received

An unmapped MSI is defined as an MSI arriving at GITS_TRANSLATER for which there is insufficient mapping information for it to be forwarded to a Redistributor.

It is IMPLEMENTATION DEFINED whether an INT command can be reported as an unmapped MSI.

UMSI	Meaning
0b0	No unmapped MSIs have been received.
0b1	Unmapped MSI received.

A software write of 1 to the bit clears it. A write of any other value is ignored.

If GITS_TYPER.UMSI is 0, this field is RES0.

WROD, bit [3]

Write to an RO location.

WROD	Meaning
0b0	Normal operation.
0b1	A write to an RO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RWOD, bit [2]

Read of a WO location.

RWOD	Meaning
0b0	Normal operation.
0b1	A read of a WO location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

WRD, bit [1]

Write to a reserved location.

WRD	Meaning
0b0	Normal operation.
0b1	A write to a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

RRD, bit [0]

Read of a reserved location.

RRD	Meaning
0b0	Normal operation.
0b1	A read of a reserved location has been detected.

When a violation is detected, software must write 1 to this register to reset it.

Accessing GITS_STATUSR

This is an optional register. If the register is not implemented, the location is RAZ/WI.

GITS_STATUSR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0040	GITS_STATUSR

Accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

GITS_TRANSLATER, ITS Translation Register

The GITS_TRANSLATER characteristics are:

Purpose

Written by a requesting Device to signal an interrupt for translation by the ITS.

Configuration

This register is at the same offset as GICD_SETSPI_NSR in the Distributor, and is at the same offset as GICR_SETLPIR in the Redistributor.

Attributes

GITS_TRANSLATER is a 32-bit register.

Field descriptions

EventID, bits [31:0]

An identifier corresponding to the interrupt to be translated.

Note

The size of the EventID is DeviceID specific, and set when the DeviceID is mapped to an ITT (using MAPD).

The number of EventID bits implemented is reported by GITS_TYPER.ID_bits. If a write specifies nonzero identifiers bits outside this range behavior is a CONSTRAINED UNPREDICTABLE choice between:

- Nonzero identifier bits outside the supported range are ignored.
- The write is ignored.

Additional information

The DeviceID presented to an ITS is used to index a device table. The device table maps the DeviceID to an interrupt translation table for that device.

Accessing GITS_TRANSLATER

16-bit access to bits [15:0] of this register must be supported. When this register is written by a 16-bit transaction, bits [31:16] are written as zero.

Implementations must ensure that:

- A unique DeviceID is provided for each requesting device, and the DeviceID is presented to the ITS when a write to this register occurs in a manner that cannot be spoofed by any agent capable of performing writes.
- The DeviceID presented corresponds to the DeviceID field in the ITS commands.

Writes to this register are ignored if any of the following are true:

- GITS_CTLR.Enabled == 0.
- The presented DeviceID is not mapped to an Interrupt Translation Table.
- The DeviceID is larger than the supported size.
- The DeviceID is mapped to an Interrupt Translation Table, but the EventID is outside the range specified by MAPD.
- The EventID is mapped to an Interrupt Translation Table and the EventID is within the range specified by MAPD, but the EventID is unmapped.

Translation requests that result from writes to this register are subject to certain ordering rules. For more information, see 'Ordering of translations with the output to ITS commands' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

GITS_TRANSLATER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS translation	0x0040	GITS_TRANSLATER

Accesses to this register are WO.

2025-12-10 16:11:30, 2025-12_rel

GITS_TYPER, ITS Type Register

The GITS_TYPER characteristics are:

Purpose

Specifies the features that an ITS supports.

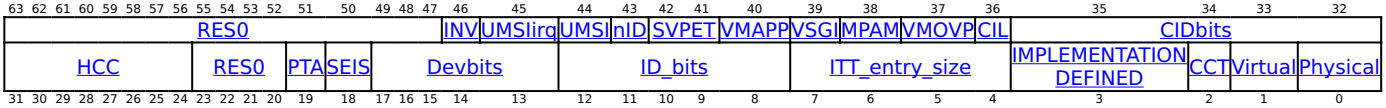
Configuration

There are no configuration notes.

Attributes

GITS_TYPER is a 64-bit register.

Field descriptions



Bits [63:47]

Reserved, RES0.

INV, bit [46]

ITS cache invalidation behavior on disable.

The value of this field is an IMPLEMENTATION DEFINED choice of:

INV	Meaning
0b0	It is IMPLEMENTATION DEFINED whether ITS caches are invalidated on clearing GITS_CTLR.Enabled and GITS_BASER<n>.Valid.
0b1	ITS caches are invalidated on clearing GITS_CTLR.Enabled and GITS_BASER<n>.Valid.

If GITS_TYPER.INV is 1, after the following sequence:

- GITS_CTLR.Enabled written to 0.
- A read of GITS_CTLR.Quiescent returns 1.
- GITS_BASER<n>.Valid written to 0.

There is no cached information from the ITS memory structure pointed to by GITS_BASER<n>.

Access to this field is RO.

UMSIirq, bit [45]

Indicates support for generating an interrupt on receiving unmapped MSI.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UMSIirq	Meaning
0b0	Interrupt on unmapped MSI not supported.
0b1	Interrupt on unmapped MSI is supported.

If GITS_TYPER.UMSI is 0, this field is RES0.

Access to this field is RO.

UMSI, bit [44]

Indicates support for reporting receipt of unmapped MSIs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

UMSI	Meaning
0b0	Reporting of unmapped MSIs is not supported.
0b1	Reporting of unmapped MSIs is supported.

Access to this field is RO.

nID, bit [43]
When GICv4.1 is implemented:

nID

The value of this field is an IMPLEMENTATION DEFINED choice of:

nID	Meaning
0b0	Individual doorbell interrupt supported.
0b1	Individual doorbell interrupt not supported.

Access to this field is RO.

Otherwise:

Reserved, RES0.

SVPET, bits [42:41]
When GICv4.1 is implemented:

SVPET

The value of this field is an IMPLEMENTATION DEFINED choice of:

SVPET	Meaning
0b00	vPE Table is not shared with Redistributors.
0b01	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR.Aff3.
0b10	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3 and Aff2.
0b11	vPE Table is shared with the groups of Redistributors indicated by GITS_MPIDR fields Aff3, Aff2 and Aff1.

Access to this field is RO.

Otherwise:

Reserved, RES0.

VMAPP, bit [40]
When GICv4.1 is implemented:

VMAPP

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMAPP	Meaning
0b0	FEAT_GICv4 VMAPP command layout.
0b1	FEAT_GICv4p1 VMAPP command layout.

Access to this field is RO.

Otherwise:

Reserved, RES0.

VSGI, bit [39]
When GICv4.1 is implemented:

VSGI

The value of this field is an IMPLEMENTATION DEFINED choice of:

VSGI	Meaning
0b0	Direct injection of SGIs is not supported.
0b1	Direct injection of SGIs is supported.

Access to this field is RO.

Otherwise:

Reserved, RES0.

MPAM, bit [38]
When GICv3.1 is implemented:

MPAM

The value of this field is an IMPLEMENTATION DEFINED choice of:

MPAM	Meaning
0b0	MPAM is not supported.
0b1	MPAM is supported.

Access to this field is RO.

Otherwise:

Reserved, RES0.

VMOVP, bit [37]
When GICv4 is implemented:

Indicates the form of the VMOVP command.

The value of this field is an IMPLEMENTATION DEFINED choice of:

VMOVP	Meaning
0b0	When moving a vPE, software must issue a VMOVP on all ITSs that have mappings for that vPE. The ITSList and Sequence Number fields in the VMOVP command must ensure synchronization, otherwise behavior is UNPREDICTABLE.
0b1	When moving a vPE, software must only issue a VMOVP on one of the ITSs that has a mapping for that vPE. The ITSList and Sequence Number fields in the VMOVP command are RES0.

Access to this field is RO.

Otherwise:

Reserved, RES0.

CIL, bit [36]

Collection ID Limit.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CIL	Meaning
0b0	ITS supports 16-bit Collection ID, GITS_TYPER.CIDbits is RES0.
0b1	GITS_TYPER.CIDbits indicates supported Collection ID size

In implementations that do not support Collections in external memory, this bit is RES0 and the number of Collections supported is reported by GITS_TYPER.HCC.

Access to this field is RO.

CIDbits, bits [35:32]

Number of Collection ID bits.

- The number of bits of Collection ID minus one.
- When GITS_TYPER.CIL == 0, this field is RES0.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

HCC, bits [31:24]

Hardware Collection Count. The number of interrupt collections supported by the ITS without provisioning of external memory.

Note

Collections held in hardware are unmapped at reset.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [23:20]

Reserved, RES0.

PTA, bit [19]

Physical Target Addresses. Indicates the format of the target address:

The value of this field is an IMPLEMENTATION DEFINED choice of:

PTA	Meaning
0b0	The target address corresponds to the PE number specified by GICR_TYPER.Processor_Number.
0b1	The target address corresponds to the base physical address of the required Redistributor.

For more information, see 'RDbase' in ARM® Generic Interrupt Controller Architecture Specification, GIC architecture version 3.0 and version 4.0 (ARM IHI 0069).

Access to this field is RO.

SEIS, bit [18]

SEI support. Indicates whether the ITS supports generation of SEIs:

The value of this field is an IMPLEMENTATION DEFINED choice of:

SEIS	Meaning
0b0	The ITS does not support local generation of SEIs.
0b1	The ITS supports local generation of SEIs.

Access to this field is RO.

Devbits, bits [17:13]

The number of DeviceID bits implemented, minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ID_bits, bits [12:8]

The number of EventID bits implemented, minus one.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ITT_entry_size, bits [7:4]

Read-only. Indicates the number of bytes per translation table entry, minus one.

For more information about the ITS command 'MAPD', see MAPD.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

IMPLEMENTATION DEFINED, bit [3]

IMPLEMENTATION DEFINED.

CCT, bit [2]

Cumulative Collection Tables.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CCT	Meaning
0b0	The total number of supported collections is determined by the number of collections held in memory only.
0b1	The total number of supported collections is determined by number of collections that are held in memory and the number indicated by GITS_TYPER.HCC.

If GITS_TYPER.HCC == 0, or if memory backed collections are not supported (all GITS_BASER<n>.Type != 100), this bit is RES0.

Access to this field is RO.

Virtual, bit [1]
When GICv4 is implemented:

Indicates whether the ITS supports virtual LPIs and direct injection of virtual LPIs:

The value of this field is an IMPLEMENTATION DEFINED choice of:

Virtual	Meaning
0b0	The ITS does not support virtual LPIs or direct injection of virtual LPIs.
0b1	The ITS supports virtual LPIs and direct injection of virtual LPIs.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Physical, bit [0]

Indicates whether the ITS supports physical LPIs:

The value of this field is an IMPLEMENTATION DEFINED choice of:

Physical	Meaning
0b0	The ITS does not support physical LPIs.
0b1	The ITS supports physical LPIs.

This field is RES1, indicating that the ITS supports physical LPIs.

Access to this field is RO.

Accessing GITS_TYPER

GITS_TYPER can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0008	GITS_TYPER

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

GITS_UMSIR, ITS Unmapped MSI register

The GITS_UMSIR characteristics are:

Purpose

Provides the DeviceID and EventID of the unmapped MSI that set GITS_STATUSR.UMSI.

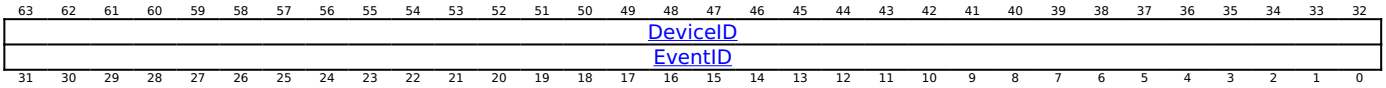
Configuration

This register is present only when GITS_TYPER.UMSI == '1'. Otherwise, direct accesses to GITS_UMSIR are RES0.

Attributes

GITS_UMSIR is a 64-bit register.

Field descriptions



DeviceID, bits [63:32]

DeviceID of MSI that set GITS_STATUSR.UMSI to 1.

If GITS_STATUSR.UMSI is 0, this field is UNKNOWN.

EventID, bits [31:0]

EventID of MSI that set GITS_STATUSR.UMSI to 1.

If GITS_STATUSR.UMSI is 0, this field is UNKNOWN.

Accessing GITS_UMSIR

GITS_UMSIR can be accessed through the memory-mapped interfaces:

Component	Offset	Instance
GIC ITS control	0x0048	GITS_UMSIR

Accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the PE, including an implementer code for the device and a device ID number.

Configuration

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch64 System register MIDR_EL1[31:0].

External register MIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MIDR[31:0].

The power domain of MIDR_EL1 is IMPLEMENTATION DEFINED.

Attributes

MIDR_EL1 is a 32-bit register.

Field descriptions

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

Access to this field is RO.

Variant, bits [23:20]

Variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Architecture, bits [19:16]

Architecture version.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Architecture	Meaning
0b0001	Armv4.
0b0010	Armv4T.
0b0011	Armv5 (obsolete).
0b0100	Armv5T.
0b0101	Armv5TE.
0b0110	Armv5TEJ.
0b0111	Armv6.
0b1111	Architectural features are individually identified in the ID_* registers.

All other values are reserved.

Access to this field is RO.

PartNum, bits [15:4]

Primary Part Number for the device.

On processors implemented by Arm, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [3:0]

Revision number for the device.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MIDR_EL1

MIDR_EL1 can be accessed through the external debug interface:

Component	Offset	Instance
Debug	0xD00	MIDR_EL1

Accessible as follows:

- When DoubleLockStatus() or !IsCorePowered(), accesses to this register are IMPDEF.

• Otherwise, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_CASSOC, MPAM Cache Maximum Associativity Partition Configuration Register

The MPAMCFG_CASSOC characteristics are:

Purpose

The MPAMCFG_CASSOC is a 32-bit read/write register that controls the maximum fraction of the cache associativity that the PARTID selected by MPAMCFG_PART_SEL is permitted to allocate.

MPAMCFG_CASSOC_s controls the cache maximum associativity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CASSOC_ns controls the cache maximum associativity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_CASSOC_rl controls the cache maximum associativity for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL. MPAMCFG_CASSOC_rt controls the cache maximum associativity for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CASSOC is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CCAP_PART == '1', (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented), and MPAMF_CCAP_IDR.HAS_CASSOC == '1'. Otherwise, direct accesses to MPAMCFG_CASSOC are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CASSOC is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

CASSOC, bits [15:0]

Maximum cache associativity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the cache associativity that the PARTID is permitted to allocate. CASSOC controls the fraction of associativity in each associativity grouping of the cache. In a set associative cache, CASSOC applies to the fraction of the ways in each set.

The implemented width of the fixed-point fraction is given in MPAMF_CCAP_IDR.CASSOC_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CASSOC field are always the most significant bits of the field.

The fixed-point fraction CASSOC is less than 1. The implied binary point is between bits 15 and 16. In an implementation with w implemented bits, the largest fraction of the cache that can be represented is $1- (0.5)^{W}$.

Accessing MPAMCFG_CASSOC

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_CASSOC_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_CASSOC_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CASSOC_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_CASSOC_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_CASSOC_s, MPAMCFG_CASSOC_ns, MPAMCFG_CASSOC_rt, and MPAMCFG_CASSOC_rl must be separate registers:
- The Secure instance (MPAMCFG_CASSOC_s) accesses the cache maximum associativity partitioning used for Secure PARTIDs.

- The Non-secure instance (MPAMCFG_CASSOC_ns) accesses the cache maximum associativity partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CASSOC_rt) accesses the cache maximum associativity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CASSOC_rl) accesses the cache maximum associativity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CASSOC access the cache maximum associativity partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CASSOC can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0118

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0118	MPAMCFG_CASSOC_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0118	MPAMCFG_CASSOC_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0118	MPAMCFG_CASSOC_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0118	MPAMCFG_CASSOC_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_CMAX, MPAM Cache Maximum Capacity Partition Configuration Register

The MPAMCFG_CMAX characteristics are:

Purpose

The MPAMCFG_CMAX is a 32-bit read/write register that controls the maximum fraction of the cache capacity that the PARTID selected by MPAMCFG_PART_SEL is permitted to allocate.

MPAMCFG_CMAX_s controls the cache maximum capacity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMAX_ns controls the cache maximum capacity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMAX_rt controls the cache maximum capacity for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. MPAMCFG_CMAX_rl controls the cache maximum capacity for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CMAX is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_CCAP_PART == '1', and MPAMF_CCAP_IDR.NO_CMAX == '0'. Otherwise, direct accesses to MPAMCFG_CMAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CMAX is a 32-bit register.

Field descriptions

SOFTLIM, bit [31]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CCAP_IDR.HAS_CMAX_SOFTLIM == '1':

Soft limiting of CMAX. Soft limiting allows some allocations by a PARTID when its cache use is above the CMAX maximum cache capacity.

SOFTLIM	Meaning
0b0	When CMAX cache capacity is exceeded, the partition is not allowed to increase its cache capacity usage. It is only permitted to replace a line that was previously occupied by a line allocated by that PARTID.
0b1	When CMAX cache capacity is exceeded, the partition is permitted to allocate capacity beyond CMAX, but only from invalid lines or lines belonging to disabled PARTIDs.

Otherwise:

Reserved, RES0.

Bits [30:16]

Reserved, RES0.

CMAX, bits [15:0]

Maximum cache capacity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the total cache capacity that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_CCAP_IDR.CMAX_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMAX field are always the most significant bits of the field.

The fixed-point fraction CMAX is less than 1. The implied binary point is between bits 15 and 16. In an implementation with w implemented bits, the largest fraction of the cache that can be represented is 1- $(0.5)^{w}$.

Accessing MPAMCFG_CMAX

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_CMAX_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_CMAX_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CMAX_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_CMAX_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_CMAX_s, MPAMCFG_CMAX_ns, MPAMCFG_CMAX_rt, and MPAMCFG_CMAX_rl must be separate registers:
- The Secure instance (MPAMCFG_CMAX_s) accesses the cache capacity partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CMAX_ns) accesses the cache capacity partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CMAX_rt) accesses the cache capacity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CMAX_rl) accesses the cache capacity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMAX access the cache maximum capacity partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CMAX can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0108

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0108	MPAMCFG_CMAX_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0108	MPAMCFG_CMAX_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0108	MPAMCFG_CMAX_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0108	MPAMCFG_CMAX_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_CMIN, MPAM Cache Minimum Capacity Partition Configuration Register

The MPAMCFG_CMIN characteristics are:

Purpose

The MPAMCFG_CMIN is a 32-bit read/write register that controls the fraction of the cache capacity that the PARTID selected by MPAMCFG_PART_SEL has priority to allocate.

MPAMCFG_CMIN_s controls the cache minimum capacity for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMIN_ns controls the cache minimum capacity for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_CMIN_rl controls the cache minimum capacity for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL. MPAMCFG_CMIN_rt controls the cache minimum capacity for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CMIN is IMPLEMENTATION DEFINED.

This register is present only when MPAMF_IDR.HAS_CCAP_PART == '1', (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented), and MPAMF_CCAP_IDR.HAS_CMIN == '1'. Otherwise, direct accesses to MPAMCFG_CMIN are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CMIN is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

CMIN, bits [15:0]

Minimum cache capacity usage in fixed-point fraction format by the partition selected by MPAMCFG_PART_SEL. The fraction represents the portion of the total cache capacity that the PARTID has priority to allocate.

The implemented width of the fixed-point fraction is the same as the width of MPAMCFG_CMAX.CMAX which is given in MPAMF_CCAP_IDR.CMAX_WD. Unimplemented bits within the field are RAZ/WI. The implemented bits of the CMIN field are always the most significant bits of the field.

The fixed-point fraction CMIN is less than 1. The implied binary point is between bits 15 and 16. In an implementation with w implemented bits, the largest fraction of the cache that can be represented is $1- (0.5)^{w}$.

Accessing MPAMCFG_CMIN

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_CMIN_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_CMIN_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_CMIN_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_CMIN_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_CMIN_s, MPAMCFG_CMIN_ns, MPAMCFG_CMIN_rt, and MPAMCFG_CMIN_rl must be separate registers:
- The Secure instance (MPAMCFG_CMIN_s) accesses the cache minimum capacity partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CMIN_ns) accesses the cache minimum capacity partitioning used for Non-secure PARTIDs.

- The Root instance (MPAMCFG_CMIN_rt) accesses the cache minimum capacity partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_CMIN_rl) accesses the cache minimum capacity partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CMIN access the cache minimum capacity partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CMIN can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0110

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0110	MPAMCFG_CMIN_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0110	MPAMCFG_CMIN_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0110	MPAMCFG_CMIN_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0110	MPAMCFG_CMIN_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_CPBM<n>, MPAM Cache Portion Bitmap Partition Configuration Register, n = 0 - 1023

The MPAMCFG_CPBM<n> characteristics are:

Purpose

The MPAMCFG_CPBM<n> register array gives access to the cache portion bitmap. Each register in the array is a read/write register that configures the cache portions numbered from <n * 32> to <31 + (n * 32)> that a PARTID is allowed to allocate.

After setting MPAMCFG_PART_SEL with a PARTID, software writes to the MPAMCFG_CPBM<n> register to configure which cache portions the PARTID is allowed to allocate.

The MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has n equal to p[15:5]. The field, P<x>, of that MPAMCFG_CPBM<n> register that contains the bitmap bit corresponding to cache portion p has x equal to p[4:0].

MPAMCFG_CPBM<n>_s controls cache portions for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_CPBM<n>_ns controls the cache portions for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_CPBM<n>_rt controls cache portions for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. MPAMCFG_CPBM<n>_rl controls the cache portions for the Realm PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_CPBM<n> is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_CPOR_PART == '1'. Otherwise, direct accesses to MPAMCFG_CPBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_CPBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Portion allocation control bit. Each cache portion allocation control bit, MPAMCFG_CPBM<n>.P<x>, grants permission to the PARTID selected by MPAMCFG_PART_SEL to allocate cache lines within cache portion <n*32> + x.

P<x>	Meaning
0b0	The PARTID is not permitted to allocate into cache portion <n * 32> + x.
0b1	The PARTID is permitted to allocate within cache portion <n * 32> + x.

The number of bits in the cache portion partitioning bit map of this component is given in MPAMF_CPOR_IDR.CPBM_WD. MPAMF_CPOR_IDR.CPBM_WD contains a value from 1 to 2^{15}, inclusive. Values of MPAMF_CPOR_IDR.CPBM_WD greater than 32 require an array of 32-bit MPAMCFG_CPBM<n> registers to access the cache portion bitmap, up to 1024 registers.

When (n * 32) + x > UInt(MPAMF_CPOR_IDR().CPBM_WD), access to this field is RES0 .

Accessing MPAMCFG_CPBM<n>

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_CPBM<n>_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_CPBM<n>_ns must only be accessible from the Non-secure MPAM feature page.

- MPAMCFG_CPBM<n>_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_CPBM<n>_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_CPBM<n>_s, MPAMCFG_CPBM<n>_ns, MPAMCFG_CPBM<n>_rt, and MPAMCFG_CPBM<n>_rl must be separate registers:
- The Secure instance (MPAMCFG_CPBM<n>_s) accesses the cache portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_CPBM<n>_ns) accesses the cache portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_CPBM<n>_rt) accesses the cache portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_CPBM<n>_rl) accesses the cache portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the cache resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_CPBM<n> access the cache portion bitmap configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_CPBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x1000 + (4 * n)	MPAMCFG_CPBM<n>_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_DIS, MPAM Partition Configuration Disable Register

The MPAMCFG_DIS characteristics are:

Purpose

Disables a PARTID configuration as set in other MPAMCFG registers.

MPAMCFG_DIS_s disables a Secure PARTID. MPAMCFG_DIS_ns disables a Non-secure PARTID. MPAMCFG_DIS_rl disables a Realm PARTID. MPAMCFG_DIS_rt disables a Root PARTID.

Configuration

The power domain of MPAMCFG_DIS is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ENDIS == '1'. Otherwise, direct accesses to MPAMCFG_DIS are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_DIS is a 32-bit register.

Field descriptions

NFU, bit [31]
When MPAMF_IDR.HAS_NFU == '1':

No Future Use. Software indicates that the PARTID disabled with NFU of 1 will not be used again and will be reconfigured and reenabled before being used again.

NFU	Meaning
0b0	Control settings of the disabled PARTID must be retained.
0b1	Control settings of the disabled PARTID may take an UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [30:16]

Reserved, RES0.

PARTID, bits [15:0]

Selects the PARTID to disable.

Accessing MPAMCFG_DIS

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_DIS_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_DIS_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_DIS_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_DIS_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_DIS_s, MPAMCFG_DIS_ns, MPAMCFG_DIS_rt, and MPAMCFG_DIS_rl must be separate registers:
- The Secure instance (MPAMCFG_DIS_s) accesses the PARTID disable used for Secure PARTIDs.

- The Non-secure instance (MPAMCFG_DIS_ns) accesses the PARTID disable used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_DIS_rt) accesses the PARTID disable used for Root PARTIDs.
- The Realm instance (MPAMCFG_DIS_rl) accesses the PARTID disable used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the PARTID disable resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_DIS access the PARTID disable configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_DIS can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0310

When FEAT_MPAMv2_MSC is implemented, accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0310	MPAMCFG_DIS_s

Accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0310	MPAMCFG_DIS_ns

Accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0310	MPAMCFG_DIS_rt

When FEAT_RME is implemented, accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0310	MPAMCFG_DIS_rl

When FEAT_RME is implemented, accesses to this register are WO/RAZ.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_EN, MPAM Partition Configuration Enable Register

The MPAMCFG_EN characteristics are:

Purpose

Enables a PARTID configuration as set in other MPAMCFG registers.

MPAMCFG_EN_s enables a Secure PARTID. MPAMCFG_EN_ns enables a Non-secure PARTID. MPAMCFG_EN_rl enables a Realm PARTID. MPAMCFG_EN_rt enables a Root PARTID.

Configuration

The power domain of MPAMCFG_EN is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ENDIS == '1'. Otherwise, direct accesses to MPAMCFG_EN are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_EN is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

PARTID, bits [15:0]

Selects the PARTID to enable.

Accessing MPAMCFG_EN

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_EN_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_EN_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_EN_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_EN_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_EN_s, MPAMCFG_EN_ns, MPAMCFG_EN_rt, and MPAMCFG_EN_rl must be separate registers:
- The Secure instance (MPAMCFG_EN_s) accesses the PARTID enable used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_EN_ns) accesses the PARTID enable used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_EN_rt) accesses the PARTID enable used for Root PARTIDs.
- The Realm instance (MPAMCFG_EN_rl) accesses the PARTID enable used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the PARTID enable resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_EN access the PARTID enable configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_EN can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0300

When FEAT_MPAMv2_MSC is implemented, accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0300	MPAMCFG_EN_s

Accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0300	MPAMCFG_EN_ns

Accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0300	MPAMCFG_EN_rt

When FEAT_RME is implemented, accesses to this register are WO/RAZ.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0300	MPAMCFG_EN_rl

When FEAT_RME is implemented, accesses to this register are WO/RAZ.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_EN_FLAGS, MPAM Partition Configuration Enable Flags Register

The MPAMCFG_EN_FLAGS characteristics are:

Purpose

Enable flags for 32 PARTIDs.

MPAMCFG_EN_FLAGS_s gives read/write access to 32 Secure PARTIDs. MPAMCFG_EN_FLAGS_ns gives read/write access to 32 Non-secure PARTIDs. MPAMCFG_EN_FLAGS_rl gives read/write access to 32 Realm PARTIDs. MPAMCFG_EN_FLAGS_rt gives read/write access to 32 Root PARTIDs.

Configuration

The power domain of MPAMCFG_EN_FLAGS is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_ENDIS == '1'. Otherwise, direct accesses to MPAMCFG_EN_FLAGS are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_EN_FLAGS is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3
EN31	EN30	EN29	EN28	EN27	EN26	EN25	EN24	EN23	EN22	EN21	EN20	EN19	EN18	EN17	EN16	EN15	EN14	EN13	EN12	EN11	EN10	EN9	EN8	EN7	EN6	EN5	EN4	EN3

EN<x>, bit [x], for x = 31 to 0

PARTID Enable flags. The group of flags accessed is selected by MPAMCFG_PART_SEL.PARTID_SEL & 0xFFE0 in bit [0] to (MPAMCFG_PART_SEL.PARTID_SEL & 0xFFE0) + 31 in bit [31].

EN<x>	Meaning
0b0	The PARTID is disabled.
0b1	The PARTID is enabled.

Each bit in MPAMCFG_EN_FLAGS gives access to the same state as controlled by MPAMCFG_EN and MPAMCFG_DIS.

Bits MPAMCFG_EN_FLAGS.EN<x>, where (MPAMCFG_PART_SEL.PARTID_SEL & 0xFFE0) + x is greater than MPAMF_IDR.PARTID_MAX, are not required to be implemented.

As with other partitioning controls, the enable flag for PARTID 0 must be reset to 0b1 (enabled).

Accessing MPAMCFG_EN_FLAGS

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_EN_FLAGS_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_EN_FLAGS_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_EN_FLAGS_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_EN_FLAGS_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_EN_FLAGS_s, MPAMCFG_EN_FLAGS_ns, MPAMCFG_EN_FLAGS_rt, and MPAMCFG_EN_FLAGS_rl must be separate registers:
- The Secure instance (MPAMCFG_EN_FLAGS_s) accesses the PARTID enable used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_EN_FLAGS_ns) accesses the PARTID enable used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_EN_FLAGS_rt) accesses the PARTID enable used for Root PARTIDs.

- The Realm instance (MPAMCFG_EN_FLAGS_rl) accesses the PARTID enable used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the PARTID enable resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_EN_FLAGS access the PARTID enable configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_EN_FLAGS can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0320

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0320	MPAMCFG_EN_FLAGS_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0320	MPAMCFG_EN_FLAGS_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0320	MPAMCFG_EN_FLAGS_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0320	MPAMCFG_EN_FLAGS_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_IN_TL, MPAM Ingress PARTID Translation Configuration Register

The MPAMCFG_IN_TL characteristics are:

Purpose

Enables ingress PARTID translation and configures direct ingress PARTID translations.

Configuration

The power domain of MPAMCFG_IN_TL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented and MPAMF_IDR.HAS_IN_TL == '1'. Otherwise, direct accesses to MPAMCFG_IN_TL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_IN_TL is a 32-bit register.

Field descriptions

ENABLE, bit [31]

Enables ingress PARTID translation in the MSC.

ENABLE	Meaning
0b0	Ingress PARTID translation is disabled.
0b1	Ingress PARTID translation is enabled.

Bits [30:16]

Reserved, RES0.

PARTID_TL, bits [15:0]
When MPAMF_IN_TL_IDR.HAS_DIRECT_TL == '1':

PARTID to be used as direct translation of the ingress PARTID configured in MPAMCFG_PART_SEL.PARTID_SEL when MPAMCFG_PART_SEL.INGRESS_TL == 1.

Otherwise:

Reserved, RES0.

Accessing MPAMCFG_IN_TL

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_IN_TL_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_IN_TL_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_IN_TL_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_IN_TL_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_IN_TL_s, MPAMCFG_IN_TL_ns, MPAMCFG_IN_TL_rt, and MPAMCFG_IN_TL_rl must be separate registers:
- The Secure instance (MPAMCFG_IN_TL_s) accesses the ingress PARTID translation used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_IN_TL_ns) accesses the ingress PARTID translation used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_IN_TL_rt) accesses the ingress PARTID translation used for Root PARTIDs.

- The Realm instance (MPAMCFG_IN_TL_rl) accesses the ingress PARTID translation used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_IN_TL access the ingress PARTID translation configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

MPAMCFG_IN_TL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3008

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x3008	MPAMCFG_IN_TL_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3008	MPAMCFG_IN_TL_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3008	MPAMCFG_IN_TL_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3008	MPAMCFG_IN_TL_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_IN_TL_BASE, MPAM Ingress PARTID Translation Base Configuration Register

The MPAMCFG_IN_TL_BASE characteristics are:

Purpose

Configures the base value used to compute translation PARTIDs for ingress PARTIDs that do not have direct translation.

Configuration

The power domain of MPAMCFG_IN_TL_BASE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented, MPAMF_IDR.HAS_IN_TL == '1', and MPAMF_IN_TL_IDR.HAS_BASE_MASK == '1'. Otherwise, direct accesses to MPAMCFG_IN_TL_BASE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_IN_TL_BASE is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

BASE, bits [15:0]

Base value used to compute the ingress translation of PARTIDs that do not have a direct translation configured.

Accessing MPAMCFG_IN_TL_BASE

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_IN_TL_BASE_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_IN_TL_BASE_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_IN_TL_BASE_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_IN_TL_BASE_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_IN_TL_BASE_s, MPAMCFG_IN_TL_BASE_ns, MPAMCFG_IN_TL_BASE_rt, and MPAMCFG_IN_TL_BASE_rl must be separate registers:
- The Secure instance (MPAMCFG_IN_TL_BASE_s) accesses the ingress PARTID translation base used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_IN_TL_BASE_ns) accesses the ingress PARTID translation base used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_IN_TL_BASE_rt) accesses the ingress PARTID translation base used for Root PARTIDs.
- The Realm instance (MPAMCFG_IN_TL_BASE_rl) accesses the ingress PARTID translation base used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_IN_TL_BASE access the ingress PARTID translation base configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

MPAMCFG_IN_TL_BASE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3010

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_s	0x3010	MPAMCFG_IN_TL_BASE_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3010	MPAMCFG_IN_TL_BASE_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3010	MPAMCFG_IN_TL_BASE_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3010	MPAMCFG_IN_TL_BASE_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_IN_TL_MASK, MPAM Ingress PARTID Translation Mask Configuration Register

The MPAMCFG_IN_TL_MASK characteristics are:

Purpose

Configures the mask value used to compute translation PARTIDs for ingress PARTIDs that do not have direct translation.

Configuration

The power domain of MPAMCFG_IN_TL_MASK is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented, MPAMF_IDR.HAS_IN_TL == '1', and MPAMF_IN_TL_IDR.HAS_BASE_MASK == '1'. Otherwise, direct accesses to MPAMCFG_IN_TL_MASK are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_IN_TL_MASK is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

MASK_WD, bits [4:0]

Value used to calculate the mask as 2^{MASK_WD}-1. The mask is then used to compute the ingress translation of PARTIDs that do not have a direct translation configured.

Accessing MPAMCFG_IN_TL_MASK

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_IN_TL_MASK_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_IN_TL_MASK_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_IN_TL_MASK_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_IN_TL_MASK_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_IN_TL_MASK_s, MPAMCFG_IN_TL_MASK_ns, MPAMCFG_IN_TL_MASK_rt, and MPAMCFG_IN_TL_MASK_rl must be separate registers:
- The Secure instance (MPAMCFG_IN_TL_MASK_s) accesses the ingress PARTID translation mask used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_IN_TL_MASK_ns) accesses the ingress PARTID translation mask used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_IN_TL_MASK_rt) accesses the ingress PARTID translation mask used for Root PARTIDs.
- The Realm instance (MPAMCFG_IN_TL_MASK_rl) accesses the ingress PARTID translation mask used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_IN_TL_MASK access the ingress PARTID translation mask configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

MPAMCFG_IN_TL_MASK can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3018

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x3018	MPAMCFG_IN_TL_MASK_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3018	MPAMCFG_IN_TL_MASK_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3018	MPAMCFG_IN_TL_MASK_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3018	MPAMCFG_IN_TL_MASK_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_INTPARTID, MPAM Internal PARTID Narrowing Configuration Register

The MPAMCFG_INTPARTID characteristics are:

Purpose

MPAMCFG_INTPARTID is a 32-bit read/write register that controls the mapping of the PARTID selected by MPAMCFG_PART_SEL into a narrower internal PARTID (intPARTID).

MPAMCFG_INTPARTID_s controls the mapping for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL.
MPAMCFG_INTPARTID_ns controls the mapping for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL.
MPAMCFG_INTPARTID_rt controls the mapping for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL.
MPAMCFG_INTPARTID_rl controls the mapping for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

The MPAMCFG_INTPARTID register associates the request PARTID (reqPARTID) in the MPAMCFG_PART_SEL register with an internal PARTID (intPARTID) in this register. To set that association, store reqPARTID into the MPAMCFG_PART_SEL register and then store the intPARTID into the MPAMCFG_INTPARTID register. To read the association, store reqPARTID into the MPAMCFG_PART_SEL register and then read MPAMCFG_INTPARTID.

If the intPARTID stored into MPAMCFG_INTPARTID is out-of-range or does not have the INTERNAL bit set, the association of reqPARTID to intPARTID is not written and MPAMF_ESR is set to indicate an intPARTID_Range error.

If MPAMCFG_PART_SEL.INTERNAL is 1 when MPAMCFG_INTPARTID is read or written, MPAMF_ESR is set to indicate an Unexpected_INTERNAL error.

Configuration

The power domain of MPAMCFG_INTPARTID is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_PARTID_NRW == '1'. Otherwise, direct accesses to MPAMCFG_INTPARTID are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_INTPARTID is a 32-bit register.

Field descriptions

Bits [31:17]

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID flag.

This bit must be 1 when written to the register. If written as 0, the write will not update the reqPARTID to intPARTID association.

On a read of this register, the bit will always read the value last written.

INTPARTID, bits [15:0]

This field contains the intPARTID mapped to the reqPARTID in MPAMCFG_PART_SEL.

The maximum intPARTID supported is MPAMF_PARTID_NRW_IDR.INTPARTID_MAX.

Accessing MPAMCFG_INTPARTID

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_INTPARTID_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_INTPARTID_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_INTPARTID_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_INTPARTID_rl must only be accessible from the Realm MPAM feature page.

- MPAMCFG_INTPARTID_s, MPAMCFG_INTPARTID_ns, MPAMCFG_INTPARTID_rt, and MPAMCFG_INTPARTID_rl must be separate registers:
- The Secure instance (MPAMCFG_INTPARTID_s) accesses the PARTID narrowing used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_INTPARTID_ns) accesses the PARTID narrowing used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_INTPARTID_rt) accesses the PARTID narrowing used for Root PARTIDs.
- The Realm instance (MPAMCFG_INTPARTID_rl) accesses the PARTID narrowing used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

Loads and stores to MPAMCFG_INTPARTID access the PARTID narrowing configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_INTPARTID can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0600

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0600	MPAMCFG_INTPARTID_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0600	MPAMCFG_INTPARTID_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0600	MPAMCFG_INTPARTID_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0600	MPAMCFG_INTPARTID_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_MBW_MAX, MPAM Memory Bandwidth Maximum Partition Configuration Register

The MPAMCFG_MBW_MAX characteristics are:

Purpose

MPAMCFG_MBW_MAX is a 32-bit read/write register that controls the maximum fraction of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL is permitted to use.

MPAMCFG_MBW_MAX_s controls maximum bandwidth for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MAX_ns controls the maximum bandwidth for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MAX_rt controls the maximum bandwidth for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MAX_rl controls the maximum bandwidth for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

A PARTID that has used more than MAX is given no access to additional bandwidth if HARDLIM == 1 or is given additional bandwidth only if there are no requests from PARTIDs that have not exceeded their MAX if HARDLIM == 0.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_MAX is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MBW_PART == '1', and MPAMF_MBW_IDR.HAS_MAX == '1'. Otherwise, direct accesses to MPAMCFG_MBW_MAX are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MAX is a 32-bit register.

Field descriptions

HARDLIM, bit [31]

Maximum-bandwidth limit behaviour selection.

HARDLIM	Meaning
0b0	Soft limit: when MAX bandwidth is exceeded, the partition contends with a low preference for downstream bandwidth beyond MAX.
0b1	Hard limit: when MAX bandwidth is exceeded, the partition does not use any more bandwidth until the memory bandwidth measurement for the partition falls below MAX.

Accessing this field has the following behavior:

- When MPAMF_MBW_IDR.MAX_LIM == '00', access to this field is RW.
- When MPAMF_MBW_IDR.MAX_LIM == '01', access to this field is RAZ/WI.
- When MPAMF_MBW_IDR.MAX_LIM == '10', access to this field is RAO/WI.

Bits [30:16]

Reserved, RES0.

MAX, bits [15:0]

Memory maximum bandwidth allocated to the partition selected by MPAMCFG_PART_SEL. MAX is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA_WD. Unimplemented bits are RAZ/WI. The implemented bits of the MAX field are always to the left of the field. For example, if BWA_WD = 3, the implemented bits are MPAMCFG_MBW_MAX[15:13] and MPAMCFG_MBW_MAX[12:0] are unimplemented.

The fixed-point fraction MAX is less than 1. The implied binary point is between bits 15 and 16. In an implementation with w implemented bits, the largest fraction of the bandwidth that can be represented is 1- $(0.5)^{W}$.

Accessing MPAMCFG_MBW_MAX

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_MBW_MAX_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MAX_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MAX_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MAX_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_MBW_MAX_s, MPAMCFG_MBW_MAX_ns, MPAMCFG_MBW_MAX_rt, and MPAMCFG_MBW_MAX_rl must be separate registers:
- The Secure instance (MPAMCFG_MBW_MAX_s) accesses the memory maximum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MAX_ns) accesses the memory maximum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MAX_rt) accesses the memory maximum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MAX_rl) accesses the memory maximum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MAX access the memory maximum bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_MAX can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0208

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0208	MPAMCFG_MBW_MAX_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0208	MPAMCFG_MBW_MAX_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0208	MPAMCFG_MBW_MAX_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0208	MPAMCFG_MBW_MAX_rl

When FEAT_RME is implemented, accesses to this register are RW.

MPAMCFG_MBW_MIN, MPAM Memory Bandwidth Minimum Partition Configuration Register

The MPAMCFG_MBW_MIN characteristics are:

Purpose

MPAMCFG_MBW_MIN is a 32-bit read/write register that controls the minimum fraction of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL is permitted to use.

MPAMCFG_MBW_MIN_s controls the minimum bandwidth for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MIN_ns controls the minimum bandwidth for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MIN_rt controls the minimum bandwidth for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_MIN_rl controls the minimum bandwidth for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

A PARTID that has used less than MIN is given preferential access to bandwidth.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_MIN is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MBW_PART == '1', and MPAMF_MBW_IDR.HAS_MIN == '1'. Otherwise, direct accesses to MPAMCFG_MBW_MIN are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_MIN is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

MIN, bits [15:0]

Memory minimum bandwidth allocated to the partition selected by MPAMCFG_PART_SEL. MIN is in fixed-point fraction format. The fraction represents the portion of the total memory bandwidth capacity through the controlled component that the PARTID is permitted to allocate.

The implemented width of the fixed-point fraction is given in MPAMF_MBW_IDR.BWA_WD. Unimplemented bits are RAZ/WI. The implemented bits of the MIN field are always to the left of the field. For example, if BWA_WD = 4, the implemented bits are MPAMCFG_MBW_MIN[15:12] and MPAMCFG_MBW_MIN[11:0] are unimplemented.

The fixed-point fraction MIN is less than 1. The implied binary point is between bits 15 and 16. In an implementation with w implemented bits, the largest fraction of the bandwidth that can be represented is 1- $(0.5)^{w}$.

Accessing MPAMCFG_MBW_MIN

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_MBW_MIN_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_MIN_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_MIN_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_MIN_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_MBW_MIN_s, MPAMCFG_MBW_MIN_ns, MPAMCFG_MBW_MIN_rt, and MPAMCFG_MBW_MIN_rl must be separate registers:

- The Secure instance (MPAMCFG_MBW_MIN_s) accesses the memory minimum bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_MIN_ns) accesses the memory minimum bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_MIN_rt) accesses the memory minimum bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_MIN_rl) accesses the memory minimum bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_MIN access the memory minimum bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_MIN can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0200

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0200	MPAMCFG_MBW_MIN_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0200	MPAMCFG_MBW_MIN_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0200	MPAMCFG_MBW_MIN_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0200	MPAMCFG_MBW_MIN_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_MBW_PBM<n>, MPAM Bandwidth Portion Bitmap Partition Configuration Register, n = 0 - 127

The MPAMCFG_MBW_PBM<n> characteristics are:

Purpose

The MPAMCFG_MBW_PBM<n> register array gives access to the memory bandwidth portion bitmap. Each register in the array is a read/write register that configures whether a PARTID is allowed to allocate bandwidth portions within a range.

The range of portions covered in MPAMCFG_MBW_PBM<n> is from portion <32*n> to portion <32*n +31>.

After setting MPAMCFG_PART_SEL with a PARTID, software writes to one or more of the MPAMCFG_MBW_PBM<n> registers to configure with bandwidth portions the PARTID is allowed to allocate.

The MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has n equal to p[11:5]. The field, P<x> of that MPAMCFG_MBW_PBM<n> register that contains the bitmap bit corresponding to memory bandwidth portion p has <x> equal to p[4:0].

The MPAMCFG_MBW_PBM<n>_s registers control the bandwidth portion bitmap for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. The MPAMCFG_MBW_PBM<n>_ns registers control the bandwidth portion bitmap for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. The MPAMCFG_MBW_PBM<n>_rt registers control the bandwidth portion bitmap for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. The MPAMCFG_MBW_PBM<n>_rl registers control the bandwidth portion bitmap for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_PBM<n> is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MBW_PART == '1', and MPAMF_MBW_IDR.HAS_PBM == '1'. Otherwise, direct accesses to MPAMCFG_MBW_PBM<n> are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PBM<n> is a 32-bit register.

Field descriptions

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
P31	P30	P29	P28	P27	P26	P25	P24	P23	P22	P21	P20	P19	P18	P17	P16	P15	P14	P13	P12	P11	P10	P9	P8	P7	P6	P5	P4	P3	P2	P1	P0

P<x>, bit [x], for x = 31 to 0

Portion allocation control bit. Each bandwidth portion allocation control bit MPAMCFG_MBW_PBM<n>.P<x> grants permission to the PARTID selected by MPAMCFG_PART_SEL to allocate bandwidth within bandwidth portion <32*n> + <x>.

P<x>	Meaning
0b0	The PARTID is not permitted to allocate into bandwidth portion <32*n> + <x>.
0b1	The PARTID is permitted to allocate within bandwidth portion <32*n> + <x>.

The number of bits in the bandwidth portion partitioning bit map of this component is given in MPAMF_MBW_IDR.BWPBM_WD. BWPBM_WD contains a value from 1 to 2^{12}, inclusive. Values of MPAMF_MBW_IDR.BWPBM_WD greater than 32 require a group of 32-bit registers to access the bandwidth portion bitmap, up to 128 32-bit registers.

When (n * 32) + x > UInt(MPAMF_MBW_IDR().BWPBM_WD), access to this field is RES0 .

Accessing MPAMCFG_MBW_PBM<n>

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_MBW_PBM<n>_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PBM<n>_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_MBW_PBM<n>_s, MPAMCFG_MBW_PBM<n>_ns, MPAMCFG_MBW_PBM<n>_rt, and MPAMCFG_MBW_PBM<n>_rl must be separate registers:
- The Secure instance (MPAMCFG_MBW_PBM<n>_s) accesses the memory bandwidth portion bitmap used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PBM<n>_ns) accesses the memory bandwidth portion bitmap used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PBM<n>_rt) accesses the memory bandwidth portion bitmap used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PBM<n>_rl) accesses the memory bandwidth portion bitmap used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PBM<n> access the memory bandwidth portion bitmap configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_PBM<n> can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x2000 + (4 * n)	MPAMCFG_MBW_PBM<n>_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_MBW_PROP, MPAM Memory Bandwidth Proportional Stride Partition Configuration Register

The MPAMCFG_MBW_PROP characteristics are:

Purpose

Controls the proportional stride of memory bandwidth that the PARTID selected by MPAMCFG_PART_SEL uses.

MPAMCFG_MBW_PROP_s controls the bandwidth proportional stride for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_PROP_ns controls the bandwidth proportional stride for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_PROP_rt controls the bandwidth proportional stride for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_PROP_rl controls the bandwidth proportional stride for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

Proportional stride is a relative cost of bandwidth requested by one PARTID in relation to the costs of the bandwidths requested by each other PARTID also competing to use the bandwidth.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_PROP is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MBW_PART == '1', and MPAMF_MBW_IDR.HAS_PROP == '1'. Otherwise, direct accesses to MPAMCFG_MBW_PROP are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_PROP is a 32-bit register.

Field descriptions

EN, bit [31]

Enable proportional stride bandwidth partitioning.

EN	Meaning
0b0	The selected partition is not regulated by proportional stride bandwidth partitioning.
0b1	The selected partition has bandwidth usage regulated by proportional stride bandwidth partitioning as controlled by STRIDEM1.

Bits [30:16]

Reserved, RES0.

STRIDEM1, bits [15:0]

Memory bandwidth stride minus 1 allocated to the partition selected by MPAMCFG_PART_SEL. STRIDEM1 represents the normalized cost of bandwidth consumption by the partition.

The proportional stride partitioning control parameter is an unsigned integer representing the normalized cost to a partition for consuming bandwidth. Larger values have a larger cost and correspond to a lesser allocation of bandwidth while smaller values indicate a lesser cost and therefore a higher allocation of bandwidth.

The implemented width of STRIDEM1 is given in MPAMF_MBW_IDR.BWA_WD.

Accessing MPAMCFG_MBW_PROP

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:

- MPAMCFG_MBW_PROP_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_PROP_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_PROP_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_PROP_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_MBW_PROP_s, MPAMCFG_MBW_PROP_ns, MPAMCFG_MBW_PROP_rt, and MPAMCFG_MBW_PROP_rl must be separate registers:
- The Secure instance (MPAMCFG_MBW_PROP_s) accesses the memory proportional stride bandwidth partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_PROP_ns) accesses the memory proportional stride bandwidth partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_PROP_rt) accesses the memory proportional stride bandwidth partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_PROP_rl) accesses the memory proportional stride bandwidth partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_PROP access the memory proportional stride bandwidth partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_PROP can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0500

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0500	MPAMCFG_MBW_PROP_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0500	MPAMCFG_MBW_PROP_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0500	MPAMCFG_MBW_PROP_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0500	MPAMCFG_MBW_PROP_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_MBW_WINWD, MPAM Memory Bandwidth Partitioning Window Width Configuration Register

The MPAMCFG_MBW_WINWD characteristics are:

Purpose

MPAMCFG_MBW_WINWD is a 32-bit register that shows and sets the value of the window width for the PARTID in MPAMCFG_PART_SEL.

MPAMCFG_MBW_WINWD_s reads and controls the bandwidth control window width for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD_ns reads and controls the bandwidth control window width for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD_rt reads and controls the bandwidth control window width for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. MPAMCFG_MBW_WINWD_rl reads and controls the bandwidth control window width for the Real PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

MPAMCFG_MBW_WINWD is read-only if MPAMF_MBW_IDR.WINDWR == 0, and the window width is set by the hardware, even if variable.

MPAMCFG_MBW_WINWD is read/write if MPAMF_MBW_IDR.WINDWR == 1, permitting configuration of the window width for each PARTID independently on hardware that supports this functionality.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_MBW_WINWD is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_MBW_PART == '1'. Otherwise, direct accesses to MPAMCFG_MBW_WINWD are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_MBW_WINWD is a 32-bit register.

Field descriptions

Bits [31:24]

Reserved, RES0.

US_INT, bits [23:8]

Window width, integer microseconds.

This field reads (and sets) the integer part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.

US_FRAC, bits [7:0]

Window width, fractional microseconds.

This field reads (and sets) the fractional part of the window width in microseconds for the PARTID selected by MPAMCFG_PART_SEL.

Accessing MPAMCFG_MBW_WINWD

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_MBW_WINWD_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_MBW_WINWD_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_MBW_WINWD_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_MBW_WINWD_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_MBW_WINWD_s, MPAMCFG_MBW_WINWD_ns, MPAMCFG_MBW_WINWD_rt, and MPAMCFG_MBW_WINWD_rl must be separate registers:

- The Secure instance (MPAMCFG_MBW_WINWD_s) accesses the window width used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_MBW_WINWD_ns) accesses the window width used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_MBW_WINWD_rt) accesses the window width used for Root PARTIDs.
- The Realm instance (MPAMCFG_MBW_WINWD_rl) accesses the window width used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the bandwidth resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_MBW_WINWD access the window width configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_MBW_WINWD can be accessed through the memory-mapped interfaces:

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0220	MPAMCFG_MBW_WINWD_s

Accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == '0', accesses to this register are RO.
- When MPAMF_MBW_IDR.WINDWR == '1', accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0220	MPAMCFG_MBW_WINWD_ns

Accessible as follows:

- When MPAMF_MBW_IDR.WINDWR == '0', accesses to this register are RO.
- When MPAMF_MBW_IDR.WINDWR == '1', accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0220	MPAMCFG_MBW_WINWD_rt

Accessible as follows:

- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == '0', accesses to this register are RO.
- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == '1', accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0220	MPAMCFG_MBW_WINWD_rl

Accessible as follows:

- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == '0', accesses to this register are RO.
- When FEAT_RME is implemented and MPAMF_MBW_IDR.WINDWR == '1', accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_OUT_TL, MPAM Egress PARTID Translation Configuration Register

The MPAMCFG_OUT_TL characteristics are:

Purpose

Enables egress PARTID translation and configures direct egress PARTID translations.

Configuration

The power domain of MPAMCFG_OUT_TL is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented and MPAMF_IDR.HAS_OUT_TL == '1'. Otherwise, direct accesses to MPAMCFG_OUT_TL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_OUT_TL is a 32-bit register.

Field descriptions

ENABLE, bit [31]

Enables egress PARTID translation in the MSC.

ENABLE	Meaning
0b0	Egress PARTID translation is disabled.
0b1	Egress PARTID translation is enabled.

Bits [30:16]

Reserved, RES0.

PARTID_TL, bits [15:0]
When MPAMF_OUT_TL_IDR.HAS_DIRECT_TL == '1':

PARTID to be used as direct translation of the egress PARTID configured in MPAMCFG_PART_SEL.PARTID_SEL when MPAMCFG_PART_SEL.INGRESS_TL == 0.

Otherwise:

Reserved, RES0.

Accessing MPAMCFG_OUT_TL

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_OUT_TL_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_OUT_TL_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_OUT_TL_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_OUT_TL_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_OUT_TL_s, MPAMCFG_OUT_TL_ns, MPAMCFG_OUT_TL_rt, and MPAMCFG_OUT_TL_rl must be separate registers:
- The Secure instance (MPAMCFG_OUT_TL_s) accesses the egress PARTID translation used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_OUT_TL_ns) accesses the egress PARTID translation used for Non-secure PARTIDs.

- The Root instance (MPAMCFG_OUT_TL_rt) accesses the egress PARTID translation used for Root PARTIDs.
- The Realm instance (MPAMCFG_OUT_TL_rl) accesses the egress PARTID translation used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_OUT_TL access the egress PARTID translation configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

MPAMCFG_OUT_TL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3208

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x3208	MPAMCFG_OUT_TL_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3208	MPAMCFG_OUT_TL_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3208	MPAMCFG_OUT_TL_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3208	MPAMCFG_OUT_TL_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_OUT_TL_BASE, MPAM Egress PARTID Translation Base Configuration Register

The MPAMCFG_OUT_TL_BASE characteristics are:

Purpose

Configures the base value used to compute translation PARTIDs for egress PARTIDs that do not have direct translation.

Configuration

The power domain of MPAMCFG_OUT_TL_BASE is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented, MPAMF_IDR.HAS_OUT_TL == '1', and MPAMF_OUT_TL_IDR.HAS_BASE_MASK == '1'. Otherwise, direct accesses to MPAMCFG_OUT_TL_BASE are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_OUT_TL_BASE is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

BASE, bits [15:0]

Base value used to compute the egress translation of PARTIDs that do not have a direct translation configured.

Accessing MPAMCFG_OUT_TL_BASE

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_OUT_TL_BASE_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_OUT_TL_BASE_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_OUT_TL_BASE_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_OUT_TL_BASE_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_OUT_TL_BASE_s, MPAMCFG_OUT_TL_BASE_ns, MPAMCFG_OUT_TL_BASE_rt, and MPAMCFG_OUT_TL_BASE_rl must be separate registers:
- The Secure instance (MPAMCFG_OUT_TL_BASE_s) accesses the egress PARTID translation base used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_OUT_TL_BASE_ns) accesses the egress PARTID translation base used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_OUT_TL_BASE_rt) accesses the egress PARTID translation base used for Root PARTIDs.
- The Realm instance (MPAMCFG_OUT_TL_BASE_rl) accesses the egress PARTID translation base used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_OUT_TL_BASE access the egress PARTID translation base configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

MPAMCFG_OUT_TL_BASE can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3210

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance

MPAM	MPAMF_BASE_s	0x3210	MPAMCFG_OUT_TL_BASE_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3210	MPAMCFG_OUT_TL_BASE_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3210	MPAMCFG_OUT_TL_BASE_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3210	MPAMCFG_OUT_TL_BASE_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_OUT_TL_MASK, MPAM Egress PARTID Translation Mask Configuration Register

The MPAMCFG_OUT_TL_MASK characteristics are:

Purpose

Configures the mask value used to compute translation PARTIDs for egress PARTIDs that do not have direct translation.

Configuration

The power domain of MPAMCFG_OUT_TL_MASK is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAM_MSC_DOMAINS is implemented, MPAMF_IDR.HAS_OUT_TL == '1', and MPAMF_OUT_TL_IDR.HAS_BASE_MASK == '1'. Otherwise, direct accesses to MPAMCFG_OUT_TL_MASK are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_OUT_TL_MASK is a 32-bit register.

Field descriptions

Bits [31:5]

Reserved, RES0.

MASK_WD, bits [4:0]

Value used to calculate the mask as 2^{MASK_WD}-1. The mask is then used to compute the egress translation of PARTIDs that do not have a direct translation configured.

Accessing MPAMCFG_OUT_TL_MASK

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_OUT_TL_MASK_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_OUT_TL_MASK_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_OUT_TL_MASK_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_OUT_TL_MASK_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_OUT_TL_MASK_s, MPAMCFG_OUT_TL_MASK_ns, MPAMCFG_OUT_TL_MASK_rt, and MPAMCFG_OUT_TL_MASK_rl must be separate registers:
- The Secure instance (MPAMCFG_OUT_TL_MASK_s) accesses the egress PARTID translation mask used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_OUT_TL_MASK_ns) accesses the egress PARTID translation mask used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_OUT_TL_MASK_rt) accesses the egress PARTID translation mask used for Root PARTIDs.
- The Realm instance (MPAMCFG_OUT_TL_MASK_rl) accesses the egress PARTID translation mask used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_OUT_TL_MASK access the egress PARTID translation mask configuration settings without being affected by MPAMCFG_PART_SEL.RIS.

MPAMCFG_OUT_TL_MASK can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x3218

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x3218	MPAMCFG_OUT_TL_MASK_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x3218	MPAMCFG_OUT_TL_MASK_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x3218	MPAMCFG_OUT_TL_MASK_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x3218	MPAMCFG_OUT_TL_MASK_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_PART_SEL, MPAM Partition Configuration Selection Register

The MPAMCFG_PART_SEL characteristics are:

Purpose

Selects a partition ID to configure.

MPAMCFG_PART_SEL_s selects a Secure PARTID to configure. MPAMCFG_PART_SEL_ns selects a Non-secure PARTID to configure. MPAMCFG_PART_SEL_rt selects a Root PARTID to configure. MPAMCFG_PART_SEL_rl selects a Realm PARTID to configure.

After setting this register with a PARTID, software (usually a hypervisor) can perform a series of accesses to MPAMCFG registers to configure parameters for MPAM resource controls to use when requests have that PARTID.

Configuration

The power domain of MPAMCFG_PART_SEL is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and (MPAMF_IDR.HAS_CCAP_PART == '1', or MPAMF_IDR.HAS_CPOR_PART == '1', or MPAMF_IDR.HAS_MBW_PART == '1', or MPAMF_IDR.HAS_PRI_PART == '1', or MPAMF_IDR.HAS_PARTID_NRW == '1', or (MPAMF_IDR.EXT == '0' and MPAMF_IDR.HAS_IMPL_IDR == '1'), or (MPAMF_IDR.EXT == '1', MPAMF_IDR.HAS_IMPL_IDR == '1', and MPAMF_IDR.NO_IMPL_PART == '0')). Otherwise, direct accesses to MPAMCFG_PART_SEL are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PART_SEL is a 32-bit register.

Field descriptions

Bits [31:28]

Reserved, RES0.

RIS, bits [27:24]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented), MPAMF_IDR.EXT == '1', and MPAMF_IDR.HAS_RIS == '1':

Resource Instance Selector. RIS selects one resource to configure through MPAMCFG registers and describe with MPAMF ID registers.

Otherwise:

Reserved, RES0.

Bits [23:19]

Reserved, RES0.

DEFAULT_PARTID, bit [18]
When FEAT_MPAM_MSC_DCTRL is implemented:

Disables PARTID selection and instead configures the default resource control behavior.

DEFAULT_PARTID	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID.
0b1	PARTID_SEL is ignored and any access to MPAMCFG registers is intended to be for configuring the default resource control behaviour.

Otherwise:

Reserved, RES0.

INGRESS_TL, bit [17]
When FEAT_MPAM_MSC_DOMAINS is implemented:

Indicates that PARTID_SEL is used for ingress translation.

INGRESS_TL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID for configuring MSC controls.
0b1	PARTID_SEL is interpreted as an untranslated ingress request PARTID to be used for configuring direct translations.

When MPAMF_IDR.HAS_IN_TL == '0', access to this field is RAZ/WI.

Otherwise:

Reserved, RES0.

INTERNAL, bit [16]

Internal PARTID.

If MPAMF_IDR.HAS_PARTID_NRW == 0b1:

INTERNAL	Meaning
0b0	PARTID_SEL is interpreted as a request PARTID and ignored except for use with MPAMCFG_INTPARTID register access.
0b1	PARTID_SEL is interpreted as an internal PARTID and used for access to MPAMCFG control settings except for MPAMCFG_INTPARTID.

If PARTID narrowing is implemented as indicated by MPAMF_IDR.HAS_PARTID_NRW = 1, when accessing other MPAMCFG registers the value of the MPAMCFG_PART_SEL.INTERNAL bit is checked for these conditions:

- When the MPAMCFG_INTPARTID register is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 0, an Unexpected_INTERNAL error is set in MPAMF_ESR.
- When an MPAMCFG register other than MPAMCFG_INTPARTID is read or written, if the value of MPAMCFG_PART_SEL.INTERNAL is not 1, MPAMF_ESR is set to indicate an intPARTID_Range error.

In either error case listed here, the value returned by a read operation is UNPREDICTABLE, and the control settings are not affected by a write.

When MPAMF_IDR.HAS_PARTID_NRW == '0', access to this field is RAZ/WI.

PARTID_SEL, bits [15:0]

Selects the partition ID to configure.

Reads and writes to other MPAMCFG registers are indexed by PARTID_SEL and by the NS bit used to access MPAMCFG_PART_SEL to access the configuration for a single partition.

Accessing MPAMCFG_PART_SEL

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_PART_SEL_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_PART_SEL_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_PART_SEL_rt must only be accessible from the Root MPAM feature page.
- MPAMCFG_PART_SEL_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_PART_SEL_s, MPAMCFG_PART_SEL_ns, MPAMCFG_PART_SEL_rt, and MPAMCFG_PART_SEL_rl must be separate registers:
- The Secure instance (MPAMCFG_PART_SEL_s) accesses the PARTID selector used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_PART_SEL_ns) accesses the PARTID selector used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_PART_SEL_rt) accesses the PARTID selector used for Root PARTIDs.

- The Realm instance (MPAMCFG_PART_SEL_rl) accesses the PARTID selector used for Realm PARTIDs.

MPAMCFG_PART_SEL can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0100

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0100	MPAMCFG_PART_SEL_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0100	MPAMCFG_PART_SEL_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0100	MPAMCFG_PART_SEL_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0100	MPAMCFG_PART_SEL_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMCFG_PRI, MPAM Priority Partition Configuration Register

The MPAMCFG_PRI characteristics are:

Purpose

Controls the internal and downstream priority of requests attributed to the PARTID selected by MPAMCFG_PART_SEL.

MPAMCFG_PRI_s controls the priorities for the Secure PARTID selected by the Secure instance of MPAMCFG_PART_SEL. MPAMCFG_PRI_ns controls the priorities for the Non-secure PARTID selected by the Non-secure instance of MPAMCFG_PART_SEL. MPAMCFG_PRI_rt controls the priorities for the Root PARTID selected by the Root instance of MPAMCFG_PART_SEL. MPAMCFG_PRI_rl controls the priorities for the Realm PARTID selected by the Realm instance of MPAMCFG_PART_SEL.

If MPAMF_IDR.HAS_RIS is 1, the control settings accessed are those of the resource instance currently selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

Configuration

The power domain of MPAMCFG_PRI is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_PRI_PART == '1'. Otherwise, direct accesses to MPAMCFG_PRI are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMCFG_PRI is a 32-bit register.

Field descriptions

DSPRI, bits [31:16]

Downstream priority.

If MPAMF_PRI_IDR.HAS_DSPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_DSPRI == 1, this field is a priority value applied to downstream communications from this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.DSPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.DSPRI_0_IS_LOW.

INTPRI, bits [15:0]

Internal priority.

If MPAMF_PRI_IDR.HAS_INTPRI == 0, bits of this field are RES0 as this field is not used.

If MPAMF_PRI_IDR.HAS_INTPRI == 1, this field is a priority value applied internally inside this MSC for transactions of the partition selected by MPAMCFG_PART_SEL.

The implemented width of this field is MPAMF_PRI_IDR.INTPRI_WD bits. If the implemented width is less than the width of this field, the least significant bits are used.

The encoding of priority is 0-as-lowest or 0-as-highest priority according to the value of MPAMF_PRI_IDR.INTPRI_0_IS_LOW.

Accessing MPAMCFG_PRI

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps:
- MPAMCFG_PRI_s must only be accessible from the Secure MPAM feature page.
- MPAMCFG_PRI_ns must only be accessible from the Non-secure MPAM feature page.
- MPAMCFG_PRI_rt must only be accessible from the Root MPAM feature page.

- MPAMCFG_PRI_rl must only be accessible from the Realm MPAM feature page.
- MPAMCFG_PRI_s, MPAMCFG_PRI_ns, MPAMCFG_PRI_rt, and MPAMCFG_PRI_rl must be separate registers:
- The Secure instance (MPAMCFG_PRI_s) accesses the priority partitioning used for Secure PARTIDs.
- The Non-secure instance (MPAMCFG_PRI_ns) accesses the priority partitioning used for Non-secure PARTIDs.
- The Root instance (MPAMCFG_PRI_rt) accesses the priority partitioning used for Root PARTIDs.
- The Realm instance (MPAMCFG_PRI_rl) accesses the priority partitioning used for Realm PARTIDs.

When RIS is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the priority resource instance selected by MPAMCFG_PART_SEL.RIS and the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When RIS is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL.

When PARTID narrowing is implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the internal PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 1.

When PARTID narrowing is not implemented, loads and stores to MPAMCFG_PRI access the priority partitioning configuration settings for the request PARTID selected by MPAMCFG_PART_SEL.PARTID_SEL, and MPAMCFG_PART_SEL.INTERNAL must be 0.

MPAMCFG_PRI can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0400

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0400	MPAMCFG_PRI_s

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0400	MPAMCFG_PRI_ns

Accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0400	MPAMCFG_PRI_rt

When FEAT_RME is implemented, accesses to this register are RW.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0400	MPAMCFG_PRI_rl

When FEAT_RME is implemented, accesses to this register are RW.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_AIDR, MPAM Architecture Identification Register

The MPAMF_AIDR characteristics are:

Purpose

Identifies the version of the MPAM architecture that this MSC implements.

Configuration

The power domain of MPAMF_AIDR is IMPLEMENTATION DEFINED.

This register is present only when FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv2_MSC is implemented. Otherwise, direct accesses to MPAMF_AIDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_AIDR is a 32-bit register.

Field descriptions

Bits [31:8]

Reserved, RES0.

ArchMajorRev, bits [7:4]

Major revision of the MPAM architecture implemented by the MSC.

This table shows the only valid combinations of MPAM version numbers in an MSC. FORCE_NS functionality is only available in MPAM v0.1.

ArchMajorRev	ArchMinorRev	MPAMv	Available
0	0		None.
0	1	v0.1	MPAMv1.0 + MPAMv1.1 + FORCE_NS
1	0	v1.0	MPAMv1.0
1	1	v1.1	MPAMv1.0 + MPAMv1.1 - FORCE_NS
2	0	v2.0	MPAMv2.0

Use of MPAMv0.1 in MSCs is restricted to limited circumstances. The MSC must be able to initiate requests in the Secure address space which have MPAM PARTID forced to the Non-secure space with that forcing not controllable or observable by the software that configures the device for Secure requests. Please contact Arm before setting MPAMF_AIDR to report MPAMv0.1.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ArchMinorRev, bits [3:0]

Minor revision of the MPAM architecture implemented by the MSC.

See the table in the description of the ArchMajorRev field in this register.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_AIDR

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MPAMF_AIDR must be readable from the Non-secure and Secure MPAM feature pages.
- MPAMF_AIDR must have the same contents in the Secure and Non-secure MPAM feature pages.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_AIDR must be readable from the Secure, Non-secure, Root, and Realm MPAM feature pages.
- MPAMF_AIDR must have the same contents in the Secure, Non-secure, Root, and Realm MPAM feature pages.

MPAMF_AIDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0020

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0020	MPAMF_AIDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0020	MPAMF_AIDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0020	MPAMF_AIDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0020	MPAMF_AIDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_CCAP_IDR, MPAM Features Cache Capacity Partitioning ID register

The MPAMF_CCAP_IDR characteristics are:

Purpose

Indicates the number of fractional bits in MPAMCFG_CMAX.CMAX.

MPAMF_CCAP_IDR_s indicates the number of fractional bits in the Secure instance of MPAMCFG_CMAX. MPAMF_CCAP_IDR_ns indicates the number of fractional bits in the Non-secure instance of MPAMCFG_CMAX. MPAMF_CCAP_IDR_rt indicates the number of fractional bits in the Root cache capacity control settings register field, MPAMCFG_CMAX.CMAX. MPAMF_CCAP_IDR_rl indicates the number of fractional bits in the Realm cache capacity control settings register field, MPAMCFG_CMAX.CMAX.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selected by MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has information within the field description.

Configuration

The power domain of MPAMF_CCAP_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_CCAP_PART == '1'. Otherwise, direct accesses to MPAMF_CCAP_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CCAP_IDR is a 32-bit register.

Field descriptions

HAS_CMAX_SOFTLIM, bit [31]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has soft limiting selection field in MPAMCFG_CMAX.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CMAX_SOFTLIM	Meaning
0b0	If MPAMCFG_CMAX is implemented, it has no SOFTLIM field and the maximum capacity is controlled with a hard limit.
0b1	If MPAMCFG_CMAX is implemented, that register has a SOFTLIMIT field to select between hard or soft limiting to the CMAX parameter.

If RIS is implemented, this field indicates selectable limiting for the cache maximum capacity control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NO_CMAX, bit [30]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Does not have CMAX partitioning.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_CMAX	Meaning
0b0	MPAMCFG_CMAX is implemented.
0b1	MPAMCFG_CMAX is not implemented.

If RIS is implemented, this field indicates the absence of a cache maximum capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_CMIN, bit [29]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has cache minimum capacity partitioning.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CMIN	Meaning
0b0	MPAMCFG_CMIN is not implemented.
0b1	MPAMCFG_CMIN is implemented.

If RIS is implemented, this field indicates the presence of a cache minimum capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_CASSOC, bit [28]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Has cache maximum associativity partitioning.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CASSOC	Meaning
0b0	MPAMCFG_CASSOC is not implemented.
0b1	MPAMCFG_CASSOC is implemented.

If RIS is implemented, this field indicates the presence of a cache maximum associativity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [27:13]

Reserved, RES0.

CASSOC_WD, bits [12:8]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Number of fractional bits implemented in the cache associativity partitioning control, MPAMCFG_CASSOC.CASSOC, of this MSC. See MPAMCFG_CASSOC.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [7:6]

Reserved, RES0.

CMAX_WD, bits [5:0]

Number of fractional bits implemented in the cache capacity partitioning control, MPAMCFG_CMAX.CMAX, of this device. See MPAMCFG_CMAX.

This field must contain a value from 1 to 16, inclusive.

If RIS is implemented, this field indicates the number of fractional bits in the cache capacity partitioning control for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_CCAP_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_CCAP_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_CCAP_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_CCAP_IDR_s is permitted to have either the same or different contents to MPAMF_CCAP_IDR_ns, MPAMF_CCAP_IDR_rt, or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_ns is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rt or MPAMF_CCAP_IDR_rl.
- MPAMF_CCAP_IDR_rt is permitted to have either the same or different contents to MPAMF_CCAP_IDR_rl.
- There must be separate registers in the Secure (MPAMF_CCAP_IDR_s), Non-secure (MPAMF_CCAP_IDR_ns), Root (MPAMF_CCAP_IDR_rt), and Realm (MPAMF_CCAP_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_CCAP_IDR shows the configuration of cache capacity partitioning for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CCAP_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0038

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0038	MPAMF_CCAP_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0038	MPAMF_CCAP_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0038	MPAMF_CCAP_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0038	MPAMF_CCAP_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_CPOR_IDR, MPAM Features Cache Portion Partitioning ID register

The MPAMF_CPOR_IDR characteristics are:

Purpose

Indicates the number of bits in MPAMCFG_CPBM<n>.

MPAMF_CPOR_IDR_s indicates the number of bits in the Secure instance of MPAMCFG_CPBM<n>. MPAMF_CPOR_IDR_ns indicates the number of bits in the Non-secure instance of MPAMCFG_CPBM<n>. MPAMF_CPOR_IDR_rt indicates the number of bits in the Root instance of MPAMCFG_CPBM<n>. MPAMF_CPOR_IDR_rl indicates the number of bits in the Realm instance of MPAMCFG_CPBM<n>.

When MPAMF_IDR.HAS_RIS is 1, some fields in this register give information for the resource instance selector, MPAMCFG_PART_SEL.RIS. The description of every field that is affected by MPAMCFG_PART_SEL.RIS has information within the field description.

Configuration

The power domain of MPAMF_CPOR_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv2_MSC is implemented) and MPAMF_IDR.HAS_CPOR_PART == '1'. Otherwise, direct accesses to MPAMF_CPOR_IDR are RES0.

The power and reset domain of each MSC component is specific to that component.

Attributes

MPAMF_CPOR_IDR is a 32-bit register.

Field descriptions

Bits [31:16]

Reserved, RES0.

CPBM_WD, bits [15:0]

Number of bits in the cache portion partitioning bit map of this device. See MPAMCFG_CPBM<n>.

This field must contain a value from 1 to 32768, inclusive. Values greater than 32 require a group of 32-bit registers to access the CPBM, up to 1024 if CPBM_WD is the largest value.

If RIS is implemented, this field indicates the number bits in the cache portion bitmap for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_CPOR_IDR

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_CPOR_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_CPOR_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_CPOR_IDR_s is permitted to have either the same or different contents to MPAMF_CPOR_IDR_ns, MPAMF_CPOR_IDR_rt, or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_ns is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rt or MPAMF_CPOR_IDR_rl.
- MPAMF_CPOR_IDR_rt is permitted to have either the same or different contents to MPAMF_CPOR_IDR_rl.
- There must be separate registers in the Secure (MPAMF_CPOR_IDR_s), Non-secure (MPAMF_CPOR_IDR_ns), Root (MPAMF_CPOR_IDR_rt), and Realm (MPAMF_CPOR_IDR_rl) MPAM feature pages.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- When MPAMF_IDR.HAS_RIS is 1, MPAMF_CPOR_IDR shows the configuration of cache portion partitioning for the cache resource instance selected by MPAMCFG_PART_SEL.RIS. Fields that mention RIS in their field descriptions have values that track the implemented properties of the resource instance. Fields that do not mention RIS are constant across all resource instances.

MPAMF_CPOR_IDR can be accessed through the memory-mapped interfaces:

Component	Offset
MPAM	0x0030

When FEAT_MPAMv2_MSC is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_s	0x0030	MPAMF_CPOR_IDR_s

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_ns	0x0030	MPAMF_CPOR_IDR_ns

Accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rt	0x0030	MPAMF_CPOR_IDR_rt

When FEAT_RME is implemented, accesses to this register are RO.

Component	Frame	Offset	Instance
MPAM	MPAMF_BASE_rl	0x0030	MPAMF_CPOR_IDR_rl

When FEAT_RME is implemented, accesses to this register are RO.

2025-12-10 16:11:30, 2025-12_rel

MPAMF_CSAMON_IDR, MPAM Features Cache Storage Allocation Monitoring ID register

The MPAMF_CSAMON_IDR characteristics are:

Purpose

Indicates the number of cache storage allocation monitor instances and other properties of the CSA monitoring.

Configuration

The power domain of MPAMF_CSAMON_IDR is IMPLEMENTATION DEFINED.

This register is present only when (FEAT_MPAMv1p0 is implemented, or FEAT_MPAMv0p1 is implemented, or FEAT_MPAMv2_MSC is implemented), MPAMF_IDR.HAS_MSMON == '1', and MPAMF_MSMON_IDR.MSMON_CSA == '1'. Otherwise, direct accesses to MPAMF_CSAMON_IDR are RES0.

If FEAT_MPAM is implemented, the following statements apply:

- MPAMF_CSAMON_IDR_s indicates the number and properties of Secure cache storage allocation monitoring.
- MPAMF_CSAMON_IDR_ns indicates the number and properties of Non-secure cache storage allocation monitoring.
- If FEAT_RME is implemented the following statements also apply:
- MPAMF_CSAMON_IDR_rt indicates the number and properties of Root cache storage allocation monitoring.
- MPAMF_CSAMON_IDR_rl indicates the number and properties of Realm cache storage allocation monitoring.

If any one of these features is implemented:

- FEAT_MPAMv0p1
- FEAT_MPAMv1p1
- FEAT_MPAMv2_MSC

then, the following statements apply:

- If MPAMF_IDR.HAS_RIS is 1, fields that mention RIS must reflect the properties of the resource instance currently selected by MPAMCFG_PART_SEL.RIS. Fields that do not mention RIS are constant across all resource instances.

The power and reset domain of each MSC component is specific to that component.

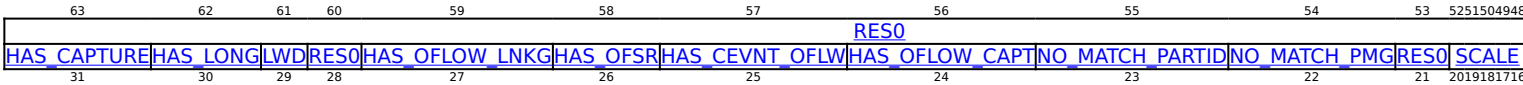
Attributes

MPAMF_CSAMON_IDR is a:

- 64-bit register when FEAT_MPAMv2_MSC is implemented
- 32-bit register when FEAT_MPAMv1p0 is implemented or FEAT_MPAMv0p1 is implemented

Field descriptions

When FEAT_MPAMv2_MSC is implemented:



Bits [63:33]

Reserved, RES0.

HAS_MON_SEC, bit [32]

Reports if monitor instance assignment to physical address space is implemented for the monitor type.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_MON_SEC	Meaning
0b0	Monitor instance assignment to physical address space is not implemented for the monitor type.
0b1	Monitor instance assignment to physical address space is implemented for the monitor type. This value is mandatory if FEAT_RME is implemented.

Access to this field is RO.

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_CSA to the corresponding MSMON_CSA_CAPTURE on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CAPTURE	Meaning
0b0	MSMON_CSA_CAPTURE is not implemented and there is no support for capture events in the CSA monitor.
0b1	The MSMON_CSA_CAPTURE register is implemented and the CSA monitor supports the capture event behavior.

If MPAMF_IDR.HAS_RIS is 1, this field reports that CSA monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_CSAMON_IDR.HAS_LONG is 1, this field also reports that MSMON_CSA_L_CAPTURE is implemented.

Access to this field is RO.

HAS_LONG, bit [30]

Reports whether MSMON_CSA_L is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_LONG	Meaning
0b0	MSMON_CSA_L is not implemented. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE is also not implemented.
0b1	MSMON_CSA_L is implemented. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE is also implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the long CSA monitor is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, this field also reports that MSMON_CSA_L_CAPTURE is implemented.

Access to this field is RO.

LWD, bit [29]
When MPAMF_CSAMON_IDR.HAS_LONG == '1':

Long register VALUE width.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LWD	Meaning
0b0	MSMON_CSA_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_CSA_L has 63-bit VALUE field in bits [62:0]. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

If MPAMF_IDR.HAS_RIS is 1, this field reports the length of the MSMON_CSA_L.VALUE field implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]

Supports MSMON_CFG_CSA_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_LNKG	Meaning
0b0	Does not support CSA overflow linkage.
0b1	Supports CSA overflow linkage and the MSMON_CFG_CSA_CTL.OFLOW_LNKG field.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSA_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_OFSR, bit [26]

The CSA monitor overflow status bitmap register, MSMON_CSA_OFSR, is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFSR	Meaning
0b0	MSMON_CSA_OFSR register is not implemented.
0b1	MSMON_CSA_OFSR register is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the CSA monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_CEVNT_OFLW, bit [25]

Supports MSMON_CFG_CSA_CTL.CEVNT_OFLW field which can enable the CSA monitor instance to perform overflow behaviors on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CEVNT_OFLW	Meaning
0b0	Does not support MSMON_CFG_CSA_CTL.CEVNT_OFLW.
0b1	Supports MSMON_CFG_CSA_CTL.CEVNT_OFLW.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSA_CTL.CEVNT_OFLW is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

HAS_OFLOW_CAPT, bit [24]

Supports MSMON_CFG_CSA_CTL.OFLOW_CAPT field which can enable the CSA monitor instance to capture the monitor on an overflow.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_CAPT	Meaning
0b0	Does not support MSMON_CFG_CSA_CTL.OFLOW_CAPT.
0b1	Supports MSMON_CFG_CSA_CTL.OFLOW_CAPT.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSA_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

NO_MATCH_PARTID, bit [23]

Indicates support for using PARTID identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PARTID	Meaning
0b0	Supports cache storage allocation monitoring based on PARTID.
0b1	Does not support cache storage allocation monitoring based on PARTID.

Access to this field is RO.

NO_MATCH_PMG, bit [22]

Indicates support for using PMG identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PMG	Meaning
0b0	Supports cache storage allocation monitoring based on PMG.
0b1	Does not support cache storage allocation monitoring based on PMG.

Access to this field is RO.

Bit [21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of MSMON_CSA.VALUE in bits. If scaling is enabled by MSMON_CFG_CSA_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

If MPAMF_IDR.HAS_RIS is 1, this field reports the scale value for MSMON_CSA.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

NUM_MON, bits [15:0]

The number of cache storage allocation monitor instances implemented.

The largest MSMON_CFG_MON_SEL.MON_SEL value is NUM_MON minus 1.

If MPAMF_IDR.HAS_RIS is 1, this field reports the number of CSA monitor instances implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When FEAT_MPAMv1p0 is implemented or FEAT_MPAMv0p1 is implemented:

HAS_CAPTURE, bit [31]

The implementation supports copying an MSMON_CSA to the corresponding MSMON_CSA_CAPTURE on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CAPTURE	Meaning
0b0	MSMON_CSA_CAPTURE is not implemented and there is no support for capture events in the CSA monitor.
0b1	The MSMON_CSA_CAPTURE register is implemented and the CSA monitor supports the capture event behavior.

If MPAMF_IDR.HAS_RIS is 1, this field reports that CSA monitor capture is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_CSAMON_IDR.HAS_LONG is 1, this field also reports that MSMON_CSA_L_CAPTURE is implemented.

Access to this field is RO.

HAS_LONG, bit [30]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Reports whether MSMON_CSA_L is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_LONG	Meaning
0b0	MSMON_CSA_L is not implemented. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE is also not implemented.
0b1	MSMON_CSA_L is implemented. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE is also implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the long CSA monitor is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, this field also reports that MSMON_CSA_L_CAPTURE is implemented.

Access to this field is RO.

Otherwise:

Reserved, RES0.

LWD, bit [29]
When (FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented) and MPAMF_CSAMON_IDR.HAS_LONG == '1':

Long register VALUE width.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LWD	Meaning
0b0	MSMON_CSA_L has 44-bit VALUE field in bits [43:0]. Bits [62:44] are RES0. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE also has 44-bit VALUE field in bits [43:0].
0b1	MSMON_CSA_L has 63-bit VALUE field in bits [62:0]. If MPAMF_CSAMON_IDR.HAS_CAPTURE is 1, MSMON_CSA_L_CAPTURE also has 63-bit VALUE field in bits [62:0].

If MPAMF_IDR.HAS_RIS is 1, this field reports the length of the MSMON_CSA_L.VALUE field implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

HAS_OFLOW_LNKG, bit [27]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSA_CTL.OFLOW_LNKG field to control how overflow on an instance affects other monitor instances in this MSC.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_LNKG	Meaning
0b0	Does not support CSA overflow linkage.
0b1	Supports CSA overflow linkage and the MSMON_CFG_CSA_CTL.OFLOW_LNKG field.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSA_CTL.OFLOW_LNKG is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFSR, bit [26]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

The CSA monitor overflow status bitmap register, MSMON_CSA_OFSR, is implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFSR	Meaning
0b0	MSMON_CSA_OFSR register is not implemented.
0b1	MSMON_CSA_OFSR register is implemented.

If MPAMF_IDR.HAS_RIS is 1, this field reports that the CSA monitor overflow status bitmap register is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_CEVNT_OFLW, bit [25]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSA_CTL.CEVNT_OFLW field which can enable the CSA monitor instance to perform overflow behaviors on a capture event.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_CEVNT_OFLW	Meaning
0b0	Does not support MSMON_CFG_CSA_CTL.CEVNT_OFLW.
0b1	Supports MSMON_CFG_CSA_CTL.CEVNT_OFLW.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSA_CTL.CEVNT_OFLW is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

HAS_OFLOW_CAPT, bit [24]
When FEAT_MPAMv0p1 is implemented or FEAT_MPAMv1p1 is implemented:

Supports MSMON_CFG_CSA_CTL.OFLOW_CAPT field which can enable the CSA monitor instance to capture the monitor on an overflow.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HAS_OFLOW_CAPT	Meaning
0b0	Does not support MSMON_CFG_CSA_CTL.OFLOW_CAPT.
0b1	Supports MSMON_CFG_CSA_CTL.OFLOW_CAPT.

If MPAMF_IDR.HAS_RIS is 1, this field reports that MSMON_CFG_CSA_CTL.OFLOW_CAPT is implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

Access to this field is RO.

Otherwise:

Reserved, RES0.

NO_MATCH_PARTID, bit [23]

Indicates support for using PARTID identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PARTID	Meaning
0b0	Supports cache storage allocation monitoring based on PARTID.
0b1	Does not support cache storage allocation monitoring based on PARTID.

Access to this field is RO.

NO_MATCH_PMG, bit [22]

Indicates support for using PMG identifiers for monitoring.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NO_MATCH_PMG	Meaning
0b0	Supports cache storage allocation monitoring based on PMG.
0b1	Does not support cache storage allocation monitoring based on PMG.

Access to this field is RO.

Bit [21]

Reserved, RES0.

SCALE, bits [20:16]

Scaling of MSMON_CSA.VALUE in bits. If scaling is enabled by MSMON_CFG_CSA_CTL.SCLEN, the byte count in the VALUE field has been shifted by SCALE bits to the right.

If MPAMF_IDR.HAS_RIS is 1, this field reports the scale value for MSMON_CSA.VALUE field for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

NUM_MON, bits [15:0]

The number of cache storage allocation monitor instances implemented.

The largest MSMON_CFG_MON_SEL.MON_SEL value is NUM_MON minus 1.

If MPAMF_IDR.HAS_RIS is 1, this field reports the number of CSA monitor instances implemented for the resource instance selected by MPAMCFG_PART_SEL.RIS.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPAMF_CSAMON_IDR

This register is within the MPAM feature page memory frames.

If FEAT_MPAM is implemented, the following statements apply:

- In a system that supports Secure and Non-secure memory maps, there must be both Secure and Non-secure MPAM feature pages.
- MPAMF_CSAMON_IDR must be readable from the Non-secure and Secure MPAM feature pages.
- MPAMF_CSAMON_IDR is permitted to have the same contents when read from the Secure or Non-secure MPAM feature pages unless the register contents are different for the different versions, when MPAMF_CSAMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSAMON_IDR_ns.
- There must be separate registers in the Secure (MPAMF_CSAMON_IDR_s) and Non-secure (MPAMF_CSAMON_IDR_ns) MPAM feature pages.

If both FEAT_MPAM and FEAT_RME are implemented, the following statements apply:

- In a system that supports Secure, Non-secure, Root, and Realm memory maps, there must be MPAM feature pages in all four address maps.
- MPAMF_CSAMON_IDR must be readable from the Non-secure, Secure, Root, and Realm MPAM feature pages.
- MPAMF_CSAMON_IDR is permitted to have the same contents when read from the Secure, Non-secure, Root, and Realm MPAM feature pages unless the register contents are different for the different versions:
- MPAMF_CSAMON_IDR_s is permitted to have either the same or different contents to MPAMF_CSAMON_IDR_ns, MPAMF_CSAMON_IDR_rt, or MPAMF_CSAMON_IDR_rl.
- MPAMF_CSAMON_IDR_ns is permitted to have either the same or different contents to MPAMF_CSAMON_IDR_rt or MPAMF_CSAMON_IDR_rl.
- MPAMF_CSAMON_IDR_rt is permitted to have either the same or different contents to MPAMF_CSAMON_IDR_rl.
