MPIDR_EL1, Multiprocessor Affinity Register

The MPIDR_EL1 characteristics are:

Purpose

In a multiprocessor system, provides an additional PE identification mechanism.

Configuration

AArch64 System register MPIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register MPIDR[31:0].

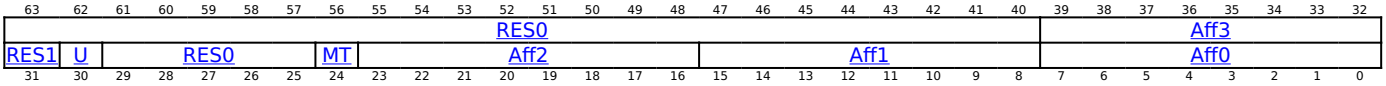
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MPIDR_EL1 are UNDEFINED.

In a uniprocessor system, Arm recommends that each Aff<n> field of this register returns a value of 0.

Attributes

MPIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

Affinity level 3. See the description of Aff0 for more information.

Aff3 is not supported in AArch32 state.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [31]

Reserved, RES1.

U, bit [30]

Indicates a Uniprocessor system, as distinct from PE 0 in a multiprocessor system.

The value of this field is an IMPLEMENTATION DEFINED choice of:

U	Meaning
0b0	Processor is part of a multiprocessor system.
0b1	Processor is part of a uniprocessor system.

Access to this field is RO.

Bits [29:25]

Reserved, RES0.

MT, bit [24]

Indicates whether the lowest level of affinity consists of logical PEs that are implemented using an interdependent approach, such as multithreading. See the description of Aff0 for more information about affinity levels.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MT	Meaning
0b0	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is largely independent.
0b1	Performance of PEs with different affinity level 0 values, and the same values for affinity level 1 and higher, is very interdependent.

Note

This field does not indicate that multithreading is implemented and does not indicate that PEs with different affinity level 0 values, and the same values for affinity level 1 and higher are implemented.

Access to this field is RO.

Aff2, bits [23:16]

Affinity level 2. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff1, bits [15:8]

Affinity level 1. See the description of Aff0 for more information.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Aff0, bits [7:0]

Affinity level 0. The value of the MPIDR.{Aff2, Aff1, Aff0} or MPIDR_EL1.{Aff3, Aff2, Aff1, Aff0} set of fields of each PE must be unique within the system as a whole.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing MPIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MPIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0000	0b101

```
if !IsFeatureImplemented(FEAT_AA64) then
    UnimplementedIDRegister();

    X{64}(t) = MPIDR_EL1();
elsif PSTATE.EL == EL3 then
    X{64}(t) = MPIDR_EL1();
end;
```

MVFR0_EL1, AArch32 Media and VFP Feature Register 0

The MVFR0_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR1_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR0_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR0[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MVFR0_EL1 are UNDEFINED.

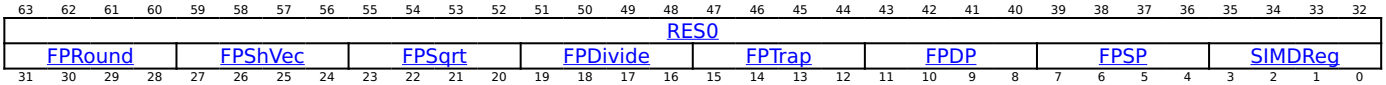
In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR0_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

FPRound, bits [31:28]

Floating-Point Rounding modes. Indicates whether the floating-point implementation provides support for rounding modes.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPRound	Meaning
0b0000	Not implemented, or only Round to Nearest mode supported, except that Round towards Zero mode is supported for VCVT instructions that always use that rounding mode regardless of the FPSCR setting.
0b0001	All rounding modes supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

FPShVec, bits [27:24]

Short Vectors. Indicates whether the floating-point implementation provides support for the use of short vectors.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPShVec	Meaning
0b0000	Short vectors not supported.
0b0001	Short vector operation supported.

All other values are reserved.

In Armv8-A the only permitted value is 0b0000.

Access to this field is RO.

FPSqrt, bits [23:20]

Square Root. Indicates whether the floating-point implementation provides support for the ARMv6 VFP square root operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSqrt	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VSQRT.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VSQRT.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is RO.

FPDivide, bits [19:16]

Indicates whether the floating-point implementation provides support for VFP divide operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDivide	Meaning
0b0000	Not supported in hardware.
0b0001	Supported.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0001.

The VDIV.F32 instruction also requires the single-precision floating-point attribute, bits [7:4], and the VDIV.F64 instruction also requires the double-precision floating-point attribute, bits [11:8].

Access to this field is RO.

FPTrap, bits [15:12]

Floating-Point Exception Trapping. Indicates whether the floating-point implementation provides support for exception trapping.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPTrap	Meaning
0b0000	Not supported.
0b0001	Supported.

All other values are reserved.

A value of 0b0001 indicates that, when the corresponding trap is enabled, a floating-point exception generates an exception.

Access to this field is RO.

FPDP, bits [11:8]

Floating-Point Double-Precision. Indicates whether the floating-point implementation provides support for double-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3, VFPv4, or Armv8. VFPv3 and Armv8 add an instruction to load a double-precision floating-point constant, and conversions between double-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP double-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F64 is only available if the Square root field is 0b0001.
- VDIV.F64 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the single-precision field is nonzero.

Access to this field is RO.

FPSP, bits [7:4]

Floating-Point Single-Precision. Indicates whether the floating-point implementation provides support for single-precision operations.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPSP	Meaning
0b0000	Not supported in hardware.
0b0001	Supported, VFPv2.
0b0010	Supported, VFPv3 or VFPv4. VFPv3 adds an instruction to load a single-precision floating-point constant, and conversions between single-precision and fixed-point values.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

A value of 0b0001 or 0b0010 indicates support for all VFP single-precision instructions in the supported version of VFP, except that, in addition to this field being nonzero:

- VSQRT.F32 is only available if the Square root field is 0b0001.
- VDIV.F32 is only available if the Divide field is 0b0001.
- Conversion between double-precision and single-precision is only available if the double-precision field is nonzero.

Access to this field is RO.

SIMDReg, bits [3:0]

Advanced SIMD registers. Indicates whether the Advanced SIMD and floating-point implementation provides support for the Advanced SIMD and floating-point register bank.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDReg	Meaning
0b0000	The implementation has no Advanced SIMD and floating-point support.
0b0001	The implementation includes floating-point support with 16 x 64-bit registers.
0b0010	The implementation includes Advanced SIMD and floating-point support with 32 x 64-bit registers.

All other values are reserved.

In Armv8-A the permitted values are 0b0000 and 0b0010.

Access to this field is RO.

Otherwise:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
UNKNOWN

2025-12-10 16:11:30, 2025-12_rel

MVFR1_EL1, AArch32 Media and VFP Feature Register 1

The MVFR1_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR2_EL1.

For general information about the interpretation of the ID registers see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR1_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR1[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MVFR1_EL1 are UNDEFINED.

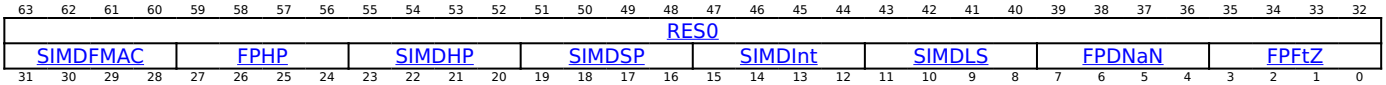
In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR1_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:32]

Reserved, RES0.

SIMDFMAC, bits [31:28]

Advanced SIMD Fused Multiply-Accumulate. Indicates whether the Advanced SIMD implementation provides fused multiply accumulate instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDFMAC	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

The Advanced SIMD and floating-point implementations must provide the same level of support for these instructions.

Access to this field is RO.

FPHP, bits [27:24]

Floating-Point Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPHP	Meaning
0b0000	Not supported.
0b0001	Floating-point half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds instructions for conversion between double-precision and half-precision.
0b0011	As for 0b0010, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8, the permitted values are:

- 0b0000 in an implementation without floating-point support.
- 0b0010 in an implementation with floating-point support that does not include the FEAT_FP16 extension.
- 0b0011 in an implementation with floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the SIMDHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

Access to this field is RO.

SIMDHP, bits [23:20]

Advanced SIMD Half-Precision. Indicates the level of half-precision floating-point support.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDHP	Meaning
0b0000	Not supported.
0b0001	SIMD half-precision conversion instructions are supported for conversion between single-precision and half-precision.
0b0010	As for 0b0001, and adds support for half-precision floating-point arithmetic.

All other values are reserved.

In Armv8, the permitted values are:

- 0b0000 in an implementation without SIMD floating-point support.
- 0b0001 in an implementation with SIMD floating-point support that does not include the FEAT_FP16 extension.
- 0b0010 in an implementation with SIMD floating-point support that includes the FEAT_FP16 extension.

The level of support indicated by this field must be equivalent to the level of support indicated by the FPHP field, meaning the permitted values are:

Half-Precision instructions supported	FPHP	SIMDHP
No support	0b0000	0b0000
Conversions only	0b0010	0b0001
Conversions and arithmetic	0b0011	0b0010

Access to this field is RO.

SIMDSP, bits [19:16]

Advanced SIMD Single-Precision. Indicates whether the Advanced SIMD and floating-point implementation provides single-precision floating-point instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDSP	Meaning
0b0000	Not implemented.
0b0001	Implemented. This value is permitted only if the SIMDInt field is 0b0001.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

SIMDInt, bits [15:12]

Advanced SIMD Integer. Indicates whether the Advanced SIMD and floating-point implementation provides integer instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDInt	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

SIMDLS, bits [11:8]

Advanced SIMD Load/Store. Indicates whether the Advanced SIMD and floating-point implementation provides load/store instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SIMDLS	Meaning
0b0000	Not implemented.
0b0001	Implemented.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

FPDNaN, bits [7:4]

Default NaN mode. Indicates whether the floating-point implementation provides support only for the Default NaN mode.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPDNaN	Meaning
0b0000	Not implemented, or hardware supports only the Default NaN mode.
0b0001	Hardware supports propagation of NaN values.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

FPFtZ, bits [3:0]

Flush to Zero mode. Indicates whether the floating-point implementation provides support only for the Flush-to-Zero mode of operation.

The value of this field is an IMPLEMENTATION DEFINED choice of:

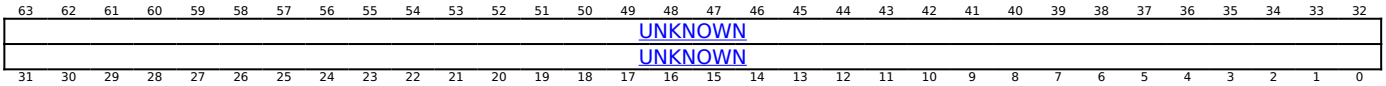
FPFtZ	Meaning
0b0000	Not implemented, or hardware supports only the Flush-to-Zero mode of operation.
0b0001	Hardware supports full denormalized number arithmetic.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0001.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR1_EL1

Accesses to this register use the following encodings in the System register encoding space:

end;
```

MVFR2_EL1, AArch32 Media and VFP Feature Register 2

The MVFR2_EL1 characteristics are:

Purpose

Describes the features provided by the AArch32 Advanced SIMD and floating-point implementation.

Must be interpreted with MVFR0_EL1 and MVFR1_EL1.

For general information about the interpretation of the ID registers, see 'Principles of the ID scheme for fields in ID registers'.

Configuration

AArch64 System register MVFR2_EL1 bits [31:0] are architecturally mapped to AArch32 System register MVFR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to MVFR2_EL1 are UNDEFINED.

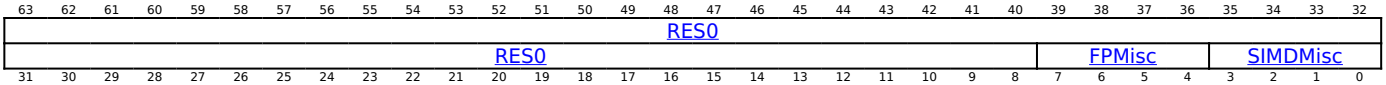
In an implementation where at least one Exception level supports execution in AArch32 state, but there is no support for Advanced SIMD and floating-point operation, this register is RAZ.

Attributes

MVFR2_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented:



Bits [63:8]

Reserved, RES0.

FPMisc, bits [7:4]

Indicates whether the floating-point implementation provides support for miscellaneous VFP features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Support for Floating-point selection.
0b0010	As 0b0001, and Floating-point Conversion to Integer with Directed Rounding modes.
0b0011	As 0b0010, and Floating-point Round to Integer Floating-point.
0b0100	As 0b0011, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0100.

Access to this field is RO.

SIMDMisc, bits [3:0]

Indicates whether the Advanced SIMD implementation provides support for miscellaneous Advanced SIMD features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

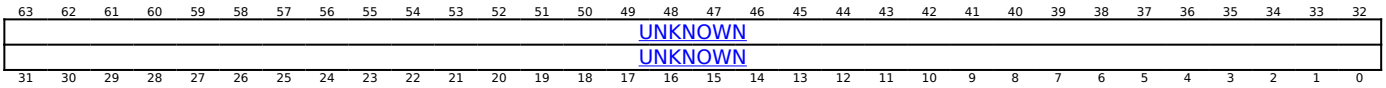
SIMDMisc	Meaning
0b0000	Not implemented, or no support for miscellaneous features.
0b0001	Floating-point Conversion to Integer with Directed Rounding modes.
0b0010	As 0b0001, and Floating-point Round to Integer Floating-point.
0b0011	As 0b0010, and Floating-point MaxNum and MinNum.

All other values are reserved.

In Armv8-A, the permitted values are 0b0000 and 0b0011.

Access to this field is RO.

Otherwise:



Bits [63:0]

Reserved, UNKNOWN.

Accessing MVFR2_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, MVFR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0000	0b0011	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    UnimplementedIDRegister();

    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = MVFR2_EL1();
end;
```

NVHCR_EL2, Nested Virtual Hypervisor Configuration Register

The NVHCR_EL2 characteristics are:

Purpose

Provides storage for a virtual view of HCR_EL2 under nested virtualization. Except for the TGE bit, all bits in this register are simply stateful and have no effect on PE behavior.

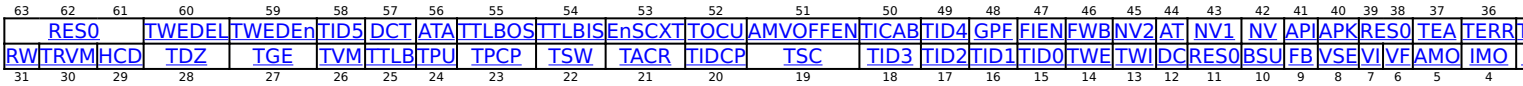
Configuration

This register is present only when FEAT_NV3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to NVHCR_EL2 are UNDEFINED.

Attributes

NVHCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:61]

Reserved, RES0.

TWEDEL, bit [60]
When FEAT_TWED is implemented:

Storage for the virtual view of HCR_EL2.TWEDEL under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TWEDEL == '1'.

Otherwise:

Reserved, RES0.

TWEDEn, bit [59]
When FEAT_TWED is implemented:

Storage for the virtual view of HCR_EL2.TWEDEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TWEDEn == '1'.

Otherwise:

Reserved, RES0.

TID5, bit [58]
When FEAT_MTE2 is implemented:

Storage for the virtual view of HCR_EL2.TID5 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TID5 == '1'.

Otherwise:

Reserved, RES0.

DCT, bit [57]
When FEAT_MTE2 is implemented:

Storage for the virtual view of HCR_EL2.DCT under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.DCT == '1'.

Otherwise:

Reserved, RES0.

ATA, bit [56]
When FEAT_MTE2 is implemented:

Storage for the virtual view of HCR_EL2.ATA under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.ATA == '1'.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]
When FEAT_EVT is implemented:

Storage for the virtual view of HCR_EL2.TTLBOS under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.

◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
◦ NVHCRMASK_EL2.TTLBOS == '1'.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]
When FEAT_EVT is implemented:

Storage for the virtual view of HCR_EL2.TTLBIS under nested virtualization.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
◦ FEAT_SRMASK2 is implemented.
◦ PSTATE.EL == EL2.
◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
◦ NVHCRMASK_EL2.TTLBIS == '1'.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]
When FEAT_CSV2_2 is implemented:

Storage for the virtual view of HCR_EL2.EnSCXT under nested virtualization.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
◦ FEAT_SRMASK2 is implemented.
◦ PSTATE.EL == EL2.
◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
◦ NVHCRMASK_EL2.EnSCXT == '1'.

Otherwise:

Reserved, RES0.

TOCU, bit [52]
When FEAT_EVT is implemented:

Storage for the virtual view of HCR_EL2.TOCU under nested virtualization.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
◦ FEAT_SRMASK2 is implemented.
◦ PSTATE.EL == EL2.
◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
◦ NVHCRMASK_EL2.TOCU == '1'.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]
When FEAT_AMUv1p1 is implemented:

Storage for the virtual view of HCR_EL2.AMVOFFEN under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.AMVOFFEN == '1'.

Otherwise:

Reserved, RES0.

TICAB, bit [50]
When FEAT_EVT is implemented:

Storage for the virtual view of HCR_EL2.TICAB under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TICAB == '1'.

Otherwise:

Reserved, RES0.

TID4, bit [49]
When FEAT_EVT is implemented:

Storage for the virtual view of HCR_EL2.TID4 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TID4 == '1'.

Otherwise:

Reserved, RES0.

GPF, bit [48]
When FEAT_RME is implemented:

Storage for the virtual view of HCR_EL2.GPF under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.GPF == '1'.

Otherwise:

Reserved, RES0.

FIEN, bit [47]
When FEAT_RASv1p1 is implemented:

Storage for the virtual view of HCR_EL2.FIEN under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.FIEN == '1'.

Otherwise:

Reserved, RES0.

FWB, bit [46]
When FEAT_S2FWB is implemented:

Storage for the virtual view of HCR_EL2.FWB under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.FWB == '1'.

Otherwise:

Reserved, RES0.

NV2, bit [45]
When FEAT_NV2 is implemented:

Storage for the virtual view of HCR_EL2.NV2 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.NV2 == '1'.

Otherwise:

Reserved, RES0.

AT, bit [44]
When FEAT_NV is implemented:

Storage for the virtual view of HCR_EL2.AT under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.AT == '1'.

Otherwise:

Reserved, RES0.

NV1, bit [43]
When FEAT_NV is implemented:

Storage for the virtual view of HCR_EL2.NV1 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.NV1 == '1'.

Otherwise:

Reserved, RES0.

NV, bit [42]
When FEAT_NV is implemented:

Storage for the virtual view of HCR_EL2.NV under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.NV == '1'.

Otherwise:

Reserved, RES0.

API, bit [41]
When FEAT_PAuth is implemented:

Storage for the virtual view of HCR_EL2.API under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.API == '1'.

Otherwise:

Reserved, RES0.

APK, bit [40]
When FEAT_PAuth is implemented:

Storage for the virtual view of HCR_EL2.APK under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.APK == '1'.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TEA, bit [37]
When FEAT_RAS is implemented:

Storage for the virtual view of HCR_EL2.TEA under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TEA == '1'.

Otherwise:

Reserved, RES0.

TERR, bit [36]
When FEAT_RAS is implemented:

Storage for the virtual view of HCR_EL2.TERR under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TERR == '1'.

Otherwise:

Reserved, RES0.

TLOR, bit [35]
When FEAT_LOR is implemented:

Storage for the virtual view of HCR_EL2.TLOR under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TLOR == '1'.

Otherwise:

Reserved, RES0.

E2H, bit [34]
When FEAT_VHE is implemented:

Storage for the virtual view of HCR_EL2.E2H under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.E2H == '1'.

Otherwise:

Reserved, RES0.

ID, bit [33]

Storage for the virtual view of HCR_EL2.ID under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.ID == '1'.

CD, bit [32]

Storage for the virtual view of HCR_EL2.CD under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.CD == '1'.

RW, bit [31]
When FEAT_AA32EL1 is implemented:

Storage for the virtual view of HCR_EL2.RW under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRVM, bit [30]

Storage for the virtual view of HCR_EL2.TRVM under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TRVM == '1'.

HCD, bit [29]
When EL3 is not implemented:

Storage for the virtual view of HCR_EL2.HCD under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - NVHCRMASK_EL2.HCD == '1'.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Storage for the virtual view of HCR_EL2.TDZ under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TDZ == '1'.

TGE, bit [27]

Guest TGE control bit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TGE == '1'.

TVM, bit [26]

Storage for the virtual view of HCR_EL2.TVM under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TVM == '1'.

TTLB, bit [25]

Storage for the virtual view of HCR_EL2.TTLB under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TTLB == '1'.

TPU, bit [24]

Storage for the virtual view of HCR_EL2.TPU under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TPU == '1'.

TPCP, bit [23]

Storage for the virtual view of HCR_EL2.TPCP under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TPCP == '1'.

TSW, bit [22]

Storage for the virtual view of HCR_EL2.TSW under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TSW == '1'.

TACR, bit [21]

Storage for the virtual view of HCR_EL2.TACR under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TACR == '1'.

TIDCP, bit [20]

Storage for the virtual view of HCR_EL2.TIDCP under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TIDCP == '1'.

TSC, bit [19]

Storage for the virtual view of HCR_EL2.TSC under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TSC == '1'.

TID3, bit [18]

Storage for the virtual view of HCR_EL2.TID3 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TID3 == '1'.

TID2, bit [17]

Storage for the virtual view of HCR_EL2.TID2 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TID2 == '1'.

TID1, bit [16]

Storage for the virtual view of HCR_EL2.TID1 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TID1 == '1'.

TID0, bit [15]
When FEAT_AA32 is implemented:

Storage for the virtual view of HCR_EL2.TID0 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TID0 == '1'.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Storage for the virtual view of HCR_EL2.TWE under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TWE == '1'.

TWI, bit [13]

Storage for the virtual view of HCR_EL2.TWI under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.TWI == '1'.

DC, bit [12]

Storage for the virtual view of HCR_EL2.DC under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.

- EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
- NVHCRMASK_EL2.DC == '1'.

Bit [11]

Reserved, RES0.

BSU, bit [10]

Storage for the virtual view of HCR_EL2.BSU under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.BSU == '1'.

FB, bit [9]

Storage for the virtual view of HCR_EL2.FB under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.FB == '1'.

VSE, bit [8]

Storage for the virtual view of HCR_EL2.VSE under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.VSE == '1'.

VI, bit [7]

Storage for the virtual view of HCR_EL2.VI under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.VI == '1'.

VF, bit [6]

Storage for the virtual view of HCR_EL2.VF under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.VF == '1'.

AMO, bit [5]

Storage for the virtual view of HCR_EL2.AMO under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.AMO == '1'.

IMO, bit [4]

Storage for the virtual view of HCR_EL2.IMO under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.IMO == '1'.

FMO, bit [3]

Storage for the virtual view of HCR_EL2.FMO under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.FMO == '1'.

PTW, bit [2]

Storage for the virtual view of HCR_EL2.PTW under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.PTW == '1'.

SWIO, bit [1]

Storage for the virtual view of HCR_EL2.SWIO under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.SWIO == '1'.

VM, bit [0]

Storage for the virtual view of HCR_EL2.VM under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRMASK_EL2.VM == '1'.

Accessing NVHCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, NVHCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0101	0b000

```
if !(IsFeatureImplemented(FEAT_NV3) && IsFeatureImplemented(FEAT_AA64)) then

NVHCRMASK_EL2, Nested Virtual Hypervisor Configuration Masking Register

The NVHCRMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in NVHCR_EL2 on direct writes to NVHCR_EL2.

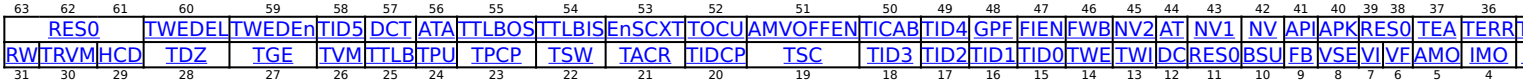
Configuration

This register is present only when FEAT_NV3 is implemented, FEAT_SRMASK2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to NVHCRMASK_EL2 are UNDEFINED.

Attributes

NVHCRMASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:61]

Reserved, RES0.

TWEDEL, bit [60]
When FEAT_TWED is implemented:

Mask bit for TWEDEL.

TWEDEL	Meaning
0b0	NVHCR_EL2.TWEDEL is writeable.
0b1	NVHCR_EL2.TWEDEL is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [59]
When FEAT_TWED is implemented:

Mask bit for TWEDEn.

TWEDEn	Meaning
0b0	NVHCR_EL2.TWEDEn is writeable.
0b1	NVHCR_EL2.TWEDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [58]
When FEAT_MTE2 is implemented:

Mask bit for TID5.

TID5	Meaning
0b0	NVHCR_EL2.TID5 is writeable.
0b1	NVHCR_EL2.TID5 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DCT, bit [57]
When FEAT_MTE2 is implemented:

Mask bit for DCT.

DCT	Meaning
0b0	NVHCR_EL2.DCT is writeable.
0b1	NVHCR_EL2.DCT is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [56]
When FEAT_MTE2 is implemented:

Mask bit for ATA.

ATA	Meaning
0b0	NVHCR_EL2.ATA is writeable.
0b1	NVHCR_EL2.ATA is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBOS, bit [55]
When FEAT_EVT2 is implemented:

Mask bit for TTLBOS.

TTLBOS	Meaning
0b0	NVHCR_EL2.TTLBOS is writeable.
0b1	NVHCR_EL2.TTLBOS is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTLBIS, bit [54]
When FEAT_EVT2 is implemented:

Mask bit for TTLBIS.

TTLBIS	Meaning
0b0	NVHCR_EL2.TTLBIS is writeable.
0b1	NVHCR_EL2.TTLBIS is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [53]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Mask bit for EnSCXT.

EnSCXT	Meaning
0b0	NVHCR_EL2.EnSCXT is writeable.
0b1	NVHCR_EL2.EnSCXT is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TOCU, bit [52]
When FEAT_EVT is implemented:

Mask bit for TOCU.

TOCU	Meaning
0b0	NVHCR_EL2.TOCU is writeable.
0b1	NVHCR_EL2.TOCU is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [51]
When FEAT_AMUv1p1 is implemented:

Mask bit for AMVOFFEN.

AMVOFFEN	Meaning
0b0	NVHCR_EL2.AMVOFFEN is writeable.
0b1	NVHCR_EL2.AMVOFFEN is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TICAB, bit [50]
When FEAT_EVT is implemented:

Mask bit for TICAB.

TICAB	Meaning
0b0	NVHCR_EL2.TICAB is writeable.
0b1	NVHCR_EL2.TICAB is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID4, bit [49]
When FEAT_EVT is implemented:

Mask bit for TID4.

TID4	Meaning
0b0	NVHCR_EL2.TID4 is writeable.
0b1	NVHCR_EL2.TID4 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]
When FEAT_RME is implemented:

Mask bit for GPF.

GPF	Meaning
0b0	NVHCR_EL2.GPF is writeable.
0b1	NVHCR_EL2.GPF is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIEN, bit [47]
When FEAT_RASv1p1 is implemented:

Mask bit for FIEN.

FIEN	Meaning
0b0	NVHCR_EL2.FIEN is writeable.
0b1	NVHCR_EL2.FIEN is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FWB, bit [46]
When FEAT_S2FWB is implemented:

Mask bit for FWB.

FWB	Meaning
0b0	NVHCR_EL2.FWB is writeable.
0b1	NVHCR_EL2.FWB is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV2, bit [45]
When FEAT_NV2 is implemented:

Mask bit for NV2.

NV2	Meaning
0b0	NVHCR_EL2.NV2 is writeable.
0b1	NVHCR_EL2.NV2 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AT, bit [44]
When FEAT_NV is implemented:

Mask bit for AT.

AT	Meaning
0b0	NVHCR_EL2.AT is writeable.
0b1	NVHCR_EL2.AT is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV1, bit [43]
When FEAT_NV is implemented:

Mask bit for NV1.

NV1	Meaning
0b0	NVHCR_EL2.NV1 is writeable.
0b1	NVHCR_EL2.NV1 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NV, bit [42]
When FEAT_NV is implemented:

Mask bit for NV.

NV	Meaning
0b0	NVHCR_EL2.NV is writeable.
0b1	NVHCR_EL2.NV is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [41]
When FEAT_PAuth is implemented:

Mask bit for API.

API	Meaning
0b0	NVHCR_EL2.API is writeable.
0b1	NVHCR_EL2.API is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [40]
When FEAT_PAuth is implemented:

Mask bit for APK.

APK	Meaning
0b0	NVHCR_EL2.APK is writeable.
0b1	NVHCR_EL2.APK is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

TEA, bit [37]
When FEAT_RAS is implemented:

Mask bit for TEA.

TEA	Meaning
0b0	NVHCR_EL2.TEA is writeable.
0b1	NVHCR_EL2.TEA is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [36]
When FEAT_RAS is implemented:

Mask bit for TERR.

TERR	Meaning
0b0	NVHCR_EL2.TERR is writeable.
0b1	NVHCR_EL2.TERR is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [35]
When FEAT_LOR is implemented:

Mask bit for TLOR.

TLOR	Meaning
0b0	NVHCR_EL2.TLOR is writeable.
0b1	NVHCR_EL2.TLOR is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E2H, bit [34]
When FEAT_VHE is implemented:

Mask bit for E2H.

E2H	Meaning
0b0	NVHCR_EL2.E2H is writeable.
0b1	NVHCR_EL2.E2H is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ID, bit [33]

Mask bit for ID.

ID	Meaning
0b0	NVHCR_EL2.ID is writeable.
0b1	NVHCR_EL2.ID is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CD, bit [32]

Mask bit for CD.

CD	Meaning
0b0	NVHCR_EL2.CD is writeable.
0b1	NVHCR_EL2.CD is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [31]
When FEAT_AA32EL1 is implemented:

Mask bit for RW.

RW	Meaning
0b0	NVHCR_EL2.RW is writeable.
0b1	NVHCR_EL2.RW is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRVM, bit [30]

Mask bit for TRVM.

TRVM	Meaning
0b0	NVHCR_EL2.TRVM is writeable.
0b1	NVHCR_EL2.TRVM is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCD, bit [29]
When EL3 is not implemented:

Mask bit for HCD.

HCD	Meaning
0b0	NVHCR_EL2.HCD is writeable.
0b1	NVHCR_EL2.HCD is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TDZ, bit [28]

Mask bit for TDZ.

TDZ	Meaning
0b0	NVHCR_EL2.TDZ is writeable.
0b1	NVHCR_EL2.TDZ is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TGE, bit [27]

Mask bit for TGE.

TGE	Meaning
0b0	NVHCR_EL2.TGE is writeable.
0b1	NVHCR_EL2.TGE is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TVM, bit [26]

Mask bit for TVM.

TVM	Meaning
0b0	NVHCR_EL2.TVM is writeable.
0b1	NVHCR_EL2.TVM is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TTLB, bit [25]

Mask bit for TTLB.

TTLB	Meaning
0b0	NVHCR_EL2.TTLB is writeable.
0b1	NVHCR_EL2.TTLB is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPU, bit [24]

Mask bit for TPU.

TPU	Meaning
0b0	NVHCR_EL2.TPU is writeable.
0b1	NVHCR_EL2.TPU is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TPCP, bit [23]

Mask bit for TPCP.

TPCP	Meaning
0b0	NVHCR_EL2.TPCP is writeable.
0b1	NVHCR_EL2.TPCP is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSW, bit [22]

Mask bit for TSW.

TSW	Meaning
0b0	NVHCR_EL2.TSW is writeable.
0b1	NVHCR_EL2.TSW is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TACR, bit [21]

Mask bit for TACR.

TACR	Meaning
0b0	NVHCR_EL2.TACR is writeable.
0b1	NVHCR_EL2.TACR is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TIDCP, bit [20]

Mask bit for TIDCP.

TIDCP	Meaning
0b0	NVHCR_EL2.TIDCP is writeable.
0b1	NVHCR_EL2.TIDCP is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TSC, bit [19]

Mask bit for TSC.

TSC	Meaning
0b0	NVHCR_EL2.TSC is writeable.
0b1	NVHCR_EL2.TSC is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID3, bit [18]

Mask bit for TID3.

TID3	Meaning
0b0	NVHCR_EL2.TID3 is writeable.
0b1	NVHCR_EL2.TID3 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID2, bit [17]

Mask bit for TID2.

TID2	Meaning
0b0	NVHCR_EL2.TID2 is writeable.
0b1	NVHCR_EL2.TID2 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID1, bit [16]

Mask bit for TID1.

TID1	Meaning
0b0	NVHCR_EL2.TID1 is writeable.
0b1	NVHCR_EL2.TID1 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TID0, bit [15]
When FEAT_AA32 is implemented:

Mask bit for TID0.

TID0	Meaning
0b0	NVHCR_EL2.TID0 is writeable.
0b1	NVHCR_EL2.TID0 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [14]

Mask bit for TWE.

TWE	Meaning
0b0	NVHCR_EL2.TWE is writeable.
0b1	NVHCR_EL2.TWE is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [13]

Mask bit for TWI.

TWI	Meaning
0b0	NVHCR_EL2.TWI is writeable.
0b1	NVHCR_EL2.TWI is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DC, bit [12]

Mask bit for DC.

DC	Meaning
0b0	NVHCR_EL2.DC is writeable.
0b1	NVHCR_EL2.DC is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

BSU, bit [10]

Mask bit for BSU.

BSU	Meaning
0b0	NVHCR_EL2.BSU is writeable.
0b1	NVHCR_EL2.BSU is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FB, bit [9]

Mask bit for FB.

FB	Meaning
0b0	NVHCR_EL2.FB is writeable.
0b1	NVHCR_EL2.FB is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VSE, bit [8]

Mask bit for VSE.

VSE	Meaning
0b0	NVHCR_EL2.VSE is writeable.
0b1	NVHCR_EL2.VSE is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VI, bit [7]

Mask bit for VI.

VI	Meaning
0b0	NVHCR_EL2.VI is writeable.
0b1	NVHCR_EL2.VI is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VF, bit [6]

Mask bit for VF.

VF	Meaning
0b0	NVHCR_EL2.VF is writeable.
0b1	NVHCR_EL2.VF is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

AMO, bit [5]

Mask bit for AMO.

AMO	Meaning
0b0	NVHCR_EL2.AMO is writeable.
0b1	NVHCR_EL2.AMO is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMO, bit [4]

Mask bit for IMO.

IMO	Meaning
0b0	NVHCR_EL2.IMO is writeable.
0b1	NVHCR_EL2.IMO is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FMO, bit [3]

Mask bit for FMO.

FMO	Meaning
0b0	NVHCR_EL2.FMO is writeable.
0b1	NVHCR_EL2.FMO is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [2]

Mask bit for PTW.

PTW	Meaning
0b0	NVHCR_EL2.PTW is writeable.
0b1	NVHCR_EL2.PTW is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SWIO, bit [1]

Mask bit for SWIO.

SWIO	Meaning
0b0	NVHCR_EL2.SWIO is writeable.
0b1	NVHCR_EL2.SWIO is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

VM, bit [0]

Mask bit for VM.

VM	Meaning
0b0	NVHCR_EL2.VM is writeable.
0b1	NVHCR_EL2.VM is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing NVHCRMASK_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, NVHCRMASK_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0101	0b100

```
if !(IsFeatureImplemented(FEAT_NV3) && IsFeatureImplemented(FEAT_SRMASK2) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then

NVHCRX_EL2, Nested Virtual Extended Hypervisor Configuration Register

The NVHCRX_EL2 characteristics are:

Purpose

Provides storage for a virtual view of HCRX_EL2 under nested virtualization.

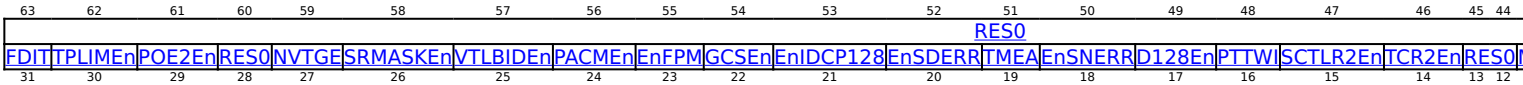
Configuration

This register is present only when FEAT_NV3 is implemented, FEAT_SRMASK2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to NVHCRX_EL2 are UNDEFINED.

Attributes

NVHCRX_EL2 is a 64-bit register.

Field descriptions



Bits [63:37]

Reserved, RES0.

FNB, bit [36]
When FEAT_TLBID is implemented:

Storage for the virtual view of HCRX_EL2.FNB under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.FNB == '1'.

Otherwise:

Reserved, RES0.

VTLBIDOSEn, bit [35]
When FEAT_TLBID is implemented:

Storage for the virtual view of HCRX_EL2.VTLBIDOSEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.VTLBIDOSEn == '1'.

Otherwise:

Reserved, RES0.

NVnTTLBOS, bit [34]
When FEAT_NV3 is implemented:

Storage for the virtual view of HCRX_EL2.NVnTTLBOS under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.NVnTTLBOS == '1'.

Otherwise:

Reserved, RES0.

NVnTTLBIS, bit [33]
When FEAT_NV3 is implemented:

Storage for the virtual view of HCRX_EL2.NVnTTLBIS under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.NVnTTLBIS == '1'.

Otherwise:

Reserved, RES0.

NVnTTLB, bit [32]
When FEAT_NV3 is implemented:

Storage for the virtual view of HCRX_EL2.NVnTTLB under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.NVnTTLB == '1'.

Otherwise:

Reserved, RES0.

FDIT, bit [31]
When FEAT_FDIT is implemented:

Storage for the virtual view of HCRX_EL2.FDIT under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.FDIT == '1'.

Otherwise:

Reserved, RES0.

TPLIMEn, bit [30]
When FEAT_TPS is implemented:

Storage for the virtual view of HCRX_EL2.TPLIMEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.TPLIMEn == '1'.

Otherwise:

Reserved, RES0.

POE2En, bit [29]
When FEAT_S1POE2 is implemented:

Storage for the virtual view of HCRX_EL2.POE2En under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.POE2En == '1'.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

NVTGE, bit [27]
When FEAT_NV3 is implemented:

Storage for the virtual view of HCRX_EL2.NVTGE under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.NVTGE == '1'.

Otherwise:

Reserved, RES0.

SRMASKEn, bit [26]
When FEAT_SRMASK is implemented:

Storage for the virtual view of HCRX_EL2.SRMASKEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.SRMASKEn == '1'.

Otherwise:

Reserved, RES0.

VTLBIDEn, bit [25]
When FEAT_TLBID is implemented:

Storage for the virtual view of HCRX_EL2.VTLBIDEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.VTLBIDEn == '1'.

Otherwise:

Reserved, RES0.

PACMEn, bit [24]
When FEAT_PAuth_LR is implemented:

Storage for the virtual view of HCRX_EL2.PACMEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.PACMEn == '1'.

Otherwise:

Reserved, RES0.

EnFPM, bit [23]
When FEAT_FPMR is implemented:

Storage for the virtual view of HCRX_EL2.EnFPM under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.EnFPM == '1'.

Otherwise:

Reserved, RES0.

GCSEn, bit [22]
When FEAT_GCS is implemented:

Storage for the virtual view of HCRX_EL2.GCSEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.GCSEn == '1'.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [21]
When FEAT_SYSREG128 is implemented:

Storage for the virtual view of HCRX_EL2.EnIDCP128 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.EnIDCP128 == '1'.

Otherwise:

Reserved, RES0.

EnSDERR, bit [20]
When FEAT_ADERR is implemented:

Storage for the virtual view of HCRX_EL2.EnSDERR under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.EnSDERR == '1'.

Otherwise:

Reserved, RES0.

TMEA, bit [19]
When FEAT_DoubleFault2 is implemented:

Storage for the virtual view of HCRX_EL2.TMEA under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.TMEA == '1'.

Otherwise:

Reserved, RES0.

EnSNERR, bit [18]
When FEAT_ANERR is implemented:

Storage for the virtual view of HCRX_EL2.EnSNERR under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.EnSNERR == '1'.

Otherwise:

Reserved, RES0.

D128En, bit [17]
When FEAT_D128 is implemented:

Storage for the virtual view of HCRX_EL2.D128En under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.D128En == '1'.

Otherwise:

Reserved, RES0.

PTTWI, bit [16]
When FEAT_THE is implemented:

Storage for the virtual view of HCRX_EL2.PTTWI under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.PTTWI == '1'.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [15]
When FEAT_SCTLR2 is implemented:

Storage for the virtual view of HCRX_EL2.SCTLR2En under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.SCTLR2En == '1'.

Otherwise:

Reserved, RES0.

TCR2En, bit [14]
When FEAT_TCR2 is implemented:

Storage for the virtual view of HCRX_EL2.TCR2En under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.TCR2En == '1'.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

MSCEn, bit [11]
When FEAT_MOPS is implemented:

Storage for the virtual view of HCRX_EL2.MSCEn under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.MSCEn == '1'.

Otherwise:

Reserved, RES0.

MCE2, bit [10]
When FEAT_MOPS is implemented:

Storage for the virtual view of HCRX_EL2.MCE2 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.MCE2 == '1'.

Otherwise:

Reserved, RES0.

CMOW, bit [9]
When FEAT_CMOW is implemented:

Storage for the virtual view of HCRX_EL2.CMOW under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.CMOW == '1'.

Otherwise:

Reserved, RES0.

VFNMI, bit [8]
When FEAT_NMI is implemented:

Storage for the virtual view of HCRX_EL2.VFNMI under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.VFNMI == '1'.

Otherwise:

Reserved, RES0.

VINMI, bit [7]
When FEAT_NMI is implemented:

Storage for the virtual view of HCRX_EL2.VINMI under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.VINMI == '1'.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]
When FEAT_NMI is implemented:

Storage for the virtual view of HCRX_EL2.TALLINT under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.TALLINT == '1'.

Otherwise:

Reserved, RES0.

SMPME, bit [5]
When FEAT_SME is implemented:

Storage for the virtual view of HCRX_EL2.SMPME under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.SMPME == '1'.

Otherwise:

Reserved, RES0.

FGTnXS, bit [4]
When FEAT_XS is implemented:

Storage for the virtual view of HCRX_EL2.FGTnXS under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.
  - EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  - NVHCRXMASK_EL2.FGTnXS == '1'.

Otherwise:

Reserved, RES0.

FnXS, bit [3]
When FEAT_XS is implemented:

Storage for the virtual view of HCRX_EL2.FnXS under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK2 is implemented.
  - PSTATE.EL == EL2.

◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
◦ NVHCRXMASK_EL2.FnXS == '1'.

Otherwise:

Reserved, RES0.

EnASR, bit [2]
When FEAT_LS64_V is implemented:

Storage for the virtual view of HCRX_EL2.EnASR under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  ◦ FEAT_SRMASK2 is implemented.
  ◦ PSTATE.EL == EL2.
  ◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  ◦ NVHCRXMASK_EL2.EnASR == '1'.

Otherwise:

Reserved, RES0.

EnALS, bit [1]
When FEAT_LS64 is implemented:

Storage for the virtual view of HCRX_EL2.EnALS under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  ◦ FEAT_SRMASK2 is implemented.
  ◦ PSTATE.EL == EL2.
  ◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  ◦ NVHCRXMASK_EL2.EnALS == '1'.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]
When FEAT_LS64_ACCDATA is implemented:

Storage for the virtual view of HCRX_EL2.EnAS0 under nested virtualization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  ◦ FEAT_SRMASK2 is implemented.
  ◦ PSTATE.EL == EL2.
  ◦ EL3 is not implemented or SCR2_EL3.SRMASK2En == '1'.
  ◦ NVHCRXMASK_EL2.EnAS0 == '1'.

Otherwise:

Reserved, RES0.

Accessing NVHCRX_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, NVHCRX_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0101	0b001

NVHCRXMASK_EL2, Nested Virtual Extended Hypervisor Configuration Masking Register

The NVHCRXMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in NVHCRX_EL2 on direct writes to NVHCRX_EL2.

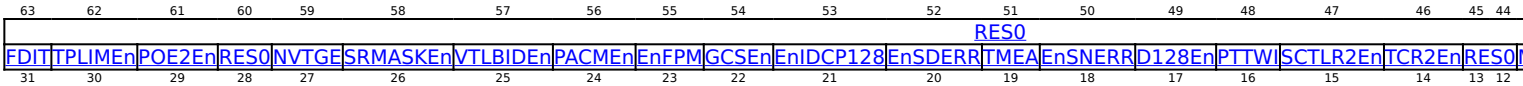
Configuration

This register is present only when FEAT_NV3 is implemented, FEAT_SRMASK2 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to NVHCRXMASK_EL2 are UNDEFINED.

Attributes

NVHCRXMASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:37]

Reserved, RES0.

FNB, bit [36]
When FEAT_TLBID is implemented:

Mask bit for FNB.

FNB	Meaning
0b0	NVHCRX_EL2.FNB is writeable.
0b1	NVHCRX_EL2.FNB is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTLBIDOSEn, bit [35]
When FEAT_TLBID is implemented:

Mask bit for VTLBIDOSEn.

VTLBIDOSEn	Meaning
0b0	NVHCRX_EL2.VTLBIDOSEn is writeable.
0b1	NVHCRX_EL2.VTLBIDOSEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NVnTTLBOS, bit [34]
When FEAT_NV3 is implemented:

Mask bit for NVnTTLBOS.

NVnTTLBOS	Meaning
0b0	NVHCRX_EL2.NVnTTLBOS is writeable.
0b1	NVHCRX_EL2.NVnTTLBOS is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NVnTTLBIS, bit [33]
When FEAT_NV3 is implemented:

Mask bit for NVnTTLBIS.

NVnTTLBIS	Meaning
0b0	NVHCRX_EL2.NVnTTLBIS is writeable.
0b1	NVHCRX_EL2.NVnTTLBIS is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NVnTTLB, bit [32]
When FEAT_NV3 is implemented:

Mask bit for NVnTTLB.

NVnTTLB	Meaning
0b0	NVHCRX_EL2.NVnTTLB is writeable.
0b1	NVHCRX_EL2.NVnTTLB is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FDIT, bit [31]
When FEAT_FDIT is implemented:

Mask bit for FDIT.

FDIT	Meaning
0b0	NVHCRX_EL2.FDIT is writeable.
0b1	NVHCRX_EL2.FDIT is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TPLIMEn, bit [30]
When FEAT_TPS is implemented:

Mask bit for TPLIMEn.

TPLIMEn	Meaning
0b0	NVHCRX_EL2.TPLIMEn is writeable.
0b1	NVHCRX_EL2.TPLIMEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE2En, bit [29]
When FEAT_S1POE2 is implemented:

Mask bit for POE2En.

POE2En	Meaning
0b0	NVHCRX_EL2.POE2En is writeable.
0b1	NVHCRX_EL2.POE2En is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [28]

Reserved, RES0.

NVTGE, bit [27]
When FEAT_NV3 is implemented:

Mask bit for NVTGE.

NVTGE	Meaning
0b0	NVHCRX_EL2.NVTGE is writeable.
0b1	NVHCRX_EL2.NVTGE is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRMASKEn, bit [26]
When FEAT_SRMASK is implemented:

Mask bit for SRMASKEn.

SRMASKEn	Meaning
0b0	NVHCRX_EL2.SRMASKEn is writeable.
0b1	NVHCRX_EL2.SRMASKEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTLBIDEn, bit [25]
When FEAT_TLBID is implemented:

Mask bit for VTLBIDEn.

VTLBIDEn	Meaning
0b0	NVHCRX_EL2.VTLBIDEn is writeable.
0b1	NVHCRX_EL2.VTLBIDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACMEn, bit [24]
When FEAT_PAuth_LR is implemented:

Mask bit for PACMEn.

PACMEn	Meaning
0b0	NVHCRX_EL2.PACMEn is writeable.
0b1	NVHCRX_EL2.PACMEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [23]
When FEAT_FPMR is implemented:

Mask bit for EnFPM.

EnFPM	Meaning
0b0	NVHCRX_EL2.EnFPM is writeable.
0b1	NVHCRX_EL2.EnFPM is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GCSEn, bit [22]
When FEAT_GCS is implemented:

Mask bit for GCSEn.

GCSEn	Meaning
0b0	NVHCRX_EL2.GCSEn is writeable.
0b1	NVHCRX_EL2.GCSEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [21]
When FEAT_SYSREG128 is implemented:

Mask bit for EnIDCP128.

EnIDCP128	Meaning
0b0	NVHCRX_EL2.EnIDCP128 is writeable.
0b1	NVHCRX_EL2.EnIDCP128 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSDERR, bit [20]
When FEAT_ADERR is implemented:

Mask bit for EnSDERR.

EnSDERR	Meaning
0b0	NVHCRX_EL2.EnSDERR is writeable.
0b1	NVHCRX_EL2.EnSDERR is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMEA, bit [19]
When FEAT_DoubleFault2 is implemented:

Mask bit for TMEA.

TMEA	Meaning
0b0	NVHCRX_EL2.TMEA is writeable.
0b1	NVHCRX_EL2.TMEA is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSNERR, bit [18]
When FEAT_ANERR is implemented:

Mask bit for EnSNERR.

EnSNERR	Meaning
0b0	NVHCRX_EL2.EnSNERR is writeable.
0b1	NVHCRX_EL2.EnSNERR is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128En, bit [17]
When FEAT_D128 is implemented:

Mask bit for D128En.

D128En	Meaning
0b0	NVHCRX_EL2.D128En is writeable.
0b1	NVHCRX_EL2.D128En is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [16]
When FEAT_THE is implemented:

Mask bit for PTTWI.

PTTWI	Meaning
0b0	NVHCRX_EL2.PTTWI is writeable.
0b1	NVHCRX_EL2.PTTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [15]
When FEAT_SCTLR2 is implemented:

Mask bit for SCTLR2En.

SCTLR2En	Meaning
0b0	NVHCRX_EL2.SCTLR2En is writeable.
0b1	NVHCRX_EL2.SCTLR2En is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2En, bit [14]
When FEAT_TCR2 is implemented:

Mask bit for TCR2En.

TCR2En	Meaning
0b0	NVHCRX_EL2.TCR2En is writeable.
0b1	NVHCRX_EL2.TCR2En is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

MSCEn, bit [11]
When FEAT_MOPS is implemented:

Mask bit for MSCEn.

MSCEn	Meaning
0b0	NVHCRX_EL2.MSCEn is writeable.
0b1	NVHCRX_EL2.MSCEn is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MCE2, bit [10]
When FEAT_MOPS is implemented:

Mask bit for MCE2.

MCE2	Meaning
0b0	NVHCRX_EL2.MCE2 is writeable.
0b1	NVHCRX_EL2.MCE2 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [9]
When FEAT_CMOW is implemented:

Mask bit for CMOW.

CMOW	Meaning
0b0	NVHCRX_EL2.CMOW is writeable.
0b1	NVHCRX_EL2.CMOW is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VFNMI, bit [8]
When FEAT_NMI is implemented:

Mask bit for VFNMI.

VFNMI	Meaning
0b0	NVHCRX_EL2.VFNMI is writeable.
0b1	NVHCRX_EL2.VFNMI is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VINMI, bit [7]
When FEAT_NMI is implemented:

Mask bit for VINMI.

VINMI	Meaning
0b0	NVHCRX_EL2.VINMI is writeable.
0b1	NVHCRX_EL2.VINMI is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TALLINT, bit [6]
When FEAT_NMI is implemented:

Mask bit for TALLINT.

TALLINT	Meaning
0b0	NVHCRX_EL2.TALLINT is writeable.
0b1	NVHCRX_EL2.TALLINT is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SMPME, bit [5]
When FEAT_SME is implemented:

Mask bit for SMPME.

SMPME	Meaning
0b0	NVHCRX_EL2.SMPME is writeable.
0b1	NVHCRX_EL2.SMPME is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTnXS, bit [4]
When FEAT_XS is implemented:

Mask bit for FGTnXS.

FGTnXS	Meaning
0b0	NVHCRX_EL2.FGTnXS is writeable.
0b1	NVHCRX_EL2.FGTnXS is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnXS, bit [3]
When FEAT_XS is implemented:

Mask bit for FnXS.

FnXS	Meaning
0b0	NVHCRX_EL2.FnXS is writeable.
0b1	NVHCRX_EL2.FnXS is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [2]
When FEAT_LS64_V is implemented:

Mask bit for EnASR.

EnASR	Meaning
0b0	NVHCRX_EL2.EnASR is writeable.
0b1	NVHCRX_EL2.EnASR is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [1]
When FEAT_LS64 is implemented:

Mask bit for EnALS.

EnALS	Meaning
0b0	NVHCRX_EL2.EnALS is writeable.
0b1	NVHCRX_EL2.EnALS is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [0]
When FEAT_LS64_ACCDATA is implemented:

Mask bit for EnAS0.

EnAS0	Meaning
0b0	NVHCRX_EL2.EnAS0 is writeable.
0b1	NVHCRX_EL2.EnAS0 is not writeable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing NVHCRXMASK_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, NVHCRXMASK_EL2

NZCV, Condition Flags

The NZCV characteristics are:

Purpose

Allows access to the condition flags.

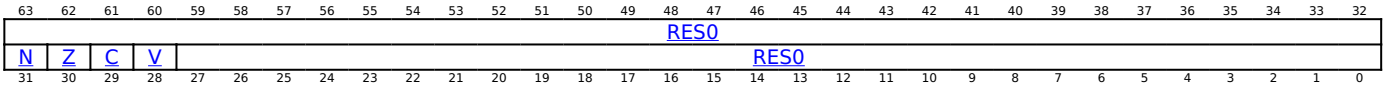
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to NZCV are UNDEFINED.

Attributes

NZCV is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative condition flag. Set to 1 if the result of the last flag-setting instruction was negative.

Z, bit [30]

Zero condition flag. Set to 1 if the result of the last flag-setting instruction was zero, and to 0 otherwise. A result of zero often indicates an equal result from a comparison.

C, bit [29]

Carry condition flag. Set to 1 if the last flag-setting instruction resulted in a carry condition, for example an unsigned overflow on an addition.

V, bit [28]

Overflow condition flag. Set to 1 if the last flag-setting instruction resulted in an overflow condition, for example a signed overflow on an addition.

Bits [27:0]

Reserved, RES0.

Accessing NZCV

The MSR (register) and MRS instructions used to access NZCV are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, NZCV

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b000

OSDLR_EL1, OS Double Lock Register

The OSDLR_EL1 characteristics are:

Purpose

Used to control the OS Double Lock.

Configuration

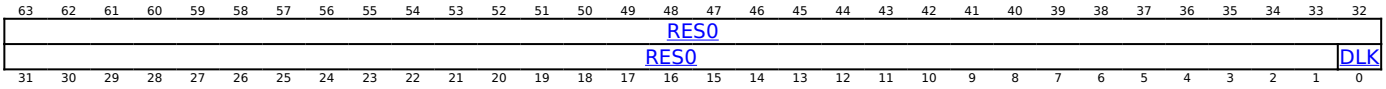
AArch64 System register OSDLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSDLR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSDLR_EL1 are UNDEFINED.

Attributes

OSDLR_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

DLK, bit [0]
When FEAT_DoubleLock is implemented:

OS Double Lock control bit.

DLK	Meaning
0b0	OS Double Lock unlocked.
0b1	OS Double Lock locked, if DBGPRCR_EL1.CORENPDRQ (Core no powerdown request) bit is set to 0 and the PE is in Non-debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RAZ/WI.

Accessing OSDLR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSDLR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0011	0b100

OSDTRRX_EL1, OS Lock Data Transfer Register, Receive

The OSDTRRX_EL1 characteristics are:

Purpose

Used for save and restore of DBGDTRRX_EL0. It is a component of the Debug Communications Channel.

Configuration

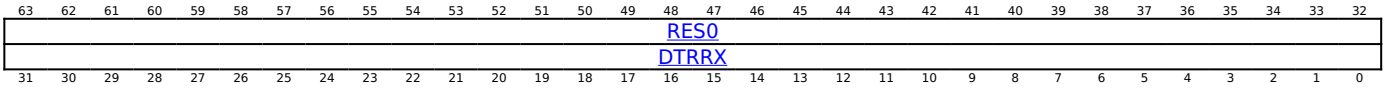
AArch64 System register OSDTRRX_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGDTRRXext[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSDTRRX_EL1 are UNDEFINED.

Attributes

OSDTRRX_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

DTRRX, bits [31:0]

Update DTRRX without side-effect.

Writes to this register update the value in DTRRX and do not change RXfull.

Reads of this register return the last value written to DTRRX and do not change RXfull.

For the full behavior of the Debug Communications Channel, see 'The Debug Communication Channel and Instruction Transfer Register'.

Accessing OSDTRRX_EL1

Arm deprecates reads and writes of OSDTRRX_EL1 when the OS Lock is unlocked.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSDTRRX_EL1

OSECCR_EL1, OS Lock Exception Catch Control Register

The OSECCR_EL1 characteristics are:

Purpose

Provides a mechanism for an operating system to access the contents of EDECCR that are otherwise invisible to software, so it can save/restore the contents of EDECCR over powerdown on behalf of the external debugger.

Configuration

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSECCR[31:0].

AArch64 System register OSECCR_EL1 bits [31:0] are architecturally mapped to External register EDECCR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSECCR_EL1 are UNDEFINED.

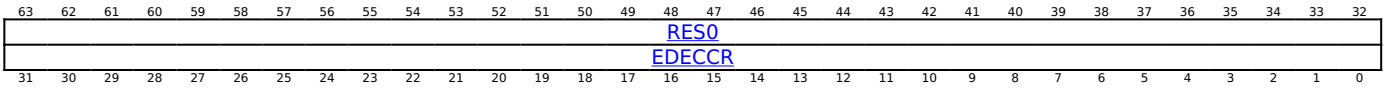
If OSLSR_EL1.OSLK == 0, then OSECCR_EL1 returns an UNKNOWN value on reads and ignores writes.

Attributes

OSECCR_EL1 is a 64-bit register.

Field descriptions

When OSLSR_EL1.OSLK == '1':



Bits [63:32]

Reserved, RES0.

EDECCR, bits [31:0]

Used for save/restore to EDECCR over powerdown.

Reads or writes to this field are indirect accesses to EDECCR.

The reset behavior of this field is:

- On a Cold reset, this field resets to the expression `0x00`.

Accessing OSECCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSECCR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0000	0b0110	0b010

OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS Lock.

Configuration

AArch64 System register OSLAR_EL1 bits [31:0] are architecturally mapped to External register OSLAR_EL1[31:0].

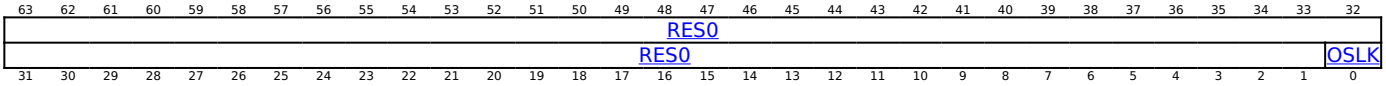
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSLAR_EL1 are UNDEFINED.

The OS Lock can also be locked or unlocked using DBGOSLAR.

Attributes

OSLAR_EL1 is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS Lock.

Use OSLSR_EL1.OSLK to check the current status of the lock.

Accessing OSLAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MSR OSLAR_EL1, <Xt>

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0000	0b100

```
if !IsFeatureImplemented(FEAT_AA64) then

OSLSR_EL1, OS Lock Status Register

The OSLSR_EL1 characteristics are:

Purpose

Provides the status of the OS Lock.

Configuration

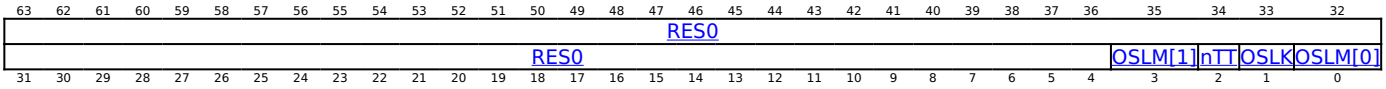
AArch64 System register OSLSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register DBGOSLSR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to OSLSR_EL1 are UNDEFINED.

Attributes

OSLSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

OSLM, bits [3, 0]

OS Lock model implemented. Identifies the form of OS save and restore mechanism implemented.

The value of this field is an IMPLEMENTATION DEFINED choice of:

OSLM	Meaning
0b00	OS Lock not implemented.
0b10	OS Lock implemented.

All other values are reserved. In an Armv8 implementation the value 0b00 is not permitted.

The OSLM field is split as follows:

- OSLM[1] is OSLSR_EL1[3].
- OSLM[0] is OSLSR_EL1[0].

Access to this field is RO.

nTT, bit [2]

Not 32-bit access. This bit is always RAZ. It indicates that a 32-bit access is needed to write the key to the OS Lock Access Register.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

OSLK, bit [1]

OS Lock Status.

OSLK	Meaning
0b0	OS Lock unlocked.
0b1	OS Lock locked.

The OS Lock is locked and unlocked by writing to the OS Lock Access Register.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing OSLSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, OSLSR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b0001	0b0001	0b100

```
if !IsFeatureImplemented(FEAT_AA64) then

PAN, Privileged Access Never

The PAN characteristics are:

Purpose

Allows access to the Privileged Access Never bit.

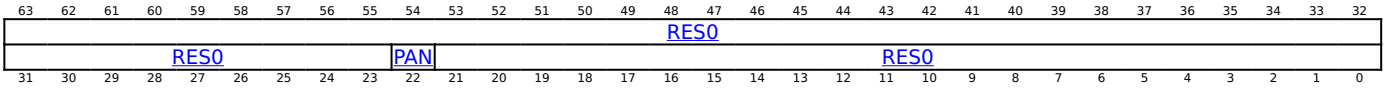
Configuration

This register is present only when FEAT_PAN is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PAN are UNDEFINED.

Attributes

PAN is a 64-bit register.

Field descriptions



Bits [63:23]

Reserved, RES0.

PAN, bit [22]

Privileged Access Never.

PAN	Meaning
0b0	Privileged reads and write are not disabled by this mechanism.
0b1	Disables privileged read and write accesses to addresses accessible at EL0 for an enabled stage 1 translation regime that defines the EL0 permissions.

The value of this bit is usually preserved on taking an exception, except in the following situations:

- When the target of the exception is EL1, and the value of the SCTLR_EL1.SPAN bit is 0, this bit is set to 1.
- When the target of the exception is EL2, the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and the value of the SCTLR_EL2.SPAN bit is 0, this bit is set to 1.

Bits [21:0]

Reserved, RES0.

Accessing PAN

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PAN

    PSTATE.PAN = X{64}(t)[22];
elsif PSTATE.EL == EL3 then
    PSTATE.PAN = X{64}(t)[22];
end;
```

MSR PAN, #<imm>

op0	op1	CRn	op2
0b00	0b000	0b0100	0b100

2025-12-10 16:11:30, 2025-12_rel

PAR_EL1, Physical Address Register

The PAR_EL1 characteristics are:

Purpose

Returns the output address (OA) from an Address translation instruction that executed successfully, or fault information if the instruction did not execute successfully.

Configuration

AArch64 System register PAR_EL1 bits [63:0] are architecturally mapped to AArch32 System register PAR[63:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to PAR_EL1 are UNDEFINED.

AArch64 System register PAR_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

Single stage AT Instructions (ATS1*) report their result using the 128-bit format of PAR_EL1 if the translation system that they target uses VMSAv9-128.

ATS12* Instructions report their result using the 128-bit format PAR_EL1 if either of the following is true:

- if stage 2 translations are enabled and the stage 2 translation system uses VMSAv9-128.
- if stage 2 translations are disabled and the stage 1 translation system uses VMSAv9-128.

Otherwise, 64-bit format of PAR_EL1 is used.

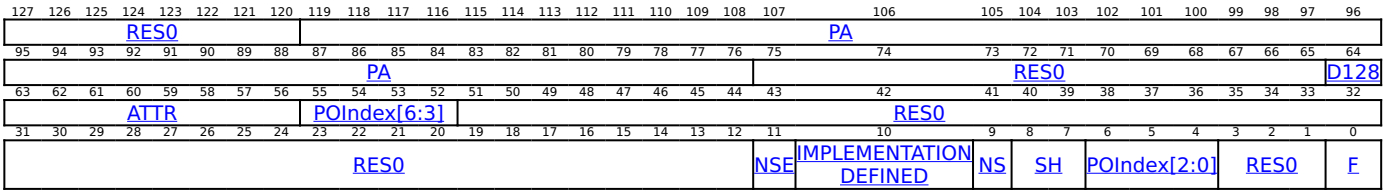
Attributes

PAR_EL1 is a:

- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == '1', and GetPAR_EL1_F() == '0'
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == '1', and GetPAR_EL1_F() == '1'
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == '0', and GetPAR_EL1_F() == '0'
- 128-bit register when FEAT_D128 is implemented, GetPAR_EL1_D128() == '0', and GetPAR_EL1_F() == '1'
- 64-bit register when FEAT_D128 is not implemented and GetPAR_EL1_F() == '0'
- 64-bit register when FEAT_D128 is not implemented and GetPAR_EL1_F() == '1'

Field descriptions

When FEAT_D128 is implemented, GetPAR_EL1_D128() == '1', and GetPAR_EL1_F() == '0':



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

Bits [127:120]

Reserved, RES0.

PA, bits [119:76]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[55:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [75:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

If FEAT_MTE_PERM is implemented and the instruction performed a stage 2 translation, the following additional encoding is defined:

ATTR	Meaning
0b11100000	Tagged NoTagAccess Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory.

Note

This encoding in MAIR_ELx is Reserved.

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POIndex, bits [55:52, 6:4]
When FEAT_S1POE2 is implemented:

Stage 1 POIndex for the returned output address.

If POE2 is disabled for the translation regime targeted by the AT operation, this field is RES0.

The POIndex field is split as follows:

- POIndex[6:3] is PAR_EL1[55:52].
- POIndex[2:0] is PAR_EL1[6:4].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [51:12]

Reserved, RES0.

NSE, bit [11]
When FEAT_RME is implemented:

Reports the NSE attribute for a translation table descriptor from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is unknown.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]
When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

F, bit [0]

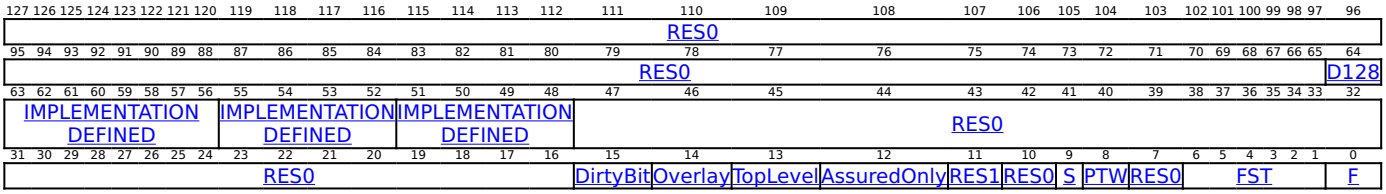
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == '1', and GetPAR_EL1_F() == '1':



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b1	PAR_EL1 uses the 128-bit format. PAR_EL1[127:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]
When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation that is using Indirect Permissions, and dirty state is managed by software, then this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to dirty state.
0b1	The Permission Fault is due to dirty state.

For any other fault or Access, this field is RES0.

Note

At stage 1, dirty state is indicated by the nDirty bit in Block and Page descriptors. At stage 2, dirty state is indicated by the Dirty bit in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]
When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation, then this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is not due to Overlay Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]
When FEAT_THE is implemented:

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]
When FEAT_THE is implemented:

AssuredOnly flag.

If PAR_EL1.S indicates a stage 2 fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented

0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented

Note

The encodings for FST do not include Synchronous External abort on translation table walk or hardware update of translation table, because these MMU faults are reported as a Data Abort exception instead of being recorded in PAR_EL1. See Exceptions to reporting the fault in PAR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

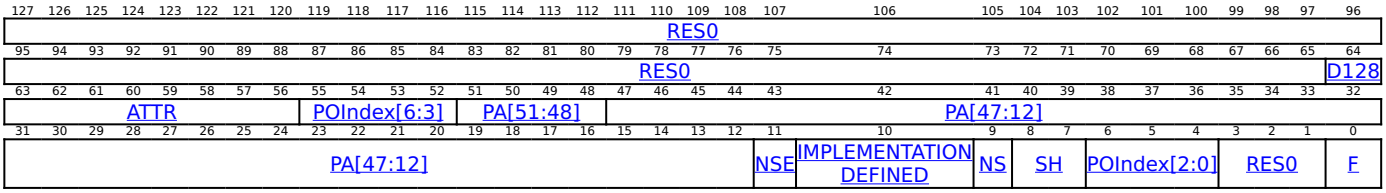
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == '0', and GetPAR_EL1_F() == '0':



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b0	PAR_EL1 uses the 64-bit format. PAR_EL1[63:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

If FEAT_MTE_PERM is implemented and the instruction performed a stage 2 translation, the following additional encoding is defined:

ATTR	Meaning
0b11100000	Tagged NoTagAccess Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory.

Note

This encoding in MAIR_ELx is Reserved.

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POIndex, bits [55:52, 6:4]
When FEAT_S1POE2 is implemented:

Stage 1 POIndex for the returned output address.

If POE2 is disabled for the translation regime targeted by the AT operation, this field is RES0.

The POIndex field is split as follows:

- POIndex[6:3] is PAR_EL1[55:52].
- POIndex[2:0] is PAR_EL1[6:4].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]
When FEAT_LPA is implemented:

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]
When FEAT_RME is implemented:

Reports the NSE attribute for a translation table entry from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]
When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

F, bit [0]

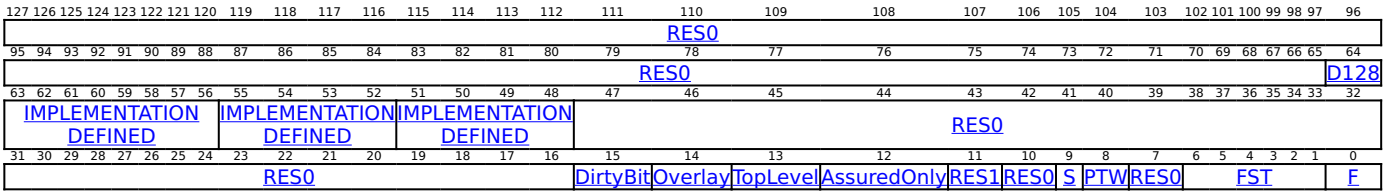
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is implemented, GetPAR_EL1_D128() == '0', and GetPAR_EL1_F() == '1':



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

Bits [127:65]

Reserved, RES0.

D128, bit [64]

Indicates if the PAR_EL1 uses the 128-bit format.

D128	Meaning
0b0	PAR_EL1 uses the 64-bit format. PAR_EL1[63:0] holds valid data.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]
When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation that is using Indirect Permissions, and dirty state is managed by software, then this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]
When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation, then this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is not due to Overlay Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]
When FEAT_THE is implemented:

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]
When FEAT_THE is implemented:

AssuredOnly flag.

If PAR_EL1.S indicates a stage 2 fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort exception ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented

0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented

Note

The encodings for FST do not include Synchronous External abort on translation table walk or hardware update of translation table, because these MMU faults are reported as a Data Abort exception instead of being recorded in PAR_EL1. See Exceptions to reporting the fault in PAR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

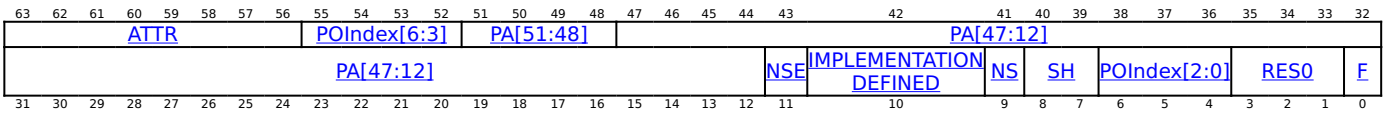
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented and GetPAR_EL1_F() == '0':



This section describes the register value returned by the successful execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

On a successful conversion, the PAR_EL1 can return a value that indicates the resulting attributes, rather than the values that appear in the Translation table descriptors. More precisely:

- The PAR_EL1.{ATTR, SH} fields are permitted to report the resulting attributes, as determined by any permitted implementation choices and any applicable configuration bits, instead of reporting the values that appear in the Translation table descriptors.
- See the PAR_EL1.NS bit description for constraints on the value it returns.

ATTR, bits [63:56]

Memory attributes for the returned output address. This field uses the same encoding as the Attr<n> fields in MAIR_EL1, MAIR_EL2, and MAIR_EL3.

If FEAT_MTE_PERM is implemented and the instruction performed a stage 2 translation, the following additional encoding is defined:

ATTR	Meaning
0b11100000	Tagged NoTagAccess Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory.

Note

This encoding in MAIR_ELx is Reserved.

The value returned in this field can be the resulting attribute that is actually implemented by the implementation, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

Note

The attributes presented are consistent with the stages of translation applied in the address translation instruction. If the instruction performed a stage 1 translation only, the attributes are from the stage 1 translation. If the instruction performed a stage 1 and stage 2 translation, the attributes are from the combined stage 1 and stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

POIndex, bits [55:52, 6:4]
When FEAT_S1POE2 is implemented:

Stage 1 POIndex for the returned output address.

If POE2 is disabled for the translation regime targeted by the AT operation, this field is RES0.

The POIndex field is split as follows:

- POIndex[6:3] is PAR_EL1[55:52].
- POIndex[2:0] is PAR_EL1[6:4].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]
When FEAT_LPA is implemented:

Extension to PA[47:12]. For more information, see PA[47:12].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[47:12], bits [47:12]

Output address. The output address (OA) corresponding to the supplied input address. This field returns address bits[47:12].

When FEAT_LPA is implemented and 52-bit addresses are in use, PA[51:48] forms the upper part of the address value. Otherwise, when 52-bit addresses are not in use, PA[51:48] is RES0.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NSE, bit [11]
When FEAT_RME is implemented:

Reports the NSE attribute for a translation table entry from the EL3 translation regime.

For a description of the values derived by evaluating NS and NSE together, see PAR_EL1.NS.

For a result from a Secure, Non-secure, or Realm translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IMPLEMENTATION DEFINED, bit [10]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [9]
When FEAT_RME is implemented:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime, a Realm translation regime, and the EL3 translation regime.

For a result from an EL3 translation regime, NS and NSE are evaluated together to report the physical address space:

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Root.
0b1	0b1	Realm.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

For a result from an S1E1 or S1E0 operation on the Realm EL1&0 translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure. The NS attribute for a translation table entry from a Secure translation regime.

For a result from a Secure translation regime, when SCR_EL3.EEL2 is 1, this bit distinguishes between the Secure and Non-secure intermediate physical address space of the translation for the instructions:

- In AArch64 state: AT S1E1R, AT S1E1W, AT S1E1RP, AT S1E1WP, AT S1E0R, and AT S1E0W.
- In AArch32 state: ATS1CPR, ATS1CPW, ATS1CPRP, ATS1CPWP, ATS1CUR, and ATS1CUW.

Otherwise, this bit reflects the Security state of the physical address space of the translation. This means it reflects the effect of the NSTable bits of earlier levels of the translation table walk if those NSTable bits have an effect on the translation.

For a result from a Non-secure translation regime, this bit is UNKNOWN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH, bits [8:7]

Shareability attribute, for the returned output address.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

The value 0b01 is reserved.

Note

This field returns the value 0b10 for:

- Any type of Device memory.
- Normal memory with both Inner Non-cacheable and Outer Non-cacheable attributes.

The value returned in this field can be the resulting attribute, as determined by any permitted implementation choices and any applicable configuration bits, instead of the value that appears in the Translation table descriptor.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:1]

Reserved, RES0.

F, bit [0]

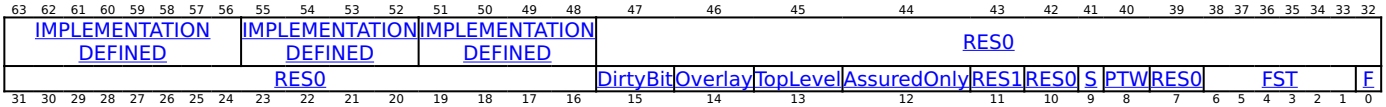
Indicates whether the instruction performed a successful address translation.

F	Meaning
0b0	Address translation completed successfully.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_D128 is not implemented and GetPAR_EL1_F() == '1':



This section describes the register value returned by a fault on the execution of an Address translation instruction. Software might subsequently write a different value to the register, and that write does not affect the operation of the PE.

IMPLEMENTATION DEFINED, bits [63:56]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [55:52]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IMPLEMENTATION DEFINED, bits [51:48]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [47:16]

Reserved, RES0.

DirtyBit, bit [15]
When FEAT_S1PIE is implemented or FEAT_S2PIE is implemented:

DirtyBit flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation that is using Indirect Permissions, and dirty state is managed by software, then this field holds information about the fault.

DirtyBit	Meaning
0b0	The Permission Fault is not due to nDirty State or Dirty State.
0b1	The Permission Fault is due to nDirty State or Dirty State.

For any other fault or Access, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Overlay, bit [14]
When FEAT_S1POE is implemented or FEAT_S2POE is implemented:

Overlay flag.

If PAR_EL1.FST indicates a Permission fault for a stage of translation, then this field holds information about the fault.

Overlay	Meaning
0b0	The Data Abort is not due to Overlay Permissions.
0b1	The Data Abort is due to Overlay Permissions.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TopLevel, bit [13]
When FEAT_THE is implemented:

Fault due to TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [12]
When FEAT_THE is implemented:

AssuredOnly flag.

If PAR_EL1.S indicates a stage 2 fault, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	The Data Abort is not due to AssuredOnly.
0b1	The Data Abort is due to AssuredOnly.

For any other fault, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [11]

Reserved, RES1.

Bit [10]

Reserved, RES0.

S, bit [9]

Indicates the translation stage at which the translation aborted:

S	Meaning
0b0	Translation aborted because of a fault in the stage 1 translation.
0b1	Translation aborted because of a fault in the stage 2 translation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PTW, bit [8]

If this bit is set to 1, it indicates the translation aborted because of a stage 2 fault during a stage 1 translation table walk.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [7]

Reserved, RES0.

FST, bits [6:1]

Fault status code, as shown in the Data Abort exception ESR encoding.

FST	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b011100	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 0.	When FEAT_RAS is not implemented
0b011101	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 1.	When FEAT_RAS is not implemented
0b011110	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 2.	When FEAT_RAS is not implemented
0b011111	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level 3.	When FEAT_RAS is not implemented
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented

0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b111101	Section Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented
0b111110	Page Domain fault, from an AArch32 stage 1 EL1&0 translation regime using Short-descriptor translation table format.	When FEAT_AA32EL1 is implemented

Note

The encodings for FST do not include Synchronous External abort on translation table walk or hardware update of translation table, because these MMU faults are reported as a Data Abort exception instead of being recorded in PAR_EL1. See Exceptions to reporting the fault in PAR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [0]

Indicates whether the instruction performed a successful address translation.

F	Meaning
0b1	Address translation aborted.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PAR_EL1

op0	op1	CRn	CRm	op2

```

PFAR_EL1, Physical Fault Address Register (EL1)

The PFAR_EL1 characteristics are:

Purpose

Records the faulting physical address for a synchronous External abort, or SError exception taken to EL1.

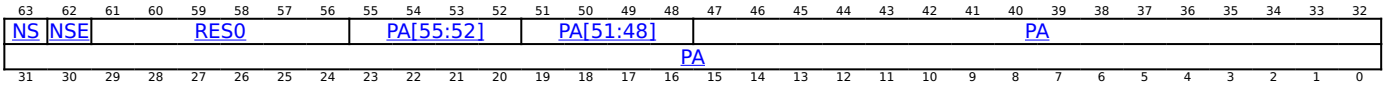
Configuration

This register is present only when FEAT_PFAR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PFAR_EL1 are UNDEFINED.

Attributes

PFAR_EL1 is a 64-bit register.

Field descriptions



NS, bit [63]
When FEAT_RME is implemented:

Together with PFAR_EL1.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL3 is implemented or FEAT_Secure is implemented:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [62]
When FEAT_RME is implemented:

Together with PFAR_EL1.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [61:56]

Reserved, RES0.

PA[55:52], bits [55:52]
When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to PFAR_EL1.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]
When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to PFAR_EL1.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA, bits [47:0]

Physical Address. Bits [47:0] of the aborting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED and no larger than the larger than:

- The size of the range of values permitted to be recorded in FAR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PFAR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name PFAR_EL1 or PFAR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

PFAR_EL1 is not valid and reads UNKNOWN if ESR_EL1.PFV is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PFAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0110	0b0000	0b101

PFAR_EL2, Physical Fault Address Register (EL2)

The PFAR_EL2 characteristics are:

Purpose

Records the faulting physical address for a synchronous External abort, or SError exception taken to EL2.

Configuration

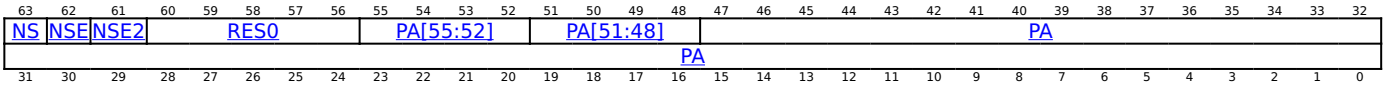
This register is present only when FEAT_PFAR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PFAR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

PFAR_EL2 is a 64-bit register.

Field descriptions



NS, bit [63]
When FEAT_RME_GDI is implemented:

Together with PFAR_EL2.NSE and PFAR_EL2.NSE2, reports the physical address space of the access that triggered the exception.

NSE2	NSE	NS	Meaning
0b0	0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b0	0b1	Non-secure.
0b0	0b1	0b0	Reserved.
0b0	0b1	0b1	Realm.
0b1	0b0	0b0	System Agent.
0b1	0b0	0b1	NS Protected.
0b1	0b1	0b0	Reserved.
0b1	0b1	0b1	Reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_RME is implemented:

Together with PFAR_EL2.NSE, reports the physical address space of the access that triggered the exception.

NSE	NS	Meaning
0b0	0b0	When Secure state is implemented, Secure. Otherwise reserved.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EL3 is implemented or FEAT_Secure is implemented:

Non-secure. Reports the physical address space of the access that triggered the exception.

NS	Meaning
0b0	Secure physical address space.
0b1	Non-secure physical address space.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [62]
When FEAT_RME is implemented:

Together with PFAR_EL2.NS, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS and NSE together, see MFAR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE2, bit [61]
When FEAT_RME_GDI is implemented:

Together with PFAR_EL2.NS and PFAR_EL2.NSE, reports the physical address space of the access that triggered the exception.

For a description of the values derived by evaluating NS, NSE, and NSE2 together, see PFAR_EL2.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [60:56]

Reserved, RES0.

PA[55:52], bits [55:52]
When FEAT_D128 is implemented:

When FEAT_D128 is implemented, extension to PFAR_EL2.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA[51:48], bits [51:48]
When FEAT_LPA is implemented:

When FEAT_LPA is implemented, extension to PFAR_EL2.PA[47:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PA, bits [47:0]

Physical Address. Bits [47:0] of the aborting physical address.

For implementations with fewer than 48 physical address bits, the corresponding upper bits in this field are RES0.

The recorded address can be any address within the same naturally-aligned fault granule as the faulting physical address, where the size of the fault granule is IMPLEMENTATION DEFINED and no larger than the larger than:

- The size of the range of values permitted to be recorded in FAR_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PFAR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name PFAR_EL2 or PFAR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

PFAR_EL2 is not valid and reads UNKNOWN if ESR_EL2.PFV is recorded as 0.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PFAR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0110	0b0000	0b101

PIR_EL1, Permission Indirection Register 1 (EL1)

The PIR_EL1 characteristics are:

Purpose

Stage 1 Permission Indirection Register for privileged access of the EL1&0 translation regime.

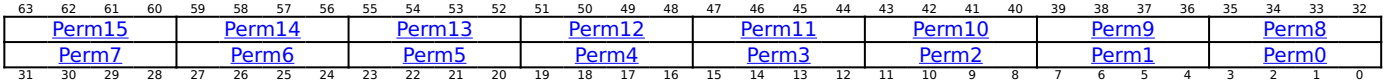
Configuration

This register is present only when FEAT_S1PIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PIR_EL1 are UNDEFINED.

Attributes

PIR_EL1 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access. Overlay applied.
0b0001	Read. Overlay applied.
0b0010	Execute. Overlay applied.
0b0011	Read and Execute. Overlay applied.
0b0100	If FEAT_BTIE is implemented: Read, Write, Execute, and EnhancedGuard. Overlay applied. Otherwise: Reserved - treated as No access. Overlay applied.
0b0101	Read and Write. Overlay applied.
0b0110	Read, Write, and Execute. Overlay applied. WXN control applied.
0b0111	Read, Write, and Execute. Overlay applied.
0b1000	Read. Overlay not applied.
0b1001	Read, GCS Read, and GCS Write. Overlay not applied.
0b1010	Read and Execute. Overlay not applied.
0b1011	If FEAT_BTIE is implemented: Read, Execute, and EnhancedGuard. Overlay not applied. Otherwise: Reserved - treated as No access. Overlay not applied.
0b1100	Read and Write. Overlay not applied.
0b1101	Reserved - treated as No access. Overlay not applied.
0b1110	Read, Write, and Execute. Overlay not applied.
0b1111	Reserved - treated as No access. Overlay not applied.

This field is permitted to be cached in a TLB.

When stage 1 Indirect Permission mechanism is disabled, this register is ignored.

Unless otherwise specified, the WXN control is not applied.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIR_EL1

PIR_EL3, Permission Indirection Register 3 (EL3)

The PIR_EL3 characteristics are:

Purpose

Stage 1 Permission Indirection Register for privileged access of the EL3 translation regime.

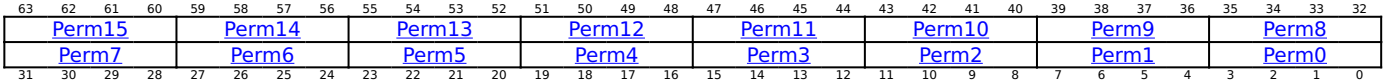
Configuration

This register is present only when FEAT_S1PIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PIR_EL3 are UNDEFINED.

Attributes

PIR_EL3 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access. Overlay applied.
0b0001	Read. Overlay applied.
0b0010	Execute. Overlay applied.
0b0011	Read and Execute. Overlay applied.
0b0100	If FEAT_BTIE is implemented: Read, Write, Execute, and EnhancedGuard. Overlay applied. Otherwise: Reserved - treated as No access. Overlay applied.
0b0101	Read and Write. Overlay applied.
0b0110	Read, Write, and Execute. Overlay applied. WXN control applied.
0b0111	Read, Write, and Execute. Overlay applied.
0b1000	Read. Overlay not applied.
0b1001	Read, GCS Read, and GCS Write. Overlay not applied.
0b1010	Read and Execute. Overlay not applied.
0b1011	If FEAT_BTIE is implemented: Read, Execute, and EnhancedGuard. Overlay not applied. Otherwise: Reserved - treated as No access. Overlay not applied.
0b1100	Read and Write. Overlay not applied.
0b1101	Reserved - treated as No access. Overlay not applied.
0b1110	Read, Write, and Execute. Overlay not applied.
0b1111	Reserved - treated as No access. Overlay not applied.

This field is permitted to be cached in a TLB.

When stage 1 Indirect Permission mechanism is disabled, this register is ignored.

Unless otherwise specified, the WXN control is not applied.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PIR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b011

PIRE0_EL2, Permission Indirection Register 0 (EL2)

The PIRE0_EL2 characteristics are:

Purpose

Stage 1 Permission Indirection Register for unprivileged access of the EL2&0 translation regime.

Configuration

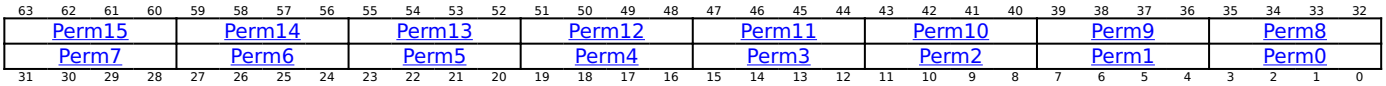
This register is present only when FEAT_S1PIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PIRE0_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

PIRE0_EL2 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents stage 1 Base Permissions.

Perm<m>	Meaning
0b0000	No access. Overlay applied.
0b0001	Read. Overlay applied.
0b0010	Execute. Overlay applied.
0b0011	Read and Execute. Overlay applied.
0b0100	If FEAT_BTIE is implemented: Read, Write, Execute, and EnhancedGuard. Overlay applied. Otherwise: Reserved - treated as No access. Overlay applied.
0b0101	Read and Write. Overlay applied.
0b0110	Read, Write, and Execute. Overlay applied. WXN control applied.
0b0111	Read, Write, and Execute. Overlay applied.
0b1000	Read. Overlay not applied.
0b1001	Read, GCS Read, and GCS Write. Overlay not applied.
0b1010	Read and Execute. Overlay not applied.
0b1011	If FEAT_BTIE is implemented: Read, Execute, and EnhancedGuard. Overlay not applied. Otherwise, Reserved - treated as No access. Overlay not applied.
0b1100	Read and Write. Overlay not applied.
0b1101	Reserved - treated as No access. Overlay not applied.
0b1110	Read, Write, and Execute. Overlay not applied.
0b1111	Reserved - treated as No access. Overlay not applied.

This field is permitted to be cached in a TLB.

When stage 1 Indirect Permission mechanism is disabled, this register is ignored.

Unless otherwise specified, the WXN control is not applied.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PIRE0_EL2

PLBI ALLE1, PLBI ALLE1NXS, PLB Invalidate All, EL1

The PLBI ALLE1, PLBI ALLE1NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL1&0 translation regime in the current Security state.

The invaldation applies to entries with any VMID.

The invalidation applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI ALLE1, PLBI ALLE1NXS are UNDEFINED.

Attributes

PLBI ALLE1, PLBI ALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing PLBI ALLE1, PLBI ALLE1NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_PLBI_ALL() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

PLBI ALLE1{, <Xt>}

PLBI ALLE3, PLBI ALLE3NXS, PLB Invalidate All, EL3

The PLBI ALLE3, PLBI ALLE3NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL3 translation regime in the current Security state.

The invalidation applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI ALLE3, PLBI ALLE3NXS are UNDEFINED.

Attributes

PLBI ALLE3, PLBI ALLE3NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing PLBI ALLE3, PLBI ALLE3NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

Accesses to this instruction use the following encodings in the System instruction encoding space:

PLBI ALLE3{, <Xt>}

PLBI ASIDE1, PLBI ASIDE1NXS, PLB Invalidate by ASID, EL1

The PLBI ASIDE1, PLBI ASIDE1NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.

The invalidation applies to the PE that executes this System instruction.

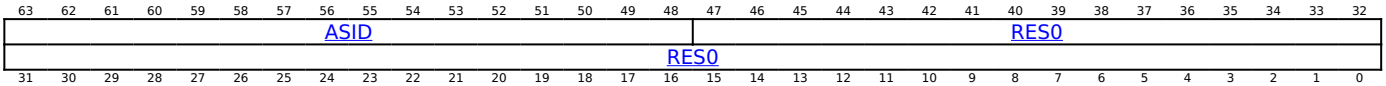
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI ASIDE1, PLBI ASIDE1NXS are UNDEFINED.

Attributes

PLBI ASIDE1, PLBI ASIDE1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate PLB entries that match the ASID value will be affected by this System instruction.

Bits [47:0]

Reserved, RES0.

Executing PLBI ASIDE1, PLBI ASIDE1NXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_PLBI_ASID() in the Shared Pseudocode.

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

PLBI PERMAE1, PLBI PERMAE1NXS, PLB Invalidate by Indicies, All ASID, EL1

The PLBI PERMAE1, PLBI PERMAE1NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to the PE that executes this System instruction.

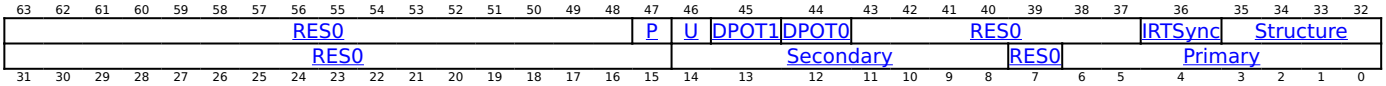
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERMAE1, PLBI PERMAE1NXS are UNDEFINED.

Attributes

PLBI PERMAE1, PLBI PERMAE1NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

Bits [31:15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

PLBI PERMAE1IS, PLBI PERMAE1ISNXS, PLB Invalidate by Indicies, All ASID, EL1, Inner Shareable

The PLBI PERMAE1IS, PLBI PERMAE1ISNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

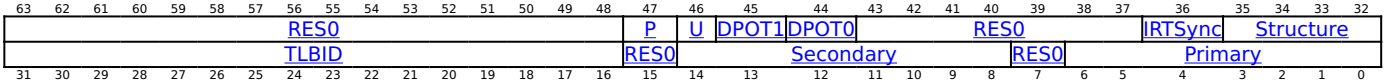
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERMAE1IS, PLBI PERMAE1ISNXS are UNDEFINED.

Attributes

PLBI PERMAE1IS, PLBI PERMAE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

TLBID, bits [31:16]
When FEAT_TLBID is implemented:

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

PLBI PERMAE1OS, PLBI PERMAE1OSNXS, PLB Invalidate by Indicies, All ASID, EL1, Outer Shareable

The PLBI PERMAE1OS, PLBI PERMAE1OSNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

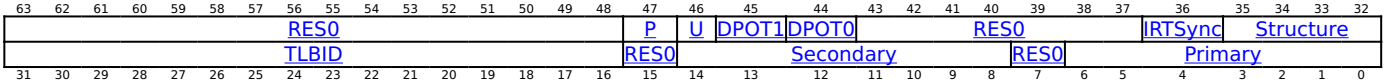
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERMAE1OS, PLBI PERMAE1OSNXS are UNDEFINED.

Attributes

PLBI PERMAE1OS, PLBI PERMAE1OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

TLBID, bits [31:16]
When FEAT_TLBID is implemented:

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

Executing PLBI PERMAE1OS, PLBI PERMAE1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_PLBI_PERMA() in the Shared Pseudocode.

PLBI PERME1, PLBI PERME1NXS, PLB Invalidate by Indicies, EL1

The PLBI PERME1, PLBI PERME1NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to the PE that executes this System instruction.

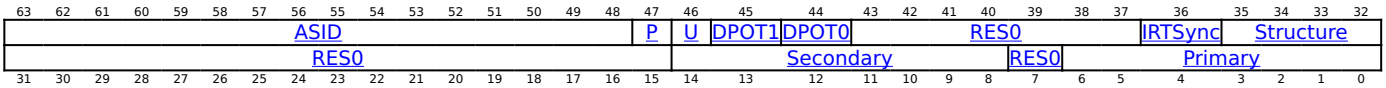
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME1, PLBI PERME1NXS are UNDEFINED.

Attributes

PLBI PERME1, PLBI PERME1NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate PLB entries that match the ASID value will be affected by this System instruction.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

Bits [31:15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

PLBI PERME1IS, PLBI PERME1ISNXS, PLB Invalidate by Indicies, EL1, Inner Shareable

The PLBI PERME1IS, PLBI PERME1ISNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

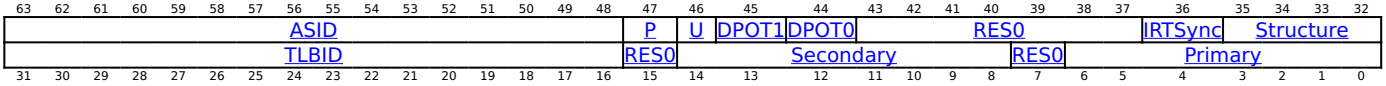
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME1IS, PLBI PERME1ISNXS are UNDEFINED.

Attributes

PLBI PERME1IS, PLBI PERME1ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate PLB entries that match the ASID value will be affected by this System instruction.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

TLBID, bits [31:16]
When FEAT_TLBID is implemented:

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

Executing PLBI PERME1IS, PLBI PERME1ISNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_PLBI_PERM() in the Shared Pseudocode.

PLBI PERME1OS, PLBI PERME1OSNXS, PLB Invalidate by Indicies, EL1, Outer Shareable

The PLBI PERME1OS, PLBI PERME1OSNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry matches the specified ASID.
- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

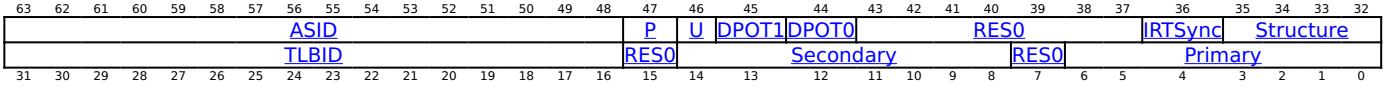
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME1OS, PLBI PERME1OSNXS are UNDEFINED.

Attributes

PLBI PERME1OS, PLBI PERME1OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate PLB entries that match the ASID value will be affected by this System instruction.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

TLBID, bits [31:16]
When FEAT_TLBID is implemented:

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

Executing PLBI PERME1OS, PLBI PERME1OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_PLBI_PERM() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

PLBI PERME1OS{, <Xt>}

PLBI PERME2, PLBI PERME2NXS, PLB Invalidate by Indicies, EL2

The PLBI PERME2, PLBI PERME2NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL2&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to the PE that executes this System instruction.

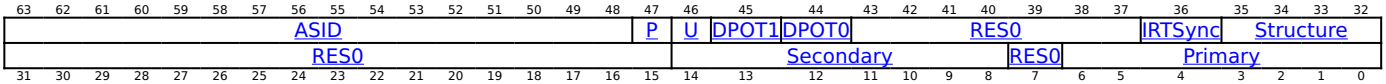
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME2, PLBI PERME2NXS are UNDEFINED.

Attributes

PLBI PERME2, PLBI PERME2NXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate PLB entries that match the ASID value will be affected by this System instruction.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

Bits [31:15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

Executing PLBI PERME2, PLBI PERME2NXS

This system instruction is an alias of the SYS instruction.

PLBI PERME2IS, PLBI PERME2ISNXS, PLB Invalidate by Indicies, EL2, Inner Shareable

The PLBI PERME2IS, PLBI PERME2ISNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL2&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

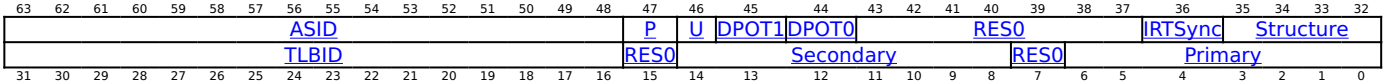
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME2IS, PLBI PERME2ISNXS are UNDEFINED.

Attributes

PLBI PERME2IS, PLBI PERME2ISNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate PLB entries that match the ASID value will be affected by this System instruction.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

TLBID, bits [31:16]
When FEAT_TLBID is implemented:

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

Executing PLBI PERME2IS, PLBI PERME2ISNXS

PLBI PERME2OS, PLBI PERME2OSNXS, PLB Invalidate by Indicies, EL2, Outer Shareable

The PLBI PERME2OS, PLBI PERME2OSNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL2&0 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

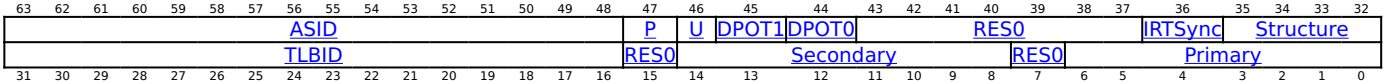
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME2OS, PLBI PERME2OSNXS are UNDEFINED.

Attributes

PLBI PERME2OS, PLBI PERME2OSNXS is a 64-bit System instruction.

Field descriptions



ASID, bits [63:48]

ASID value to match. Any appropriate PLB entries that match the ASID value will be affected by this System instruction.

P, bit [47]

Invalidate Privileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

P	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Privileged entries.

U, bit [46]

Invalidate Unprivileged entries. If the Structure field indicates an IRT or TTT entry, this field controls whether the invalidation affects Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

U	Meaning
0b0	This value has no effect on the invalidation.
0b1	The invalidation affects Unprivileged entries.

DPOT1, bit [45]

Invalidate DPOT1 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT1 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT1	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT1 entries.

DPOT0, bit [44]

Invalidate DPOT0 entries. If the Structure field indicates a DPOT entry, this field controls whether the invalidation affects DPOT0 entries.

This field is ignored if the Structure field indicates an IRT or TTT entry.

DPOT0	Meaning
0b0	This value has no effect on the entries to invalidate.
0b1	The invalidation affects DPOT0 entries.

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

TLBID, bits [31:16]
When FEAT_TLBID is implemented:

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

Otherwise:

Reserved, RES0.

Bit [15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

Executing PLBI PERME2OS, PLBI PERME2OSNXS

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_PLBI_PERM() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

PLBI PERME2OS{, <Xt>}

PLBI PERME3, PLBI PERME3NXS, PLB Invalidate by Indicies, EL3

The PLBI PERME3, PLBI PERME3NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL3 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to the PE that executes this System instruction.

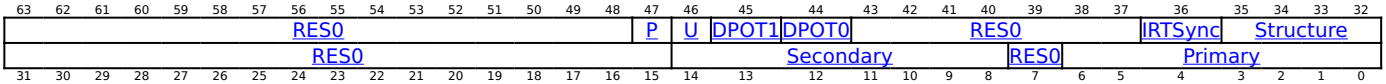
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME3, PLBI PERME3NXS are UNDEFINED.

Attributes

PLBI PERME3, PLBI PERME3NXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

P, bit [47]

Invalidate Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

Access to this field is RES1 .

U, bit [46]

Invalidate Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

Access to this field is RES0 .

DPOT1, bit [45]

Invalidate DPOT1 entries.

Access to this field is RES0 .

DPOT0, bit [44]

Invalidate DPOT0 entries.

Access to this field is RES1 .

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

Bits [31:15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

PLBI PERME3IS, PLBI PERME3ISNXS, PLB Invalidate by Indicies, EL3, Inner Shareable

The PLBI PERME3IS, PLBI PERME3ISNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL3 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

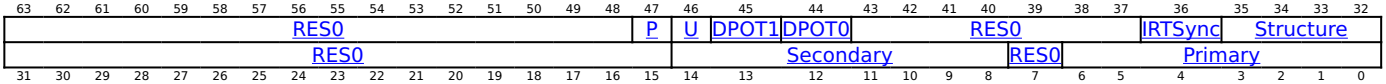
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME3IS, PLBI PERME3ISNXS are UNDEFINED.

Attributes

PLBI PERME3IS, PLBI PERME3ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

P, bit [47]

Invalidate Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

Access to this field is RES1 .

U, bit [46]

Invalidate Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

Access to this field is RES0 .

DPOT1, bit [45]

Invalidate DPOT1 entries.

Access to this field is RES0 .

DPOT0, bit [44]

Invalidate DPOT0 entries.

Access to this field is RES1 .

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

Bits [31:15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

PLBI PERME3OS, PLBI PERME3OSNXS, PLB Invalidate by Indicies, EL3, Outer Shareable

The PLBI PERME3OS, PLBI PERME3OSNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- The entry would be used in the EL3 translation regime in the current Security state.
- The entry is from the table type specified in the Structure field, and any of the following apply:
  - Structure specifies an IRT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified TIndex value, if specified.
    - The entry matches the specified FPOIndex value, if specified.
  - Structure specifies a TTT entry and all of the following apply:
    - The entry is from a table specified by the P and U bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified target TIndex value, if specified.
  - Structure indicates a DPOT entry and all of the following apply:
    - The entry is from a table specified by the DPOT0 and DPOT1 bits.
    - The entry matches the specified POTIndex value, if specified.
    - The entry matches the specified DPOIndex value, if specified.

The invalidation applies to all PEs in the same Outer Shareable shareability domain as the PE that executes this System instruction.

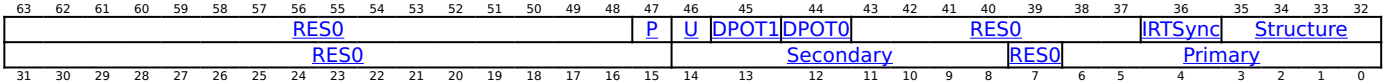
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI PERME3OS, PLBI PERME3OSNXS are UNDEFINED.

Attributes

PLBI PERME3OS, PLBI PERME3OSNXS is a 64-bit System instruction.

Field descriptions



Bits [63:48]

Reserved, RES0.

P, bit [47]

Invalidate Privileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

Access to this field is RES1 .

U, bit [46]

Invalidate Unprivileged entries.

This field is ignored if the Structure field indicates a DPOT entry.

Access to this field is RES0 .

DPOT1, bit [45]

Invalidate DPOT1 entries.

Access to this field is RES0 .

DPOT0, bit [44]

Invalidate DPOT0 entries.

Access to this field is RES1 .

Bits [43:37]

Reserved, RES0.

IRTSync, bit [36]

Level of Synchronization for perform for invalidated IRT entries.

IRTSync	Meaning
0b0	Completion of this PLBI does not guarantee completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.
0b1	Completion of this PLBI guarantees completion of outstanding instructions using the POTIndex of the cached IRT entries invalidated by this PLBI.

This field is RES0 if the Structure field indicates an entry which is not a cached IRT entry.

Structure, bits [35:32]

The table structure for the entries to be invalidated.

Structure	Meaning
0b0000	All IRT entries.
0b0001	IRT by TIndex.
0b0011	IRT by TIndex and FPOIndex.
0b0100	All DPOT entries.
0b0101	DPOT by POTIndex.
0b0111	DPOT by POTIndex and DPOIndex.
0b1000	All TTT entries.
0b1001	TTT by POTIndex.
0b1011	TTT by POTIndex and target TIndex.

All other values are reserved.

If this field is set to a reserved value, no PLB entries are required to be invalidated.

Bits [31:15]

Reserved, RES0.

Secondary, bits [14:8]

Secondary filter.

If the Structure field is 0b0011, this field is the FPOIndex.

If the Structure field is 0b0111, this field is the DPOIndex.

If the Structure field is 0b1011, this field is the Target TIndex.

Otherwise this field is RES0.

Bit [7]

Reserved, RES0.

Primary, bits [6:0]

Primary filter.

If the Structure field indicates an IRT entry, this field is the TIndex.

If the Structure field indicates a DPOT or TTT entry, this field is the POTIndex.

PLBI VMALLE1, PLBI VMALLE1NXS, PLB Invalidate by VMID, All, EL1

The PLBI VMALLE1, PLBI VMALLE1NXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or is not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.

The invalidation applies to the PE that executes this System instruction.

Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI VMALLE1, PLBI VMALLE1NXS are UNDEFINED.

Attributes

PLBI VMALLE1, PLBI VMALLE1NXS is a 64-bit System instruction.

Field descriptions

This instruction has no applicable fields.

The value in the register specified by <Xt> is ignored.

Executing PLBI VMALLE1, PLBI VMALLE1NXS

The Rt field should be set to 0b11111. If the Rt field is not set to 0b11111, it is CONSTRAINED UNPREDICTABLE whether:

- The instruction is UNDEFINED.
- The instruction behaves as if the Rt field is set to 0b11111.

This system instruction is an alias of the SYS instruction.

The following pseudocode describes traps which apply to the system instruction. For information about changes to the scope of the invalidation to the instruction under different conditions, see AArch64_PLBI_VMALL() in the Shared Pseudocode.

Accesses to this instruction use the following encodings in the System instruction encoding space:

PLBI VMALLE1{, <Xt>}

PLBI VMALLE1IS, PLBI VMALLE1ISNXS, PLB Invalidate by VMID, All, EL1, Inner Shareable

The PLBI VMALLE1IS, PLBI VMALLE1ISNXS characteristics are:

Purpose

Invalidates cached copies of IRT, TTT, and DPOT entries from PLBs that meet all the following requirements:

- If EL2 is implemented and enabled in the current Security state:
  - If HCR_EL2.{E2H, TGE} is not {1, 1}, the entry matches the current VMID, and the entry would be used in the EL1&0 translation regime in the current Security state.
  - If HCR_EL2.{E2H, TGE} is {1, 1}, and the entry would be used in the EL2&0 translation regime in the current Security state.
- If EL2 is not implemented or is not enabled in the current Security state, the entry would be used in the EL1&0 translation regime in the current Security state.

The invalidation applies to all PEs in the same Inner Shareable shareability domain as the PE that executes this System instruction.

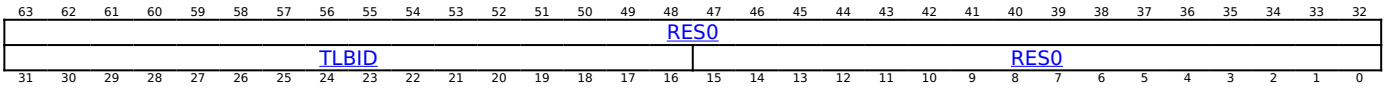
Configuration

This instruction is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PLBI VMALLE1IS, PLBI VMALLE1ISNXS are UNDEFINED.

Attributes

PLBI VMALLE1IS, PLBI VMALLE1ISNXS is a 64-bit System instruction.

Field descriptions



Bits [63:32]

Reserved, RES0.

TLBID, bits [31:16]
When FEAT_TLBID is implemented:

TLBI Domain.

The following set of FEAT_TLBID behaviors apply to PLBI operations:

- TLBI Domain numbering for PLBs matches that used for TLBs.
- HCRX_EL2.{VTLBIDEn, VTLBIDOSEn} causes the TLBID value specified in PLBI instructions executed at EL1 to be transformed.
- The effect of HCR_EL2.FB and HCRX_EL2.FNB on PLBI instructions executed at EL1 that specify the Inner shareable domain, or do not specify the Inner or Outer shareable domain.
- The effect of SCTLR2_ELx.TLBOSNIS on PLBI OS instructions executed at EL1 and EL2.

Otherwise:

Reserved, RES0.

Bits [15:0]

PM, Profiling Exception Mask

The PM characteristics are:

Purpose

Allows access to the Profiling exception Mask bit.

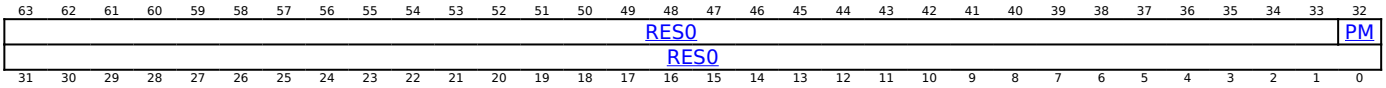
Configuration

This register is present only when FEAT_EBEP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PM are UNDEFINED.

Attributes

PM is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

PM, bit [32]

PMU Exception Mask.

PM	Meaning
0b0	Does not cause the Profiling exception to be masked.
0b1	Causes the Profiling exception to be masked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [31:0]

Reserved, RES0.

Accessing PM

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PM

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0011	0b001

2025-12-10 16:11:30, 2025-12_rel

PMBIDR_EL1, Profiling Buffer ID Register

The PMBIDR_EL1 characteristics are:

Purpose

Provides information to software as to whether the buffer can be programmed at the current Exception level.

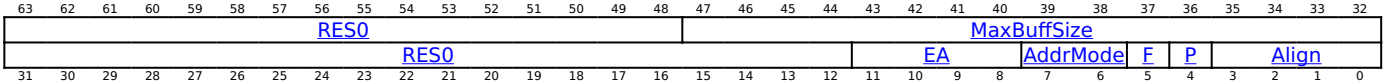
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBIDR_EL1 are UNDEFINED.

Attributes

PMBIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:48]

Reserved, RES0.

MaxBuffSize, bits [47:32]

Maximum supported Profiling Buffer size. Reserved for software use.

The only permitted value is 0x0000, indicating there is no limit to the maximum buffer size.

Note

Permitted values relate to the values an implementation is permitted to set this field to. A hypervisor might trap accesses to this register and use other values to describe limitations of its virtualization support to a guest operating system, as follows:

- MaxBuffSize bits[8:0] encodes a mantissa value, M.
- MaxBuffSize bits[13:9] encodes an exponent value, E.
- MaxBuffSize bits[15:14] are reserved.

The maximum buffer size, in bytes, is expressed using the following function:

if IsZero(E), then UInt(M:Zeros(12)) else UInt('1':M:Zeros(UInt(E)+11))

For example:

- A value of 0x0001 means a maximum buffer size of 4KB.
- A value of 0x3FFF means a maximum buffer size of 4092TB.

Reads as 0x0000.

Access to this field is RO.

Bits [31:12]

Reserved, RES0.

EA, bits [11:8]

External Abort handling. Describes how the PE manages External aborts on writes made by the Statistical Profiling Unit to the Profiling Buffer.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EA	Meaning
0b0000	Not described.
0b0001	The PE ignores External aborts on writes made by the Statistical Profiling Unit.
0b0010	An External abort on a write made by the Statistical Profiling Unit generates an asynchronous SError exception at the PE.

All other values are reserved.

From Armv8.8, the value 0b0000 is not permitted.

The behavior described by this field does not apply for External aborts on a translation table walk, translation table update, or GPT walk made by the Statistical Profiling Unit that are reported as MMU faults using PMBSR_ELx. For more information, see 'External aborts'.

Access to this field is RO.

AddrMode, bits [7:6]
When FEAT_SPE_nVM is implemented:

Address Modes. Describes the addressing modes available for the Profiling Buffer.

AddrMode	Meaning
0b00	Only virtual address mode is supported.
0b01	Virtual and physical address modes are supported.
0b11	Reserved for software use under virtualization, to show that only physical address mode is supported.

Other values are reserved.

If the Effective value of PMSCR_EL2.EnVM is 1 and the value returned for PMBIDR_EL1.P is 0, then this field reads as 0b01. Otherwise, this field reads as 0b00.

Note

A hypervisor might trap accesses to this register to describe limitations of its virtualization support to a guest operating system.

Otherwise:

Reserved, RES0.

F, bit [5]

Flag updates. Describes how address translations performed by the Statistical Profiling Unit manage the Access flag and dirty state.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F	Meaning
0b0	Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Unit is always disabled for all translation stages.
0b1	Hardware management of the Access flag and dirty state for accesses made by the Statistical Profiling Unit is controlled in the same way as explicit memory accesses in the Profiling Buffer owning translation regime.

Note

If hardware management of the Access flag is disabled for a stage of translation, an access to a Page or Block with the Access flag bit not set in the descriptor will generate an Access Flag fault.

If hardware management of the dirty state is disabled for a stage of translation, an access to a Page or Block will ignore the Dirty Bit Modifier in the descriptor and might generate a Permission fault, depending on the values of the access permission bits in the descriptor.

From Armv8.8, the value 0 is not permitted.

Access to this field is RO.

P, bit [4]

Programming not allowed. When read at EL3, this field reads as zero. Otherwise, indicates that the Profiling Buffer owning Exception level is a higher Exception level or the Profiling Buffer owning Security state is not the current Security state.

P	Meaning
0b0	Programming is allowed.
0b1	Programming not allowed.

The value read from this field depends on the current Exception level and the Effective values of MDCR_EL3.NSPB, MDCR_EL3.NSPBE, and MDCR_EL2.E2PB:

- If EL3 is implemented, MDCR_EL3.NSPB is 0b0x, and either FEAT_RME is not implemented, or Secure state is implemented and MDCR_EL3.NSPBE is 0, then this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
  - If Secure EL2 is implemented and enabled, and MDCR_EL2.E2PB is 0b00, Secure EL1.
- If EL3 is implemented, MDCR_EL3.NSPB is 0b1x and either FEAT_RME is not implemented or MDCR_EL3.NSPBE is 0, then this field reads as one from:
  - If Secure state is implemented, Secure EL1.
  - If Secure EL2 is implemented, Secure EL2.
  - If EL2 is implemented and MDCR_EL2.E2PB is 0b00, Non-secure EL1.
  - If FEAT_RME is implemented, Realm EL1 and Realm EL2.
- If FEAT_RME is implemented, and MDCR_EL3.{NSPB, NSPBE} is {0b1x, 1}, then this field reads as one from:
  - Non-secure EL1 and Non-secure EL2.
  - If Secure state is implemented, Secure EL1 and Secure EL2.
  - If MDCR_EL2.E2PB is 0b00, Realm EL1.
- If EL3 is not implemented, EL2 is implemented, and MDCR_EL2.E2PB is 0b00, then this field reads as one from EL1.

Otherwise, this field reads as zero.

Align, bits [3:0]

Defines the minimum alignment constraint for writes to PMBPTR_EL1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Align	Meaning
0b0000	Byte.
0b0001	Halfword.
0b0010	Word.
0b0011	Doubleword.
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

For more information, see 'Restrictions on the current write pointer'.

If this field is nonzero, then every record is a multiple of this size.

Access to this field is RO.

Accessing PMBIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b111

PMBLIMITR_EL1, Profiling Buffer Limit Address Register

The PMBLIMITR_EL1 characteristics are:

Purpose

Defines the upper limit for the profiling buffer, and enables the profiling buffer

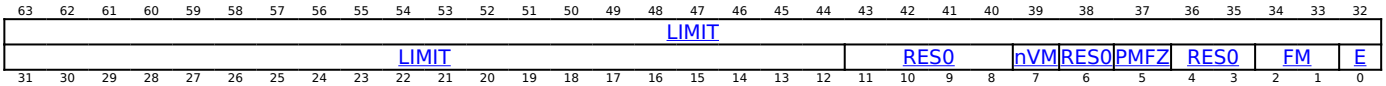
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBLIMITR_EL1 are UNDEFINED.

Attributes

PMBLIMITR_EL1 is a 64-bit register.

Field descriptions



LIMIT, bits [63:12]

Limit address. PMBLIMITR_EL1.LIMIT:Zeros(12) is the address of the first byte in memory after the last byte in the profiling buffer. If the smallest implemented translation granule is not 4KB, then bits[N-1:12] are RES0, where N is the IMPLEMENTATION DEFINED value, Log_2(smallest implemented translation granule).

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [11:8]

Reserved, RES0.

nVM, bit [7]
When FEAT_SPE_nVM is implemented:

Address mode.

nVM	Meaning
0b0	The Profiling Buffer pointers are virtual addresses.
0b1	The Profiling Buffer pointers are: • Physical address in the owning security state if the owning translation regime has no stage 2 translation. • Intermediate physical addresses in the owning security state if the owning translation regime has stage 2 translations.

If the Effective value of PMSCR_EL2.EnVM is 0, then the PE ignores the value of this field, and the Profiling Buffer pointers are always virtual addresses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

Bit [6]

Reserved, RES0.

PMFZ, bit [5]
When FEAT_SPEv1p2 is implemented:

Freeze PMU on SPE event. Stop PMU event counters when PMBSR_EL1.S == 1.

PMFZ	Meaning
0b0	Do not freeze PMU event counters on Statistical Profiling Buffer Management event.
0b1	Freeze PMU event counters on Statistical Profiling Buffer Management event.

The PMU event counters affected by this control is controlled by PMCR_EL0.FZS and, if EL2 is implemented, MDCR_EL2.HPMFZS. See the descriptions of these control bits for more information.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [4:3]

Reserved, RES0.

FM, bits [2:1]

Fill mode.

FM	Meaning	Applies when
0b00	Fill mode. Stop collection and raise maintenance interrupt on buffer fill.	
0b10	Discard mode. All output is discarded.	When FEAT_SPEv1p2 is implemented

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [0]

Profiling Buffer enable

E	Meaning
0b0	All output is discarded.
0b1	Profiling buffer enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PMBLIMITR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBLIMITR_EL1

PMBMAR_EL1, Profiling Buffer Memory Attribute Register

The PMBMAR_EL1 characteristics are:

Purpose

Controls Statistical Profiling Unit accesses to memory.

If the Profiling Buffer pointers specify virtual addresses, the address properties are defined by the translation tables and this register is ignored.

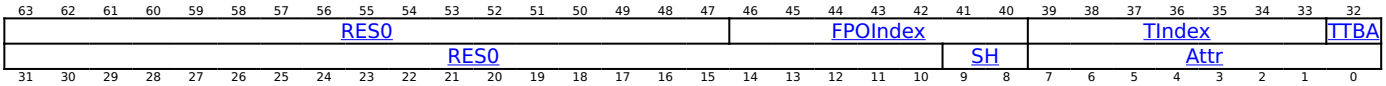
Configuration

This register is present only when FEAT_SPE_nVM is implemented or (FEAT_SPE is implemented and FEAT_S1POE2 is implemented). Otherwise, direct accesses to PMBMAR_EL1 are UNDEFINED.

Attributes

PMBMAR_EL1 is a 64-bit register.

Field descriptions



Bits [63:47]

Reserved, RES0.

FPOIndex, bits [46:40]
When FEAT_S1POE2 is implemented:

FPOIndex to use for the Profiling Buffer.

Bits of this field above the configured POIndex size in TCR2_ELx.POIW for the Owning Exception level are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TIndex, bits [39:33]
When FEAT_S1POE2 is implemented:

Privileged TIndex to use for the Profiling Buffer.

Bits of this field above the configured TIndex size in IRTBRP_ELx.TIW for the Owning Exception level are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TTBA, bit [32]
When FEAT_S1POE2 is implemented:

Selects which ASID for the Owning Exception level to use for IRT PLB lookups for the Profiling Buffer, if TCR2_ELx.A2 is 1.

TTBA	Meaning
0b0	TTBR0_ELx.ASID is used.
0b1	TTBR1_ELx.ASID is used.

If TCR2_ELx.A2 is 0, this field is RES0 and has no effect on the selection of ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [31:10]

Reserved, RES0.

SH, bits [9:8]

Profiling Buffer shareability domain. Defines the shareability domain for Normal memory used by the Profiling Buffer.

SH	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

All other values are reserved.

This field is ignored when PMBMAR_EL1.Attr specifies any of the following memory types:

- Any Device memory type.
- Normal memory, Inner Non-cacheable, Outer Non-cacheable.

All Device and Normal Inner Non-cacheable Outer Non-cacheable memory regions are always treated as Outer Shareable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Attr, bits [7:0]

Profiling Buffer memory type and attributes. Defines the memory type and, for Normal memory, the cacheability attributes, for memory addressed by the Profiling Buffer.

The encoding of this field is the same as that of a MAIR_ELx.Attr<n> field, as follows:

Attr		Meaning
0b0000dd00		Device memory. See encoding of 'dd' for the type of Device memory.
0b0000dd01		If FEAT_XS is implemented: Device memory with the XS attribute set to 0. See encoding of 'dd' for the type of Device memory. Otherwise,UNPREDICTABLE.
0b0000dd1x		UNPREDICTABLE.
0booooiiii	where oooo != 0000 and iiii != 0000	Normal memory. See encoding of 'oooo' and 'iiii' for the type of Normal memory.
0b01000000		If FEAT_XS is implemented: Normal Inner Non-cacheable, Outer Non-cacheable memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b10100000		If FEAT_XS is implemented: Normal Inner Write-through Cacheable, Outer Write-through Cacheable, Read-Allocate, No-Write Allocate, Non-transient memory with the XS attribute set to 0. Otherwise,UNPREDICTABLE.
0b11110000		If FEAT_MTE2 or FEAT_VMTE is implemented: Tagged Normal Inner Write-Back, Outer Write-Back, Read-Allocate, Write-Allocate Non-transient memory. Otherwise,UNPREDICTABLE.
0bxxxx0000	where xxxx != 0000 and xxxx != 0100 and xxxx != 1010 and xxxx != 1111	UNPREDICTABLE.

dd is encoded as follows:

'dd'	Meaning
0b00	Device-nGnRnE memory.
0b01	Device-nGnRE memory.
0b10	Device-nGRE memory.
0b11	Device-GRE memory.

oooo is encoded as follows:

'oooo'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Outer Write-Through Transient.
0b0100		Normal memory, Outer Non-cacheable.
0b01RW	where RW != 00	Normal memory, Outer Write-Back Transient.
0b10RW		Normal memory, Outer Write-Through Non-transient.
0b11RW		Normal memory, Outer Write-Back Non-transient.

R encodes the Outer Read-Allocate policy and W encodes the Outer Write-Allocate policy.

iiii is encoded as follows:

'iiii'		Meaning
0b0000		See encoding of Attr.
0b00RW	where RW != 00	Normal memory, Inner Write-Through Transient.
0b0100		Normal memory, Inner Non-cacheable.
0b01RW	where RW != 00	Normal memory, Inner Write-Back Transient.
0b10RW		Normal memory, Inner Write-Through Non-transient.
0b11RW		Normal memory, Inner Write-Back Non-transient.

R encodes the Inner Read-Allocate policy and W encodes the Inner Write-Allocate policy.

In oooo and iiii, R and W are encoded as follows:

'R' or 'W'	Meaning
0b0	No Allocate.
0b1	Allocate.

When FEAT_XS is implemented, stage 1 Inner Write-Back Cacheable, Outer Write-Back Cacheable memory types have the XS attribute set to 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PMBPTR_EL1, Profiling Buffer Write Pointer Register

The PMBPTR_EL1 characteristics are:

Purpose

Defines the current write pointer for the profiling buffer.

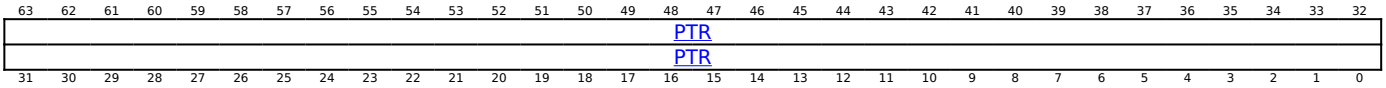
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBPTR_EL1 are UNDEFINED.

Attributes

PMBPTR_EL1 is a 64-bit register.

Field descriptions



PTR, bits [63:0]

Current write address. Defines the virtual address of the next entry to be written to the buffer.

If PMBIDR_EL1.Align is not zero, then it is IMPLEMENTATION DEFINED whether bits [M-1:0] are RES0 or read/write, where M is an integer between 1 and PMBIDR_EL1.Align inclusive.

The architecture places restrictions on the values software can write to the pointer when the SPU is not in Discard mode. For more information see 'Restrictions on the current write pointer'.

On a management interrupt, PMBPTR_EL1 is frozen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMBPTR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBPTR_EL1

PMBSR_EL1, Profiling Buffer Status/syndrome Register (EL1)

The PMBSR_EL1 characteristics are:

Purpose

Provides syndrome information to software for a Profiling Buffer management event.

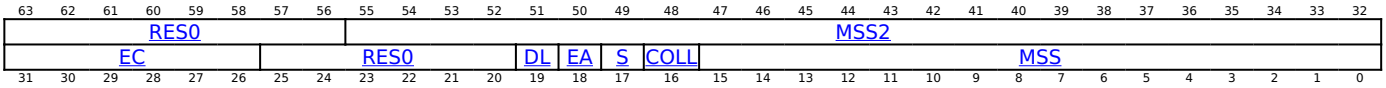
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMBSR_EL1 are UNDEFINED.

Attributes

PMBSR_EL1 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

MSS2 encoding for other Profiling Buffer management events

Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer

DPOIndex, bits [23:17]
When FEAT_S1POE2 is implemented:

DPOIndex for the fault.

For a stage 1 Permission fault, if FEAT_S1POE2 is implemented and MSS2.Overlay is 1, this field reports the POIndex from the translation for the access that generated the fault.

Otherwise:

Reserved, RES0.

OverlayFetch, bit [16]
When FEAT_S1POE2 is implemented:

Fetch of POE2 table.

OverlayFetch	Meaning
0b0	Fault was not generated on a fetch of IRT or DPOT information.
0b1	Fault was generated on a fetch of IRT or DPOT information.

Otherwise:

Reserved, RES0.

Bits [15:9]

Reserved, RES0.

TopLevel, bit [8]
When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented, PMBSR_EL1.EC == '100101', and GetPMBSR_EL1_FSC() IN {'0011xx'}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetPMBSR_EL1_FSC() IN {'0011xx'}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetPMBSR_EL1_FSC() IN {'0011xx'}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer

Bits [23:0]

Reserved, RES0.

MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the Profiling Buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other Profiling Buffer management event. All Profiling Buffer management events other than those described by the other defined Event class codes.	MSS encoding for other Profiling Buffer management events	MSS2 encoding for other Profiling Buffer management events	
0b011110	Granule Protection Check fault on write to Profiling Buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to Profiling Buffer	MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer	When FEAT_RME is implemented
0b011111	Profiling Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost. Following a buffer management event, indicates whether the last record written to the Profiling Buffer is complete. PMBSR_EL1.DL is also set to 1 when an asynchronous External abort is reported to the SPU.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer by the SPU, and no asynchronous External abort has been reported to the SPU.
0b1	Part of a record was lost because of a Profiling Buffer management event, or an asynchronous External abort has been reported to the SPU. PMBPTR_EL1 might not be the address of the first byte after the last complete sample record written to the Profiling Buffer by the SPU.

When the SPU sets this bit to 1, sofware must not assume that there is any valid data between the end of the last complete record and PMBPTR_EL1. If software restarts profiling from the saved PMBPTR_EL1 value, then this might result in buffer contents that software cannot parse. If PMBSR_EL1.EA is also set to 1 by the SPU, then software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if there are no circumstances when the PE would ever set this bit to 1 as a result of a Profiling Buffer management event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]
When the PE sets this bit as the result of an External abort:

External abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Statistical Profiling Unit.

It is IMPLEMENTATION DEFINED whether this field is set to 1 or is unchanged by the PE when a write by the Statistical Profiling Unit generates an External abort on a translation table walk, translation table update, or GPT walk that is reported as an MMU fault. When FEAT_SPEv1p3 is implemented, this field is not set to 1 by the PE for any other Profiling Buffer management event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Service. Indicates that a Profiling Buffer management event has been recorded.

S	Meaning
0b0	No Profiling Buffer management event for EL1 has been recorded.
0b1	A Profiling Buffer management event for EL1 has been recorded.

When FEAT_SPE_EXC is implemented, this field indicates a management event for EL1.

If FEAT_SPE_EXC is implemented and the SPE Profiling exception for EL1 is enabled, then when this field is 1, an SPE Profiling exception for EL1 is pending

If FEAT_SPE_EXC is not implemented or the SPE Profiling exception for EL1 is disabled, then this field drives the PMBIRQ Profiling Buffer interrupt request signal.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the Profiling Buffer management event.

The syndrome contents for each Profiling Buffer management event are described in the following sections.

MSS encoding for other Profiling Buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Profiling Buffer status code

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Profiling Buffer filled.
0b000100	Buffer size. The requested Profiling Buffer size was too large.

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	

0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110010	PLB conflict abort.	When FEAT_S1POE2 is implemented

All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to Profiling Buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing PMBSR_EL1

When the Effective value of HCR_EL2.E2H is 1 and FEAT_SPE_EXC is implemented, without explicit synchronization, accesses from EL3 using the accessor name PMBSR_EL1 or PMBSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBSR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b011

PMBSR_EL2, Profiling Buffer Syndrome Register (EL2)

The PMBSR_EL2 characteristics are:

Purpose

Provides syndrome information to software for a Profiling Buffer management event.

Configuration

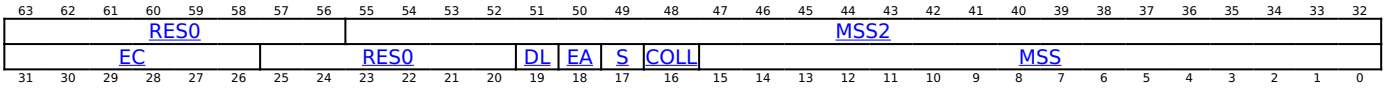
This register is present only when FEAT_SPE_EXC is implemented. Otherwise, direct accesses to PMBSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

PMBSR_EL2 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

MSS2 encoding for other Profiling Buffer management events

Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer

DPOIndex, bits [23:17]
When FEAT_S1POE2 is implemented:

DPOIndex for the fault.

For a stage 1 Permission fault, if FEAT_S1POE2 is implemented and MSS2.Overlay is 1, this field reports the POIndex from the translation for the access that generated the fault.

Otherwise:

Reserved, RES0.

OverlayFetch, bit [16]
When FEAT_S1POE2 is implemented:

Fetch of POE2 table.

OverlayFetch	Meaning
0b0	Fault was not generated on a fetch of IRT or DPOT information.
0b1	Fault was generated on a fetch of IRT or DPOT information.

Otherwise:

Reserved, RES0.

Bits [15:9]

Reserved, RES0.

TopLevel, bit [8]
When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented, PMBSR_EL2.EC == '100101', and GetPMBSR_EL2_FSC() IN {'0011xx'}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetPMBSR_EL2_FSC() IN {'0011xx'}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetPMBSR_EL2_FSC() IN {'0011xx'}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer

Bits [23:0]

Reserved, RES0.

MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the Profiling Buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other Profiling Buffer management event. All Profiling Buffer management events other than those described by the other defined Event class codes.	MSS encoding for other Profiling Buffer management events	MSS2 encoding for other Profiling Buffer management events	
0b011110	Granule Protection Check fault on write to Profiling Buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to Profiling Buffer	MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer	When FEAT_RME is implemented
0b011111	Profiling Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost. Following a buffer management event, indicates whether the last record written to the Profiling Buffer is complete. PMBSR_EL2.DL is also set to 1 when an asynchronous External abort is reported to the SPU.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer by the SPU, and no asynchronous External abort has been reported to the SPU.
0b1	Part of a record was lost because of a Profiling Buffer management event, or an asynchronous External abort has been reported to the SPU. PMBPTR_EL1 might not be the address of the first byte after the last complete sample record written to the Profiling Buffer by the SPU.

When the SPU sets this bit to 1, sofware must not assume that there is any valid data between the end of the last complete record and PMBPTR_EL1. If software restarts profiling from the saved PMBPTR_EL1 value, then this might result in buffer contents that software cannot parse. If PMBSR_EL2.EA is also set to 1 by the SPU, then software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if there are no circumstances when the PE would ever set this bit to 1 as a result of a Profiling Buffer management event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]
When the PE sets this bit as the result of an External abort:

External abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Statistical Profiling Unit.

It is IMPLEMENTATION DEFINED whether this field is set to 1 or is unchanged by the PE when a write by the Statistical Profiling Unit generates an External abort on a translation table walk, translation table update, or GPT walk that is reported as an MMU fault. When FEAT_SPEv1p3 is implemented, this field is not set to 1 by the PE for any other Profiling Buffer management event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Service. Indicates that a Profiling Buffer management event has been recorded.

S	Meaning
0b0	No Profiling Buffer management event for EL2 has been recorded.
0b1	A Profiling Buffer management event for EL2 has been recorded.

When FEAT_SPE_EXC is implemented, this field indicates a management event for EL2.

If the SPE Profiling exception for EL2 is enabled, then when this field is 1, an SPE Profiling exception for EL2 is pending

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the Profiling Buffer management event.

The syndrome contents for each Profiling Buffer management event are described in the following sections.

MSS encoding for other Profiling Buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Profiling Buffer status code

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Profiling Buffer filled.
0b000100	Buffer size. The requested Profiling Buffer size was too large.

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	

0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110010	PLB conflict abort.	When FEAT_S1POE2 is implemented

All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to Profiling Buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing PMBSR_EL2

When the Effective value of HCR_EL2.E2H is 1 and FEAT_SPE_EXC is implemented, without explicit synchronization, accesses from EL2 using the accessor name PMBSR_EL2 or PMBSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBSR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1001	0b1010	0b011

```
if !IsFeatureImplemented(FEAT_SPE_EXC) then

PMBSR_EL3, Profiling Buffer Syndrome Register (EL3)

The PMBSR_EL3 characteristics are:

Purpose

Provides syndrome information to software for a Profiling Buffer management event.

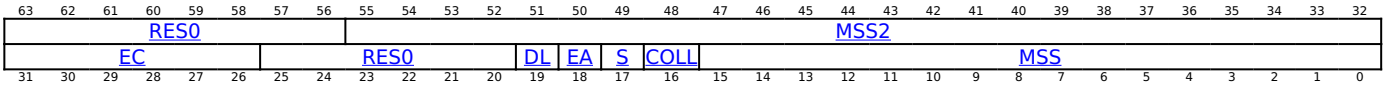
Configuration

This register is present only when FEAT_SPE_EXC is implemented and EL3 is implemented. Otherwise, direct accesses to PMBSR_EL3 are UNDEFINED.

Attributes

PMBSR_EL3 is a 64-bit register.

Field descriptions



Bits [63:56]

Reserved, RES0.

MSS2, bits [55:32]

Management event Specific Syndrome 2. Contains syndrome specific to the management event.

The syndrome contents for each management event are described in the following sections.

MSS2 encoding for other Profiling Buffer management events

Bits [23:0]

Reserved, RES0.

MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer

DPOIndex, bits [23:17]
When FEAT_S1POE2 is implemented:

DPOIndex for the fault.

For a stage 1 Permission fault, if FEAT_S1POE2 is implemented and MSS2.Overlay is 1, this field reports the POIndex from the translation for the access that generated the fault.

Otherwise:

Reserved, RES0.

OverlayFetch, bit [16]
When FEAT_S1POE2 is implemented:

Fetch of POE2 table.

OverlayFetch	Meaning
0b0	Fault was not generated on a fetch of IRT or DPOT information.
0b1	Fault was generated on a fetch of IRT or DPOT information.

Otherwise:

Reserved, RES0.

Bits [15:9]

Reserved, RES0.

TopLevel, bit [8]
When FEAT_THE is implemented:

TopLevel. Indicates if the fault was due to TopLevel.

TopLevel	Meaning
0b0	Fault is not due to TopLevel.
0b1	Fault is due to TopLevel.

Otherwise:

Reserved, RES0.

AssuredOnly, bit [7]
When FEAT_THE is implemented, PMBSR_EL3.EC == '100101', and GetPMBSR_EL3_FSC() IN {'0011xx'}:

AssuredOnly flag. If a memory access generates a stage 2 Data Abort, then this field holds information about the fault.

AssuredOnly	Meaning
0b0	Data Abort is not due to AssuredOnly.
0b1	Data Abort is due to AssuredOnly.

Otherwise:

Reserved, RES0.

Overlay, bit [6]
When (FEAT_S1POE is implemented or FEAT_S2POE is implemented) and GetPMBSR_EL3_FSC() IN {'0011xx'}:

Overlay flag. If a memory access generates a Data Abort for a Permission fault, then this field holds information about the fault.

Overlay	Meaning
0b0	Data Abort is not due to Overlay Permissions.
0b1	Data Abort is due to Overlay Permissions.

Otherwise:

Reserved, RES0.

DirtyBit, bit [5]
When (FEAT_S1PIE is implemented or FEAT_S2PIE is implemented) and GetPMBSR_EL3_FSC() IN {'0011xx'}:

DirtyBit flag. If a write access to memory generates a Data Abort for a Permission fault using Indirect Permission, then this field holds information about the fault.

DirtyBit	Meaning
0b0	Permission Fault is not due to dirty state.
0b1	Permission Fault is due to dirty state.

Otherwise:

Reserved, RES0.

Bits [4:0]

Reserved, RES0.

MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer

Bits [23:0]

Reserved, RES0.

MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [23:0]

IMPLEMENTATION DEFINED.

EC, bits [31:26]

Event class. Top-level description of the cause of the Profiling Buffer management event.

EC	Meaning	MSS	MSS2	Applies when
0b000000	Other Profiling Buffer management event. All Profiling Buffer management events other than those described by the other defined Event class codes.	MSS encoding for other Profiling Buffer management events	MSS2 encoding for other Profiling Buffer management events	
0b011110	Granule Protection Check fault on write to Profiling Buffer, other than Granule Protection Fault (GPF). That is, any of the following: • Granule Protection Table (GPT) address size fault. • GPT walk fault. • External abort on GPT fetch. A GPF on translation table walk or update is reported as either a Stage 1 or Stage 2 Data Abort, as appropriate. Other GPFs are reported as a Stage 1 Data Abort.	MSS encoding for Granule Protection Check faults on write to Profiling Buffer	MSS2 encoding for Granule Protection Check faults on write to Profiling Buffer	When FEAT_RME is implemented
0b011111	Profiling Buffer management event for an IMPLEMENTATION DEFINED reason.	MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	MSS2 encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason	
0b100100	Stage 1 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	
0b100101	Stage 2 Data Abort on write to Profiling Buffer.	MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	MSS2 encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer	

All other values are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [25:20]

Reserved, RES0.

DL, bit [19]

Partial record lost. Following a buffer management event, indicates whether the last record written to the Profiling Buffer is complete. PMBSR_EL3.DL is also set to 1 when an asynchronous External abort is reported to the SPU.

DL	Meaning
0b0	PMBPTR_EL1 points to the first byte after the last complete record written to the Profiling Buffer by the SPU, and no asynchronous External abort has been reported to the SPU.
0b1	Part of a record was lost because of a Profiling Buffer management event, or an asynchronous External abort has been reported to the SPU. PMBPTR_EL1 might not be the address of the first byte after the last complete sample record written to the Profiling Buffer by the SPU.

When the SPU sets this bit to 1, sofware must not assume that there is any valid data between the end of the last complete record and PMBPTR_EL1. If software restarts profiling from the saved PMBPTR_EL1 value, then this might result in buffer contents that software cannot parse. If PMBSR_EL3.EA is also set to 1 by the SPU, then software must not assume that any valid data has been written to the Profiling Buffer.

This bit is RES0 if there are no circumstances when the PE would ever set this bit to 1 as a result of a Profiling Buffer management event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EA, bit [18]
When the PE sets this bit as the result of an External abort:

External abort.

EA	Meaning
0b0	An External abort has not been asserted.
0b1	An External abort has been asserted and detected by the Statistical Profiling Unit.

It is IMPLEMENTATION DEFINED whether this field is set to 1 or is unchanged by the PE when a write by the Statistical Profiling Unit generates an External abort on a translation table walk, translation table update, or GPT walk that is reported as an MMU fault. When FEAT_SPEv1p3 is implemented, this field is not set to 1 by the PE for any other Profiling Buffer management event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

S, bit [17]

Service. Indicates that a Profiling Buffer management event has been recorded.

S	Meaning
0b0	No Profiling Buffer management event for EL3 has been recorded.
0b1	A Profiling Buffer management event for EL3 has been recorded.

When FEAT_SPE_EXC is implemented, this field indicates a management event for EL3.

If the SPE Profiling exception for EL3 is enabled, then when this field is 1, an SPE Profiling exception for EL3 is pending

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

COLL, bit [16]

Collision detected.

COLL	Meaning
0b0	No collision events detected.
0b1	At least one collision event was recorded.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS, bits [15:0]

Management Event Specific Syndrome. Contains syndrome specific to the Profiling Buffer management event.

The syndrome contents for each Profiling Buffer management event are described in the following sections.

MSS encoding for other Profiling Buffer management events

Bits [15:6]

Reserved, RES0.

BSC, bits [5:0]

Profiling Buffer status code

BSC	Meaning
0b000000	Collection not stopped, or access not allowed.
0b000001	Profiling Buffer filled.
0b000100	Buffer size. The requested Profiling Buffer size was too large.

All other values are reserved.

MSS encoding for stage 1 or stage 2 Data Aborts on write to Profiling Buffer

Bits [15:6]

Reserved, RES0.

FSC, bits [5:0]

Fault status code

FSC	Meaning	Applies when
0b000000	Address size fault, level 0 of translation or translation table base register.	
0b000001	Address size fault, level 1.	
0b000010	Address size fault, level 2.	
0b000011	Address size fault, level 3.	
0b000100	Translation fault, level 0.	
0b000101	Translation fault, level 1.	
0b000110	Translation fault, level 2.	
0b000111	Translation fault, level 3.	
0b001001	Access flag fault, level 1.	
0b001010	Access flag fault, level 2.	
0b001011	Access flag fault, level 3.	
0b001000	Access flag fault, level 0.	When FEAT_LPA2 is implemented
0b001100	Permission fault, level 0.	When FEAT_LPA2 is implemented
0b001101	Permission fault, level 1.	
0b001110	Permission fault, level 2.	
0b001111	Permission fault, level 3.	
0b010000	Synchronous External abort, not on translation table walk or hardware update of translation table.	
0b010001	Asynchronous External abort.	
0b010010	Synchronous External abort on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented
0b010011	Synchronous External abort on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented
0b010100	Synchronous External abort on translation table walk or hardware update of translation table, level 0.	
0b010101	Synchronous External abort on translation table walk or hardware update of translation table, level 1.	
0b010110	Synchronous External abort on translation table walk or hardware update of translation table, level 2.	

0b010111	Synchronous External abort on translation table walk or hardware update of translation table, level 3.	
0b011011	Synchronous parity or ECC error on memory access on translation table walk or hardware update of translation table, level -1.	When FEAT_LPA2 is implemented and FEAT_RAS is not implemented
0b100001	Alignment fault.	
0b100010	Granule Protection Fault on translation table walk or hardware update of translation table, level -2.	When FEAT_D128 is implemented and FEAT_RME is implemented
0b100011	Granule Protection Fault on translation table walk or hardware update of translation table, level -1.	When FEAT_RME is implemented and FEAT_LPA2 is implemented
0b100100	Granule Protection Fault on translation table walk or hardware update of translation table, level 0.	When FEAT_RME is implemented
0b100101	Granule Protection Fault on translation table walk or hardware update of translation table, level 1.	When FEAT_RME is implemented
0b100110	Granule Protection Fault on translation table walk or hardware update of translation table, level 2.	When FEAT_RME is implemented
0b100111	Granule Protection Fault on translation table walk or hardware update of translation table, level 3.	When FEAT_RME is implemented
0b101000	Granule Protection Fault, not on translation table walk or hardware update of translation table.	When FEAT_RME is implemented
0b101001	Address size fault, level -1.	When FEAT_LPA2 is implemented
0b101010	Translation fault, level -2.	When FEAT_D128 is implemented
0b101011	Translation fault, level -1.	When FEAT_LPA2 is implemented
0b101100	Address Size fault, level -2.	When FEAT_D128 is implemented
0b110000	TLB conflict abort.	
0b110001	Unsupported atomic hardware update fault.	When FEAT_HAFDBS is implemented
0b110010	PLB conflict abort.	When FEAT_S1POE2 is implemented

All other values are reserved.

It is IMPLEMENTATION DEFINED whether each of the Access Flag fault, asynchronous External abort and synchronous External abort, Alignment fault, and TLB Conflict abort values can be generated by the PE. For more information see 'Faults and Watchpoints'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

MSS encoding for Granule Protection Check faults on write to Profiling Buffer

Bits [15:0]

Reserved, RES0.

MSS encoding for Profiling Buffer management event for an IMPLEMENTATION DEFINED reason

IMPLEMENTATION DEFINED, bits [15:0]

IMPLEMENTATION DEFINED.

Accessing PMBSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMBSR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1001	0b1010	0b011

```

PMCCFILTR_EL0, Performance Monitors Cycle Count Filter Register

The PMCCFILTR_EL0 characteristics are:

Purpose

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.

Configuration

AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCCFILTR[31:0].

AArch64 System register PMCCFILTR_EL0 bits [63:32] are architecturally mapped to External register PMCCFILTR_EL0[63:32] when FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented, or FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_SME is implemented.

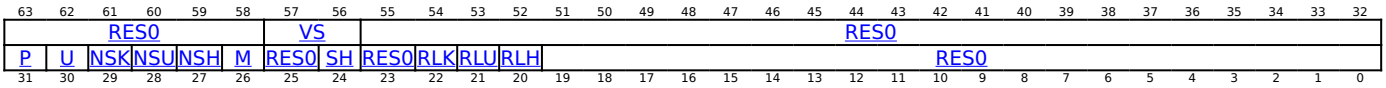
AArch64 System register PMCCFILTR_EL0 bits [31:0] are architecturally mapped to External register PMCCFILTR_EL0[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCCFILTR_EL0 are UNDEFINED.

Attributes

PMCCFILTR_EL0 is a 64-bit register.

Field descriptions



Bits [63:58]

Reserved, RES0.

VS, bits [57:56]
When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting cycles in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of cycles.
0b01	The PE does not count cycles in Streaming SVE mode.
0b10	The PE does not count cycles in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting cycles in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL1.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL1 is further controlled by PMCCFILTR_EL0.NSK.

If FEAT_RME is implemented, then counting cycles in Realm EL1 is further controlled by PMCCFILTR_EL0.RLK.

If EL3 is implemented, then counting cycles in EL3 is further controlled by PMCCFILTR_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting cycles in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of cycles.
0b1	The PE does not count cycles in EL0.

If Secure and Non-secure states are implemented, then counting cycles in Non-secure EL0 is further controlled by PMCCFILTR_EL0.NSU.

If FEAT_RME is implemented, then counting cycles in Realm EL0 is further controlled by PMCCFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 filtering. Controls counting cycles in Non-secure EL1. If PMCCFILTR_EL0.NSK is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL1.

NSK	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in Non-secure EL1.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in Non-secure EL1. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 filtering. Controls counting cycles in Non-secure EL0. If PMCCFILTR_EL0.NSU is not equal to PMCCFILTR_EL0.U, then the PE does not count cycles in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of cycles in Non-secure EL0.

NSU	Meaning
0b0	When PMCCFILTR_EL0.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.U == 1, the PE does not count cycles in Non-secure EL0.
0b1	When PMCCFILTR_EL0.U == 0, the PE does not count cycles in Non-secure EL0. When PMCCFILTR_EL0.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 filtering. Controls counting cycles in EL2.

NSH	Meaning
0b0	The PE does not count cycles in EL2.
0b1	This mechanism has no effect on filtering of cycles.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting cycles in Secure EL2 is further controlled by PMCCFILTR_EL0.SH.

If FEAT_RME is implemented, then counting cycles in Realm EL2 is further controlled by PMCCFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]
When EL3 is implemented:

EL3 filtering. Controls counting cycles in EL3. If PMCCFILTR_EL0.M is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in EL3. Otherwise, this mechanism has no effect on filtering of cycles in EL3.

M	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in EL3.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in EL3. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]
When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting cycles in Secure EL2. If PMCCFILTR_EL0.SH is equal to PMCCFILTR_EL0.NSH, then the PE does not count cycles in Secure EL2. Otherwise, this mechanism has no effect on filtering of cycles in Secure EL2.

SH	Meaning
0b0	When PMCCFILTR_EL0.NSH == 0, the PE does not count cycles in Secure EL2. When PMCCFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of cycles.
0b1	When PMCCFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.NSH == 1, the PE does not count cycles in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is RES0 .

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting cycles in Realm EL1. If PMCCFILTR_EL0.RLK is not equal to PMCCFILTR_EL0.P, then the PE does not count cycles in Realm EL1. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL1.

RLK	Meaning
0b0	When PMCCFILTR_EL0.P == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.P == 1, the PE does not count cycles in Realm EL1.
0b1	When PMCCFILTR_EL0.P == 0, the PE does not count cycles in Realm EL1. When PMCCFILTR_EL0.P == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting cycles in Realm EL0. If PMCCFILTR_EL0.RLU is not equal to PMCCFILTR_EL0.U, then the PE does not count cycles in Realm EL0. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL0.

RLU	Meaning
0b0	When PMCCFILTR_EL0.U == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.U == 1, the PE does not count cycles in Realm EL0.
0b1	When PMCCFILTR_EL0.U == 0, the PE does not count cycles in Realm EL0. When PMCCFILTR_EL0.U == 1, this mechanism has no effect on filtering of cycles.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]
When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting cycles in Realm EL2. If PMCCFILTR_EL0.RLH is equal to PMCCFILTR_EL0.NSH, then the PE does not count cycles in Realm EL2. Otherwise, this mechanism has no effect on filtering of cycles in Realm EL2.

RLH	Meaning
0b0	When PMCCFILTR_EL0.NSH == 0, the PE does not count cycles in Realm EL2. When PMCCFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of cycles.
0b1	When PMCCFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of cycles. When PMCCFILTR_EL0.NSH == 1, the PE does not count cycles in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:0]

Reserved, RES0.

Accessing PMCCFILTR_EL0

PMCCFILTR_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to 0b11111.

Permitted reads and writes of PMCCFILTR_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.C == 0.

Permitted writes of PMCCFILTR_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,CR} == {1,1}.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCFILTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1110	0b1111	0b111

```

PMCCNTR_EL0, Performance Monitors Cycle Count Register

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles. See 'Time as measured by the Performance Monitors cycle counter' for more information.

PMCCFILTR_EL0 determines the modes and states in which the PMCCNTR_EL0 can increment.

Configuration

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to AArch32 System register PMCCNTR[63:0].

AArch64 System register PMCCNTR_EL0 bits [63:0] are architecturally mapped to External register PMCCNTR_EL0[63:0].

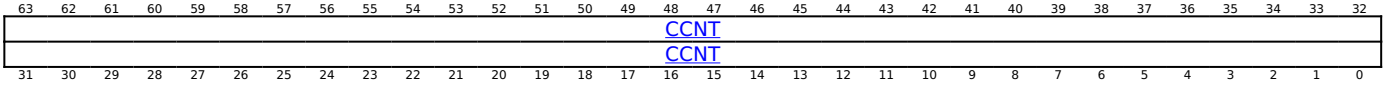
This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCCNTR_EL0 are UNDEFINED.

All counters are subject to any changes in clock frequency, including clock stopping caused by the WFI and WFE instructions. This means that it is CONSTRAINED UNPREDICTABLE whether or not PMCCNTR_EL0 continues to increment when clocks are stopped by WFI and WFE instructions.

Attributes

PMCCNTR_EL0 is a 64-bit register.

Field descriptions



CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, this field increments in one of the following ways:

- Every processor clock cycle.
- Every 64th processor clock cycle.

Writing 1 to PMCR_EL0.C sets this field to 0.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTR_EL0

Permitted reads and writes of PMCCNTR_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.C == 0.

Permitted writes of PMCCNTR_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,CR} == {1,1}.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCNTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1101	0b000

PMCCNTSVR_EL1, Performance Monitors Cycle Count Saved Value Register

The PMCCNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Cycle counter, PMCCNTR_EL0.

Configuration

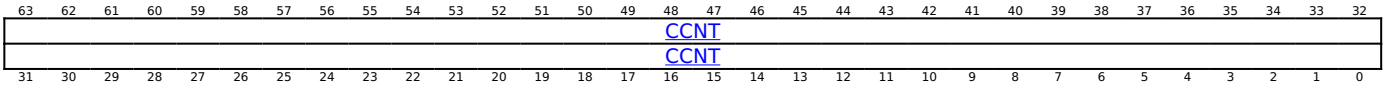
AArch64 System register PMCCNTSVR_EL1 bits [63:0] are architecturally mapped to External register PMCCNTSVR_EL1[63:0].

This register is present only when FEAT_PMUv3_SS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCCNTSVR_EL1 are UNDEFINED.

Attributes

PMCCNTSVR_EL1 is a 64-bit register.

Field descriptions



CCNT, bits [63:0]

Sampled Cycle Count. The value of PMCCNTR_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMCCNTSVR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCCNTSVR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1110	0b1011	0b111

PMCEID0_EL0, Performance Monitors Common Event Identification Register 0

The PMCEID0_EL0 characteristics are:

Purpose

Defines which Common architectural events and Common microarchitectural events are implemented, or counted, using PMU events in the ranges 0x0000 to 0x001F and 0x4000 to 0x401F.

For more information about the Common events and the use of the PMCEID<n>_EL0 registers see 'The PMU event number space and common events'.

Configuration

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to AArch32 System register PMCEID2[31:0].

AArch64 System register PMCEID0_EL0 bits [31:0] are architecturally mapped to External register PMCEID0[31:0].

AArch64 System register PMCEID0_EL0 bits [63:32] are architecturally mapped to External register PMCEID2[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCEID0_EL0 are UNDEFINED.

Attributes

PMCEID0_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41
IDhi31	IDhi30	IDhi29	IDhi28	IDhi27	IDhi26	IDhi25	IDhi24	IDhi23	IDhi22	IDhi21	IDhi20	IDhi19	IDhi18	IDhi17	IDhi16	IDhi15	IDhi14	IDhi13	IDhi12	IDhi11	IDhi10	IDhi9
ID31	ID30	ID29	ID28	ID27	ID26	ID25	ID24	ID23	ID22	ID21	ID20	ID19	ID18	ID17	ID16	ID15	ID14	ID13	ID12	ID11	ID10	ID9
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9

IDhi<n>, bit [n+32], for n = 31 to 0
When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to Common event (0x4000 + n).

For each bit:

IDhi<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event n.

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing PMCEID0_EL0

When FEAT_PMUv3p1 is implemented:

IDhi[n] corresponds to Common event (0x4020 + n).

For each bit:

IDhi<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Otherwise:

Reserved, RES0.

ID<n>, bit [n], for n = 31 to 0

ID[n] corresponds to Common event (0x0020 + n).

For each bit:

ID<n>	Meaning
0b0	The Common event is not implemented, or not counted.
0b1	The Common event is implemented.

When the value of a bit in the field is 1, the corresponding Common event is implemented and counted.

Note

Arm recommends that if a Common event is never counted, the value of the corresponding bit is 0.

A bit that corresponds to a reserved event number is reserved. The value might be used in a future revision of the architecture to identify an additional Common event.

Note

Such an event might be added retrospectively to an earlier version of the PMU architecture, provided the event does not require any additional PMU features and has an event number that can be represented in the PMCEID<n>_EL0 registers of that earlier version of the PMU architecture.

Accessing PMCEID1_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCEID1_EL0

PMCNTENCLR_EL0, Performance Monitors Count Enable Clear Register

The PMCNTENCLR_EL0 characteristics are:

Purpose

Allows software to disable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which counters are enabled.

Configuration

AArch64 System register PMCNTENCLR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENSET_EL0[63:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

AArch64 System register PMCNTENCLR_EL0 bits [63:32] are architecturally mapped to External register PMCNTENCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

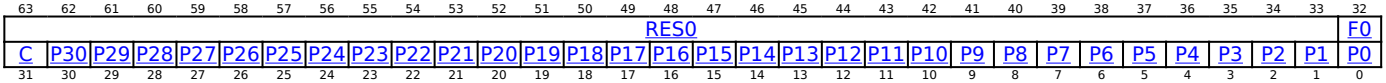
AArch64 System register PMCNTENCLR_EL0 bits [63:32] are architecturally mapped to External register PMCNTENSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCNTENCLR_EL0 are UNDEFINED.

Attributes

PMCNTENCLR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 disable. On writes, allows software to disable PMICNTR_EL0. On reads, returns the PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMICNTR_EL0 disabled.
0b1	PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - PSTATE.EL == EL0.

- PMUSERENR_EL0.UEN == '0' or PMUACR_EL1.F0 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or (HDFGRTR2_EL2.nPMICFILTR_EL0 == '0' and HDFGWTR2_EL2.nPMICFILTR_EL0 == '0').
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
  - PMUSERENR_EL0.IR == '1'.
- Access to this field is WO/RAZ if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGWTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == '1'.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 disable. On writes, allows software to disable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.C == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == '11'.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 disable. On writes, allows software to disable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.P<m> == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == '11'.
- Otherwise, access to this field is W1C.

Accessing PMCNTENCLR_EL0

Accesses to this register use the following encodings in the System register encoding space:

PMCNTENSET_EL0, Performance Monitors Count Enable Set Register

The PMCNTENSET_EL0 characteristics are:

Purpose

Allows software to enable the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which counters are enabled.

Configuration

AArch64 System register PMCNTENSET_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMCNTENCLR_EL0[63:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENSET[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCNTENCLR[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register PMCNTENSET_EL0[31:0].

AArch64 System register PMCNTENSET_EL0 bits [31:0] are architecturally mapped to External register PMCNTENCLR_EL0[31:0].

AArch64 System register PMCNTENSET_EL0 bits [63:32] are architecturally mapped to External register PMCNTENSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

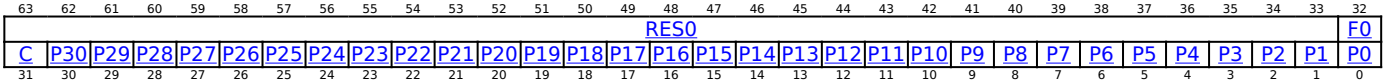
AArch64 System register PMCNTENSET_EL0 bits [63:32] are architecturally mapped to External register PMCNTENCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCNTENSET_EL0 are UNDEFINED.

Attributes

PMCNTENSET_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

PMICNTR_EL0 enable. On writes, allows software to enable PMICNTR_EL0. On reads, returns the PMICNTR_EL0 enable status.

F0	Meaning
0b0	PMICNTR_EL0 disabled.
0b1	PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - PSTATE.EL == EL0.

- PMUSERENR_EL0.UEN == '0' or PMUACR_EL1.F0 == '0'.

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or (HDFGRTR2_EL2.nPMICFILTR_EL0 == '0' and HDFGWTR2_EL2.nPMICFILTR_EL0 == '0').
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
  - PMUSERENR_EL0.IR == '1'.
- Access to this field is WO/RAZ if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGWTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == '1'.
- Otherwise, access to this field is W1S.

Otherwise:

Reserved, RES0.

C, bit [31]

PMCCNTR_EL0 enable. On writes, allows software to enable PMCCNTR_EL0. On reads, returns the PMCCNTR_EL0 enable status.

C	Meaning
0b0	PMCCNTR_EL0 disabled.
0b1	PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.C == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == '11'.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

PMEVCNTR<m>_EL0 enable. On writes, allows software to enable PMEVCNTR<m>_EL0. On reads, returns the PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 disabled.
0b1	PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.P<m> == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == '11'.
- Otherwise, access to this field is W1S.

Accessing PMCNTENSET_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMCNTENSET_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b001

```

PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

Purpose

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

Configuration

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMCR[31:0].

AArch64 System register PMCR_EL0 bits [31:0] are architecturally mapped to External register PMCR_EL0[31:0].

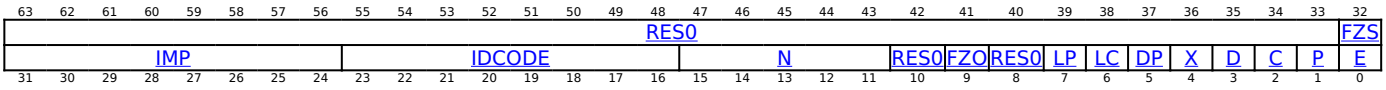
AArch64 System register PMCR_EL0 bits [63:32] are architecturally mapped to External register PMCR_EL0[63:32] when FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMCR_EL0 are UNDEFINED.

Attributes

PMCR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

FZS, bit [32]
When FEAT_SPEv1p2 is implemented:

Freeze-on-SPE event. Stop counters when PMBLIMITR_EL1.{PMFZ,E} is {1,1} and profiling is stopped.

FZS	Meaning
0b0	Do not freeze on a Statistical Profiling Buffer Management event.
0b1	Affected counters do not count following a Statistical Profiling Buffer Management event.

The pseudocode function SPEProfilingStopped describes when profiling is stopped.

The counters affected by this field are:

- The event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If FEAT_SPE_DPFZS is implemented and PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When FEAT_SPE_DPFZS is not implemented or PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset:
  - When FEAT_AA32 is implemented, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IMP, bits [31:24]
When FEAT_PMUv3p7 is not implemented:

Implementer code.

If this field is zero, then PMCR_EL0.IDCODE is RES0 and software must use MIDR_EL1 to identify the PE.

Otherwise, this field and PMCR_EL0.IDCODE identify the PMU implementation to software. The implementer codes are allocated by Arm. A nonzero value has the same interpretation as MIDR_EL1.Implementer.

Arm deprecates use of this field.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RAZ.

IDCODE, bits [23:16]
When PMCR_EL0.IMP != '00000000':

Identification code. Arm deprecates use of this field.

Each implementer must maintain a list of identification codes that are specific to the implementer. A specific implementation is identified by the combination of the implementer code and the identification code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, RES0.

N, bits [15:11]

Indicates the number of event counters implemented. This value is in the range of 0b00000-0b11111. If the value is 0b00000, then only PMCCNTR_EL0 is implemented. If the value is 0b11111, then PMCCNTR_EL0 and 31 event counters are implemented.

When EL2 is implemented and enabled for the current Security state, reads of this field from EL1 and EL0 return the Effective value of MDCR_EL2.HPMN.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [10]

Reserved, RES0.

FZO, bit [9]
When FEAT_PMUv3p7 is implemented:

Freeze-on-overflow. Stop event counters on overflow.

FZO	Meaning
0b0	Do not freeze on overflow.
0b1	Affected counters do not count when any of the following applies: • For any event counter PMEVCNTR<m>_EL0 in the first range, PMOVSCLR_EL0[m] is 1, and either FEAT_SEBEP is not implemented or PMEVTYPER<m>_EL0.SYNC is 0. • FEAT_PMUv3_ICNTR is implemented, PMOVSCLR_EL0.F0 is 1, and either FEAT_SEBEP is not implemented or PMICFILTR_EL0.SYNC is 0.

The counters affected by this field are:

- The event counters in the first range.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- If PMCR_EL0.DP is 1, the cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

When PMCR_EL0.DP is 0, PMCCNTR_EL0 is not affected by this field.

For more information about event counter ranges, see MDCR_EL2.HPMN.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

LP, bit [7]
When FEAT_PMUv3p5 is implemented:

Long event counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.P[n].

LP	Meaning
0b0	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[31:0].
0b1	Event counter overflow on increment that causes unsigned overflow of PMEVCNTR<n>_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

The counters affected by this field are the event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.

Other event counters and PMCCNTR_EL0 are not affected by this field.

When FEAT_PMUv3_ICNTR is implemented, PMICNTR_EL0 is not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LC, bit [6]
When FEAT_AA32 is implemented:

Long cycle counter enable. Determines when unsigned overflow is recorded by PMOVSCLR_EL0.C.

LC	Meaning
0b0	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[31:0].
0b1	Cycle counter overflow on increment that causes unsigned overflow of PMCCNTR_EL0[63:0].

When FEAT_EBEP is implemented and the PMU Profiling exception is enabled, the Effective value of this field is 1.

Arm deprecates use of PMCR_EL0.LC = 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

DP, bit [5]
When EL3 is implemented, or (FEAT_PMUv3p1 is implemented and EL2 is implemented), or FEAT_PMUv3p7 is implemented, or FEAT_SPE_DPFZS is implemented:

Disable cycle counter when event counting is prohibited.

DP	Meaning
0b0	Cycle counting by PMCCNTR_EL0 is not affected by this mechanism.
0b1	Cycle counting by PMCCNTR_EL0 is disabled in prohibited regions and when event counting is frozen: • If FEAT_PMUv3p1 is implemented, EL2 is implemented, and MDCR_EL2.HPMD is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL2. • If FEAT_SPE_DPFZS is implemented and event counting is frozen by PMCR_EL0.FZS, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented and event counting is frozen by PMCR_EL0.FZO, then cycle counting by PMCCNTR_EL0 is disabled. • If FEAT_PMUv3p7 is implemented, EL3 is implemented, and MDCR_EL3.MPMX is 1, then cycle counting by PMCCNTR_EL0 is disabled at EL3. • If EL3 is implemented, MDCR_EL3.SPME is 0, and either FEAT_PMUv3p7 is not implemented or MDCR_EL3.MPMX is 0, then cycle counting by PMCCNTR_EL0 is disabled at EL3 and in Secure state.

The conditions when this field disables the cycle counter are the same as when event counting by an event counter in the first range is prohibited or frozen. For more information about event counter ranges, see MDCR_EL2.HPMN.

If FEAT_PMUv3p7 and FEAT_SPEv1p2 are implemented, meaning PMCR_EL0.FZS is implemented, and FEAT_SPE_DPFZS is not implemented, then cycle counting by PMCCNTR_EL0 is not affected by PMCR_EL0.FZS.

For more information, see 'Prohibiting event and cycle counting'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

X, bit [4]
When the implementation includes a PMU event export bus:

Enable export of events in an IMPLEMENTATION DEFINED PMU event export bus.

X	Meaning
0b0	Do not export events.
0b1	Export events where not prohibited.

This field enables the exporting of events over an IMPLEMENTATION DEFINED PMU event export bus to another device.

No events are exported when counting is prohibited.

This field does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the PE.

If FEAT_ETE is implemented, this field does not affect the use of PMU events as an External Input by the trace unit.

If FEAT_ETMv4 is implemented, this field does affect the use of PMU events as an External Input by the trace unit.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

D, bit [3]
When FEAT_AA32 is implemented:

Clock divider.

D	Meaning
0b0	When enabled, PMCCNTR_EL0 counts every clock cycle.
0b1	When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

If the Effective value of PMCR_EL0.LC is 1, then this field is ignored and the cycle counter counts every clock cycle.

Arm deprecates use of PMCR_EL0.D = 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [2]

Cycle counter reset. The effects of writing to this field are:

C	Meaning
0b0	No action.
0b1	Reset PMCCNTR_EL0 to zero.

Note

Resetting PMCCNTR_EL0 does not change the cycle counter overflow field. The value of PMCR_EL0.LC is ignored, and bits [63:0] of the cycle counter are reset.

Access to this field is WO/RAZ.

P, bit [1]

Event counter reset.

P	Meaning
0b0	No action.
0b1	Reset all affected event counters PMEVCNTR<n>_EL0 to zero.

The event counters affected by this field are:

- All event counters in the first range.
- If any of the following are true, all event counters in the second range:
  - EL2 is disabled or not implemented in the current Security state.
  - The PE is executing at EL2 or EL3.

Writes to this field do not affect other event counters, the cycle counter PMCCNTR_EL0, or the instruction counter PMICNTR_EL0.

For more information about event counter ranges, see MDCR_EL2.HPMN.

Note

Resetting the event counters does not change the event counter overflow fields. If FEAT_PMUv3p5 is implemented, the values of MDCR_EL2.HLP and PMCR_EL0.LP are ignored, and bits [63:0] of all affected event counters are reset.

Access to this field is WO/RAZ.

E, bit [0]

Enable.

E	Meaning
0b0	Affected counters are disabled and do not count.
0b1	Affected counters are enabled by PMCNTENSET_EL0.

The counters affected by this field are:

- The event counters in the first range. For more information about event counter ranges, see MDCR_EL2.HPMN.
- If FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.
- The cycle counter PMCCNTR_EL0.

Other event counters are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing PMCR_EL0

Accesses to this register use the following encodings in the System register encoding space:

PMECR_EL1, Performance Monitors Extended Control Register (EL1)

The PMECR_EL1 characteristics are:

Purpose

Provides EL1 configuration options for the Performance Monitors.

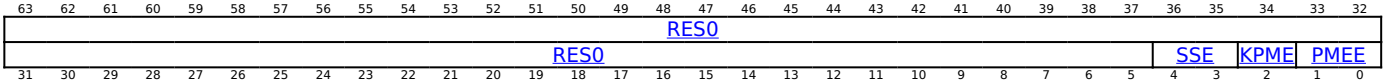
Configuration

This register is present only when (FEAT_EBEP is implemented or FEAT_PMUv3_SS is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to PMECR_EL1 are UNDEFINED.

Attributes

PMECR_EL1 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

SSE, bits [4:3]
When FEAT_PMUv3_SS is implemented:

Snapshot Enable. Controls the generation of Capture events.

SSE	Meaning
0b00	Capture events are disabled.
0b10	Capture events are enabled and prohibited.
0b11	Capture events are enabled and allowed.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KPME, bit [2]
When FEAT_EBEP is implemented:

Local (Kernel) PMU Exception Enable. Enables PMU Profiling exceptions taken to the current Exception level.

KPME	Meaning
0b0	PMU Profiling exceptions taken to the current Exception level are disabled.
0b1	PMU Profiling exceptions taken to the current Exception level are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PMEE, bits [1:0]
When FEAT_EBEP is implemented:

Performance Monitors Exception Enable. Controls the generation of the PMUIRQ signal and the PMU Profiling exception at EL0 and EL1.

PMEE	Meaning
0b00	The PMUIRQ signal is asserted on a PMU overflow, and the PMU Profiling exception is disabled.
0b11	The PMUIRQ signal is deasserted, and the PMU Profiling exception is enabled.

All other values are reserved.

This field is ignored by the PE when any of the following are true:

- All of the following are true:
  - EL3 is implemented.
  - MDCR_EL3.PMEE != 0b01.
- All of the following are true:
  - EL2 is implemented and enabled in the current Security State.
  - MDCR_EL2.PMEE != 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing PMECR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMECR_EL1

PMEVCNTR<n>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<n>_EL0 characteristics are:

Purpose

Holds event counter n, which counts events, where n is 0 to 30.

Configuration

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVCNTR<n>[31:0].

AArch64 System register PMEVCNTR<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVCNTR<n>_EL0[31:0].

AArch64 System register PMEVCNTR<n>_EL0 bits [63:32] are architecturally mapped to External register PMEVCNTR<n>_EL0[63:32] when FEAT_PMUv3p5 is implemented.

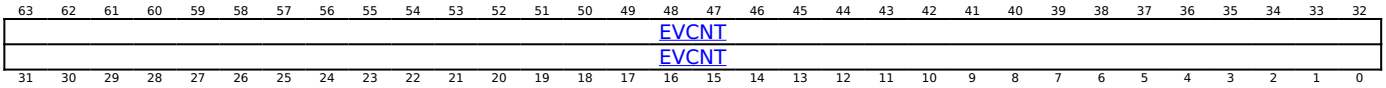
This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

PMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:



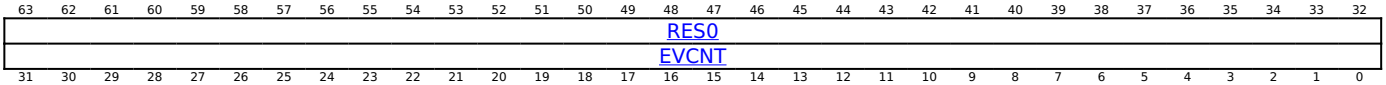
EVCNT, bits [63:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:32]

Reserved, RES0.

EVCNT, bits [31:0]

Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTR<n>_EL0

PMEVCNTR<n>_EL0 can also be accessed by using PMXEVCNTR_EL0 with PMSELR_EL0.SEL set to the value of <n>.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVCNTR<n>_EL0 is as follows:

- If <n> is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVCNTR<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.

- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMEVCNTR<n>_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<n> == 0.

Permitted writes of PMEVCNTR<n>_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVCNTR<m>_EL0 ; Where m = 0-30

PMEVCNTSVR<n>_EL1, Performance Monitors Event Count Saved Value Registers, n = 0 - 30

The PMEVCNTSVR<n>_EL1 characteristics are:

Purpose

Captures the PMU Event counter <n>, PMEVCNTR<n>_EL0.

Configuration

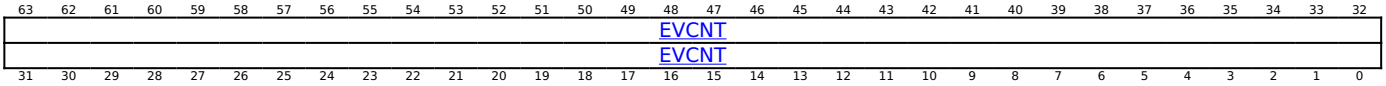
AArch64 System register PMEVCNTSVR<n>_EL1 bits [63:0] are architecturally mapped to External register PMEVCNTSVR<n>_EL1[63:0].

This register is present only when FEAT_PMUv3_SS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMEVCNTSVR<n>_EL1 are UNDEFINED.

Attributes

PMEVCNTSVR<n>_EL1 is a 64-bit register.

Field descriptions



EVCNT, bits [63:0]

Sampled Event Count. The value of PMEVCNTR<n>_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVCNTSVR<n>_EL1

If <n> is greater-than-or-equal-to the Effective value of PMCCR.EPMN, then direct reads of PMEVCNTSVR<n>_EL1 are UNDEFINED.

Otherwise, direct reads of PMEVCNTSVR<n>_EL1 generate a Trap exception to EL2 when all of the following are true:

- <n> is greater-than-or-equal-to the number of snapshot registers accessible at the current Exception level.
- EL2 is implemented and enabled in the current Security state.
- The access is from EL1.

Note

If EL2 is implemented and enabled in the current Security state, MDCR_EL2.HPMN identifies the number of accessible snapshot registers at EL1. Otherwise, the number of accessible snapshot registers is the number of implemented event counters. See MDCR_EL2.HPMN for more details.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVCNTSVR<m>_EL1 ; Where m = 0-30

op0	op1	CRn	CRm	op2
0b10	0b000	0b1110	0b10:m[4:3]	m[2:0]

```
let m:integer = UInt(CRm[1:0] :: op2[2:0]);

if !(IsFeatureImplemented(FEAT_PMUv3_SS) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif m >= GetNumEventCountersSelfHosted() then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3().EnPMSS == '0' then
        Undefined();
    elsif EL2Enabled() && IsFeatureImplemented(FEAT_FGT2) && ((HaveEL(EL3) && SCR_EL3().FGTEn2 == '0') ||
HDFGRTR2_EL2().nPMSSDATA == '0') then
        AArch64_SystemAccessTrap(EL2, 0x18);
    elsif EL2Enabled() && m >= GetNumEventCountersAccessible() then
        AArch64_SystemAccessTrap(EL2, 0x18);
    elsif HaveEL(EL3) && MDCR_EL3().EnPMSS == '0' then
        if EL3SDDUndef() then
            Undefined();
        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    else
        X{64}(t) = PMEVCNTSVR_EL1(m);
    end;
elsif PSTATE.EL == EL2 then
    if HaveEL(EL3) && EL3SDDUndefPriority() && MDCR_EL3().EnPMSS == '0' then
        Undefined();
    elsif HaveEL(EL3) && MDCR_EL3().EnPMSS == '0' then
        if EL3SDDUndef() then
            Undefined();
        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    else
        X{64}(t) = PMEVCNTSVR_EL1(m);
    end;
elsif PSTATE.EL == EL3 then
    X{64}(t) = PMEVCNTSVR_EL1(m);
end;
```

2025-12-10 16:11:30, 2025-12_rel

PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.

Configuration

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMEVTYPER<n>[31:0].

AArch64 System register PMEVTYPER<n>_EL0 bits [31:0] are architecturally mapped to External register PMEVTYPER<n>_EL0[31:0].

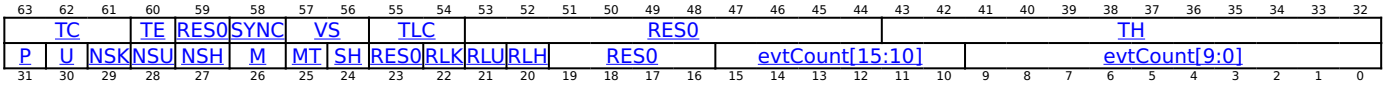
AArch64 System register PMEVTYPER<n>_EL0 bits [63:32] are architecturally mapped to External register PMEVTYPER<n>_EL0[63:32] when FEAT_PMUv3_TH is implemented, or FEAT_PMUv3p8 is implemented, or FEAT_PMUv3_EXT64 is implemented, or FEAT_PMUv3_SME is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMEVTYPER<n>_EL0 are UNDEFINED.

Attributes

PMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions



TC, bits [63:61]
When FEAT_PMUv3_TH is implemented, (FEAT_PMUv3_EDGE is not implemented or PMEVTYPER<n>_EL0.TE == '0'), and (FEAT_PMUv3_TH2 is not implemented, or n is even, or PMEVTYPER<n>_EL0.TLC IN {'0x'}):

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- For odd values of n, V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled, then V[n-1] is zero. V[n-1] is not defined for even values of n.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b000	Not-equal. The counter increments by V_B[n] on each processor cycle when V_B[n] is not equal to TH[n].
0b001	Not-equal, count. The counter increments by 1 on each processor cycle when V_B[n] is not equal to TH[n].
0b010	Equals. The counter increments by V_B[n] on each processor cycle when V_B[n] is equal to TH[n].
0b011	Equals, count. The counter increments by 1 on each processor cycle when V_B[n] is equal to TH[n].
0b100	Greater-than-or-equal. The counter increments by V_B[n] on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b101	Greater-than-or-equal, count. The counter increments by 1 on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b110	Less-than. The counter increments by V_B[n] on each processor cycle when V_B[n] is less than TH[n].
0b111	Less-than, count. The counter increments by 1 on each processor cycle when V_B[n] is less than TH[n].

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC[2:1] is true:

- If PMEVTYPER<n>_EL0.TC[0] is 0, then the counter increments by V_B[n].
- If PMEVTYPER<n>_EL0.TC[0] is 1, then the counter increments by 1.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC[2:1] is false:

- If FEAT_PMUv3_TH2 is implemented, n is odd, and PMEVTYPER<n>_EL0.TLC is 0b01, then the counter increments by V[n-1].
- Otherwise, the counter does not increment.

If PMEVTYPER<n>_EL0.{TC, TLC, TH} are zero, then the threshold function is disabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3_TH2 is implemented, PMEVTYPER<n>_EL0.TE == '0', n is odd, and PMEVTYPER<n>_EL0.TLC == '10':

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled, then V[n-1] is zero.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b000	Not-equal. The counter increments by V[n-1] on each processor cycle when V_B[n] is not equal to TH[n].
0b010	Equals. The counter increments by V[n-1] on each processor cycle when V_B[n] is equal to TH[n].
0b100	Greater-than-or-equal. The counter increments by V[n-1] on each processor cycle when V_B[n] is greater than or equal to TH[n].
0b110	Less-than. The counter increments by V[n-1] on each processor cycle when V_B[n] is less than TH[n].

All other values are reserved.

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is true, the counter increments by V[n-1].

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is false, the counter does not increment.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When FEAT_PMUv3_EDGE is implemented and PMEVTYPER<n>_EL0.TE == '1':

Threshold Control. Defines the threshold function. In the description of this field:

- V_B[n] is the value the event specified by PMEVTYPER<n>_EL0 would increment event counter n by on a processor cycle if the threshold function is disabled.
- For odd values of n, V[n-1] is the value that event counter n-1 increments by on the same processor cycle. V[n-1] is the result of applying the threshold and edge functions on event counter n-1. If event counter n-1 is disabled, then V[n-1] is zero. V[n-1] is not defined for even values of n.
- TH[n] is the value of PMEVTYPER<n>_EL0.TH.

TC	Meaning
0b001	Equal to not-equal. The counter increments on each processor cycle when V_B[n] is not equal to TH[n] and V_B[n] was equal to TH[n] on the previous processor cycle.
0b010	Equal to/from not-equal. The counter increments on each processor cycle when either: • V_B[n] is not equal to TH[n] and V_B[n] was equal to TH[n] on the previous processor cycle. • V_B[n] is equal to TH[n] and V_B[n] was not equal to TH[n] on the previous processor cycle.
0b011	Not-equal to equal. The counter increments on each processor cycle when V_B[n] is equal to TH[n] and V_B[n] was not equal to TH[n] on the previous processor cycle.
0b101	Less-than to greater-than-or-equal. The counter increments on each processor cycle when V_B[n] is greater than or equal to TH[n] and V_B[n] was less than TH[n] on the previous processor cycle.
0b110	Less-than to/from greater-than-or-equal. The counter increments on each processor cycle when either: • V_B[n] is greater than or equal to TH[n] and V_B[n] was less than TH[n] on the previous processor cycle. • V_B[n] is less than TH[n] and V_B[n] was greater than or equal to TH[n] on the previous processor cycle.
0b111	Greater-than-or-equal to less-than. The counter increments on each processor cycle when V_B[n] is less than TH[n] and V_B[n] was greater than or equal to TH[n] on the previous processor cycle.

All other values are reserved.

Comparisons treat V_B[n] and TH[n] as unsigned integer values.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is true:

- If FEAT_PMUv3_TH2 is implemented, n is odd, and PMEVTYPER<n>_EL0.TLC is 0b10, then the counter increments by V[n-1].
- Otherwise, the counter increments by 1.

On each processor cycle when the condition specified by PMEVTYPER<n>_EL0.TC is false, the counter does not increment.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '000'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TE, bit [60]
When FEAT_PMUv3_EDGE is implemented:

Threshold Edge. Enables the edge condition. When PMEVTYPER<n>_EL0.TE is 1, the event counter increments on cycles when the result of the threshold condition changes. See PMEVTYPER<n>_EL0.TC for more information.

TE	Meaning
0b0	Threshold edge condition disabled.
0b1	Threshold edge condition enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to '0'.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [59]

Reserved, RES0.

SYNC, bit [58]
When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU Profiling exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU Profiling exception is enabled.
0b1	Synchronous PMU Profiling exception is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VS, bits [57:56]
When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting events in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of events.
0b01	The PE does not count events in Streaming SVE mode.
0b10	The PE does not count events in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLC, bits [55:54]
When FEAT_PMUv3_TH2 is implemented and n is odd:

Threshold Linking Control. Extends PMEVTYPER<n>_EL0.TC with additional controls for event linking. See PMEVTYPER<n>_EL0.TC.

TLC	Meaning
0b00	Threshold linking disabled.
0b01	Threshold linking enabled. If the threshold condition described by PMEVTYPER<n>_EL0.TC is false, the counter increments by V[n-1]. Otherwise, the counter increments as described by PMEVTYPER<n>_EL0.TC.
0b10	Threshold linking enabled. If the threshold condition described by PMEVTYPER<n>_EL0.TC is true, the counter increments by V[n-1]. Otherwise, the counter does not increment.

All other values are reserved.

See PMEVTYPER<n>_EL0.TC for more information

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:44]

Reserved, RES0.

TH, bits [43:32]
When FEAT_PMUv3_TH is implemented:

Threshold value. Provides the unsigned value for the threshold function defined by PMEVTYPER<n>_EL0.TC.

If PMEVTYPER<n>_EL0.{TC, TH} are both zero and either FEAT_PMUv3_TH2 is not implemented or PMEVTYPER<n>_EL0.TLC is also zero, then the threshold function is disabled.

If PMMIR_EL1.THWIDTH is less than 12, then bits PMEVTYPER<n>_EL0.TH[11:UInt(PMMIR_EL1.THWIDTH)] are RES0. This accounts for the behavior when writing a value greater-than-or-equal-to $2^{\text{UInt(PMMIR\_EL1.THWIDTH)}}$.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset:
  - When FEAT_AA32EL1 is implemented, this field resets to the expression `0x000`.
  - When FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting events in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL1.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL1 is further controlled by PMEVTYPER<n>_EL0.NSK.

If FEAT_RME is implemented, then counting events in Realm EL1 is further controlled by PMEVTYPER<n>_EL0.RLK.

If EL3 is implemented, then counting events in EL3 is further controlled by PMEVTYPER<n>_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting events in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of events.
0b1	The PE does not count events in EL0.

If Secure and Non-secure states are implemented, then counting events in Non-secure EL0 is further controlled by PMEVTYPER<n>_EL0.NSU.

If FEAT_RME is implemented, then counting events in Realm EL0 is further controlled by PMEVTYPER<n>_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 filtering. Controls counting events in Non-secure EL1. If PMEVTYPER<n>_EL0.NSK is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL1.

NSK	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in Non-secure EL1.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in Non-secure EL1. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 filtering. Controls counting events in Non-secure EL0. If PMEVTYPER<n>_EL0.NSU is not equal to PMEVTYPER<n>_EL0.U, then the PE does not count events in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of events in Non-secure EL0.

NSU	Meaning
0b0	When PMEVTYPER<n>_EL0.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.U == 1, the PE does not count events in Non-secure EL0.
0b1	When PMEVTYPER<n>_EL0.U == 0, the PE does not count events in Non-secure EL0. When PMEVTYPER<n>_EL0.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 filtering. Controls counting events in EL2.

NSH	Meaning
0b0	The PE does not count events in EL2.
0b1	This mechanism has no effect on filtering of events.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting events in Secure EL2 is further controlled by PMEVTYPER<n>_EL0.SH.

If FEAT_RME is implemented, then counting events in Realm EL2 is further controlled by PMEVTYPER<n>_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]
When EL3 is implemented:

EL3 filtering. Controls counting events in EL3. If PMEVTYPER<n>_EL0.M is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in EL3. Otherwise, this mechanism has no effect on filtering of events in EL3.

M	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in EL3.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in EL3. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MT, bit [25]
When FEAT_MTPMU is implemented or an IMPLEMENTATION DEFINED multi-threaded PMU extension is implemented:

Multithreading.

MT	Meaning
0b0	Count events only on controlling PE.
0b1	Count events from any PE with the same affinity at level 1 and above as this PE.

Unless otherwise stated:

- If the event counts PE cycles when a stall condition is true and a second condition is true, then the counter counts Processor cycles when the stall condition is true for all of these PEs, and the second condition is true for any of these PEs.
- If the event counts PE cycles when any other condition is true, then the counter counts Processor cycles when the condition is true for any of these PEs.
- Otherwise, the event counts by the sum of the count across all of these PEs.

For the stall events, the stall condition means the applicable condition described by the STALL, STALL_FRONTEND, or STALL_BACKEND event.

The second condition is any condition in addition to this.

For example, for the STALL_FRONTEND_L1I event, the stall condition is STALL_FRONTEND, and the second condition is when there is a demand instruction miss in the first level of instruction cache.

For the STALL, STALL_FRONTEND, and STALL_BACKEND events themselves, the second condition is the null TRUE condition.

See 'Multithreaded implementations' and 'Cycle event counting in multithreaded implementations'.

From Armv8.6, the IMPLEMENTATION DEFINED multi-threaded PMU extension is not permitted, meaning if FEAT_MTPMU is not implemented, this field is RES0. See ID_AA64DFR0_EL1.MTPMU.

This field is ignored by the PE and treated as zero when FEAT_MTPMU is implemented and disabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SH, bit [24]
When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting events in Secure EL2. If PMEVTYPER<n>_EL0.SH is equal to PMEVTYPER<n>_EL0.NSH, then the PE does not count events in Secure EL2. Otherwise, this mechanism has no effect on filtering of events in Secure EL2.

SH	Meaning
0b0	When PMEVTYPER<n>_EL0.NSH == 0, the PE does not count events in Secure EL2. When PMEVTYPER<n>_EL0.NSH == 1, this mechanism has no effect on filtering of events.
0b1	When PMEVTYPER<n>_EL0.NSH == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.NSH == 1, the PE does not count events in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is RES0 .

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting events in Realm EL1. If PMEVTYPER<n>_EL0.RLK is not equal to PMEVTYPER<n>_EL0.P, then the PE does not count events in Realm EL1. Otherwise, this mechanism has no effect on filtering of events in Realm EL1.

RLK	Meaning
0b0	When PMEVTYPER<n>_EL0.P == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.P == 1, the PE does not count events in Realm EL1.
0b1	When PMEVTYPER<n>_EL0.P == 0, the PE does not count events in Realm EL1. When PMEVTYPER<n>_EL0.P == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting events in Realm EL0. If PMEVTYPER<n>_EL0.RLU is not equal to PMEVTYPER<n>_EL0.U, then the PE does not count events in Realm EL0. Otherwise, this mechanism has no effect on filtering of events in Realm EL0.

RLU	Meaning
0b0	When PMEVTYPER<n>_EL0.U == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.U == 1, the PE does not count events in Realm EL0.
0b1	When PMEVTYPER<n>_EL0.U == 0, the PE does not count events in Realm EL0. When PMEVTYPER<n>_EL0.U == 1, this mechanism has no effect on filtering of events.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]
When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting events in Realm EL2. If PMEVTYPER<n>_EL0.RLH is equal to PMEVTYPER<n>_EL0.NSH, then the PE does not count events in Realm EL2. Otherwise, this mechanism has no effect on filtering of events in Realm EL2.

RLH	Meaning
0b0	When PMEVTYPER<n>_EL0.NSH == 0, the PE does not count events in Realm EL2. When PMEVTYPER<n>_EL0.NSH == 1, this mechanism has no effect on filtering of events.
0b1	When PMEVTYPER<n>_EL0.NSH == 0, this mechanism has no effect on filtering of events. When PMEVTYPER<n>_EL0.NSH == 1, the PE does not count events in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [19:16]

Reserved, RES0.

evtCount[15:10], bits [15:10]
When FEAT_PMUv3p1 is implemented:

Extension to evtCount[9:0]. For more information, see evtCount[9:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

evtCount[9:0], bits [9:0]

Event to count.

The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

The ranges of event numbers allocated to each type of event are shown in 'Allocation of the PMU event number space'.

If FEAT_PMUv3p8 is implemented and PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.

Note

Arm recommends this behavior for all implementations of FEAT_PMUv3.

Otherwise, if PMEVTYPER<n>_EL0.evtCount is programmed to an event that is reserved or not supported by the PE, the behavior depends on the value written:

- For the range 0x0000 to 0x003F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- If FEAT_PMUv3p1 is implemented, for the range 0x4000 to 0x403F, no events are counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is the value written to the field.
- For other values, it is UNPREDICTABLE what event, if any, is counted and the value returned by a direct or external read of the PMEVTYPER<n>_EL0.evtCount field is UNKNOWN.

Note

UNPREDICTABLE means the event must not expose privileged information.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMEVTYPER<n>_EL0

PMEVTYPER<n>_EL0 can also be accessed by using PMXEVTYPER_EL0 with PMSELR_EL0.SEL set to n.

If FEAT_FGT is implemented and <n> is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMEVTYPER<n>_EL0 is as follows:

- If <n> is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and <n> is greater than or equal to the number of accessible event counters, then reads and writes of PMEVTYPER<n>_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if <n> is an UNKNOWN value less-than-or-equal-to the index of the highest accessible event counter.
- If EL2 is implemented and enabled in the current Security state, and <n> is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMEVTYPER<n>_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<n> == 0.

Permitted writes of PMEVTYPER<n>_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters. Otherwise, the number of accessible event counters is the number of implemented event counters. For more information, see MDCR_EL2.HPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMEVTYPER<m>_EL0 ; Where m = 0-30

PMIAR_EL1, Performance Monitors Instruction Address Register

The PMIAR_EL1 characteristics are:

Purpose

Captures the address of the instruction generating a PMU Profiling exception.

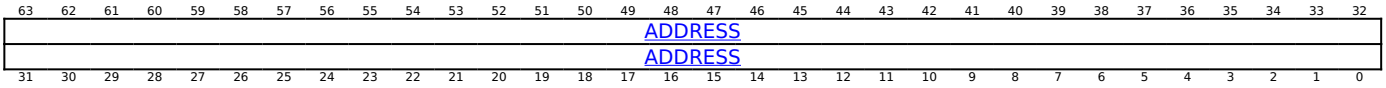
Configuration

This register is present only when FEAT_SEBEP is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMIAR_EL1 are UNDEFINED.

Attributes

PMIAR_EL1 is a 64-bit register.

Field descriptions



ADDRESS, bits [63:0]

Instruction virtual address.

For writes to PMIAR_EL1, PMIAR_EL1.ADDRESS[63:P] is RESS. P is defined as:

- 56, when FEAT_LVA3 is implemented.
- 52, when FEAT_LVA is implemented.
- 48, otherwise.

PMIAR_EL1.ADDRESS[1:0] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMIAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMIAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b111

PMICFILTR_EL0, Performance Monitors Instruction Counter Filter Register

The PMICFILTR_EL0 characteristics are:

Purpose

Configures the Instruction Counter.

Configuration

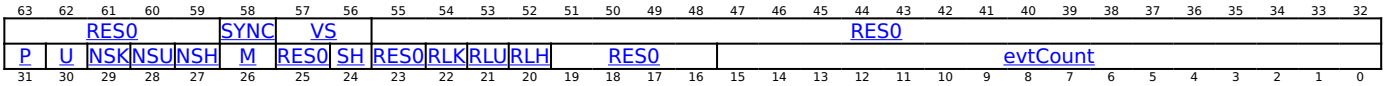
AArch64 System register PMICFILTR_EL0 bits [63:0] are architecturally mapped to External register PMICFILTR_EL0[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMICFILTR_EL0 are UNDEFINED.

Attributes

PMICFILTR_EL0 is a 64-bit register.

Field descriptions



Bits [63:59]

Reserved, RES0.

SYNC, bit [58]
When FEAT_SEBEP is implemented:

Synchronous mode. Controls whether a PMU Profiling exception generated by the counter is synchronous or asynchronous.

SYNC	Meaning
0b0	Asynchronous PMU Profiling exception is enabled.
0b1	Synchronous PMU Profiling exception is enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VS, bits [57:56]
When FEAT_PMUv3_SME is implemented:

SVE mode filtering. Controls counting instructions in Streaming and Non-streaming SVE modes.

VS	Meaning
0b00	This mechanism has no effect on the filtering of instructions.
0b01	The PE does not count instructions in Streaming SVE mode.
0b10	The PE does not count instructions in Non-streaming SVE mode.

All other values are reserved.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

P, bit [31]

EL1 filtering. Controls counting instructions in EL1.

P	Meaning
0b0	This mechanism has no effect on filtering of instructions.
0b1	The PE does not count instructions in EL1.

If Secure and Non-secure states are implemented, then counting instructions in Non-secure EL1 is further controlled by PMICFILTR_EL0.NSK.

If FEAT_RME is implemented, then counting instructions in Realm EL1 is further controlled by PMICFILTR_EL0.RLK.

If EL3 is implemented, then counting instructions in EL3 is further controlled by PMICFILTR_EL0.M.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

U, bit [30]

EL0 filtering. Controls counting instructions in EL0.

U	Meaning
0b0	This mechanism has no effect on filtering of instructions.
0b1	The PE does not count instructions in EL0.

If Secure and Non-secure states are implemented, then counting instructions in Non-secure EL0 is further controlled by PMICFILTR_EL0.NSU.

If FEAT_RME is implemented, then counting instructions in Realm EL0 is further controlled by PMICFILTR_EL0.RLU.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

NSK, bit [29]
When EL3 is implemented:

Non-secure EL1 filtering. Controls counting instructions in Non-secure EL1. If PMICFILTR_EL0.NSK is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in Non-secure EL1. Otherwise, this mechanism has no effect on filtering of instructions in Non-secure EL1.

NSK	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in Non-secure EL1.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in Non-secure EL1. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSU, bit [28]
When EL3 is implemented:

Non-secure EL0 filtering. Controls counting instructions in Non-secure EL0. If PMICFILTR_EL0.NSU is not equal to PMICFILTR_EL0.U, then the PE does not count instructions in Non-secure EL0. Otherwise, this mechanism has no effect on filtering of instructions in Non-secure EL0.

NSU	Meaning
0b0	When PMICFILTR_EL0.U == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.U == 1, the PE does not count instructions in Non-secure EL0.
0b1	When PMICFILTR_EL0.U == 0, the PE does not count instructions in Non-secure EL0. When PMICFILTR_EL0.U == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSH, bit [27]
When EL2 is implemented:

EL2 filtering. Controls counting instructions in EL2.

NSH	Meaning
0b0	The PE does not count instructions in EL2.
0b1	This mechanism has no effect on filtering of instructions.

If EL3 is implemented and FEAT_SEL2 is implemented, then counting instructions in Secure EL2 is further controlled by PMICFILTR_EL0.SH.

If FEAT_RME is implemented, then counting instructions in Realm EL2 is further controlled by PMICFILTR_EL0.RLH.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

M, bit [26]
When EL3 is implemented:

EL3 filtering. Controls counting instructions in EL3. If PMICFILTR_EL0.M is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in EL3. Otherwise, this mechanism has no effect on filtering of instructions in EL3.

M	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in EL3.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in EL3. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [25]

Reserved, RES0.

SH, bit [24]
When EL3 is implemented and FEAT_SEL2 is implemented:

Secure EL2 filtering. Controls counting instructions in Secure EL2. If PMICFILTR_EL0.SH is equal to PMICFILTR_EL0.NSH, then the PE does not count instructions in Secure EL2. Otherwise, this mechanism has no effect on filtering of instructions in Secure EL2.

SH	Meaning
0b0	When PMICFILTR_EL0.NSH == 0, the PE does not count instructions in Secure EL2. When PMICFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of instructions.
0b1	When PMICFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.NSH == 1, the PE does not count instructions in Secure EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

When Secure EL2 is not implemented, access to this field is RES0 .

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES0.

RLK, bit [22]
When FEAT_RME is implemented:

Realm EL1 filtering. Controls counting instructions in Realm EL1. If PMICFILTR_EL0.RLK is not equal to PMICFILTR_EL0.P, then the PE does not count instructions in Realm EL1. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL1.

RLK	Meaning
0b0	When PMICFILTR_EL0.P == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.P == 1, the PE does not count instructions in Realm EL1.
0b1	When PMICFILTR_EL0.P == 0, the PE does not count instructions in Realm EL1. When PMICFILTR_EL0.P == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLU, bit [21]
When FEAT_RME is implemented:

Realm EL0 filtering. Controls counting instructions in Realm EL0. If PMICFILTR_EL0.RLU is not equal to PMICFILTR_EL0.U, then the PE does not count instructions in Realm EL0. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL0.

RLU	Meaning
0b0	When PMICFILTR_EL0.U == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.U == 1, the PE does not count instructions in Realm EL0.
0b1	When PMICFILTR_EL0.U == 0, the PE does not count instructions in Realm EL0. When PMICFILTR_EL0.U == 1, this mechanism has no effect on filtering of instructions.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RLH, bit [20]
When FEAT_RME is implemented:

Realm EL2 filtering. Controls counting instructions in Realm EL2. If PMICFILTR_EL0.RLH is equal to PMICFILTR_EL0.NSH, then the PE does not count instructions in Realm EL2. Otherwise, this mechanism has no effect on filtering of instructions in Realm EL2.

RLH	Meaning
0b0	When PMICFILTR_EL0.NSH == 0, the PE does not count instructions in Realm EL2. When PMICFILTR_EL0.NSH == 1, this mechanism has no effect on filtering of instructions.
0b1	When PMICFILTR_EL0.NSH == 0, this mechanism has no effect on filtering of instructions. When PMICFILTR_EL0.NSH == 1, the PE does not count instructions in Realm EL2.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Otherwise:

PMICNTR_EL0, Performance Monitors Instruction Counter Register

The PMICNTR_EL0 characteristics are:

Purpose

If event counting is not prohibited and the instruction counter is enabled, the counter increments for each architecturally-executed instruction, according to the configuration specified by PMICFILTR_EL0.

Configuration

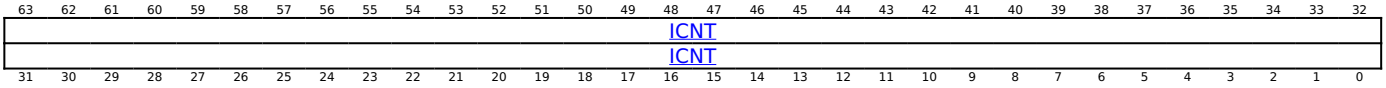
AArch64 System register PMICNTR_EL0 bits [63:0] are architecturally mapped to External register PMICNTR_EL0[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMICNTR_EL0 are UNDEFINED.

Attributes

PMICNTR_EL0 is a 64-bit register.

Field descriptions



ICNT, bits [63:0]

Instruction Counter.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTR_EL0

PMICNTR_EL0 treats permitted reads-as-zero and ignores permitted writes if all of the following are true:

- PSTATE.EL == EL0.
- PMUACR_EL1.F0 == 0.

PMICNTR_EL0 ignores permitted writes if all of the following are true:

- PSTATE.EL == EL0.
- PMUSERENR_EL0.IR == 1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMICNTR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b0100	0b000

PMICNTSVR_EL1, Performance Monitors Instruction Count Saved Value Register

The PMICNTSVR_EL1 characteristics are:

Purpose

Captures the PMU Instruction counter, PMICNTR_EL0.

Configuration

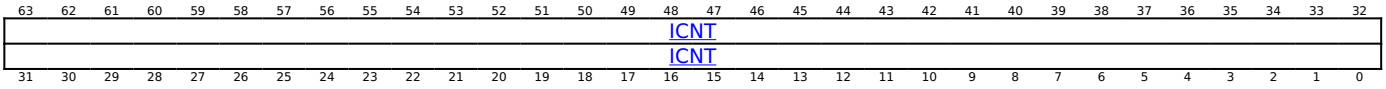
AArch64 System register PMICNTSVR_EL1 bits [63:0] are architecturally mapped to External register PMICNTSVR_EL1[63:0].

This register is present only when FEAT_PMUv3_ICNTR is implemented, FEAT_PMUv3_SS is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to PMICNTSVR_EL1 are UNDEFINED.

Attributes

PMICNTSVR_EL1 is a 64-bit register.

Field descriptions



ICNT, bits [63:0]

Sampled Instruction Count. The value of PMICNTR_EL0 at the last successful Capture event.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing PMICNTSVR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMICNTSVR_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1110	0b1100	0b000

PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear Register

The PMINTENCLR_EL1 characteristics are:

Purpose

Allows software to disable the generation of interrupt requests or, when FEAT_EBEP is implemented, PMU Profiling exceptions on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which overflow interrupt requests or PMU Profiling exceptions are enabled.

Configuration

AArch64 System register PMINTENCLR_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENSET_EL1[63:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

AArch64 System register PMINTENCLR_EL1 bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

AArch64 System register PMINTENCLR_EL1 bits [63:32] are architecturally mapped to External register PMINTENCLR_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

AArch64 System register PMINTENCLR_EL1 bits [63:32] are architecturally mapped to External register PMINTENSET_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMINTENCLR_EL1 are UNDEFINED.

Attributes

PMINTENCLR_EL1 is a 64-bit register.

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enable status.

F0	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMICNTR_EL0 enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.

- MDCR_EL3.EnPM2 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or (HDFGRTR2_EL2.nPMICFILTR_EL0 == '0' and HDFGWTR2_EL2.nPMICFILTR_EL0 == '0').
- Access to this field is WO/RAZ if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL1.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGWTR2_EL2.nPMICFILTR_EL0 == '0'.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

C, bit [31]

Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enable status.

C	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMCCNTR_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disable. On writes, allows software to disable the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0. On reads, returns the interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enable status.

P<m>	Meaning
0b0	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 disabled.
0b1	Interrupt request or PMU Profiling exception on unsigned overflow of PMEVCNTR<m>_EL0 enabled.

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

PMINTENSET_EL1, Performance Monitors Interrupt Enable Set Register

The PMINTENSET_EL1 characteristics are:

Purpose

Allows software to enable the generation of interrupt requests or, when FEAT_EBEP is implemented, PMU Profiling exceptions on overflows from the following counters:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows which overflow interrupt requests or PMU Profiling exceptions are enabled.

Configuration

AArch64 System register PMINTENSET_EL1 bits [63:0] are architecturally mapped to AArch64 System register PMINTENCLR_EL1[63:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENSET[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMINTENCLR[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to External register PMINTENSET_EL1[31:0].

AArch64 System register PMINTENSET_EL1 bits [31:0] are architecturally mapped to External register PMINTENCLR_EL1[31:0].

AArch64 System register PMINTENSET_EL1 bits [63:32] are architecturally mapped to External register PMINTENSET_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

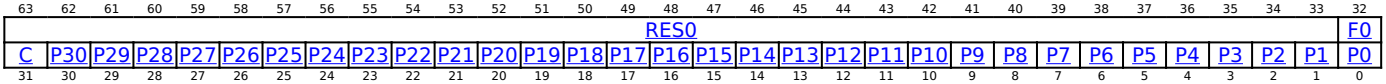
AArch64 System register PMINTENSET_EL1 bits [63:32] are architecturally mapped to External register PMINTENCLR_EL1[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMINTENSET_EL1 are UNDEFINED.

Attributes

PMINTENSET_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

PMMIR_EL1, Performance Monitors Machine Identification Register

The PMMIR_EL1 characteristics are:

Purpose

Describes Performance Monitors parameters specific to the implementation to software.

Configuration

AArch64 System register PMMIR_EL1 bits [31:0] are architecturally mapped to AArch32 System register PMMIR[31:0].

AArch64 System register PMMIR_EL1 bits [31:0] are architecturally mapped to External register PMMIR[31:0] when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p4 is implemented.

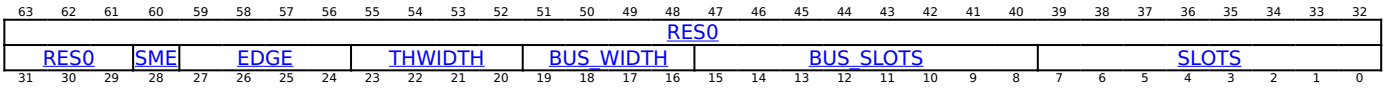
AArch64 System register PMMIR_EL1 bits [63:32] are architecturally mapped to External register PMMIR[63:32] when FEAT_PMUv3_EXT is implemented, FEAT_PMUv3p4 is implemented, and (FEAT_PMUv3_EXT64 is implemented or FEAT_PMUv3p9 is implemented).

This register is present only when FEAT_PMUv3p4 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMMIR_EL1 are UNDEFINED.

Attributes

PMMIR_EL1 is a 64-bit register.

Field descriptions



Bits [63:29]

Reserved, RES0.

SME, bit [28]

PMUv3 for SME. Adds support for the Streaming SVE mode filter.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0	Streaming SVE mode filter not implemented.
0b1	Adds support for the Streaming SVE mode filter.

All other values are reserved.

FEAT_PMUv3_SME implements the functionality identified by the value 1.

Access to this field is RO.

EDGE, bits [27:24]

PMU event edge detection. With PMMIR_EL1.THWIDTH, indicates implementation of event counter thresholding features.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EDGE	Meaning
0b0000	FEAT_PMUv3_EDGE is not implemented.
0b0001	FEAT_PMUv3_EDGE is implemented.
0b0010	As 0b0001, and adds support for threshold value linking between a pair of counters.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, the only permitted value is 0b0000.

FEAT_PMUv3_EDGE implements the functionality identified by the value 0b0001.

FEAT_PMUv3_TH2 implements the functionality identified by the value 0b0010.

Access to this field is RO.

THWIDTH, bits [23:20]

PMEVTYPER<n>_EL0.TH width. Indicates implementation of the FEAT_PMUv3_TH feature, and, if implemented, the size of the PMEVTYPER<n>_EL0.TH field.

The value of this field is an IMPLEMENTATION DEFINED choice of:

THWIDTH	Meaning
0b0000	FEAT_PMUv3_TH is not implemented.
0b0001	1 bit. PMEVTYPER<n>_EL0.TH[11:1] are RES0.
0b0010	2 bits. PMEVTYPER<n>_EL0.TH[11:2] are RES0.
0b0011	3 bits. PMEVTYPER<n>_EL0.TH[11:3] are RES0.
0b0100	4 bits. PMEVTYPER<n>_EL0.TH[11:4] are RES0.
0b0101	5 bits. PMEVTYPER<n>_EL0.TH[11:5] are RES0.
0b0110	6 bits. PMEVTYPER<n>_EL0.TH[11:6] are RES0.
0b0111	7 bits. PMEVTYPER<n>_EL0.TH[11:7] are RES0.
0b1000	8 bits. PMEVTYPER<n>_EL0.TH[11:8] are RES0.
0b1001	9 bits. PMEVTYPER<n>_EL0.TH[11:9] are RES0.
0b1010	10 bits. PMEVTYPER<n>_EL0.TH[11:10] are RES0.
0b1011	11 bits. PMEVTYPER<n>_EL0.TH[11] is RES0.
0b1100	12 bits.

All other values are reserved.

If FEAT_PMUv3_TH is not implemented, this field is zero.

Otherwise, the largest value that can be written to PMEVTYPER<n>_EL0.TH is $2^{(PMMIR\_EL1.THWIDTH)}$ minus one.

Access to this field is RO.

BUS_WIDTH, bits [19:16]

Bus width. Indicates the number of bytes each BUS_ACCESS event relates to. Encoded as Log_2(number of bytes), plus one.

The value of this field is an IMPLEMENTATION DEFINED choice of:

BUS_WIDTH	Meaning
0b0000	The information is not available.
0b0011	Four bytes.
0b0100	8 bytes.
0b0101	16 bytes.
0b0110	32 bytes.
0b0111	64 bytes.
0b1000	128 bytes.
0b1001	256 bytes.
0b1010	512 bytes.
0b1011	1024 bytes.
0b1100	2048 bytes.

All other values are reserved.

Each transfer is up to this number of bytes. An access might be smaller than the bus width.

When this field is nonzero, each access counted by BUS_ACCESS is at most BUS_WIDTH bytes. An implementation might treat a wide bus as multiple narrower buses, such that a wide access on the bus increments the BUS_ACCESS counter by more than one.

Access to this field is RO.

BUS_SLOTS, bits [15:8]

Bus count. The largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle.

When this field is nonzero, the largest value by which the BUS_ACCESS event might increment in a single BUS_CYCLES cycle is BUS_SLOTS.

If the bus count information is not available, this field will read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SLOTS, bits [7:0]

Operation width. The largest value by which the STALL_SLOT event might increment in a single cycle. If the STALL_SLOT event is not implemented, this field might read as zero.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing PMMIR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMMIR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b110

```

PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear Register

The PMOVSCLR_EL0 characteristics are:

Purpose

Allows software to clear the unsigned overflow flags for the following counters to 0:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch64 System register PMOVSCLR_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMOVSSET_EL0[63:0].

AArch64 System register PMOVSCLR_EL0 bits [63:0] are architecturally mapped to External register PMOVS[63:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

AArch64 System register PMOVSCLR_EL0 bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

AArch64 System register PMOVSCLR_EL0 bits [63:32] are architecturally mapped to External register PMOVSCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

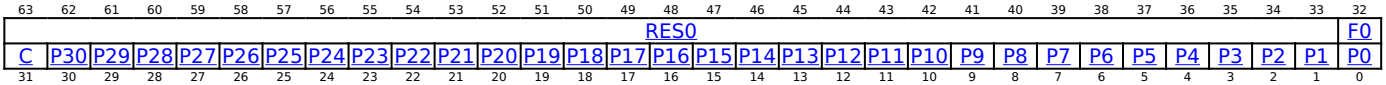
AArch64 System register PMOVSCLR_EL0 bits [63:32] are architecturally mapped to External register PMOVSSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMOVSCLR_EL0 are UNDEFINED.

Attributes

PMOVSCLR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for PMICNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMICNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMICNTR_EL0 overflow status.

F0	Meaning
0b0	PMICNTR_EL0 has not overflowed.
0b1	PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.

- MDCR_EL3.EnPM2 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '0' or PMUACR_EL1.F0 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or (HDFGRTR2_EL2.nPMICFILTR_EL0 == '0' and HDFGWTR2_EL2.nPMICFILTR_EL0 == '0').
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
  - PMUSERENR_EL0.IR == '1'.
- Access to this field is WO/RAZ if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGWTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == '1'.
- Otherwise, access to this field is W1C.

Otherwise:

Reserved, RES0.

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMCCNTR_EL0 to 0. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.C == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == '11'.
- Otherwise, access to this field is W1C.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 clear. On writes, allows software to clear the unsigned overflow flag for PMEVCNTR<m>_EL0 to 0. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.P<m> == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == '11'.
- Otherwise, access to this field is W1C.

PMOVSSET_EL0, Performance Monitors Overflow Flag Status Set Register

The PMOVSSET_EL0 characteristics are:

Purpose

Allows software to set the unsigned overflow flags for the following counters to 1:

- The cycle counter PMCCNTR_EL0.
- The event counters PMEVCNTR<n>_EL0.
- When FEAT_PMUv3_ICNTR is implemented, the instruction counter PMICNTR_EL0.

Reading from this register shows the current unsigned overflow flag values.

Configuration

AArch64 System register PMOVSSET_EL0 bits [63:0] are architecturally mapped to AArch64 System register PMOVSCLR_EL0[63:0].

AArch64 System register PMOVSSET_EL0 bits [63:0] are architecturally mapped to External register PMOVS[63:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSSET[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMOVSR[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register PMOVSCLR_EL0[31:0].

AArch64 System register PMOVSSET_EL0 bits [31:0] are architecturally mapped to External register PMOVSSET_EL0[31:0].

AArch64 System register PMOVSSET_EL0 bits [63:32] are architecturally mapped to External register PMOVSCLR_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

AArch64 System register PMOVSSET_EL0 bits [63:32] are architecturally mapped to External register PMOVSSET_EL0[63:32] when FEAT_PMUv3p9 is implemented or FEAT_PMUv3_EXT64 is implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMOVSSET_EL0 are UNDEFINED.

Attributes

PMOVSSET_EL0 is a 64-bit register.

Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Unsigned overflow flag for PMICNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMICNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMICNTR_EL0 overflow status.

F0	Meaning
0b0	PMICNTR_EL0 has not overflowed.
0b1	PMICNTR_EL0 has overflowed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.

- MDCR_EL3.EnPM2 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '0' or PMUACR_EL1.F0 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or (HDFGRTR2_EL2.nPMICFILTR_EL0 == '0' and HDFGWTR2_EL2.nPMICFILTR_EL0 == '0').
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL == EL0.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
  - PMUSERENR_EL0.IR == '1'.
- Access to this field is WO/RAZ if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGRTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGWTR2_EL2.nPMICFILTR_EL0 == '0'.
- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == '1'.
- Otherwise, access to this field is W1S.

Otherwise:

Reserved, RES0.

C, bit [31]

Unsigned overflow flag for PMCCNTR_EL0 set. On writes, allows software to set the unsigned overflow flag for PMCCNTR_EL0 to 1. On reads, returns the unsigned overflow flag for PMCCNTR_EL0 overflow status.

C	Meaning
0b0	PMCCNTR_EL0 has not overflowed.
0b1	PMCCNTR_EL0 has overflowed.

PMCR_EL0.LC controls whether an overflow is detected from unsigned overflow of PMCCNTR_EL0[31:0] or unsigned overflow of PMCCNTR_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.C == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == '11'.
- Otherwise, access to this field is W1S.

P<m>, bit [m], for m = 30 to 0

Unsigned overflow flag for PMEVCNTR<m>_EL0 set. On writes, allows software to set the unsigned overflow flag for PMEVCNTR<m>_EL0 to 1. On reads, returns the unsigned overflow flag for PMEVCNTR<m>_EL0 overflow status.

P<m>	Meaning
0b0	PMEVCNTR<m>_EL0 has not overflowed.
0b1	PMEVCNTR<m>_EL0 has overflowed.

If FEAT_PMUv3p5 is implemented, MDCR_EL2.HLP and PMCR_EL0.LP control whether an overflow is detected from unsigned overflow of PMEVCNTR<m>_EL0[31:0] or unsigned overflow of PMEVCNTR<m>_EL0[63:0].

The reset behavior of this field is:

- On a Cold reset, when FEAT_PMUv3_EXTPMN is implemented, this field resets to an architecturally UNKNOWN value.
- On a Warm reset, when FEAT_PMUv3_EXTPMN is not implemented, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.P<m> == '0'.
- Access to this field is RO if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == '11'.
- Otherwise, access to this field is W1S.

PMSCR_EL1, Statistical Profiling Control Register (EL1)

The PMSCR_EL1 characteristics are:

Purpose

Provides EL1 controls for Statistical Profiling.

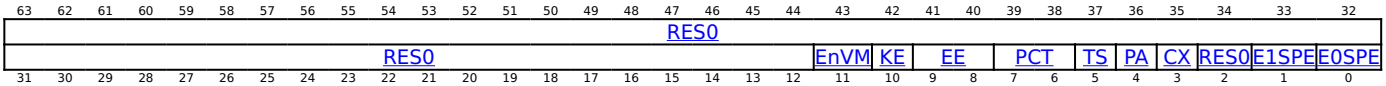
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL1 are UNDEFINED.

Attributes

PMSCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

EnVM, bit [11]
When FEAT_SPE_nVM is implemented and FEAT_NV is implemented:

Reserved for software use in nested virtualization. See also PMSCR_EL2.EnVM.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

KE, bit [10]
When FEAT_SPE_EXC is implemented:

Kernel exception enable for SPE Profiling exceptions taken to EL1.

KE	Meaning
0b0	SPE Profiling exceptions taken to EL1 are always masked at EL1.
0b1	Enabled SPE Profiling exceptions taken to EL1 are masked at EL1 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]
When FEAT_SPE_EXC is implemented:

Exception Enable.

EE	Meaning	Applies when
0b00	Disabled. SPE Profiling exceptions for EL1 are disabled. All of the following apply: • Unless enabled by a higher Exception level, SPE Profiling exceptions are not generated. • PMBSR_EL1.S drives the interrupt request signal PMBIRQ. • Accesses to PMBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1.	
0b01	Reserved for software use in nested virtualization. Behaves as 0b00 for the purpose of controlling the SPE Profiling exception and interrupt request signal PMBIRQ, and as 0b11 for the purpose of accesses to PMBSR_EL1.	When FEAT_NV is implemented
0b10	Reserved for software use in nested virtualization. Behaves as 0b11 for the purposes of controlling the SPE Profiling exception and interrupt request signal PMBIRQ, and accesses to PMBSR_EL1.	When FEAT_NV is implemented
0b11	Enabled. SPE Profiling exceptions for EL1 are enabled, as follows: • All Profiling Buffer management events are recorded in PMBSR_EL1, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE or PMBSR_EL2 by PMSCR_EL2.EE. • SPE Profiling exceptions are generated and taken to EL1 when unmasked and PMBSR_EL1.S is 1, unless the Effective value of HCR_EL2.TGE is 1, in which case the exception is taken to EL2. • The interrupt request signal PMBIRQ is not asserted.	

For more information on the values reserved for software use in nested virtualization, see PMSCR_EL2.EE.

If the Effective value of PMSCR_EL2.EE is 0b00, then the Effective value of PMSCR_EL1.EE is 0b00.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PCT, bits [7:6]
When EL2 is implemented:

Physical Timestamp. If timestamp sampling is enabled and the Profiling Buffer owning Exception level is EL1, requests which timestamp counter value is collected.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	Virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2.	
0b01	Physical timestamp. The collected timestamp is the physical counter.	
0b11	Guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn == 0. • CNTHCTL_EL2.ECV == 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented

When EL2 is implemented, all of the following apply:

- If the Profiling Buffer owning Exception level is EL1 and EL2 is enabled in the owning Security state, then the value of PMSCR_EL2.PCT might override or modify the meaning of this field.
- If the Profiling Buffer owning Exception level is EL2, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Physical Timestamp. Reserved. This field reads as 0b01 and ignores writes. Software should treat this field as UNK/SBZP.

When EL2 is not implemented, the Effective values of CNTVOFF_EL2 and CNTPOFF_EL2 are zero, meaning the virtual counter and physical counter have the same value.

TS, bit [5]

Timestamp sample enable. Enables recording of a Timestamp packet when the owning Exception level is EL1.

TS	Meaning
0b0	Timestamp packet recording disabled.
0b1	Timestamp packet recording enabled.

If the Profiling Buffer owning Exception level is EL2, then this field is ignored by the PE. For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address sample enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

When EL2 is implemented, all of the following apply:

- If the Profiling Buffer owning Exception level is EL1, then this field is combined with the Effective value PMSCR_EL2.PA to determine whether Physical addresses are collected.
- If the Profiling Buffer owning Exception level is EL2, then this field is ignored by the PE.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

CONTEXTIDR_EL1 sample enable. Enables recording of a Context packet containing the value of CONTEXTIDR_EL1.

CX	Meaning
0b0	CONTEXTIDR_EL1 recording disabled.
0b1	CONTEXTIDR_EL1 recording enabled.

The PE ignores the value of this field and CONTEXTIDR_EL1 is not recorded when any of the following apply:

- The sampled operation executes at EL2.
- The sampled operation executes at EL0 and the Effective value of HCR_EL2.TGE is 1.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E1SPE, bit [1]

EL1 Statistical Profiling Enable.

E1SPE	Meaning
0b0	Sampling disabled at EL1.
0b1	Sampling enabled at EL1.

If the Effective value of HCR_EL2.TGE is 1, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E0SPE, bit [0]

EL0 Statistical Profiling Enable. Controls sampling at EL0 when the Effective value of HCR_EL2.TGE is 0 or if EL2 is disabled or not implemented.

E0SPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If the Effective value of HCR_EL2.TGE is 1, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSCR_EL1

PMSCR_EL2, Statistical Profiling Control Register (EL2)

The PMSCR_EL2 characteristics are:

Purpose

Provides EL2 controls for Statistical Profiling.

Configuration

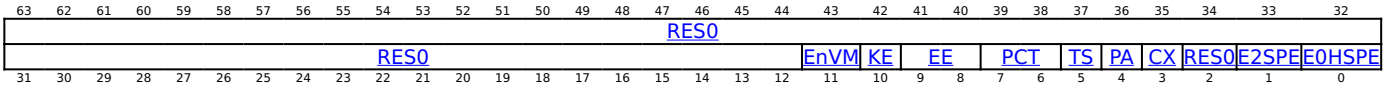
This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

PMSCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

EnVM, bit [11]
When FEAT_SPE_nVM is implemented:

Enable use of physical address Profiling Buffer pointers.

EnVM	Meaning
0b0	Use of physical address Profiling Buffer pointers is disabled. The PE behaves as if PMBLIMITR_EL1.nVM is 0.
0b1	Use of physical address Profiling Buffer pointers is permitted.

If EL2 is disabled in the owning Security state, or the Profiling Buffer owning Exception level is EL2, then the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL2.
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.

Otherwise:

Reserved, RES0.

KE, bit [10]
When FEAT_SPE_EXC is implemented:

Kernel exception enable for SPE Profiling exceptions taken to EL2.

KE	Meaning
0b0	SPE Profiling exceptions taken to EL2 are always masked at EL2.
0b1	Enabled SPE Profiling exceptions taken to EL2 are masked at EL2 when PSTATE.PM is 1 and unmasked when PSTATE.PM is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EE, bits [9:8]
When FEAT_SPE_EXC is implemented:

Exception Enable.

EE	Meaning
0b00	Disabled. SPE Profiling exceptions for EL2 and EL1 are disabled. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL2. • Unless enabled by a higher Exception level, SPE Profiling exceptions are not generated. • PMBSR_EL1.S drives the interrupt request signal PMBIRQ. • Accesses to PMBSR_EL1 at EL1 ignore the value of HCR_EL2.NV1 and accesses to PMBSR_EL1 at EL2 ignore the value of HCR_EL2.E2H.
0b01	Delegated. SPE Profiling exceptions for EL2 are disabled, but might be enabled for EL1 by PMSCR_EL1.EE. All of the following apply: • No Profiling Buffer management events are recorded in PMBSR_EL2. • PMBSR_EL2.S is ignored and SPE Profiling exceptions are not taken to EL2, other than for the case when the Effective value of HCR_EL2.TGE is 1.
0b10	Enabled. SPE Profiling exceptions for EL2 are enabled for Profiling Buffer management events targeting EL2, as follows: • Profiling Buffer management events due to a fault on a write to the Profiling Buffer that would generate a Data Abort exception taken to EL2 if generated by a store instruction executed at the owning Exception level are recorded in PMBSR_EL2, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE. If the Profiling Buffer owning Exception level is EL2, then this means any fault on a write to the Profiling Buffer. If the Profiling Buffer owning Exception level is EL1, then this means any of the following faults on a write to the Profiling Buffer: ◦ Stage 2 faults. ◦ If HCR_EL2.TEA is 1, synchronous External aborts. ◦ If HCR_EL2.GPF is 1, Granule Protection Faults (GPFs). • Profiling Buffer management events due to Granule Protection Check faults other than GPFs on a write to the Profiling Buffer are recorded in PMBSR_EL2, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE. • SPE Profiling exceptions are generated and taken to EL2 when unmasked and PMBSR_EL2.S is 1.
0b11	Trap all. SPE Profiling exceptions for EL2 are enabled for all Profiling Buffer management events, as follows: • All Profiling Buffer management events are recorded in PMBSR_EL2, unless they are configured to be recorded in PMBSR_EL3 by MDCR_EL3.PMSEE. • SPE Profiling exceptions are generated and taken to EL2 when unmasked and PMBSR_EL2.S is 1.

If the Effective value of MDCR_EL3.PMSEE is 0b00, then the Effective value of PMSCR_EL2.EE is 0b00. Otherwise, if EL2 is not implemented or the Effective value of SCR_EL3.{NS, EEL2} is {0, 0}, then the Effective value of PMSCR_EL2.EE is 0b01.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '00'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PCT, bits [7:6]

Physical Timestamp. If timestamp sampling is enabled, determines which counter is collected. The behavior depends on the Profiling Buffer owning Exception level.

If FEAT_ECV is implemented, this is a two-bit field as shown. Otherwise, bit[7] is RES0.

PCT	Meaning	Applies when
0b00	Virtual timestamp. The collected timestamp is the physical counter minus a virtual offset. If the Profiling Buffer owning Exception level is EL2 and any of the following are true, then the virtual offset is zero: • The sampled operation executed at EL2 and the Effective value of HCR_EL2.E2H is 1. • The sampled operation executed at EL0 and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}. Otherwise, the virtual offset is the value of CNTVOFF_EL2.	
0b01	If the Profiling Buffer owning Exception level is EL1, then the timestamp value is selected by PMSCR_EL1.PCT. Otherwise, physical timestamp. The collected timestamp is the physical counter.	
0b11	If the Profiling Buffer owning Exception level is EL1 and PMSCR_EL1.PCT is 0b00, then guest virtual timestamp. The collected timestamp is the physical counter minus the value of CNTVOFF_EL2. Otherwise, guest physical timestamp. The collected timestamp is the physical counter minus a physical offset. If any of the following are true, then the physical offset is zero, otherwise the physical offset is the value of CNTPOFF_EL2: • SCR_EL3.ECVEn is 0. • CNTHCTL_EL2.ECV is 0. • FEAT_ECV_POFF is not implemented.	When FEAT_ECV is implemented

All other values are reserved.

If EL2 is not implemented or EL2 is disabled in the current Security state, then the Effective value of this field is 0b01, other than for a direct read of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TS, bit [5]

Timestamp sample enable. Enables recording of a Timestamp packet when the owning Exception level is EL2.

TS	Meaning
0b0	Timestamp packet recording disabled.
0b1	Timestamp packet recording enabled.

If the Profiling Buffer owning Exception level is EL1, then this field is ignored by the PE. For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

PA, bit [4]

Physical Address Sample Enable.

PA	Meaning
0b0	Physical addresses are not collected.
0b1	Physical addresses are collected.

If the Profiling Buffer owning Exception level is EL2, then this field determines whether physical addresses are collected.

If the Profiling Buffer owning Exception level is EL1, and EL2 is enabled in the owning Security state, then this field is combined with PMSCR_EL1.PA to determine whether physical addresses are collected.

If EL2 is not implemented or EL2 is disabled in the owning Security state, then the Effective value of this field is 1.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CX, bit [3]

CONTEXTIDR_EL2 sample enable. Enables recording of a Context packet containing the value of CONTEXTIDR_EL2.

CX	Meaning
0b0	CONTEXTIDR_EL2 recording disabled.
0b1	CONTEXTIDR_EL2 recording enabled.

The PE ignores the value of this field and CONTEXTIDR_EL2 is not recorded when EL2 is not implemented or EL2 is disabled in the current Security state.

For more information, see 'Controlling the data that is collected'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [2]

Reserved, RES0.

E2SPE, bit [1]

EL2 Statistical Profiling Enable.

E2SPE	Meaning
0b0	Sampling disabled at EL2.
0b1	Sampling enabled at EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MDCR_EL2.E2PB != '00', access to this field is RES0 .
- Otherwise, access to this field is RW.

E0HSPE, bit [0]

EL0 Statistical Profiling Enable.

E0HSPE	Meaning
0b0	Sampling disabled at EL0.
0b1	Sampling enabled at EL0.

If the Effective value of HCR_EL2.TGE is 0, then this field is ignored by the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When MDCR_EL2.E2PB != '00', access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing PMSCR_EL2

Accesses to this register use the following encodings in the System register encoding space:

PMSDSFR_EL1, Sampling Data Source Filter Register

The PMSDSFR_EL1 characteristics are:

Purpose

Controls sample filtering by Data Source.

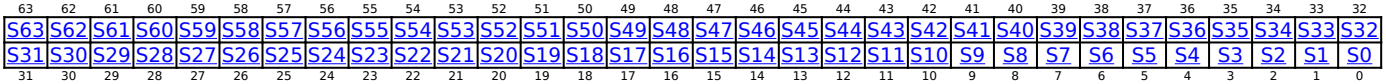
Configuration

This register is present only when FEAT_SPE_FDS is implemented. Otherwise, direct accesses to PMSDSFR_EL1 are UNDEFINED.

Attributes

PMSDSFR_EL1 is a 64-bit register.

Field descriptions



S<m>, bit [m], for m = 63 to 0
When filtering on Data Source <m> is supported:

S[<m>] is the Data Source filter for IMPLEMENTATION DEFINED Data Source <m>.

S<m>	Meaning
0b0	If PMSFCR_EL1.FDS is 1, do not record load operations that have bits [5:0] of the Data Source packet set to <m>.
0b1	Load operations with Data Source <m> are unaffected by PMSFCR_EL1.FDS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Accessing PMSDSFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSDSFR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1010	0b100

```

PMSELR_EL0, Performance Monitors Event Counter Selection Register

The PMSELR_EL0 characteristics are:

Purpose

Selects the current event counter PMEVCNTR<n>_EL0 or the cycle counter PMCCNTR_EL0.

Used in conjunction with PMXEVTYPER_EL0 to determine the event that increments a selected counter, and the modes and states in which the selected counter increments.

Used in conjunction with PMXEVCNTR_EL0 to determine the value of a selected counter.

Configuration

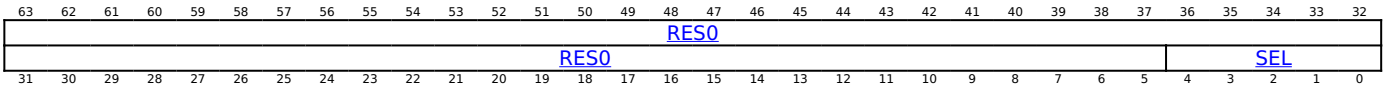
AArch64 System register PMSELR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSELR[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMSELR_EL0 are UNDEFINED.

Attributes

PMSELR_EL0 is a 64-bit register.

Field descriptions



Bits [63:5]

Reserved, RES0.

SEL, bits [4:0]

Event counter select. Selects the counter accessed by subsequent accesses to PMXEVTYPER_EL0 and PMXEVCNTR_EL0.

SEL	Meaning
0b00000..0b11110	Select event counter PMEVCNTR<n>_EL0, where n is the value of this field: • MRS and MSR of PMXEVTYPER_EL0 access PMEVTYPER<n>_EL0. • MRS and MSR of PMXEVCNTR_EL0 access PMEVCNTR<n>_EL0.
0b11111	Select the cycle counter, PMCCNTR_EL0: • MRS and MSR of PMXEVTYPER_EL0 access PMCCFILTR_EL0. • MRS and MSR of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE. For more information, see PMXEVCNTR_EL0.

If FEAT_FGT is not implemented and this field is set to a value greater than or equal to the number of implemented counters, but not equal to 31, then direct reads of this field return an UNKNOWN value.

For more information about the results of accesses to the event counters, including when PMSELR_EL0.SEL is set to the index of an unimplemented or inaccessible event counter, see PMXEVTYPER_EL0 and PMXEVCNTR_EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSELR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSELR_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b101

PMSEVFR_EL1, Sampling Event Filter Register

The PMSEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall filter is the logical AND of these filters. For example, if PMSEVFR_EL1.E[3] and PMSEVFR_EL1.E[5] are both set to 1, only samples that have both event 3 (Level 1 unified or data cache refill) and event 5 (TLB walk) set to 1 are recorded.

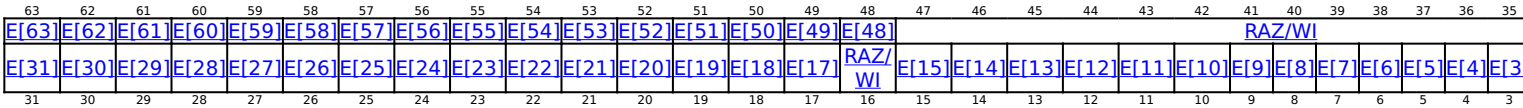
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSEVFR_EL1 are UNDEFINED.

Attributes

PMSEVFR_EL1 is a 64-bit register.

Field descriptions



E[63], bit [63]
When event 63 is implemented and filtering on event 63 is supported:

Filter on IMPLEMENTATION DEFINED event 63.

E[63]	Meaning
0b0	Event 63 is ignored.
0b1	Do not record samples that have event 63 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[62], bit [62]
When event 62 is implemented and filtering on event 62 is supported:

Filter on IMPLEMENTATION DEFINED event 62.

E[62]	Meaning
0b0	Event 62 is ignored.
0b1	Do not record samples that have event 62 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[61], bit [61]
When event 61 is implemented and filtering on event 61 is supported:

Filter on IMPLEMENTATION DEFINED event 61.

E[61]	Meaning
0b0	Event 61 is ignored.
0b1	Do not record samples that have event 61 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[60], bit [60]
When event 60 is implemented and filtering on event 60 is supported:

Filter on IMPLEMENTATION DEFINED event 60.

E[60]	Meaning
0b0	Event 60 is ignored.
0b1	Do not record samples that have event 60 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[59], bit [59]
When event 59 is implemented and filtering on event 59 is supported:

Filter on IMPLEMENTATION DEFINED event 59.

E[59]	Meaning
0b0	Event 59 is ignored.
0b1	Do not record samples that have event 59 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[58], bit [58]
When event 58 is implemented and filtering on event 58 is supported:

Filter on IMPLEMENTATION DEFINED event 58.

E[58]	Meaning
0b0	Event 58 is ignored.
0b1	Do not record samples that have event 58 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[57], bit [57]
When event 57 is implemented and filtering on event 57 is supported:

Filter on IMPLEMENTATION DEFINED event 57.

E[57]	Meaning
0b0	Event 57 is ignored.
0b1	Do not record samples that have event 57 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[56], bit [56]
When event 56 is implemented and filtering on event 56 is supported:

Filter on IMPLEMENTATION DEFINED event 56.

E[56]	Meaning
0b0	Event 56 is ignored.
0b1	Do not record samples that have event 56 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[55], bit [55]
When event 55 is implemented and filtering on event 55 is supported:

Filter on IMPLEMENTATION DEFINED event 55.

E[55]	Meaning
0b0	Event 55 is ignored.
0b1	Do not record samples that have event 55 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[54], bit [54]
When event 54 is implemented and filtering on event 54 is supported:

Filter on IMPLEMENTATION DEFINED event 54.

E[54]	Meaning
0b0	Event 54 is ignored.
0b1	Do not record samples that have event 54 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[53], bit [53]
When event 53 is implemented and filtering on event 53 is supported:

Filter on IMPLEMENTATION DEFINED event 53.

E[53]	Meaning
0b0	Event 53 is ignored.
0b1	Do not record samples that have event 53 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[52], bit [52]
When event 52 is implemented and filtering on event 52 is supported:

Filter on IMPLEMENTATION DEFINED event 52.

E[52]	Meaning
0b0	Event 52 is ignored.
0b1	Do not record samples that have event 52 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[51], bit [51]
When event 51 is implemented and filtering on event 51 is supported:

Filter on IMPLEMENTATION DEFINED event 51.

E[51]	Meaning
0b0	Event 51 is ignored.
0b1	Do not record samples that have event 51 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[50], bit [50]
When event 50 is implemented and filtering on event 50 is supported:

Filter on IMPLEMENTATION DEFINED event 50.

E[50]	Meaning
0b0	Event 50 is ignored.
0b1	Do not record samples that have event 50 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[49], bit [49]
When event 49 is implemented and filtering on event 49 is supported:

Filter on IMPLEMENTATION DEFINED event 49.

E[49]	Meaning
0b0	Event 49 is ignored.
0b1	Do not record samples that have event 49 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[48], bit [48]
When event 48 is implemented and filtering on event 48 is supported:

Filter on IMPLEMENTATION DEFINED event 48.

E[48]	Meaning
0b0	Event 48 is ignored.
0b1	Do not record samples that have event 48 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [47:32]

Reserved, RAZ/WI.

E[31], bit [31]
When FEAT_SPEv1p4 is not implemented, event 31 is implemented, and filtering on event 31 is supported:

Filter on IMPLEMENTATION DEFINED event 31.

E[31]	Meaning
0b0	Event 31 is ignored.
0b1	Do not record samples that have event 31 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[30], bit [30]
When FEAT_SPEv1p4 is not implemented, event 30 is implemented, and filtering on event 30 is supported:

Filter on IMPLEMENTATION DEFINED event 30.

E[30]	Meaning
0b0	Event 30 is ignored.
0b1	Do not record samples that have event 30 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[29], bit [29]
When FEAT_SPEv1p4 is not implemented, event 29 is implemented, and filtering on event 29 is supported:

Filter on IMPLEMENTATION DEFINED event 29.

E[29]	Meaning
0b0	Event 29 is ignored.
0b1	Do not record samples that have event 29 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[28], bit [28]
When FEAT_SPEv1p4 is not implemented, event 28 is implemented, and filtering on event 28 is supported:

Filter on IMPLEMENTATION DEFINED event 28.

E[28]	Meaning
0b0	Event 28 is ignored.
0b1	Do not record samples that have event 28 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[27], bit [27]
When FEAT_SPEv1p4 is not implemented, event 27 is implemented, and filtering on event 27 is supported:

Filter on IMPLEMENTATION DEFINED event 27.

E[27]	Meaning
0b0	Event 27 is ignored.
0b1	Do not record samples that have event 27 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[26], bit [26]
When FEAT_SPEv1p4 is not implemented, event 26 is implemented, and filtering on event 26 is supported:

Filter on IMPLEMENTATION DEFINED event 26.

E[26]	Meaning
0b0	Event 26 is ignored.
0b1	Do not record samples that have event 26 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[25], bit [25]
When (FEAT_SPE_SME is implemented or FEAT_SPEv1p5 is implemented) and event 25 is implemented:

Filter on SMCU or other shared resource operation event.

E[25]	Meaning
0b0	SMCU or other shared resource operation event is ignored.
0b1	Do not record samples that have the SMCU or other shared resource operation event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 25 is implemented, and filtering on event 25 is supported:

Filter on IMPLEMENTATION DEFINED event 25.

E[25]	Meaning
0b0	Event 25 is ignored.
0b1	Do not record samples that have event 25 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[24], bit [24]
When FEAT_SPE_SME is implemented:

Filter on Streaming SVE mode event.

E[24]	Meaning
0b0	Streaming SVE mode event is ignored.
0b1	Do not record samples that have the Streaming SVE mode event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 24 is implemented, and filtering on event 24 is supported:

Filter on IMPLEMENTATION DEFINED event 24.

E[24]	Meaning
0b0	Event 24 is ignored.
0b1	Do not record samples that have event 24 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[23], bit [23]
When FEAT_SPEv1p4 is implemented and event 23 is implemented:

Filter on Data snooped event.

E[23]	Meaning
0b0	Data snooped event is ignored.
0b1	Do not record samples that have the Data snooped event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[22], bit [22]
When FEAT_SPEv1p4 is implemented and event 22 is implemented:

Filter on Recently fetched event.

E[22]	Meaning
0b0	Recently fetched event is ignored.
0b1	Do not record samples that have the Recently fetched event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[21], bit [21]
When FEAT_SPEv1p4 is implemented and event 21 is implemented:

Filter on Cache data modified event.

E[21]	Meaning
0b0	Cache data modified event is ignored.
0b1	Do not record samples that have the Cache data modified event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[20], bit [20]
When FEAT_SPEv1p4 is implemented and event 20 is implemented:

Filter on Level 2 data cache miss event.

E[20]	Meaning
0b0	Level 2 data cache miss event is ignored.
0b1	Do not record samples that have the Level 2 data cache miss event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[19], bit [19]
When FEAT_SPEv1p4 is implemented and event 19 is implemented:

Filter on Level 2 data cache access event.

E[19]	Meaning
0b0	Level 2 data cache access event is ignored.
0b1	Do not record samples that have the Level 2 data cache access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[18], bit [18]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Empty predicate event.

E[18]	Meaning
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Partial or empty predicate event.

E[17]	Meaning
0b0	Partial or empty predicate event is ignored.
0b1	Do not record samples that have the Partial or empty predicate event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [16]

Reserved, RAZ/WI.

E[15], bit [15]
When event 15 is implemented and filtering on event 15 is supported:

Filter on IMPLEMENTATION DEFINED event 15.

E[15]	Meaning
0b0	Event 15 is ignored.
0b1	Do not record samples that have event 15 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[14], bit [14]
When event 14 is implemented and filtering on event 14 is supported:

Filter on IMPLEMENTATION DEFINED event 14.

E[14]	Meaning
0b0	Event 14 is ignored.
0b1	Do not record samples that have event 14 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[13], bit [13]
When event 13 is implemented and filtering on event 13 is supported:

Filter on IMPLEMENTATION DEFINED event 13.

E[13]	Meaning
0b0	Event 13 is ignored.
0b1	Do not record samples that have event 13 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[12], bit [12]
When event 12 is implemented and filtering on event 12 is supported:

Filter on IMPLEMENTATION DEFINED event 12.

E[12]	Meaning
0b0	Event 12 is ignored.
0b1	Do not record samples that have event 12 == 0.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]
When FEAT_SPEv1p1 is implemented:

Filter on Misalignment event.

E[11]	Meaning
0b0	Misalignment event is ignored.
0b1	Do not record samples that have the Misalignment event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[10], bit [10]
When (FEAT_SPEv1p4 is implemented or filtering on event 10 is optionally supported) and event 10 is implemented:

Filter on Remote access event.

E[10]	Meaning
0b0	Remote access event is ignored.
0b1	Do not record samples that have the Remote access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[9], bit [9]
When (FEAT_SPEv1p4 is implemented or filtering on event 9 is optionally supported) and event 9 is implemented:

Filter on Last Level cache miss event.

E[9]	Meaning
0b0	Last Level cache miss event is ignored.
0b1	Do not record samples that have the Last Level cache miss event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[8], bit [8]
When (FEAT_SPEv1p4 is implemented or filtering on event 8 is optionally supported) and event 8 is implemented:

Filter on Last Level cache access event.

E[8]	Meaning
0b0	Last Level cache access event is ignored.
0b1	Do not record samples that have the Last Level cache access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[7], bit [7]

Filter on Mispredicted event.

E[7]	Meaning
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]
When FEAT_SPE_FnE is implemented:

Filter on Not taken event.

E[6]	Meaning
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

Filter on TLB walk event.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[4], bit [4]
When FEAT_SPEv1p4 is implemented or filtering on event 4 is optionally supported:

Filter on TLB access event.

E[4]	Meaning
0b0	TLB access event is ignored.
0b1	Do not record samples that have the TLB access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[3], bit [3]

Filter on Level 1 data cache refill or miss event.

E[3]	Meaning
0b0	Level 1 data cache refill or miss event is ignored.
0b1	Do not record samples that have the Level 1 data cache refill or miss event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[2], bit [2]
When FEAT_SPEv1p4 is implemented or filtering on event 2 is optionally supported:

Filter on Level 1 data cache access event.

E[2]	Meaning
0b0	Level 1 data cache access event is ignored.
0b1	Do not record samples that have the Level 1 data cache access event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[1], bit [1]
When the PE supports sampling of speculative instructions:

Filter on Architecturally retired event.

E[1]	Meaning
0b0	Architecturally retired event is ignored.
0b1	Do not record samples that have the Architecturally retired event == 0.

This field is ignored by the PE when PMSFCR_EL1.FE is 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, UNKNOWN.

Bit [0]

Reserved, RAZ/WI.

Accessing PMSEVFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSEVFR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b101

PMSFCR_EL1, Sampling Filter Control Register

The PMSFCR_EL1 characteristics are:

Purpose

Controls sample filtering. The filter is the logical AND of the filters controlled by FDS, FnE, FL, FT, and FE bits. For example, if PMSFCR_EL1.FE is 1 and PMSFCR_EL1.FT is 1, then only samples including the selected types and the selected events will be recorded.

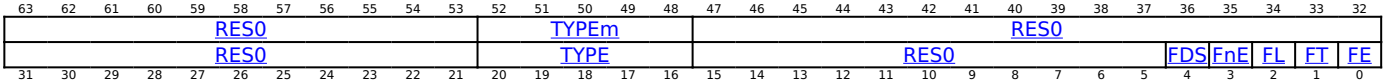
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSFCR_EL1 are UNDEFINED.

Attributes

PMSFCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:53]

Reserved, RES0.

TYPEm, bits [52:48]

TYPEm encoding when FEAT_SPE_EFT is implemented

SIMDm, bit [4]

SIMD filter mask.

SIMDm	Meaning
0b0	PMSFCR_EL1.SIMD controls whether SIMD operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.SIMD controls whether SIMD operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FPm, bit [3]

Floating-point filter mask.

FPm	Meaning
0b0	PMSFCR_EL1.FP controls whether floating-point operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.FP controls whether floating-point operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

STm, bit [2]

Store filter mask.

STm	Meaning
0b0	PMSFCR_EL1.ST controls whether store operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.ST controls whether store operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LDm, bit [1]

Load filter mask.

LDm	Meaning
0b0	PMSFCR_EL1.LD controls whether load operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.LD controls whether load operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bm, bit [0]

Branch filter mask.

Bm	Meaning
0b0	PMSFCR_EL1.B controls whether branch operations are recorded as part of a Boolean-OR filter with other masked operation type filter controls.
0b1	PMSFCR_EL1.B controls whether branch operations are recorded as part of a Boolean-AND filter with other unmasked operation type filter controls.

This field is ignored by the PE when PMSFCR_EL1.FT is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TYPEm encoding when FEAT_SPE_EFT is not implemented

Bits [4:0]

Reserved, RES0.

Bits [47:21]

Reserved, RES0.

TYPE, bits [20:16]

TYPE encoding

SIMD, bit [4]
When FEAT_SPE_EFT is implemented:

SIMD filter enable.

SIMD	Meaning
0b0	If PMSFCR_EL1.SIMDm is 1, then record only operations that are not SIMD operations. Otherwise, do not record SIMD operations, unless allowed by another operation type filter.
0b1	If PMSFCR_EL1.SIMDm is 1, then record only operations that are SIMD operations. Otherwise, record all SIMD operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- PMSFCR_EL1.SIMDm is 0 and the values of the PMSFCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSFCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, SIMD operations means all Advanced SIMD, SVE, and SME SIMD operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FP, bit [3]
When FEAT_SPE_EFT is implemented:

Floating-point filter enable.

FP	Meaning
0b0	If PMSFCR_EL1.FPm is 1, then record only operations that are not floating-point operations. Otherwise, do not record floating-point operations, unless allowed by another operation type filter.
0b1	If PMSFCR_EL1.FPm is 1, then record only operations that are floating-point operations. Otherwise, record all floating-point operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- PMSFCR_EL1.FPm is 0 and the values of the PMSFCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSFCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, floating-point operations means all scalar, Advanced SIMD, SVE, and SME floating-point operations, as defined by the FP_SPEC event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ST, bit [2]

Store filter enable.

ST	Meaning
0b0	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.STm is 1, then record only operations that are not store operations. Otherwise, do not record store operations, unless allowed by another operation type filter.
0b1	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.STm is 1, then record only operations that are store operations. Otherwise, record all store operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- FEAT_SPE_EFT is implemented, PMSFCR_EL1.STm is 0, and the values of the PMSFCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSFCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, store operations includes vector stores and all atomic operations.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

LD, bit [1]

Load filter enable.

LD	Meaning
0b0	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.LDm is 1, then record only operations that are not load operations. Otherwise, do not record load operations, unless allowed by another operation type filter.
0b1	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.LDm is 1, then record only operations that are load operations. Otherwise, record all load operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- FEAT_SPE_EFT is implemented, PMSFCR_EL1.LDm is 0, and the values of the PMSFCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSFCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, load operations includes vector loads and atomic operations that return a value to the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

B, bit [0]

Branch filter enable.

B	Meaning
0b0	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.Bm is 1, then record only operations that are not branch operations. Otherwise, do not record branch operations.
0b1	If FEAT_SPE_EFT is implemented and PMSFCR_EL1.Bm is 1, then record only operations that are branch operations. Otherwise, record all branch operations.

This field is ignored by the PE and no records are removed by this filter when any of the following apply:

- PMSFCR_EL1.FT is 0.
- FEAT_SPE_EFT is implemented, PMSFCR_EL1.Bm is 0, and the values of the PMSFCR_EL1.{SIMD, FP, ST, LD, B} bits for which the corresponding PMSFCR_EL1.{SIMDm, FPm, STm, LDm, Bm} bit is zero are all zero.

For filtering purposes, branch operations includes exception returns.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [15:5]

Reserved, RES0.

FDS, bit [4]
When FEAT_SPE_FDS is implemented:

Filter by Data Source.

FDS	Meaning
0b0	Data Source filtering disabled.
0b1	Data Source filtering enabled. Samples of load instructions reporting a Data Source not selected by PMSDSFR_EL1 will not be recorded.

If PMSFCR_EL1.FDS is 1 and PMSDSFR_EL1 is zero, then no load operations with a Data Source will be recorded.

Load operations without a Data Source and other sampled operations are unaffected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FnE, bit [3]
When FEAT_SPE_FnE is implemented:

Filter by event, inverted.

FnE	Meaning
0b0	Inverted event filtering disabled.
0b1	Inverted event filtering enabled. Samples including the events selected by PMSNEVFR_EL1 will not be recorded.

If any of the following are true, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FnE is 0:

- PMSFCR_EL1.FnE is 1 and PMSNEVFR_EL1 is zero.
- PMSFCR_EL1.FnE is 1, PMSFCR_EL1.FE is 1, and there exists a value x such that PMSEVFR_EL1.E[x] is 1 and PMSNEVFR_EL1.E[x] is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FL, bit [2]

Filter by latency.

FL	Meaning
0b0	Latency filtering disabled.
0b1	Latency filtering enabled. Samples with a total latency less than PMSLATFR_EL1.MINLAT will not be recorded.

If this field is 1 and PMSLATFR_EL1.MINLAT is zero, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FL is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FT, bit [1]

Filter by type. The filter is controlled by the TYPE and, if FEAT_SPE_EFT is implemented, TYPEm fields.

FT	Meaning
0b0	Type filtering disabled.
0b1	Type filtering enabled. Samples not one of the selected types will not be recorded.

Type filtering filters according to the type of the sampled operation.

If FEAT_SPE_EFT is not implemented, this field is 1, and the PMSFCR_EL1.{ST, LD, B} bits are all zero, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FT is 0.

For more information, see Filtering by operation type.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FE, bit [0]

Filter by event.

FE	Meaning
0b0	Event filtering disabled.
0b1	Event filtering enabled. Samples not including the events selected by PMSEVFR_EL1 will not be recorded.

If any of the following are true, then it is CONSTRAINED UNPREDICTABLE whether no samples are recorded or the PE behaves as if PMSFCR_EL1.FE is 0:

- PMSFCR_EL1.FE is 1 and PMSEVFR_EL1 is zero.
- FEAT_SPE_FnE is implemented, PMSFCR_EL1.FnE is 1, PMSFCR_EL1.FE is 1, and there exists a value x such that PMSEVFR_EL1.E[x] is 1 and PMSNEVFR_EL1.E[x] is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSFCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSFCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b100

end;
```

PMSICR_EL1, Sampling Interval Counter Register

The PMSICR_EL1 characteristics are:

Purpose

Software must write zero to PMSICR_EL1 before enabling sample profiling for a sampling session. Software must then treat PMSICR_EL1 as an opaque, 64-bit, read/write register used for context switches only.

Configuration

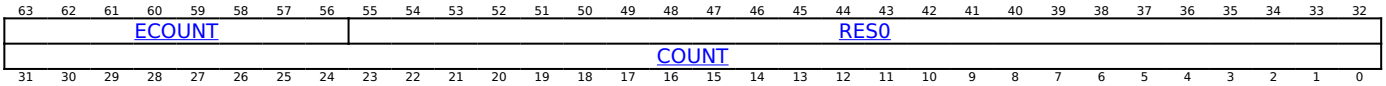
This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSICR_EL1 are UNDEFINED.

The value of PMSICR_EL1 does not change whilst profiling is disabled.

Attributes

PMSICR_EL1 is a 64-bit register.

Field descriptions



ECOUNT, bits [63:56]
When FEAT_SPE_ERnd is implemented:

Secondary sample interval counter. Provides the secondary counter used after the primary counter reaches zero.

While the secondary counter is nonzero and profiling is enabled, the secondary counter decrements by 1 for each member of the sample population. The primary counter also continues to decrement since it is also nonzero. When the secondary counter reaches zero, a member of the sampling population is selected for sampling.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [55:32]

Reserved, RES0.

COUNT, bits [31:0]

Primary sample interval counter. Provides the primary counter used for sampling.

When the PE moves from a state or Exception level where profiling is disabled to a state or Exception level where profiling is enabled, if the value of this register is zero, then the primary counter is loaded from PMSIRR_EL1.

While the primary counter is nonzero and sampling is enabled, the primary counter decrements by 1 for each member of the sample population.

The sample interval counter counts either a number of operations or a number of instructions, depending on the IMPLEMENTATION DEFINED value of PMSIDR_EL1.ArchInst.

When the counter reaches zero, the behavior depends on the value of PMSIRR_EL1.RND and whether FEAT_SPE_ERnd is implemented:

- If PMSIRR_EL1.RND is 1 and FEAT_SPE_ERnd is implemented, then the secondary counter is set to a random or pseudorandom value in the range 0x00 to 0xFF.
- Otherwise, a member of the sampling population is selected for sampling.
- The primary counter is loaded from PMSIRR_EL1.

The primary counter is loaded from PMSIRR_EL1 means:

- PMSICR_EL1.COUNT[31:8] is set to the value of PMSIRR_EL1.INTERVAL.
- If PMSIRR_EL1.RND is 1 and FEAT_SPE_ERnd is not implemented, then PMSICR_EL1.COUNT[7:0] is set to a random or pseudorandom value in the range 0x00 to 0xFF.
- Otherwise, PMSICR_EL1.COUNT[7:0] is set to 0x00.

For more information, see Initializing the sample interval counters and Behavior of the sample interval counter while profiling is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSICR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSICR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1001	0b010

PMSIDR_EL1, Sampling Profiling ID Register

The PMSIDR_EL1 characteristics are:

Purpose

Describes the Statistical Profiling implementation to software.

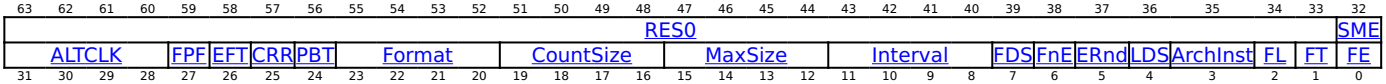
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIDR_EL1 are UNDEFINED.

Attributes

PMSIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

SME, bit [32]

SPE for SME. Describes support for the Scalable Matrix Extensions to Statistical Profiling.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SME	Meaning
0b0	The SME extensions to the Statistical Profiling Extension are not implemented.
0b1	Adds support for Statistical Profiling of the Scalable Matrix Extensions.

FEAT_SPE_SME implements the functionality identified by the value 1.

Access to this field is RO.

ALTCLK, bits [31:28]

Alternate clock domain.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ALTCLK	Meaning
0b0000	Alternate clock domain not implemented, or CPU clock domain.
0b0001	The external Streaming Mode Compute Unit provides the alternate clock domain.
0b1111	IMPLEMENTATION DEFINED clock domain.

All other values are reserved.

FEAT_SPE_ALTCLK implements the functionality identified by a nonzero value.

Access to this field is RO.

FPF, bit [27]

Floating-point flag. Describes whether Operation Type packets for sampled scalar and SIMD operations contain floating-point and Advanced SIMD indications.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FPF	Meaning
0b0	Operation Type packets for scalar and Advanced SIMD operations do not contain floating-point or Advanced SIMD information.
0b1	Operation Type packets for scalar and Advanced SIMD operations contain floating-point or Advanced SIMD information.

FEAT_SPE_FPF implements the functionality identified by the value 1.

Access to this field is RO.

EFT, bit [26]

Extended filtering by type. Describes whether Extended filtering by operation type is supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

EFT	Meaning
0b0	PMSFCR_EL1.{SIMDm, FPm, STm, Bm, LDm, SIMD, FP} are RES0.
0b1	PMSFCR_EL1.{SIMDm, FPm, STm, Bm, LDm, SIMD, FP} are implemented.

FEAT_SPE_EFT implements the functionality identified by the value 1.

Access to this field is RO.

CRR, bit [25]

Call Return branch records. Describes whether the Operation Type packets for sampled branch operations contain Call Return information.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CRR	Meaning
0b0	Operation Type packets for branch operations do not contain Call Return information.
0b1	Operation Type packets for branch operations contain Call Return information.

FEAT_SPE_CRR implements the functionality identified by the value 1.

Access to this field is RO.

PBT, bit [24]

Previous branch target Address packet. Describes whether the Previous branch target Address packet is supported.

The value of this field is an IMPLEMENTATION DEFINED choice of:

PBT	Meaning
0b0	Previous branch target Address packet not implemented.
0b1	Previous branch target Address packet implemented.

FEAT_SPE_PBT implements the OPTIONAL functionality identified by the value 1.

Access to this field is RO.

Format, bits [23:20]

Defines the format of the sample records.

Format	Meaning
0b0000	Format 0.

All other values are reserved.

Access to this field is RO.

CountSize, bits [19:16]

Defines the size of the counters.

The value of this field is an IMPLEMENTATION DEFINED choice of:

CountSize	Meaning
0b0010	12-bit saturating counters.
0b0011	16-bit saturating counters.

All other values are reserved.

Access to this field is RO.

MaxSize, bits [15:12]

Defines the largest size for a single record, rounded up to a power-of-two. If this is the same as the minimum alignment (PMBIDR_EL1.Align), then each record is exactly this size.

The value of this field is an IMPLEMENTATION DEFINED choice of:

MaxSize	Meaning
0b0100	16 bytes.
0b0101	32 bytes.
0b0110	64 bytes.
0b0111	128 bytes.
0b1000	256 bytes.
0b1001	512 bytes.
0b1010	1KB.
0b1011	2KB.

All other values are reserved.

The values 0b0100 and 0b0101 are not permitted for an implementation.

Access to this field is RO.

Interval, bits [11:8]

Minimum sampling interval. This provides guidance from the implementer to the smallest sampling interval.

The interval is defined as a number of either operations or instructions, depending on the IMPLEMENTATION DEFINED value of PMSIDR_EL1.ArchInst.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Interval	Meaning
0b0000	256 operations or instructions, or no minimum specified.
0b0010	512 operations or instructions.
0b0011	768 operations or instructions.
0b0100	1,024 operations or instructions.
0b0101	1,536 operations or instructions.
0b0110	2,048 operations or instructions.
0b0111	3,072 operations or instructions.
0b1000	4,096 operations or instructions.

All other values are reserved.

If this field reads as a nonzero value, then setting the sample interval to a value less than the indicated value is likely to cause a statistically significant number of sample collisions. For example, the smallest interval might indicate the typical size of the speculation window for the implementation. That is, the number of operations or instructions that will be executing in parallel, when the processor implementation is not heavily loaded.

Setting the sample interval to a value greater than or equal to the indicated value does not guarantee a statistically insignificant number of sample collisions, as this is typically dependent on the program being profiled. For example, if the program has a large number of long latency loads due to cache misses, then this might cause more collisions when these operations or instructions are sampled.

For more information, see 'Sample collisions'.

Access to this field is RO.

FDS, bit [7]
When FEAT_SPEv1p4 is implemented:

Filtering by data source.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FDS	Meaning
0b0	PMSDSFR_EL1 is not implemented and PMSFCR_EL1.FDS is RES0.
0b1	PMSDSFR_EL1 and PMSFCR_EL1.FDS are implemented.

FEAT_SPE_FDS implements the functionality identified by the value 1.

From Armv8.9, if FEAT_SPE_LDS is implemented, the value 0 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

FnE, bit [6]
When FEAT_SPE_FnE is implemented:

Filtering by events, inverted.

The value of this field is an IMPLEMENTATION DEFINED choice of:

FnE	Meaning
0b0	PMSNEVFR_EL1 is not implemented and PMSFCR_EL1.FnE is RES0.
0b1	PMSNEVFR_EL1 and PMSFCR_EL1.FnE are implemented.

FEAT_SPE_FnE implements the functionality identified by the value 1.

From Armv8.7, if FEAT_SPE is implemented, the value 0 is not permitted.

Access to this field is RO.

Otherwise:

Reserved, RES0.

ERnd, bit [5]

Defines how the random number generator is used in determining the interval between samples, when enabled by PMSIRR_EL1.RND.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ERnd	Meaning
0b0	The random number is added at the start of the interval, and the sample is taken and a new interval started when the combined interval expires.
0b1	The random number is added and the new interval started after the interval programmed in PMSIRR_EL1.INTERVAL expires, and the sample is taken when the random interval expires.

FEAT_SPE_ERnd implements the functionality identified by the value 1.

Access to this field is RO.

LDS, bit [4]

Data source indicator for sampled load instructions.

The value of this field is an IMPLEMENTATION DEFINED choice of:

LDS	Meaning
0b0	Loaded data source not implemented.
0b1	Loaded data source implemented.

FEAT_SPE_LDS implements the functionality identified by the value 1.

Access to this field is RO.

ArchInst, bit [3]

Architectural instruction profiling. Defines the subject of the profiling population.

The value of this field is an IMPLEMENTATION DEFINED choice of:

ArchInst	Meaning
0b0	Micro-op sampling implemented.
0b1	Architecture instruction sampling implemented.

FEAT_SPE_ArchInst implements the functionality identified by the value 1.

Access to this field is RO.

FL, bit [2]

Filtering by latency.

Reads as 0b1.

Access to this field is RO.

FT, bit [1]

Filtering by operation type.

Reads as 0b1.

Access to this field is RO.

FE, bit [0]

Filtering by events.

Reads as 0b1.

Access to this field is RO.

PMSIRR_EL1, Sampling Interval Reload Register

The PMSIRR_EL1 characteristics are:

Purpose

Defines the interval between samples.

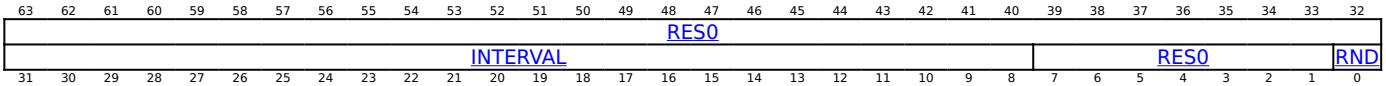
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSIRR_EL1 are UNDEFINED.

Attributes

PMSIRR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

INTERVAL, bits [31:8]

Bits [31:8] of the PMSICR_EL1 interval counter reload value. Software must set this to a nonzero value.

If this field is zero, then an UNKNOWN sampling interval is used.

If PMSIDR_EL1.Interval is nonzero, then it provides guidance from the implementer to the smallest sampling interval that should be used.

Setting this field to a nonzero value smaller than the indicated value is likely to cause a statistically significant number of sample collisions. See Sample collisions. Setting the sample interval to a value greater than or equal to the indicated value does not guarantee a statistically insignificant number of sample collisions, as this is typically dependent on the program being profiled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:1]

Reserved, RES0.

RND, bit [0]

Controls randomization of the sampling interval.

RND	Meaning
0b0	Disable randomization of sampling interval.
0b1	Add (pseudo-)random jitter to sampling interval.

The random number generator is not architected.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSIRR_EL1

Accesses to this register use the following encodings in the System register encoding space:

PMSLATFR_EL1, Sampling Latency Filter Register

The PMSLATFR_EL1 characteristics are:

Purpose

Controls sample filtering by latency

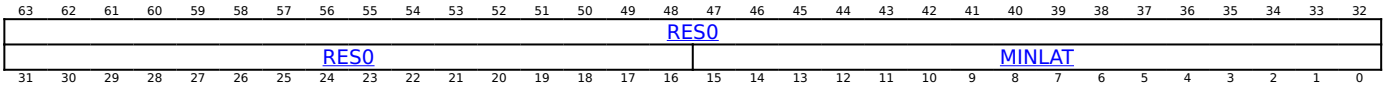
Configuration

This register is present only when FEAT_SPE is implemented. Otherwise, direct accesses to PMSLATFR_EL1 are UNDEFINED.

Attributes

PMSLATFR_EL1 is a 64-bit register.

Field descriptions



Bits [63:16]

Reserved, RES0.

MINLAT, bits [15:0]

Minimum latency.

When PMSFCR_EL1.FL is 1, defines the value used for filtering by latency. Samples with a Total latency less than PMSLATFR_EL1.MINLAT are not recorded.

If PMSIDR_EL1.CountSize is 0b0010, PMSLATFR_EL1.MINLAT[15:12] is RES0.

This field is ignored by the PE when PMSFCR_EL1.FL is 0.

For more information, see Filtering by latency.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMSLATFR_EL1

Accesses to this register use the following encodings in the System register encoding space:

```

PMSNEVFR_EL1, Sampling Inverted Event Filter Register

The PMSNEVFR_EL1 characteristics are:

Purpose

Controls sample filtering by events. The overall inverted filter is the logical OR of these filters. For example, if PMSNEVFR_EL1.E[3] and PMSNEVFR_EL1.E[5] are both set to 1, samples that have either event 3 (Level 1 unified or data cache refill) or event 5 (TLB walk) set to 1 are not recorded.

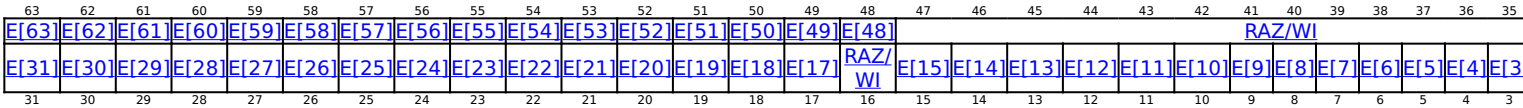
Configuration

This register is present only when FEAT_SPE_FnE is implemented. Otherwise, direct accesses to PMSNEVFR_EL1 are UNDEFINED.

Attributes

PMSNEVFR_EL1 is a 64-bit register.

Field descriptions



E[63], bit [63]
When event 63 is implemented and filtering on event 63 is supported:

Filter on IMPLEMENTATION DEFINED event 63.

E[63]	Meaning
0b0	Event 63 is ignored.
0b1	Do not record samples that have event 63 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[62], bit [62]
When event 62 is implemented and filtering on event 62 is supported:

Filter on IMPLEMENTATION DEFINED event 62.

E[62]	Meaning
0b0	Event 62 is ignored.
0b1	Do not record samples that have event 62 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[61], bit [61]
When event 61 is implemented and filtering on event 61 is supported:

Filter on IMPLEMENTATION DEFINED event 61.

E[61]	Meaning
0b0	Event 61 is ignored.
0b1	Do not record samples that have event 61 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[60], bit [60]
When event 60 is implemented and filtering on event 60 is supported:

Filter on IMPLEMENTATION DEFINED event 60.

E[60]	Meaning
0b0	Event 60 is ignored.
0b1	Do not record samples that have event 60 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[59], bit [59]
When event 59 is implemented and filtering on event 59 is supported:

Filter on IMPLEMENTATION DEFINED event 59.

E[59]	Meaning
0b0	Event 59 is ignored.
0b1	Do not record samples that have event 59 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[58], bit [58]
When event 58 is implemented and filtering on event 58 is supported:

Filter on IMPLEMENTATION DEFINED event 58.

E[58]	Meaning
0b0	Event 58 is ignored.
0b1	Do not record samples that have event 58 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[57], bit [57]
When event 57 is implemented and filtering on event 57 is supported:

Filter on IMPLEMENTATION DEFINED event 57.

E[57]	Meaning
0b0	Event 57 is ignored.
0b1	Do not record samples that have event 57 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[56], bit [56]
When event 56 is implemented and filtering on event 56 is supported:

Filter on IMPLEMENTATION DEFINED event 56.

E[56]	Meaning
0b0	Event 56 is ignored.
0b1	Do not record samples that have event 56 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[55], bit [55]
When event 55 is implemented and filtering on event 55 is supported:

Filter on IMPLEMENTATION DEFINED event 55.

E[55]	Meaning
0b0	Event 55 is ignored.
0b1	Do not record samples that have event 55 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[54], bit [54]
When event 54 is implemented and filtering on event 54 is supported:

Filter on IMPLEMENTATION DEFINED event 54.

E[54]	Meaning
0b0	Event 54 is ignored.
0b1	Do not record samples that have event 54 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[53], bit [53]
When event 53 is implemented and filtering on event 53 is supported:

Filter on IMPLEMENTATION DEFINED event 53.

E[53]	Meaning
0b0	Event 53 is ignored.
0b1	Do not record samples that have event 53 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[52], bit [52]
When event 52 is implemented and filtering on event 52 is supported:

Filter on IMPLEMENTATION DEFINED event 52.

E[52]	Meaning
0b0	Event 52 is ignored.
0b1	Do not record samples that have event 52 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[51], bit [51]
When event 51 is implemented and filtering on event 51 is supported:

Filter on IMPLEMENTATION DEFINED event 51.

E[51]	Meaning
0b0	Event 51 is ignored.
0b1	Do not record samples that have event 51 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[50], bit [50]
When event 50 is implemented and filtering on event 50 is supported:

Filter on IMPLEMENTATION DEFINED event 50.

E[50]	Meaning
0b0	Event 50 is ignored.
0b1	Do not record samples that have event 50 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[49], bit [49]
When event 49 is implemented and filtering on event 49 is supported:

Filter on IMPLEMENTATION DEFINED event 49.

E[49]	Meaning
0b0	Event 49 is ignored.
0b1	Do not record samples that have event 49 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[48], bit [48]
When event 48 is implemented and filtering on event 48 is supported:

Filter on IMPLEMENTATION DEFINED event 48.

E[48]	Meaning
0b0	Event 48 is ignored.
0b1	Do not record samples that have event 48 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bits [47:32]

Reserved, RAZ/WI.

E[31], bit [31]
When FEAT_SPEv1p4 is not implemented, event 31 is implemented, and filtering on event 31 is supported:

Filter on IMPLEMENTATION DEFINED event 31.

E[31]	Meaning
0b0	Event 31 is ignored.
0b1	Do not record samples that have event 31 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[30], bit [30]
When FEAT_SPEv1p4 is not implemented, event 30 is implemented, and filtering on event 30 is supported:

Filter on IMPLEMENTATION DEFINED event 30.

E[30]	Meaning
0b0	Event 30 is ignored.
0b1	Do not record samples that have event 30 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[29], bit [29]
When FEAT_SPEv1p4 is not implemented, event 29 is implemented, and filtering on event 29 is supported:

Filter on IMPLEMENTATION DEFINED event 29.

E[29]	Meaning
0b0	Event 29 is ignored.
0b1	Do not record samples that have event 29 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[28], bit [28]
When FEAT_SPEv1p4 is not implemented, event 28 is implemented, and filtering on event 28 is supported:

Filter on IMPLEMENTATION DEFINED event 28.

E[28]	Meaning
0b0	Event 28 is ignored.
0b1	Do not record samples that have event 28 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[27], bit [27]
When FEAT_SPEv1p4 is not implemented, event 27 is implemented, and filtering on event 27 is supported:

Filter on IMPLEMENTATION DEFINED event 27.

E[27]	Meaning
0b0	Event 27 is ignored.
0b1	Do not record samples that have event 27 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[26], bit [26]
When FEAT_SPEv1p4 is not implemented, event 26 is implemented, and filtering on event 26 is supported:

Filter on IMPLEMENTATION DEFINED event 26.

E[26]	Meaning
0b0	Event 26 is ignored.
0b1	Do not record samples that have event 26 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[25], bit [25]
When (FEAT_SPE_SME is implemented or FEAT_SPEv1p5 is implemented) and event 25 is implemented:

Filter on Not SMCU or other shared resource operation event.

E[25]	Meaning
0b0	SMCU or other shared resource operation event is ignored.
0b1	Do not record samples that have the SMCU or other shared resource operation event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 25 is implemented, and filtering on event 25 is supported:

Filter on IMPLEMENTATION DEFINED event 25.

E[25]	Meaning
0b0	Event 25 is ignored.
0b1	Do not record samples that have event 25 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[24], bit [24]
When FEAT_SPE_SME is implemented:

Filter on Non-streaming SVE mode event.

E[24]	Meaning
0b0	Streaming SVE mode event is ignored.
0b1	Do not record samples that have the Streaming SVE mode event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When FEAT_SPEv1p4 is not implemented, event 24 is implemented, and filtering on event 24 is supported:

Filter on IMPLEMENTATION DEFINED event 24.

E[24]	Meaning
0b0	Event 24 is ignored.
0b1	Do not record samples that have event 24 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[23], bit [23]
When FEAT_SPEv1p4 is implemented and event 23 is implemented:

Filter on Data not snooped event.

E[23]	Meaning
0b0	Data snooped event is ignored.
0b1	Do not record samples that have the Data snooped event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[22], bit [22]
When FEAT_SPEv1p4 is implemented and event 22 is implemented:

Filter on Not recently fetched event.

E[22]	Meaning
0b0	Recently fetched event is ignored.
0b1	Do not record samples that have the Recently fetched event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[21], bit [21]
When FEAT_SPEv1p4 is implemented and event 21 is implemented:

Filter on Cache data not modified event.

E[21]	Meaning
0b0	Cache data modified event is ignored.
0b1	Do not record samples that have the Cache data modified event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[20], bit [20]
When FEAT_SPEv1p4 is implemented and event 20 is implemented:

Filter on Level 2 data cache hit event.

E[20]	Meaning
0b0	Level 2 data cache miss event is ignored.
0b1	Do not record samples that have the Level 2 data cache miss event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[19], bit [19]
When FEAT_SPEv1p4 is implemented and event 19 is implemented:

Filter on No level 2 data cache access event.

E[19]	Meaning
0b0	Level 2 data cache access event is ignored.
0b1	Do not record samples that have the Level 2 data cache access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[18], bit [18]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Not empty predicate event.

E[18]	Meaning
0b0	Empty predicate event is ignored.
0b1	Do not record samples that have the Empty predicate event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[17], bit [17]
When FEAT_SPEv1p1 is implemented and (FEAT_SVE is implemented or FEAT_SME is implemented):

Filter on Not partial predicate event.

E[17]	Meaning
0b0	Partial or empty predicate event is ignored.
0b1	Do not record samples that have the Partial or empty predicate event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [16]

Reserved, RAZ/WI.

E[15], bit [15]
When event 15 is implemented and filtering on event 15 is supported:

Filter on IMPLEMENTATION DEFINED event 15.

E[15]	Meaning
0b0	Event 15 is ignored.
0b1	Do not record samples that have event 15 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[14], bit [14]
When event 14 is implemented and filtering on event 14 is supported:

Filter on IMPLEMENTATION DEFINED event 14.

E[14]	Meaning
0b0	Event 14 is ignored.
0b1	Do not record samples that have event 14 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[13], bit [13]
When event 13 is implemented and filtering on event 13 is supported:

Filter on IMPLEMENTATION DEFINED event 13.

E[13]	Meaning
0b0	Event 13 is ignored.
0b1	Do not record samples that have event 13 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[12], bit [12]
When event 12 is implemented and filtering on event 12 is supported:

Filter on IMPLEMENTATION DEFINED event 12.

E[12]	Meaning
0b0	Event 12 is ignored.
0b1	Do not record samples that have event 12 == 1.

An IMPLEMENTATION DEFINED event might be recorded as a multi-bit field. In this case, the corresponding bits of PMSNEVFR_EL1 define an IMPLEMENTATION DEFINED filter for the event.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[11], bit [11]
When FEAT_SPEv1p1 is implemented:

Filter on Aligned event.

E[11]	Meaning
0b0	Misalignment event is ignored.
0b1	Do not record samples that have the Misalignment event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[10], bit [10]
When (FEAT_SPEv1p4 is implemented or filtering on event 10 is optionally supported) and event 10 is implemented:

Filter on No remote access event.

E[10]	Meaning
0b0	Remote access event is ignored.
0b1	Do not record samples that have the Remote access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[9], bit [9]
When (FEAT_SPEv1p4 is implemented or filtering on event 9 is optionally supported) and event 9 is implemented:

Filter on Last Level cache hit event.

E[9]	Meaning
0b0	Last Level cache miss event is ignored.
0b1	Do not record samples that have the Last Level cache miss event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[8], bit [8]
When (FEAT_SPEv1p4 is implemented or filtering on event 8 is optionally supported) and event 8 is implemented:

Filter on No Last Level cache access event.

E[8]	Meaning
0b0	Last Level cache access event is ignored.
0b1	Do not record samples that have the Last Level cache access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[7], bit [7]

Filter on Correctly predicted event.

E[7]	Meaning
0b0	Mispredicted event is ignored.
0b1	Do not record samples that have the Mispredicted event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[6], bit [6]
When FEAT_SPE_FnE is implemented:

Filter on Taken event.

E[6]	Meaning
0b0	Not taken event is ignored.
0b1	Do not record samples that have the Not taken event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[5], bit [5]

Filter on TLB hit event.

E[5]	Meaning
0b0	TLB walk event is ignored.
0b1	Do not record samples that have the TLB walk event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[4], bit [4]
When FEAT_SPEv1p4 is implemented or filtering on event 4 is optionally supported:

Filter on No TLB access event.

E[4]	Meaning
0b0	TLB access event is ignored.
0b1	Do not record samples that have the TLB access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[3], bit [3]

Filter on Level 1 data cache hit event.

E[3]	Meaning
0b0	Level 1 data cache refill or miss event is ignored.
0b1	Do not record samples that have the Level 1 data cache refill or miss event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E[2], bit [2]
When FEAT_SPEv1p4 is implemented or filtering on event 2 is optionally supported:

Filter on No Level 1 data cache access event.

E[2]	Meaning
0b0	Level 1 data cache access event is ignored.
0b1	Do not record samples that have the Level 1 data cache access event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

E[1], bit [1]
When the PE supports sampling of speculative instructions:

Filter on Speculative event.

E[1]	Meaning
0b0	Architecturally retired event is ignored.
0b1	Do not record samples that have the Architecturally retired event == 1.

This field is ignored by the PE when PMSFCR_EL1.FnE is 0.

If the PE does not support the sampling of speculative instructions, or always discards the sample record for speculative instructions, this bit reads as an UNKNOWN value and the PE ignores its value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAZ/WI.

Bit [0]

Reserved, RAZ/WI.

PMSSCR_EL1, Performance Monitors Snapshot Status and Capture Register

The PMSSCR_EL1 characteristics are:

Purpose

Holds status information about the captured counters and provides a mechanism for software to initiate a sample.

Configuration

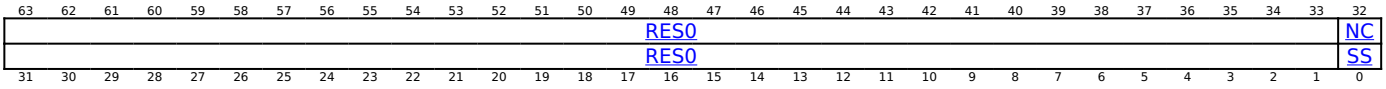
AArch64 System register PMSSCR_EL1 bits [63:0] are architecturally mapped to External register PMSSCR_EL1[63:0].

This register is present only when FEAT_PMUv3_SS is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMSSCR_EL1 are UNDEFINED.

Attributes

PMSSCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

NC, bit [32]

No Capture. Indicates whether the PMU counters have been captured.

NC	Meaning
0b0	PMU counters captured.
0b1	PMU counters not captured.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Bits [31:1]

Reserved, RES0.

SS, bit [0]

Snapshot Capture and Status.

SS	Meaning
0b0	On a read, the Capture event has completed.
0b1	On a read, the Capture event has not completed. On a write, request a Capture event.

A write of 0 to this field is ignored.

It is CONSTRAINED UNPREDICTABLE whether a Capture event has completed if this field is modified when the Capture event is ongoing.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Accessing this field has the following behavior:

- When PMU capture events are disabled, access to this field is RO.

- Otherwise, access to this field is RW.

Accessing PMSSCR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMSSCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1101	0b011

PMSWINC_EL0, Performance Monitors Software Increment Register

The PMSWINC_EL0 characteristics are:

Purpose

Increments a counter that is configured to count the Software increment event, event 0x00. For more information, see 'SW_INCR'.

Configuration

AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMSWINC[31:0].

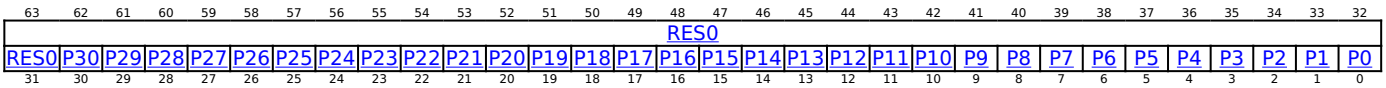
AArch64 System register PMSWINC_EL0 bits [31:0] are architecturally mapped to External register PMSWINC_EL0[31:0] when FEAT_PMUv3_EXT32 is implemented and FEAT_PMUv3p9 is not implemented.

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMSWINC_EL0 are UNDEFINED.

Attributes

PMSWINC_EL0 is a 64-bit register.

Field descriptions



Bits [63:31]

Reserved, RES0.

P<m>, bit [m], for m = 30 to 0

Software increment.

P<m>	Meaning
0b0	Write is ignored.
0b1	Increment PMEVCNTR<m>_EL0, if PMEVCNTR<m>_EL0 is configured to count software increment events.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,SW] == '10'.
  - PMUACR_EL1.P<m> == '0'.
- Otherwise, access to this field is WO/RAZ.

Accessing PMSWINC_EL0

Accesses to this register use the following encodings in the System register encoding space:

MSR PMSWINC_EL0, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b011	0b1001	0b1100	0b100

```

PMUACR_EL1, Performance Monitors User Access Control Register

The PMUACR_EL1 characteristics are:

Purpose

Enables or disables EL0 access to specfic Performance Monitors.

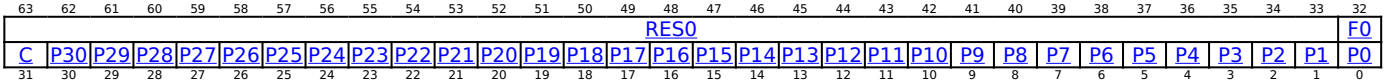
Configuration

This register is present only when FEAT_PMUv3p9 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMUACR_EL1 are UNDEFINED.

Attributes

PMUACR_EL1 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

EL0 accesses to PMICNTR_EL0 enable. With PMUSERENR_EL0.UEN and PMUSERENR_EL0.IR, controls EL0 accesses to PMICNTR_EL0.

F0	Meaning
0b0	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMICNTR_EL0 and associated controls are RAZ/WI, and permitted EL0 writes to PMZR_EL0.F0 are ignored.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMICNTR_EL0 and associated controls are either read-only or read/write, depending on the value of PMUSERENR_EL0.IR.

The controls associated with PMICNTR_EL0 that are accessible at EL0 are PMCNTENSET_EL0.F0, PMCNTENCLR_EL0.F0, PMOVSSET_EL0.F0, and PMOVSCLR_EL0.F0.

This field is ignored by the PE when any of the following are true:

- EL1 is using AArch32.
- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

C, bit [31]

EL0 accesses to PMCCNTR_EL0 enable. With PMUSERENR_EL0.EN, PMUSERENR_EL0.UEN, and PMUSERENR_EL0.CR, controls EL0 accesses to PMCCNTR_EL0.

C	Meaning
0b0	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMCCNTR_EL0 and associated controls are RAZ/WI, and permitted EL0 writes to PMZR_EL0.C are ignored.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMCCNTR_EL0 and associated controls are either read-only or read/write, depending on the value of PMUSERENR_EL0.CR.

The controls associated with PMCCNTR_EL0 that are accessible at EL0 are PMCNTENSET_EL0.C, PMCNTENCLR_EL0.C, PMOVSSET_EL0.C, and PMOVSCLR_EL0.C.

This field is ignored by the PE when any of the following are true:

- EL1 is using AArch32.
- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P<m>, bit [m], for m = 30 to 0

EL0 accesses to PMEVCNTR<m>_EL0 enable. With PMUSERENR_EL0.EN, PMUSERENR_EL0.UEN, and PMUSERENR_EL0.ER, controls EL0 accesses to PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMEVCNTR<m>_EL0 and associated controls are RAZ/WI, and permitted EL0 writes to PMZR_EL0.P<m> are ignored.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then EL0 accesses to PMEVCNTR<m>_EL0 and associated controls are either read-only or read/write, depending on the value of PMUSERENR_EL0.ER.

The controls associated with PMEVCNTR<m>_EL0 that are accessible at EL0 are PMCNTENSET_EL0.P<m>, PMCNTENCLR_EL0.P<m>, PMOVSSET_EL0.P<m>, and PMOVSCLR_EL0.P<m>.

This field is ignored by the PE when any of the following are true:

- EL1 is using AArch32.
- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Otherwise, access to this field is RW.

Accessing PMUACR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMUACR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1001	0b1110	0b100

PMUSERENR_EL0, Performance Monitors User Enable Register

The PMUSERENR_EL0 characteristics are:

Purpose

Enables or disables EL0 access to the Performance Monitors.

Configuration

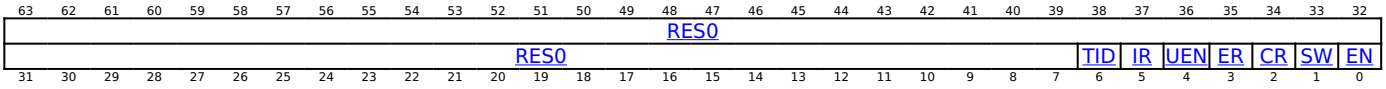
AArch64 System register PMUSERENR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMUSERENR[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMUSERENR_EL0 are UNDEFINED.

Attributes

PMUSERENR_EL0 is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TID, bit [6]
When FEAT_PMUv3p9 is implemented:

Trap ID registers. Traps EL0 read access to common event identification registers.

TID	Meaning
0b0	Accesses to PMCEID<n>_EL0 and PMCEID<n> are not trapped by this mechanism.
0b1	EL0 read accesses to PMCEID<n>_EL0 and PMCEID<n> are trapped.

In AArch64 state, the register accesses affected by this control are:

- MRS reads of PMCEID0_EL0 and PMCEID1_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC reads of PMCEID0, PMCEID1, PMCEID2, and PMCEID3.

When trapped, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IR, bit [5]
When FEAT_PMUv3_ICNTR is implemented:

Instruction counter Read-only. When PMUSERENR_EL0.UEN is 1, controls whether EL0 writes to instruction counter are ignored.

IR	Meaning
0b0	EL0 accesses are not affected by this mechanism.
0b1	If the Effective value of PMUSERENR_EL0.UEN is 1, then all of the following apply at EL0: • Writes to PMICNTR_EL0 are ignored. • The controls associated with instruction counter are RAZ/WI. • Writes to PMZR_EL0.F0 are ignored.

The controls associated with PMICNTR_EL0 that are accessible at EL0 are PMCNTENSET_EL0.F0, PMCNTENCLR_EL0.F0, PMOVSSET_EL0.F0, and PMOVSCLR_EL0.F0.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when any of the following are true:

- PMUSERENR_EL0.UEN is 0.
- The access generates an exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UEN, bit [4]
When FEAT_PMUv3p9 is implemented:

User Enable, with access controlled by PMUACR_EL1. Enables EL0 read/write access to PMU registers, other than PMCR_EL0.

UEN	Meaning
0b0	If FEAT_PMUv3_ICNTR is implemented, then EL0 accesses to PMICFILTR_EL0 and PMICNTR_EL0 are trapped. EL0 accesses to the other specified PMU registers, PMCR_EL0, and PMCR are trapped, unless enabled by PMUSERENR_EL0.{ER,CR,SW,EN}.
0b1	EL0 accesses to the specified PMU registers are enabled, unless trapped by another control. The behavior of permitted accesses is controlled by PMUSERENR_EL0.{ IR, ER,CR,SW} and PMUACR_EL1. EL0 accesses to PMCR_EL0 and PMCR are trapped.

In AArch64 state, the register accesses affected by this control are:

- MRS or MSR accesses to the following registers:
  - PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
  - If FEAT_PMUv3_ICNTR is implemented, PMICFILTR_EL0 and PMICNTR_EL0.
- MRS reads of PMCEID0_EL0 and PMCEID1_EL0.
- MSR writes to PMSWINC_EL0 and PMZR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC or MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMEVCNTR<n>, PMEVTYPER<n>, PMOVSR, PMOVSSET, PMSELR, PMXEVCNTR, and PMXEVTYPER.
- MRC reads of PMCEID0, PMCEID1, PMCEID2, and PMCEID3.
- MCR writes to PMSWINC.
- MRRC or MCRR accesses to PMCCNTR.

When trapped, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.
- AArch32 MRRC and MCRR accesses are reported using EC syndrome value 0x04.

This field is ignored by the PE and treated as zero when EL1 is using AArch32.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ER, bit [3]
When FEAT_PMUv3p9 is implemented:

Event counters Read enable or Read-only.

When PMUSERENR_EL0.{UEN,EN} is {0,0}, PMUSERENR_EL0.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

When PMUSERENR_EL0.UEN is 1, EL0 reads of the event counters and EL0 writes to PMZR_EL0 are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.ER controls the behavior of EL0 writes to the event counters and PMZR_EL0.

ER	Meaning
0b0	When PMUSERENR_EL0.UEN == 0, EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0, EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes to the event counters and PMZR_EL0.P[30:0] are ignored.

In AArch64 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}:
  - MRS reads of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
  - MRS and MSR accesses to PMSELR_EL0.
- When PMUSERENR_EL0.UEN is 1, MSR writes to PMZR_EL0.P<n>, PMEVCNTR<n>_EL0, and PMXEVCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}:
  - MRC reads of PMEVCNTR<n> and PMXEVCNTR.
  - MRC and MCR accesses to PMSELR.
- When PMUSERENR_EL0.UEN is 1, MCR writes to PMEVCNTR<n> and PMXEVCNTR.

When disabled, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when PMUSERENR_EL0.{UEN,EN} == {0,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Event counters Read enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.ER enables EL0 reads of the event counters and EL0 reads and writes of the select register.

ER	Meaning
0b0	EL0 reads of the event counters and EL0 reads and writes of the select register are disabled, unless enabled by PMUSERENR_EL0.EN.
0b1	EL0 reads of the event counters and EL0 reads and writes of the select register are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MRS reads of PMEVCNTR<n>_EL0 and PMXEVCNTR_EL0.
- MRS and MSR accesses to PMSELR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC reads of PMEVCNTR<n> and PMXEVCNTR.
- MRC and MCR accesses to PMSELR.

When disabled, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

CR, bit [2]
When FEAT_PMUv3p9 is implemented:

Cycle counter Read enable or Read-only.

When PMUSERENR_EL0.{UEN,EN} is {0,0}, PMUSERENR_EL0.CR enables EL0 reads of the cycle counter.

When PMUSERENR_EL0.UEN is 1, EL0 reads of the cycle counter and EL0 writes to PMZR_EL0 are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.CR controls the behavior of EL0 writes to the cycle counter and PMZR_EL0.

CR	Meaning
0b0	When PMUSERENR_EL0.UEN == 0, EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0, EL0 reads of the cycle counter are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes to the cycle counter and PMZR_EL0.C are ignored.

In AArch64 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}, MRS reads of PMCCNTR_EL0.
- When PMUSERENR_EL0.UEN is 1, MSR writes to PMZR_EL0.C and PMCCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- When PMUSERENR_EL0.{UEN,EN} is {0,0}:
  - MRC reads of PMCCNTR.
  - MRRC reads of PMCCNTR.
- When PMUSERENR_EL0.UEN is 1:
  - MCR writes to PMCCNTR.
  - MCRR writes to PMCCNTR.

When disabled, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.

- AArch32 MRRC reads are reported using EC syndrome value 0x04.

Ignored writes are not trapped and do not generate an exception.

This field is ignored by the PE when PMUSERENR_EL0.{UEN,EN} == {0,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Cycle counter Read enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.CR enables EL0 reads of the cycle counter.

CR	Meaning
0b0	EL0 reads of the cycle counter are disabled, unless enabled by PMUSERENR_EL0.EN.
0b1	EL0 reads of the cycle counter are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MRS reads of PMCCNTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC reads of PMCCNTR.
- MRRC reads of PMCCNTR.

When disabled, reads generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS reads are reported using EC syndrome value 0x18.
- AArch32 MRC reads are reported using EC syndrome value 0x03.
- AArch32 MRRC reads are reported using EC syndrome value 0x04.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SW, bit [1]
When FEAT_PMUv3p9 is implemented:

Software increment register Write enable.

When PMUSERENR_EL0.UEN is 0, PMUSERENR_EL0.SW enables EL0 writes to the Software increment register.

When PMUSERENR_EL0.UEN is 1, EL0 writes to the Software increment register are enabled by PMUSERENR_EL0.UEN, unless trapped by another control, and PMUSERENR_EL0.SW controls the behavior of EL0 writes to the Software increment register.

SW	Meaning
0b0	When PMUSERENR_EL0.UEN == 0, EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR_EL0.EN. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes are not affected by this mechanism.
0b1	When PMUSERENR_EL0.UEN == 0, EL0 writes to the Software increment register are enabled, unless trapped by another control. When PMUSERENR_EL0.UEN == 1, permitted EL0 writes to the Software increment register ignore the value of PMUACR_EL1.

In AArch64 state, the register accesses affected by this control are:

- MSR writes to PMSWINC_EL0.

In AArch32 state, the register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MSR writes are reported using EC syndrome value 0x18.
- AArch32 MCR writes are reported using EC syndrome value 0x03.

This field is ignored by the PE when PMUSERENR_EL0.{UEN,EN} == {0,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Software increment register Write enable.

When PMUSERENR_EL0.EN is 0, PMUSERENR_EL0.SW enables EL0 writes to the Software increment register.

SW	Meaning
0b0	EL0 writes to the Software increment register are disabled, unless enabled by PMUSERENR_EL0.EN.
0b1	EL0 writes to the Software increment register are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MSR writes to PMSWINC_EL0.

In AArch32 state, the register accesses affected by this control are:

- MCR writes to PMSWINC.

When disabled, writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MSR writes are reported using EC syndrome value 0x18.
- AArch32 MCR writes are reported using EC syndrome value 0x03.

This field is ignored by the PE when PMUSERENR_EL0.EN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

EN, bit [0]

Enable.

Enables EL0 read/write access to PMU registers, other than the instruction counter.

EN	Meaning
0b0	EL0 accesses to the specified PMU System registers are trapped, unless enabled by PMUSERENR_EL0.{UEN,ER,CR,SW}.
0b1	EL0 accesses to the specified PMU System registers are enabled, unless trapped by another control.

In AArch64 state, the register accesses affected by this control are:

- MRS or MSR accesses to PMCCFILTR_EL0, PMCCNTR_EL0, PMCNTENCLR_EL0, PMCNTENSET_EL0, PMCR_EL0, PMEVCNTR<n>_EL0, PMEVTYPER<n>_EL0, PMOVSCLR_EL0, PMOVSSET_EL0, PMSELR_EL0, PMXEVCNTR_EL0, and PMXEVTYPER_EL0.
- MRS reads of PMCEID0_EL0 and PMCEID1_EL0.
- MSR writes to the following registers:
  - PMSWINC_EL0.
  - If FEAT_PMUv3p9 is implemented, PMZR_EL0.

Note

When FEAT_PMUv3_ICNTR is implemented, this field does not affect MRS and MSR accesses to PMICNTR_EL0 and PMICFILTR_EL0.

In AArch32 state, the register accesses affected by this control are:

- MRC or MCR accesses to PMCCFILTR, PMCCNTR, PMCNTENCLR, PMCNTENSET, PMCR, PMEVCNTR<n>, PMEVTYPER<n>, PMOVSR, PMOVSSET, PMSELR, PMXEVCNTR, and PMXEVTYPER.
- MRC reads of the following registers:
  - PMCEID0 and PMCEID1.
  - If FEAT_PMUv3p1 is implemented, PMCEID2 and PMCEID3.
- MCR writes to PMSWINC.
- MRRC or MCRR accesses to PMCCNTR.

When trapped, reads and writes generate an exception to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, and:

- AArch64 MRS and MSR accesses are reported using EC syndrome value 0x18.
- AArch32 MRC and MCR accesses are reported using EC syndrome value 0x03.
- AArch32 MRRC and MCRR accesses are reported using EC syndrome value 0x04.

This field is ignored by the PE when FEAT_PMUv3p9 is implemented and PMUSERENR_EL0.UEN == 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMUSERENR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMUSERENR_EL0

PMXEVCNTR_EL0, Performance Monitors Selected Event Count Register

The PMXEVCNTR_EL0 characteristics are:

Purpose

Reads or writes the value of the selected event counter, PMEVCNTR<n>_EL0. PMSELR_EL0.SEL determines which event counter is selected.

Configuration

AArch64 System register PMXEVCNTR_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVCNTR[31:0].

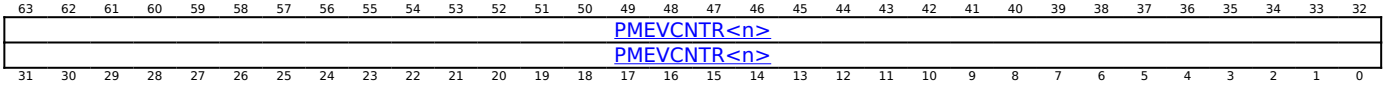
This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMXEVCNTR_EL0 are UNDEFINED.

Attributes

PMXEVCNTR_EL0 is a 64-bit register.

Field descriptions

When FEAT_PMUv3p5 is implemented:



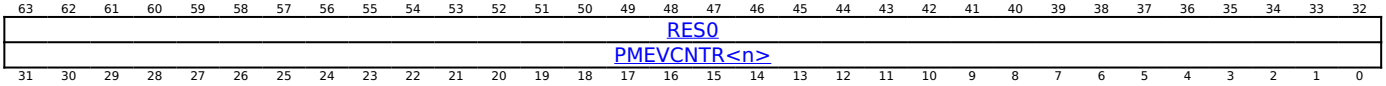
PMEVCNTR<n>, bits [63:0]

Value of the selected event counter, PMEVCNTR<n>_EL0, where n is the value stored in PMSELR_EL0.SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:32]

Reserved, RES0.

PMEVCNTR<n>, bits [31:0]

Value of the selected event counter, PMEVCNTR<n>_EL0, where n is the value stored in PMSELR_EL0.SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVCNTR_EL0

If FEAT_FGT is implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVCNTR_EL0 is as follows:

- If PMSELR_EL0.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented and PMSELR_EL0.SEL is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVCNTR_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of counters accessible at the current Exception level and Security state.
- If EL2 is implemented and enabled in the current Security state, and PMSELR_EL0.SEL is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVCNTR_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- PMUACR_EL1.P<UInt(PMSELR_EL0.SEL)> == 0.

Permitted writes of PMXEVCNTR_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.{UEN,ER} == {1,1}.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,ER,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVCNTR_EL0

```

PMXEVTYPER_EL0, Performance Monitors Selected Event Type Register

The PMXEVTYPER_EL0 characteristics are:

Purpose

When PMSELR_EL0.SEL selects an event counter, this accesses a PMEVTYPER<n>_EL0 register. When PMSELR_EL0.SEL selects the cycle counter, this accesses PMCCFILTR_EL0.

Configuration

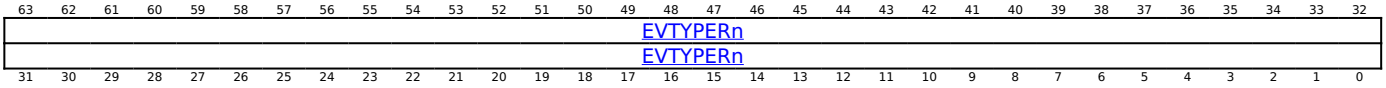
AArch64 System register PMXEVTYPER_EL0 bits [31:0] are architecturally mapped to AArch32 System register PMXEVTYPER[31:0].

This register is present only when FEAT_PMUv3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMXEVTYPER_EL0 are UNDEFINED.

Attributes

PMXEVTYPER_EL0 is a 64-bit register.

Field descriptions



EVTYPERn, bits [63:0]

When PMSELR_EL0.SEL == 31, this register accesses PMCCFILTR_EL0.

Otherwise, this register accesses PMEVTYPER<n>_EL0 where n is the value in PMSELR_EL0.SEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing PMXEVTYPER_EL0

If FEAT_FGT is implemented, and PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible event counters, then the behavior of permitted reads and writes of PMXEVTYPER_EL0 is as follows:

- If PMSELR_EL0.SEL is greater than or equal to the Effective value of PMCCR.EPMN, the access is UNDEFINED.
- Otherwise, the access is trapped to EL2.

If FEAT_FGT is not implemented, and PMSELR_EL0.SEL is not 31 and is greater than or equal to the number of accessible event counters, then reads and writes of PMXEVTYPER_EL0 are CONSTRAINED UNPREDICTABLE, and the following behaviors are permitted:

- Accesses to the register are UNDEFINED.
- Accesses to the register behave as RAZ/WI.
- Accesses to the register execute as a NOP.
- Accesses to the register behave as if PMSELR_EL0.SEL has an UNKNOWN value less than the number of event counters accessible at the current Exception level and Security state.
- Accesses to the register behave as if PMSELR_EL0.SEL is 31.
- If EL2 is implemented and enabled in the current Security state, PMSELR_EL0 is less than the number of implemented event counters, accesses from EL1 or permitted accesses from EL0 are trapped to EL2.

Permitted reads and writes of PMXEVTYPER_EL0 are RAZ/WI if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
  - PMSELR_EL0.SEL != 31 and PMUACR_EL1.P<UInt(PMSELR_EL0.SEL)> == 0.
  - PMSELR_EL0.SEL == 31 and PMUACR_EL1.C == 0.

Permitted writes of PMXEVTYPER_EL0 are ignored if all of the following are true:

- FEAT_PMUv3p9 is implemented.
- PSTATE.EL == EL0.
- PMUSERENR_EL0.UEN == 1.
- Any of the following are true:
  - PMSELR_EL0.SEL != 31 and PMUSERENR_EL0.ER == 1.
  - PMSELR_EL0.SEL == 31 and PMUSERENR_EL0.CR == 1.

Note

In EL0, an access is permitted if it is enabled by PMUSERENR_EL0.{UEN,EN}.

If EL2 is implemented and enabled in the current Security state, in EL1 and EL0, MDCR_EL2.HPMN identifies the number of accessible event counters.

Otherwise, the number of accessible event counters is determined by the Effective value of PMCCR.EPMN. For more information, see MDCR_EL2.HPMN and PMCCR.EPMN.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, PMXEVTYPER_EL0

op0	op1	CRn	CRm	op2

PMZR_EL0, Performance Monitors Zero with Mask

The PMZR_EL0 characteristics are:

Purpose

Zero the set of counters specified by the mask written to PMZR_EL0.

Configuration

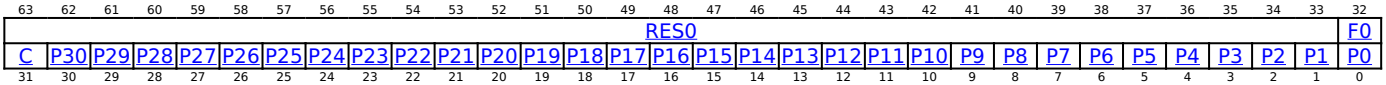
AArch64 System register PMZR_EL0 bits [63:0] are architecturally mapped to External register PMZR_EL0[63:0] when FEAT_PMUv3_EXT is implemented and FEAT_PMUv3p9 is implemented.

This register is present only when FEAT_PMUv3p9 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to PMZR_EL0 are UNDEFINED.

Attributes

PMZR_EL0 is a 64-bit register.

Field descriptions



Bits [63:33]

Reserved, RES0.

F0, bit [32]
When FEAT_PMUv3_ICNTR is implemented:

Zero PMICNTR_EL0.

F0	Meaning
0b0	Write is ignored.
0b1	Set PMICNTR_EL0 to zero.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - EL3 is implemented.
  - PSTATE.EL != EL3.
  - MDCR_EL3.EnPM2 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '0' or PMUACR_EL1.F0 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_FGT2 is implemented.
  - EL2Enabled().
  - PSTATE.EL IN {EL1, EL0}.
  - HCR_EL2.[E2H,TGE] != '11'.
  - (EL3 is implemented and SCR_EL3.FGTEn2 == '0') or HDFGWTR2_EL2.nPMICNTR_EL0 == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.IR == '1'.
- Otherwise, access to this field is WO/RAZ.

Otherwise:

Reserved, RES0.

C, bit [31]

Zero PMCCNTR_EL0.

C	Meaning
0b0	Write is ignored.
0b1	Set PMCCNTR_EL0 to zero.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.C == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,CR] == '11'.
- Otherwise, access to this field is WO/RAZ.

P<m>, bit [m], for m = 30 to 0

Zero PMEVCNTR<m>_EL0.

P<m>	Meaning
0b0	Write is ignored.
0b1	Set PMEVCNTR<m>_EL0 to zero.

Accessing this field has the following behavior:

- When m >= GetNumEventCountersAccessible(), access to this field is RAZ/WI.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.UEN == '1'.
  - PMUACR_EL1.P<m> == '0'.
- Access to this field is RAZ/WI if all the following are true:
  - FEAT_PMUv3p9 is implemented.
  - PSTATE.EL == EL0.
  - PMUSERENR_EL0.[UEN,ER] == '11'.
- Otherwise, access to this field is WO/RAZ.

Accessing PMZR_EL0

Accesses to this register use the following encodings in the System register encoding space:

POR_EL0, Permission Overlay Register 0 (EL0)

The POR_EL0 characteristics are:

Purpose

Stage 1 Permission Overlay Register for unprivileged access of EL1&0 or EL2&0 translation regime.

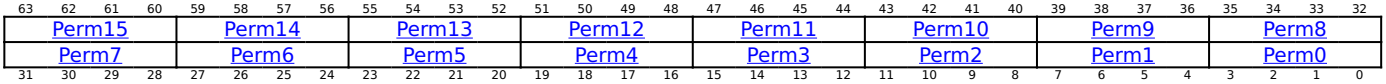
Configuration

This register is present only when FEAT_S1POE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to POR_EL0 are UNDEFINED.

Attributes

POR_EL0 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

If FEAT_D128 is implemented and VMSAv9-128 is in use, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

If FEAT_S1POE2 is implemented and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and TCR2_EL2.POE2F is 1, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

If FEAT_S1POE2 is implemented and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and TCR2_EL1.POE2F is 1, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

Otherwise, the fields Perm[8] to Perm[15] are RES0.

This field is not permitted to be cached in a TLB.

When the stage 1 Overlay mechanism is disabled, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL0

Accesses to this register use the following encodings in the System register encoding space:

POR_EL1, Permission Overlay Register 1 (EL1)

The POR_EL1 characteristics are:

Purpose

Stage 1 Permission Overlay Register for privileged access of the EL1&0 translation regime.

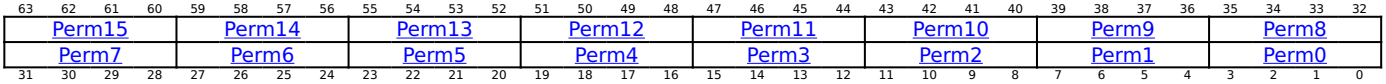
Configuration

This register is present only when FEAT_S1POE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to POR_EL1 are UNDEFINED.

Attributes

POR_EL1 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

If FEAT_D128 is implemented and VMSAv9-128 is in use, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

If FEAT_S1POE2 is implemented and TCR2_EL1.POE2F is 1, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

Otherwise, the fields Perm[8] to Perm[15] are RES0.

This field is not permitted to be cached in a TLB.

When the stage 1 Overlay mechanism is disabled, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name POR_EL1 or POR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL1

POR_EL2, Permission Overlay Register 2 (EL2)

The POR_EL2 characteristics are:

Purpose

Stage 1 Permission Overlay Register for privileged access of the EL2 or EL2&0 translation regime.

Configuration

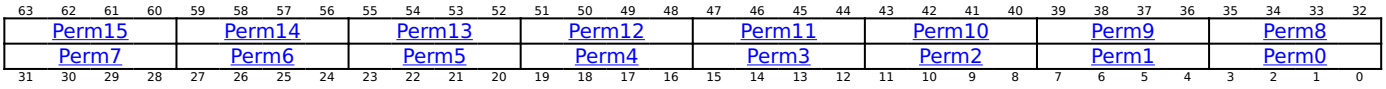
This register is present only when FEAT_S1POE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to POR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

POR_EL2 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

If FEAT_D128 is implemented and VMSAv9-128 is in use, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

If FEAT_S1POE2 is implemented and TCR2_EL2.POE2F is 1, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

Otherwise, the fields Perm[8] to Perm[15] are RES0.

This field is not permitted to be cached in a TLB.

When the stage 1 Overlay mechanism is disabled, this field is IGNORED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name POR_EL2 or POR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

POR_EL3, Permission Overlay Register 3 (EL3)

The POR_EL3 characteristics are:

Purpose

Stage 1 Permission Overlay Register for privileged access of the EL3 translation regime.

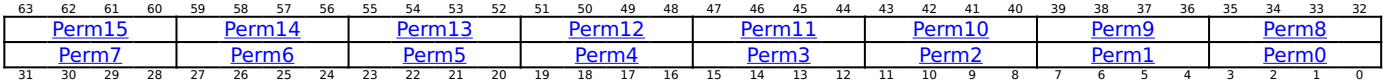
Configuration

This register is present only when FEAT_S1POE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to POR_EL3 are UNDEFINED.

Attributes

POR_EL3 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Perm Represents stage 1 Overlay Permissions.

Perm<m>	Meaning
0b0000	No access.
0b0001	Read.
0b0010	Execute.
0b0011	Read, Execute.
0b0100	Write.
0b0101	Write, Read.
0b0110	Write, Execute.
0b0111	Read, Write, Execute.
0b1xxx	Reserved - treated as No access

If FEAT_D128 is implemented and VMSAv9-128 is in use, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

If FEAT_S1POE2 is implemented and TCR_EL3.POE2F is 1, then fields Perm[8] to Perm[15] are used for POIndex values 8 to 15.

Otherwise, the fields Perm[8] to Perm[15] are RES0.

This field is not permitted to be cached in a TLB.

When stage 1 Overlay mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing POR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, POR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b1010	0b0010	0b100

RCWMASK_EL1, Read Check Write Instruction Mask (EL1)

The RCWMASK_EL1 characteristics are:

Purpose

Contains the mask used by RCW instructions.

Configuration

This register is present only when FEAT_THE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RCWMASK_EL1 are UNDEFINED.

RCWMASK_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

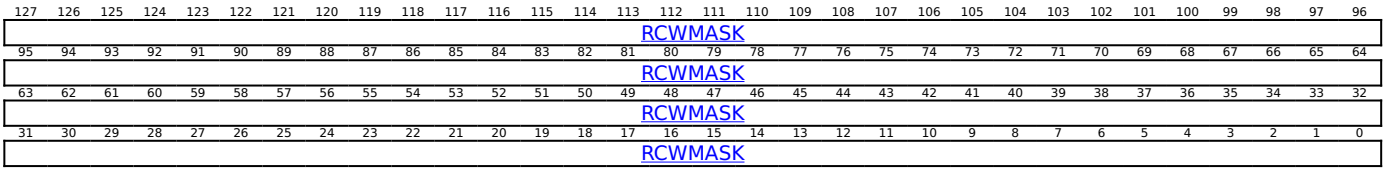
Attributes

RCWMASK_EL1 is a:

- 128-bit register when FEAT_D128 is implemented
- 64-bit register otherwise

Field descriptions

When FEAT_D128 is implemented:



RCWMASK, bits [127:0]

Mask used to decide which bit-fields are writable to the 128-bit Descriptor by RCW or RCWS instructions.

If RCWMASK_EL1 is indirectly read by 128-bit variants of RCW or RCWS instructions:

- The Effective value of RCWMASK[n] is the same as RCWMASK_EL1[n], except as follows:
  - If n >= 17, and n <= 55, the Effective value of RCWMASK[n] is the same as RCWMASK_EL1[16].
  - If n is in {126:125, 120:119, 114, 107:101, 90:56, 1:0}, the Effective value of RCWMASK[n] is 0.
  - If n >= 121, n <= 124, and FEAT_S1POE is not implemented, the Effective value of RCWMASK[n] is 0.
  - If FEAT_MEC is not implemented, the Effective value of RCWMASK[108] is 0.

If RCWMASK_EL1 is indirectly read by 64-bit variants of RCW or RCWS instructions:

- The Effective value of RCWMASK[n] is the same as RCWMASK_EL1[n], except as follows:
  - If n >= 18, and n <= 49, the Effective value of RCWMASK[n] is the same as RCWMASK_EL1[17].

RCWMASK_EL1 register bits {126:125, 120:119, 114, 107:101, 90:64, 52, 49:18, 0} are RES0.

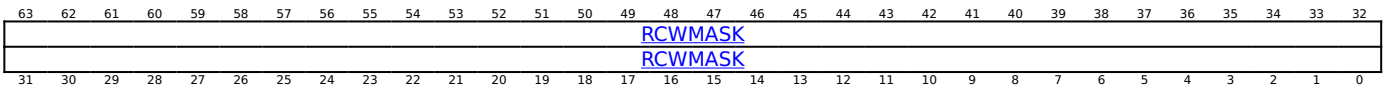
If FEAT_S1POE is not implemented, RCWMASK_EL1 register bits {124:121} are RES0.

If FEAT_MEC is not implemented, RCWMASK_EL1[108] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



RCWMASK, bits [63:0]

Mask used to decide which bit-fields are writable to the 64-bit Descriptor by RCW or RCWS Instructions.

The Effective value of RCWMASK[n] is the same as RCWMASK_EL1[n], except as follows:

- If n >= 18, and n <= 49, the Effective value of RCWMASK[n] is the same as RCWMASK_EL1[17].

RCWMASK_EL1 register bits {52, 49:18, 0} are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RCWSMASK_EL1, Software Read Check Write Instruction Mask (EL1)

The RCWSMASK_EL1 characteristics are:

Purpose

Contains the software mask used by RCWS instructions.

Configuration

This register is present only when FEAT_THE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RCWSMASK_EL1 are UNDEFINED.

RCWSMASK_EL1 is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

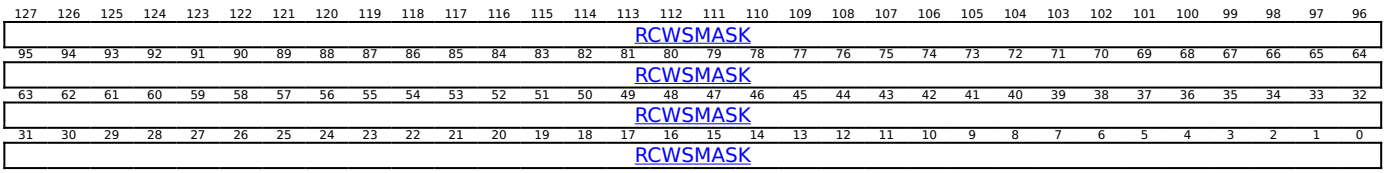
Attributes

RCWSMASK_EL1 is a:

- 128-bit register when FEAT_D128 is implemented
- 64-bit register otherwise

Field descriptions

When FEAT_D128 is implemented:



RCWSMASK, bits [127:0]

Software Mask used to decide which bit-fields are writable to the 128-bit Descriptor by RCWS instructions.

If RCWSMASK_EL1 is indirectly read by 128-bit variants of RCWS instructions:

- The Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[n], except as follows:
  - If n >= 17, and n <= 55, the Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[16].
  - If n is in {126:125, 120:119, 114, 107:101, 90:56, 1:0}, the Effective value of RCWSMASK[n] is 0.
  - If n >= 121, n <= 124, and FEAT_S1POE is not implemented, the Effective value of RCWSMASK[n] is 0.
  - If FEAT_MEC is not implemented, the Effective value of RCWSMASK bit RCWSMASK_EL1[108] is 0.

If RCWSMASK_EL1 is indirectly read by 64-bit variants of RCWS instructions:

- The Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[n], except as follows:
  - If n >= 18, and n <= 49, the Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[17].
  - If n == 52 and Protection is enabled, the Effective value of RCWSMASK[52] is 0.

RCWSMASK_EL1 register bits {126:125, 120:119, 114, 107:101, 90:64, 49:18, 0} are RES0.

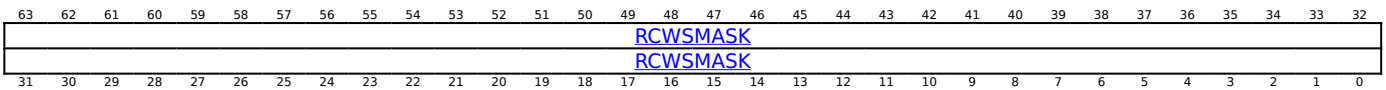
If FEAT_S1POE is not implemented, RCWSMASK_EL1 register bits {124:121} are RES0.

If FEAT_MEC is not implemented, RCWSMASK_EL1[108] is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



RCWSMASK, bits [63:0]

Software Mask used to decide which bit-fields are writable to the 64-bit Descriptor by RCWS Instruction.

The Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[n], except as follows

- If n >= 18, and n <= 49, the Effective value of RCWSMASK[n] is the same as RCWSMASK_EL1[17].
- If n == 52 and Protection is enabled, the Effective value of RCWSMASK[52] is 0.

RCWSMASK_EL1 register bits {49:18, 0} are RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

REVIDR_EL1, Revision ID Register

The REVIDR_EL1 characteristics are:

Purpose

Provides implementation-specific minor revision information.

Configuration

AArch64 System register REVIDR_EL1 bits [31:0] are architecturally mapped to AArch32 System register REVIDR[31:0].

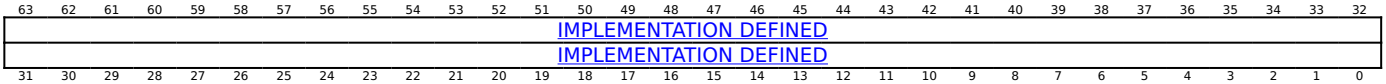
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to REVIDR_EL1 are UNDEFINED.

If REVIDR_EL1 has the same value as MIDR_EL1, then its contents have no significance.

Attributes

REVIDR_EL1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing REVIDR_EL1

RGSR_EL1, Random Allocation Tag Seed Register.

The RGSR_EL1 characteristics are:

Purpose

Random Allocation Tag Seed Register.

Configuration

This register is present only when FEAT_MTE2 is implemented or FEAT_VMTE is implemented. Otherwise, direct accesses to RGSR_EL1 are UNDEFINED.

When GCR_EL1.RRND==0b1, updates to RGSR_EL1 are implementation-specific.

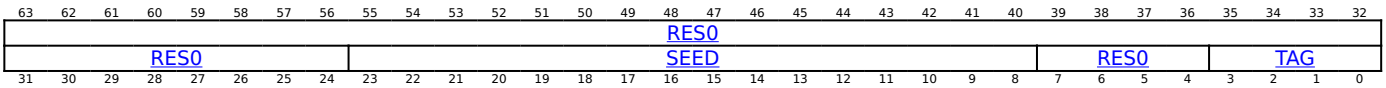
Direct and indirect reads and writes to the register appear to occur in program order relative to other instructions, without the need for any explicit synchronization.

Attributes

RGSR_EL1 is a 64-bit register.

Field descriptions

When GCR_EL1.RRND == '0':



Bits [63:24]

Reserved, RES0.

SEED, bits [23:8]

Seed register used for generating values returned by RandomTag() or, if FEAT_MTE_EIRG is implemented, ChooseTag()

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

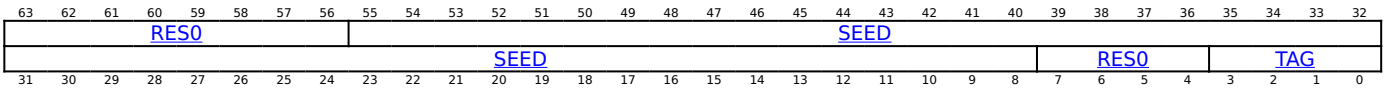
TAG, bits [3:0]

Tag generated by the most recent IRG instruction or, if FEAT_MTE_EIRG is implemented, EIRG state

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:



Bits [63:56]

Reserved, RES0.

SEED, bits [55:8]

IMPLEMENTATION DEFINED.

Note

Software is recommended to avoid writing SEED[15:0] with a value of zero, unless this has been generated by the PE in response to an earlier value with SEED being nonzero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:4]

Reserved, RES0.

TAG, bits [3:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RGSR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RGSR_EL1

2025-12-10 16:11:30, 2025-12_rel

RMR_EL1, Reset Management Register (EL1)

The RMR_EL1 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL1 can request a Warm reset.
- If EL1 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL1 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when the highest implemented Exception level is EL1.

This register is present only when the highest implemented Exception level is EL1 and FEAT_AA64 is implemented. Otherwise, direct accesses to RMR_EL1 are UNDEFINED.

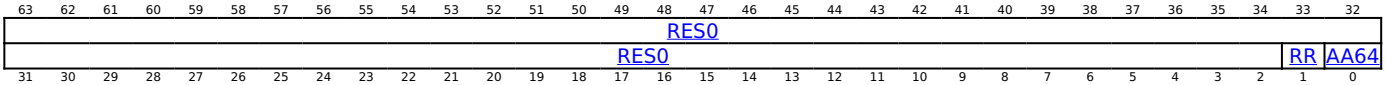
When EL1 is the highest implemented Exception level:

- If EL1 can use all Execution states then this register must be implemented.
- If EL1 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

Attributes

RMR_EL1 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When EL1 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL1 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing RMR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RMR_EL1

op0	op1	CRn	CRm	op2

0b11	0b000	0b1100	0b0000	0b010

```

2025-12-10 16:11:30, 2025-12_rel

RMR_EL2, Reset Management Register (EL2)

The RMR_EL2 characteristics are:

Purpose

When this register is implemented:

- A write to the register at EL2 can request a Warm reset.
- If EL2 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HRMR[31:0] when the highest implemented Exception level is EL2.

This register is present only when the highest implemented Exception level is EL2 and FEAT_AA64 is implemented. Otherwise, direct accesses to RMR_EL2 are UNDEFINED.

When EL2 is the highest implemented Exception level:

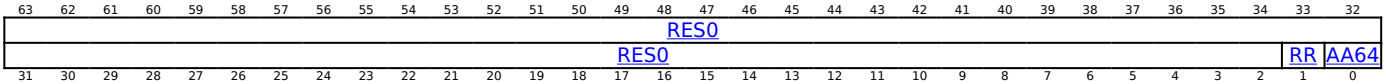
- If EL2 can use all Execution states then this register must be implemented.
- If EL2 cannot use AArch32 then it is IMPLEMENTATION DEFINED whether the register is implemented.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

RMR_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When EL2 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL2 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing RMR_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RMR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b010

```
if !(IsHighestEL(EL2) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL1 && IsHighestEL(EL2) && EffectiveHCR_EL2_NVx() IN {'xx1'} then
    AArch64_SystemAccessTrap(EL2, 0x18);
elsif PSTATE.EL == EL2 && IsHighestEL(EL2) then
    X{64}(t) = RMR_EL2();
else
    Undefined();
end;
```

MSR RMR_EL2, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b1100	0b0000	0b010

```
if !(IsHighestEL(EL2) && IsFeatureImplemented(FEAT_AA64)) then

RMR_EL3, Reset Management Register (EL3)

The RMR_EL3 characteristics are:

Purpose

If EL3 is implemented and this register is implemented:

- A write to the register at EL3 can request a Warm reset.
- If EL3 can use all Execution states, this register specifies the Execution state that the PE boots into on a Warm reset.

Configuration

AArch64 System register RMR_EL3 bits [31:0] are architecturally mapped to AArch32 System register RMR[31:0] when EL3 is implemented.

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RMR_EL3 are UNDEFINED.

When EL3 is implemented:

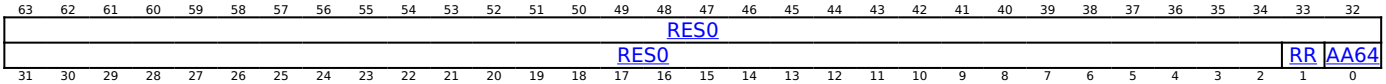
- If EL3 can use all Execution states then this register must be implemented.
- If EL3 cannot use AArch32, then it is IMPLEMENTATION DEFINED whether the register is implemented.

Otherwise, direct accesses to RMR_EL3 are UNDEFINED.

Attributes

RMR_EL3 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

RR, bit [1]

Reset Request. Setting this bit to 1 requests a Warm reset.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

AA64, bit [0]

When EL3 can use AArch32, determines which Execution state the PE boots into after a Warm reset:

AA64	Meaning
0b0	AArch32.
0b1	AArch64.

On coming out of the Warm reset, execution starts at the IMPLEMENTATION DEFINED reset vector address of the specified Execution state.

If EL3 can only use AArch64 state, this bit is RAO/WI.

The reset behavior of this field is:

- On a Cold reset, this field resets to '1'.

Accessing RMR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RMR_EL3

op0	op1	CRn	CRm	op2

0b11	0b110	0b1100	0b0000	0b010

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL3 && IsHighestEL(EL3) then
    X{64}(t) = RMR_EL3();
else
    Undefined();
end;
```

MSR RMR_EL3, <Xt>

RNDR, Random Number

The RNDR characteristics are:

Purpose

Random Number. Returns a 64-bit random number from an approved Random Bit Generator, where the Deterministic Random Bit Generator within the Random Bit Generator is reseeded from an approved entropy source at an IMPLEMENTATION DEFINED rate. See 'Properties of the generated random number'.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

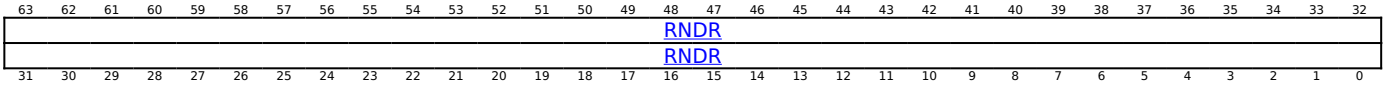
Configuration

This register is present only when (FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to RNDR are UNDEFINED.

Attributes

RNDR is a 64-bit register.

Field descriptions



RNDR, bits [63:0]

Random Number. Returns a 64-bit Random Number from an approved Random Bit Generator, where the Deterministic Random Bit Generator within the Random Bit Generator is reseeded from an approved entropy source at an IMPLEMENTATION DEFINED rate. See 'Properties of the generated random number'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing RNDR

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RNDR

op0	op1	CRn	CRm	op2
0b11	0b011	0b0010	0b0100	0b000

```
if !((IsFeatureImplemented(FEAT_RNG) || IsFeatureImplemented(FEAT_RNG_TRAP)) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_RNG_TRAP) && SCR_EL3().TRNDR == '1' then
        if EL3SDDUndef() then
            Undefined();
        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    elsif !IsFeatureImplemented(FEAT_RNG) then
        Undefined();
    else
        X{64}(t) = RNDR();
    end;
elsif PSTATE.EL == EL1 then
    if IsFeatureImplemented(FEAT_RNG_TRAP) && SCR_EL3().TRNDR == '1' then
        if EL3SDDUndef() then
            Undefined();
        else
            AArch64_SystemAccessTrap(EL3, 0x18);
        end;
    elsif !IsFeatureImplemented(FEAT_RNG) then
        Undefined();
    else
        X{64}(t) = RNDR();

RNDRRS, Random Number Full Entropy

The RNDRRS characteristics are:

Purpose

Random Number with fresh full entropy. Returns a 64-bit random number from an approved Random Bit Generator, using either a Non-deterministic Random Bit Generator or one where the Deterministic Random Bit Generator is reseeded, where possible, from an approved entropy source before the return of the random number. See 'Properties of the generated random number'.

If the hardware returns a genuine random number, PSTATE.NZCV is set to 0b0000.

If the instruction cannot return a genuine random number in a reasonable period of time, PSTATE.NZCV is set to 0b0100 and the data value returned is 0.

When FEAT_RNG_TRAP is implemented and SCR_EL3.TRNDR is 1, reads of this register are trapped to EL3.

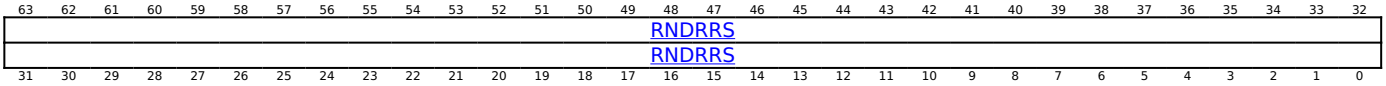
Configuration

This register is present only when (FEAT_RNG is implemented or FEAT_RNG_TRAP is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to RNDRRS are UNDEFINED.

Attributes

RNDRRS is a 64-bit register.

Field descriptions



RNDRRS, bits [63:0]

Random Number with fresh full entropy. Returns a 64-bit random number from an approved Random Bit Generator, using either a Non-deterministic Random Bit Generator or one where the Deterministic Random Bit Generator is reseeded, where possible, from an approved entropy source before the return of the random number. See 'Properties of the generated random number'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RVBAR_EL1, Reset Vector Base Address Register (if EL2 and EL3 not implemented)

The RVBAR_EL1 characteristics are:

Purpose

If EL1 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

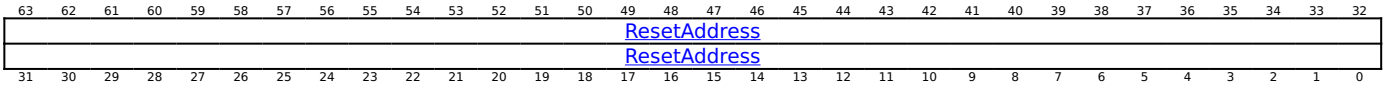
Configuration

This register is present only when the highest implemented Exception level is EL1 and FEAT_AA64 is implemented. Otherwise, direct accesses to RVBAR_EL1 are UNDEFINED.

Attributes

RVBAR_EL1 is a 64-bit register.

Field descriptions



ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing RVBAR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, RVBAR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1100	0b0000	0b001

```
if !(IsHighestEL(EL1) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL1 && IsHighestEL(EL1) then
    X{64}(t) = RVBAR_EL1();
else
    Undefined();
end;
```

2025-12-10 16:11:30, 2025-12_rel

RVBAR_EL2, Reset Vector Base Address Register (if EL3 not implemented)

The RVBAR_EL2 characteristics are:

Purpose

If EL2 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configuration

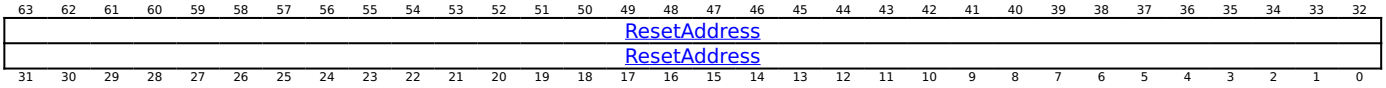
This register is present only when the highest implemented Exception level is EL2 and FEAT_AA64 is implemented. Otherwise, direct accesses to RVBAR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

RVBAR_EL2 is a 64-bit register.

Field descriptions



ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing RVBAR_EL2

RVBAR_EL3, Reset Vector Base Address Register (if EL3 implemented)

The RVBAR_EL3 characteristics are:

Purpose

If EL3 is the highest Exception level implemented, contains the IMPLEMENTATION DEFINED address that execution starts from after reset when executing in AArch64 state.

Configuration

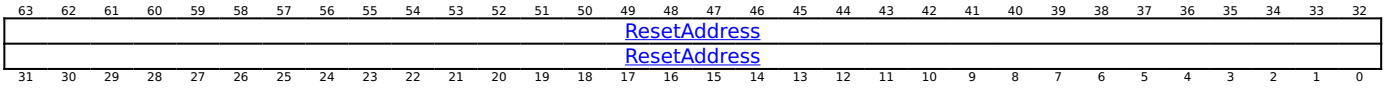
This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to RVBAR_EL3 are UNDEFINED.

Only implemented if the highest Exception level implemented is EL3.

Attributes

RVBAR_EL3 is a 64-bit register.

Field descriptions



ResetAddress, bits [63:0]

The IMPLEMENTATION DEFINED address that execution starts from after reset when executing in 64-bit state. Bits[1:0] of this register are 00, as this address must be aligned, and the address must be within the physical address size supported by the PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

S2PIR_EL2, Stage 2 Permission Indirection Register (EL2)

The S2PIR_EL2 characteristics are:

Purpose

Stage 2 Permission Indirection Register for EL1&0 translation regime.

Configuration

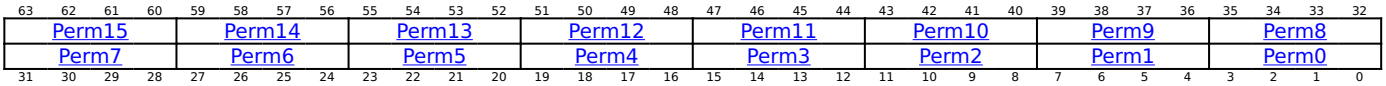
This register is present only when FEAT_S2PIE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to S2PIR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

S2PIR_EL2 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Represents stage 2 Base Permissions.

Perm<m>	Meaning
0b0000	No Access.
0b0001	Reserved - treated as No Access.
0b0010	MRO.
0b0011	MRO-TL1.
0b0100	WO.
0b0101	Reserved - treated as No Access.
0b0110	MRO-TL0.
0b0111	MRO-TL01.
0b1000	RO.
0b1001	RO+uX.
0b1010	RO+pX.
0b1011	RO+puX.

S2POR_EL1, Stage 2 Permission Overlay Register (EL1)

The S2POR_EL1 characteristics are:

Purpose

Stage 2 Permission Overlay Register for EL1&0 translation regime.

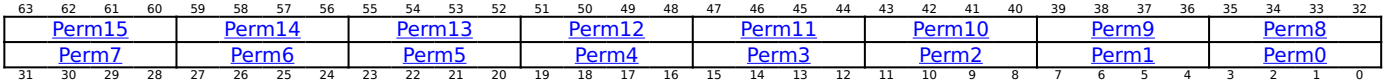
Configuration

This register is present only when FEAT_S2POE is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to S2POR_EL1 are UNDEFINED.

Attributes

S2POR_EL1 is a 64-bit register.

Field descriptions



Perm<m>, bits [4m+3:4m], for m = 15 to 0

Configures stage 2 Overlay Permissions.

Perm<m>	Meaning
0b0000	No Access.
0b0001	Reserved - treated as No Access.
0b0010	MRO.
0b0011	MRO-TL1.
0b0100	WO.
0b0101	Reserved - treated as No Access.
0b0110	MRO-TL0.
0b0111	MRO-TL01.
0b1000	RO.
0b1001	RO+uX.
0b1010	RO+pX.
0b1011	RO+puX.
0b1100	RW.
0b1101	RW+uX.
0b1110	RW+pX.
0b1111	RW+puX.

This field is not permitted to be cached in a TLB.

When stage 2 Permission Overlay mechanism is disabled, this register is ignored.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

S3_<op1>_<Cn>_<Cm>_<op2>, IMPLEMENTATION DEFINED Registers

The S3_<op1>_<Cn>_<Cm>_<op2> characteristics are:

Purpose

This area of the instruction set space is reserved for IMPLEMENTATION DEFINED registers.

Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to S3_<op1>_<Cn>_<Cm>_<op2> are UNDEFINED.

When FEAT_SYSREG128 is implemented, each register in this space is a 128-bit register that can also be accessed as a 64-bit value. If it is accessed as a 64-bit register, accesses read and write bits [63:0] and do not modify bits [127:64].

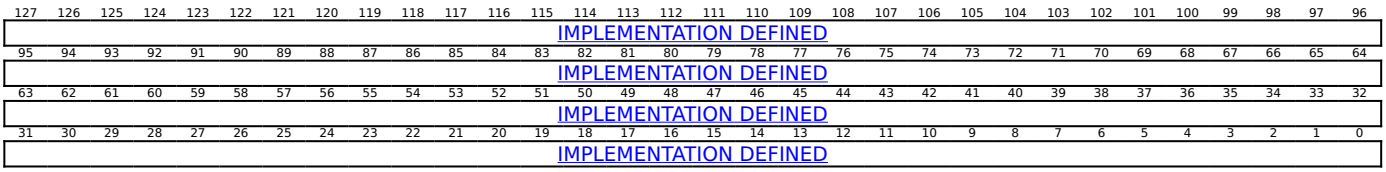
Attributes

S3_<op1>_<Cn>_<Cm>_<op2> is a:

- 128-bit register when FEAT_SYSREG128 is implemented
- 64-bit register otherwise

Field descriptions

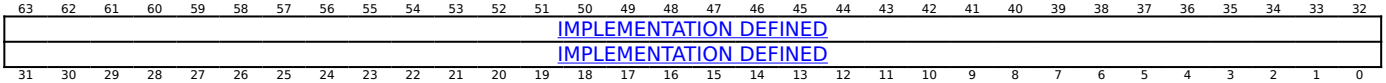
When FEAT_SYSREG128 is implemented:



IMPLEMENTATION DEFINED, bits [127:0]

IMPLEMENTATION DEFINED.

Otherwise:



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

Accessing S3_<op1>_<Cn>_<Cm>_<op2>

SCR2_EL3, Secure Configuration Register

The SCR2_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state.

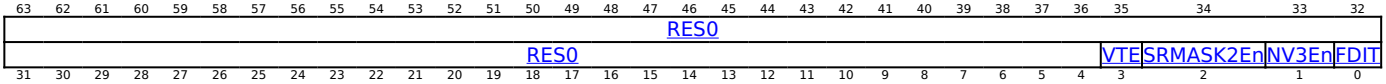
Configuration

This register is present only when FEAT_SCR2 is implemented, EL3 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SCR2_EL3 are UNDEFINED.

Attributes

SCR2_EL3 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

VTE, bit [3]
When FEAT_VMTE is implemented:

Virtual tagging enable override:

- Overrides enabling of Virtual tagging at EL2, EL1 and EL0.
- If not trapped to EL2, accesses to the following registers at EL1 and EL2 are trapped to EL3 and reported using EC syndrome value 0x18:
  - GCR_EL1.
  - RGSR_EL1.
  - TFSRE0_EL1.
  - TFSR_EL1.
  - TFSR_EL2.
  - Accesses with the register name TFSR_EL12 that are not UNDEFINED.

VTE	Meaning
0b0	Disables the use of Virtual tagging at EL2, EL1 and EL0. If SCR_EL3.ATA is 0, the specified registers are trapped to EL3 unless trapped to a lower Exception level. If SCR_EL3.ATA is 1, this field does not trap the specified registers to EL3.
0b1	This field does not disable the use of Virtual tagging at EL2, EL1 and EL0. The field does not trap the specified registers to EL3.

When EL3 is not implemented, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

SRMASK2En, bit [2]
When FEAT_SRMASK2 is implemented:

Enables access to the following registers:

- HCRMASK_EL2.
- HCRXMASK_EL2.

- If FEAT_NV3 is implemented, NVHCRX_EL2, NVHCRMASK_EL2, and NVHCRXMASK_EL2.

SRMASK2En	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3.
0b1	No accesses are trapped by this mechanism.

Traps are reported using EC syndrome value 0x18.

When EL3 is not implemented, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

NV3En, bit [1]
When FEAT_NV3 is implemented:

Enables access to the NVHCR_EL2 register at EL2.

NV3En	Meaning
0b0	EL2 accesses to the specified register is trapped to EL3. The Effective value of HCRX_EL2.NVTGE is 0.
0b1	No accesses are trapped by this mechanism.

Access to NVHCR_EL2 is trapped to EL3 and reported using EC syndrome value 0x18.

When EL3 is not implemented, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

FDIT, bit [0]
When FEAT_FDIT is implemented:

Enforce data-independent timing for execution at EL2, EL1 and EL0.

FDIT	Meaning
0b0	This control does not affect data-independent timing of execution.
0b1	Data-independent timing of execution is enforced.

When EL3 is not implemented, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Accessing SCR2_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCR2_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0010	0b010

```
if !(IsFeatureImplemented(FEAT_SCR2) && HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SCR2_EL3();
end;
```

MSR SCR2_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0010	0b010

```
if !(IsFeatureImplemented(FEAT_SCR2) && HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    SCR2_EL3() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

SCR_EL3, Secure Configuration Register

The SCR_EL3 characteristics are:

Purpose

Defines the configuration of the current Security state. It specifies:

- The Security state of EL0, EL1, and EL2. The Security state is Secure, Non-secure, or Realm.
- The Execution state at lower Exception levels.
- Whether IRQ, FIQ, SError exceptions, and External abort exceptions are taken to EL3.
- Whether various operations are trapped to EL3.

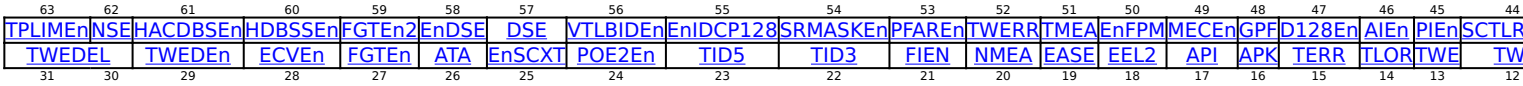
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCR_EL3 are UNDEFINED.

Attributes

SCR_EL3 is a 64-bit register.

Field descriptions



TPLIMEn, bit [63]
When FEAT_TPS is implemented:

Enable access TP limit registers at EL2, EL1 and EL0.

If EL0, EL1 or EL2 is using AArch64, then accesses to the following registers are trapped to EL3 and reported using EC syndrome value 0x18:

- TPMAX0_EL0, TPMIN0_EL0.
- TPMAX1_EL0, TPMIN1_EL0.

If FEAT_TPSP is implemented, and EL1 or EL2 is using AArch64, then accesses to the following registers are trapped to EL3 and reported using EC syndrome value 0x18:

- TPMAX0_EL1, TPMIN0_EL1, TPMAX1_EL1, TPMIN1_EL1.
- TPMAX0_EL2, TPMIN0_EL2, TPMAX1_EL2, TPMIN1_EL2.

TPLIMEn	Meaning
0b0	Accesses to the specified registers are trapped to EL3, unless the access generates a higher priority exception. No Permission faults are generated as a result of TPLIM checks for the EL2&0 or EL1&0 translation regimes.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NSE, bit [62]
When FEAT_RME is implemented:

This field, evaluated with SCR_EL3.NS, selects the Security state of EL2 and lower Exception levels.

For a description of the values derived by evaluating NS and NSE together, see SCR_EL3.NS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

The Effective value of this bit is 0b0.

Access to this field is RES0 .

HACDBSEn, bit [61]
When FEAT_HACDBS is implemented:

Enables access to the HACDBSBR_EL2 and HACDBSCONS_EL2 registers at EL2.

HACDBSEn	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HDBSSEn, bit [60]
When FEAT_HDBSS is implemented:

Enables access to HDBSSBR_EL2 and HDBSSPROD_EL2 registers at EL2.

HDBSSEn	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn2, bit [59]
When FEAT_FGT2 is implemented:

Fine-Grained Traps Enable 2.

When EL2 is implemented, enables the traps to EL2 controlled by HDFGRTR2_EL2, HDFGWTR2_EL2, HFGITR2_EL2, HFGRTR2_EL2, and HFGWTR2_EL2, and controls access to those registers.

FGTEn2	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3. The values in these registers are treated as 0.
0b1	EL2 accesses to the specified registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using EC syndrome value 0x18 and its associated ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDSE, bit [58]
When FEAT_E3DSE is implemented:

Enable for delegated SError exceptions pended by SCR_EL3.DSE.

EnDSE	Meaning
0b0	Delegated SError exceptions pended by SCR_EL3.DSE are disabled.
0b1	Delegated SError exceptions pended by SCR_EL3.DSE are enabled.

This field is ignored by the PE and treated as zero if SCR_EL3.EA is 0 and the Effective value of SCR_EL3.TMEA is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSE, bit [57]
When FEAT_E3DSE is implemented:

Delegated SError exception for EL2, EL1, and EL0.

DSE	Meaning
0b0	This mechanism is not making a delegated SError exception pending.
0b1	A delegated SError exception for EL2, EL1, and EL0 is pending because of this mechanism.

When EL2 is implemented and enabled in the current Security state, delegated SError exceptions pended by this field are affected by HCR_EL2.AMO and HCRX_EL2.TMEA.

Virtual SError exceptions pended by HCR_EL2.VSE have priority over delegated SError exceptions pended by this field.

This field is ignored by the PE and treated as zero when SCR_EL3.EnDSE == 0

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTLBIDEn, bit [56]
When FEAT_TLBID is implemented:

Enable EL2 access to VTLBID<n>_EL2 and VTLBIDOS<n>_EL2 registers.

VTLBIDEn	Meaning
0b0	EL2 accesses to VTLBID<n>_EL2 and VTLBIDOS<n>_EL2 are trapped to EL3 using EC syndrome value 0x18. The Effective values of VTLBID<n>_EL2 and VTLBIDOS<n>_EL2 are zero. EL1 and EL2 accesses to TLBIDIDR_EL1 are trapped to EL3 using EC syndrome value 0x18.
0b1	EL2 accesses to VTLBID<n>_EL2 and VTLBIDOS<n>_EL2 are not prevented by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [55]
When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL2, EL1, EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL3 using EC syndrome value 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL3.
0b1	No accesses are trapped by this control.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SRMASKEn, bit [54]
When FEAT_SRMASK is implemented:

Enables access to the following MASK registers:

- CPACRMASK_EL1, and CPACRMASK_EL12.
- SCTLRMASK_EL1, and SCTLRMASK_EL12.
- SCTLR2MASK_EL1, and SCTLR2MASK_EL12.
- TCRMASK_EL1, and TCRMASK_EL12.
- TCR2MASK_EL1, and TCR2MASK_EL12.
- ACTLRMASK_EL1 and ACTLRMASK_EL12, if they are implemented.
- CPTRMASK_EL2.
- SCTLRMASK_EL2.
- SCTLR2MASK_EL2.
- TCRMASK_EL2.
- TCR2MASK_EL2.
- ACTLRMASK_EL2, if it is implemented.

SRMASKEn	Meaning
0b0	EL2 accesses to the specified registers are trapped to EL3. EL1 accesses to the specified EL1 registers are trapped to EL3. The values in the registers are treated as 0.
0b1	No accesses are trapped by this control.

Traps are reported using EC syndrome value 0x18.

Traps generated by this control have a lower priority than traps generated by the HCRX_EL2.SRMASKEn, HFGRTR2_EL2 and HFGWTR2_EL2 controls.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PFAREn, bit [53]
When FEAT_PFAR is implemented:

Enable access to Physical Fault Address Registers. When disabled, accesses to Physical Fault Address Registers generate a trap to EL3.

PFAREn	Meaning
0b0	Accesses of the specified Physical Fault Address Registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.
0b1	This control does not cause any instructions to be trapped.

In AArch64 state, the instructions affected by this control are: MRS and MSR accesses to PFAR_EL1, PFAR_EL2, and PFAR_EL12.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped instructions are reported using EC syndrome value 0x18.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWERR, bit [52]
When FEAT_RASv2 is implemented:

Trap writes of Error Record registers. Enables a trap to EL3 on writes of Error Record registers.

TWERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Writes of the specified Error Record registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are: MSR accesses to ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, ERXMISC2_EL1, ERXMISC3_EL1, and ERXSTATUS_EL1.

In AArch32 state, the instructions affected by this control are: MCR accesses to ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, ERXMISC4, ERXMISC5, ERXMISC6, ERXMISC7, and ERXSTATUS.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TMEA, bit [51]
When FEAT_DoubleFault2 is implemented:

Trap Masked External Aborts. Controls whether a masked error exception at a lower Exception level is taken to EL3.

TMEA	Meaning
0b0	Synchronous External abort exceptions and SError exceptions at EL2, EL1, and EL0 are unaffected by this mechanism. That is, these exceptions are not taken to EL3 unless routed to EL3 by another control.
0b1	When executing at Exception levels below EL3, all of the following apply: • When PSTATE.A is 1, synchronous External abort exceptions are taken to EL3, unless they are taken from EL1 or EL0 and routed to EL2 by another control. • Masked physical SError exceptions are taken to EL3, unless they are taken from EL1 or EL0 and routed to EL2 by another control.

This field has no effect on the routing of virtual or delegated SError exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [50]
When FEAT_FPMR is implemented:

Enables direct and indirect accesses to FPMR from EL2, EL1, and EL0.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL2, EL1, and EL0 are trapped to EL3 and reported with EC syndrome value 0x18.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL2, EL1 and EL0.

EnFPM	Meaning
0b0	Direct and indirect accesses to FPMR are disabled at EL2, EL1 and EL0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

If EL3 is not implemented, the Effective value of this field is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MECEn, bit [49]
When FEAT_MEC is implemented:

Enables access to the following EL2 MECID registers, from EL2:

- MECID_P0_EL2.
- MECID_A0_EL2
- MECID_P1_EL2
- MECID_A1_EL2
- VMECID_P_EL2
- VMECID_A_EL2

Accesses to these registers are trapped and reported using EC syndrome value 0x18.

MECEn	Meaning
0b0	EL2 accesses to any of the specified registers are trapped to EL3. The values of the specified registers are treated as 0 for all purposes other than direct reads or writes to the register from EL3.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

GPF, bit [48]
When FEAT_RME is implemented:

Controls the reporting of Granule protection faults at EL0, EL1 and EL2.

GPF	Meaning
0b0	This control does not cause exceptions to be routed from EL0, EL1 or EL2 to EL3.
0b1	GPFs at EL0, EL1 and EL2 are routed to EL3 and reported as Granule Protection Check exceptions.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D128En, bit [47]
When FEAT_D128 is implemented:

128-bit System Register trap control. Enables access to 128-bit System Registers via MRRS, MSRR instructions.

MRRS and MSRR accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x14:

- TTBR0_EL1.
- TTBR1_EL1.
- RCWMASK_EL1, RCWSMASK_EL1.
- PAR_EL1.

MRRS and MSRR accesses from EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x14:

- TTBR1_EL2 and accesses using the register name TTBR1_EL12.
- TTBR0_EL2 and accesses using the register name TTBR0_EL12.
- VTTBR_EL2.

D128En	Meaning
0b0	EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIEn, bit [46]
When FEAT_AIE is implemented:

MAIR2_ELx, AMAIR2_ELx Register access trap control.

Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:

- AMAIR2_EL1.
- MAIR2_EL1.

Accesses from EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:

- AMAIR2_EL2 and accesses using the register name AMAIR2_EL12.
- MAIR2_EL2 and accesses using the register name MAIR2_EL12.

AIEn	Meaning
0b0	EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIEn, bit [45]
When FEAT_S1PIE is implemented, or FEAT_S2PIE is implemented, or FEAT_S1POE is implemented, or FEAT_S2POE is implemented:

Permission Indirection, Overlay Register access trap control. Enables access to Permission Indirection and Overlay registers.

Accesses from EL0, EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:

- POR_EL0.

Accesses from EL1 and EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:

- PIRE0_EL1.
- PIR_EL1.
- POR_EL1.
- S2POR_EL1.

Accesses from EL2 using AArch64 to the following registers are trapped and reported using EC syndrome value 0x18:

- PIRE0_EL2 and accesses using the register name PIRE0_EL12.
- PIR_EL2 and accesses using the register name PIR_EL12.
- POR_EL2 and accesses using the register name POR_EL12.
- S2PIR_EL2.

PIEn	Meaning
0b0	EL0, EL1 and EL2 accesses to the specified registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

If this field is 0, it is IMPLEMENTATION SPECIFIC whether the values of the named registers are treated as zero.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SCTLR2En, bit [44]
When FEAT_SCTLR2 is implemented:

SCTLR2_ELx register trap control. Enables access to SCTLR2_EL1 and SCTLR2_EL2 registers.

SCTLR2En	Meaning
0b0	EL1 and EL2 accesses to SCTLR2_EL1 and SCTLR2_EL2 registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCR2En, bit [43]
When FEAT_TCR2 is implemented:

TCR2_ELx register trap control. Enables access to TCR2_EL1 and TCR2_EL2 registers.

TCR2En	Meaning
0b0	EL1 and EL2 accesses to TCR2_EL1 and TCR2_EL2 registers are disabled, and trapped to EL3. The values in these registers are treated as 0.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

RCWMASKEn, bit [42]
When FEAT_THE is implemented:

RCW and RCWS Mask register trap control. Enables access to RCWMASK_EL1, RCWSMASK_EL1.

RCWMASKEn	Meaning
0b0	EL1 and EL2 accesses to RCWMASK_EL1 and RCWSMASK_EL1 registers are disabled, and trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

Traps for MRS, MSR access are reported using EC syndrome value 0x18.

Traps for MRRS, MSRR acceess are reported using EC syndrome value 0x14.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [41]
When FEAT_SME is implemented:

Traps instructions executed at EL2, EL1, and EL0 that access TPIDR2_EL0 to EL3. The exception is reported using EC syndrome value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TRNDR, bit [40]
When FEAT_RNG_TRAP is implemented:

Controls trapping of reads of RNDR and RNDRRS. The exception is reported using EC syndrome value 0x18.

TRNDR	Meaning
0b0	This control does not cause RNDR and RNDRRS to be trapped. When FEAT_RNG is implemented: • ID_AA64ISAR0_EL1.RNDR returns the value 0b0001. When FEAT_RNG is not implemented: • ID_AA64ISAR0_EL1.RNDR returns the value 0b0000. • MRS reads of RNDR and RNDRRS are UNDEFINED.
0b1	ID_AA64ISAR0_EL1.RNDR returns the value 0b0001. Any attempt to read RNDR or RNDRRS is trapped to EL3.

When FEAT_RNG is not implemented, Arm recommends that SCR_EL3.TRNDR is initialized before entering Exception levels below EL3 and not subsequently changed.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

GCSEn, bit [39]
When FEAT_GCS is implemented:

Guarded Control Stack enable. Controls access to the Guarded Control Stack registers from EL2, EL1, and EL0, and controls whether the Guarded Control Stack is enabled.

The Guarded Control Stack registers trapped by this mechanism are:

- GCSCRE0_EL1.
- GCSCR_EL1.
- GCSCR_EL2.
- GCSCR_EL12.
- GCSPR_EL0.
- GCSPR_EL1.
- GCSPR_EL2.

- GCSPR_EL12.

GCSEn	Meaning
0b0	Trap read and write accesses to all Guarded Control Stack registers to EL3. All Guarded Control Stack behavior is disabled at EL2, EL1, and EL0.
0b1	This control does not cause any instructions to be trapped, and does not disable Guarded Control Stack behavior at EL2, EL1, or EL0.

Traps are reported using EC syndrome value 0x18.

Traps are not taken if there is a higher priority exception generated by the access.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HXEn, bit [38]
When FEAT_HCX is implemented:

Enables access to the HCRX_EL2 register at EL2 from EL3.

HXEn	Meaning
0b0	Accesses at EL2 to HCRX_EL2 are trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

When EL3 is not implemented, the Effective value of this field is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ADEn, bit [37]
When FEAT_LS64_ACCDATA is implemented:

Enables access to the ACCDATA_EL1 register at EL1 and EL2.

ADEn	Meaning
0b0	Accesses to ACCDATA_EL1 at EL1 and EL2 are trapped to EL3, unless the accesses are trapped to EL2 by the EL2 fine-grained trap.
0b1	This control does not cause accesses to ACCDATA_EL1 to be trapped.

If the HFGWTR_EL2.nACCDATA_EL1 or HFGRTR_EL2.nACCDATA_EL1 traps are enabled, they take priority over this trap.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [36]
When FEAT_LS64_ACCDATA is implemented:

Traps execution of an ST64BV0 instruction at EL0, EL1, or EL2 to EL3.

EnAS0	Meaning
0b0	EL0 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL1 by SCTLR_EL1.EnAS0, or to EL2 by either HCRX_EL2.EnAS0 or SCTLR_EL2.EnAS0. EL1 execution of an ST64BV0 instruction is trapped to EL3, unless it is trapped to EL2 by HCRX_EL2.EnAS0. EL2 execution of an ST64BV0 instruction is trapped to EL3.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMVOFFEN, bit [35]
When FEAT_AMUv1p1 is implemented:

Activity Monitors Virtual Offsets Enable.

AMVOFFEN	Meaning
0b0	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 at EL2 are trapped to EL3. Indirect reads of the virtual offset registers are zero.
0b1	Accesses to AMEVCNTVOFF0<n>_EL2 and AMEVCNTVOFF1<n>_EL2 are not affected by this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [34]

Reserved, RES0.

TWEDEL, bits [33:30]
When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCR_EL3.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCR_EL3.TWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [29]
When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCR_EL3.TWE.

Traps are reported using EC syndrome value 0x01.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCR_EL3.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ECVEn, bit [28]
When FEAT_ECV_POFF is implemented:

ECV Enable. Enables access to the CNTPOFF_EL2 register.

ECVEn	Meaning
0b0	EL2 accesses to CNTPOFF_EL2 are trapped to EL3, and the value of CNTPOFF_EL2 is treated as 0 for all purposes other than direct reads or writes to the register from EL3.
0b1	EL2 accesses to CNTPOFF_EL2 are not trapped to EL3 by this mechanism.

When FEAT_ECV_POFF is not implemented, the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FGTEn, bit [27]
When FEAT_FGT is implemented:

Fine-Grained Traps Enable. When EL2 is implemented, enables the traps to EL2 controlled by HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2, and HFGWTR_EL2, and controls access to those registers.

Note

If EL2 is not implemented but EL3 is implemented, FEAT_FGT implements the MDCR_EL3.TDCC traps.

FGTEn	Meaning
0b0	EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are trapped to EL3, and the traps to EL2 controlled by those registers are disabled.
0b1	EL2 accesses to HAFGRTR_EL2, HDFGRTR_EL2, HDFGWTR_EL2, HFGRTR_EL2, HFGITR_EL2 and HFGWTR_EL2 registers are not trapped to EL3 by this mechanism.

Traps caused by accesses to the fine-grained trap registers are reported using EC syndrome value 0x18 and its associated ISS.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [26]
When FEAT_MTE2 is implemented:

Physical tagging enable override:

- Overrides enabling of Physical tagging at EL2, EL1 and EL0.
- If not trapped to EL2, accesses to the following registers at EL1 and EL2 are trapped to EL3 and reported using EC syndrome value 0x18:
  - GCR_EL1.
  - RGSR_EL1.
  - TFSRE0_EL1.
  - TFSR_EL1.
  - TFSR_EL2.
  - Accesses with the register name TFSR_EL12 that are not UNDEFINED.

Note

Prior to FEAT_VMTE, the only memory tagging is Physical Tagging.

ATA	Meaning
0b0	Disables the use of Physical tagging at EL2, EL1 and EL0. If SCR2_EL3.VTE is 0, the specified registers are trapped to EL3 unless trapped to a lower Exception level. If SCR2_EL3.VTE is 1, this field does not trap the specified registers to EL3.
0b1	This field does not disable the use of Physical tagging at EL2, EL1 and EL0. The field does not trap the specified registers to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnSCXT, bit [25]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Enables access to the SCXTNUM_EL2, SCXTNUM_EL1, and SCXTNUM_EL0 registers.

EnSCXT	Meaning
0b0	Accesses at EL0, EL1 and EL2 to SCXTNUM_EL0, SCXTNUM_EL1, or SCXTNUM_EL2 registers are trapped to EL3 if they are not trapped by a higher priority exception, and the values of these registers are treated as 0.
0b1	This control does not cause any accesses to be trapped, or register values to be treated as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE2En, bit [24]
When FEAT_S1POE2 is implemented:

Enable access to POE2 registers at EL2, EL1, and EL0.

When disabled by this control, direct accesses to the following registers are trapped to EL3:

- MRS accesses from EL0 to TINDEX_EL0 using AArch64 are trapped to EL3 and reported using EC syndrome value 0x18.
- MSR and MRS accesses from EL0 to TPIDR3_EL0 using AArch64 are trapped to EL3 and reported using EC syndrome value 0x18.
- MSR and MRS accesses from EL1 and EL2 using AArch64 to the following registers:
  - DPOTBR0_EL1, DPOTBR1_EL1.
  - IRTBRU_EL1, IRTBRP_EL1.
  - TTTBRU_EL1, TTTBRP_EL1.

    - FGDTU<n>_EL1, FGDTP<n>_EL1.
    - AFGDTU<n>_EL1, AFGDTP<n>_EL1.
    - TINDEX_EL1, TINDEX_EL0.
    - STINDEX_EL1.
    - LDSTT_EL1.
    - TPIDR3_EL1, TPIDR3_EL0.
- MSR and MRS accesses from EL2 using AArch64 are trapped to EL3 and reported using EC syndrome value 0x18.
    - DPOTBR0_EL2, DPOTBR1_EL2.
    - IRTBRU_EL2, IRTBRP_EL2.
    - TTTBRU_EL2, TTTBRP_EL2.
    - FGDTU<n>_EL2, FGDTP<n>_EL2.
    - AFGDTU<n>_EL2, AFGDTP<n>_EL2.
    - TINDEX_EL2, STINDEX_EL2.
    - LDSTT_EL2.
    - TPIDR3_EL2.
    - If FEAT_NV2 is implemented, VNCCR_EL2.

POE2En	Meaning
0b0	EL0, EL1, and EL2 accesses to the specified registers are disabled, and trapped to EL3. The Effective values of TCR2_EL1.POE2F and TCR2_EL2.POE2F are 0.
0b1	This control does not cause any instructions to be trapped.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID5, bit [23]
When FEAT_IDTE3 is implemented and FEAT_MTE2 is implemented:

Trap ID group 5. EL2 and EL1 reads of the group 5 ID register GMID_EL1 are trapped to EL3, reported using EC syndrome value 0x18, unless the instruction generates a higher priority exception.

TID5	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL2 accesses to ID group 5 registers are trapped to EL3. When EL2 is not enabled in the current Security state, or when HCR_EL2.TID5 is 0, EL1 read accesses to the specified registers are trapped to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TID3, bit [22]
When FEAT_IDTE3 is implemented:

Trap ID group 3. EL2 and EL1 reads of the following group 3 registers are trapped to EL3, reported using EC syndrome value 0x18, unless the instruction generates a higher priority exception:

- ID_PFR0_EL1, ID_PFR1_EL1, ID_DFR0_EL1, ID_AFR0_EL1, ID_MMFR0_EL1, ID_MMFR1_EL1, ID_MMFR2_EL1, ID_MMFR3_EL1, ID_ISAR0_EL1, ID_ISAR1_EL1, ID_ISAR2_EL1, ID_ISAR3_EL1, ID_ISAR4_EL1, ID_ISAR5_EL1, MVFR0_EL1, MVFR1_EL1, and MVFR2_EL1.
- ID_AA64PFR0_EL1, ID_AA64PFR1_EL1, ID_AA64DFR0_EL1, ID_AA64DFR1_EL1, ID_AA64ISAR0_EL1, ID_AA64ISAR1_EL1, ID_AA64MMFR0_EL1, ID_AA64MMFR1_EL1, ID_AA64AFR0_EL1, and ID_AA64AFR1_EL1.
- ID_PFR2_EL1, and ID_MMFR4_EL1.
- ID_MMFR5_EL1.
- ID_AA64MMFR3_EL1.
- ID_AA64MMFR4_EL1.
- ID_AA64PFR2_EL1.
- ID_AA64MMFR2_EL1 and ID_ISAR6_EL1.
- ID_DFR1_EL1.

- ID_AA64DFR2_EL1.
- ID_AA64ZFR0_EL1.
- ID_AA64SMFR0_EL1.
- ID_AA64FPFR0_EL1.
- ID_AA64ISAR2_EL1.
- ID_AA64ISAR3_EL1.
- This field traps all MRS accesses to registers in the following range that are not already mentioned in this field description: op0 == 3, op1 == 0, CRn == 0, CRm == {2-7}, op2 == {0-7}.

TID3	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	The specified EL2 read accesses to ID group 3 registers are trapped to EL3. When EL2 is not enabled in the current Security state, or when HCR_EL2.TID3 is 0, EL1 read accesses to the specified registers are trapped to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FIEN, bit [21]
When FEAT_RASv1p1 is implemented:

Fault Injection enable. Trap accesses to the registers ERXPFGCDN_EL1, ERXPFGCTL_EL1, and ERXPFGF_EL1 from EL1 and EL2 to EL3, reported using EC syndrome value 0x18.

FIEN	Meaning
0b0	Accesses to the specified registers from EL1 and EL2 generate a Trap exception to EL3.
0b1	This control does not cause any instructions to be trapped.

If EL3 is not implemented, the Effective value of SCR_EL3.FIEN is 0b1.

If ERRIDR_EL1.NUM is zero, meaning no error records are implemented, or no error record accessible using System registers is owned by a node that implements the RAS Common Fault Injection Model Extension, then this bit might be RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [20]
When FEAT_DoubleFault is implemented:

Non-maskable External Aborts. Controls whether PSTATE.A masks SError exceptions at EL3.

NMEA	Meaning
0b0	SError exceptions are not taken at EL3 if PSTATE.A == 1.
0b1	SError exceptions are taken at EL3 regardless of the value of PSTATE.A.

This field is ignored by the PE and treated as zero when all of the following are true:

- FEAT_DoubleFault2 is not implemented.
- SCR_EL3.EA is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EASE, bit [19]
When FEAT_DoubleFault is implemented:

External aborts to SError exception vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL3 are taken to the appropriate synchronous exception vector offset from VBAR_EL3.
0b1	Synchronous External abort exceptions taken to EL3 are taken to the appropriate SError exception vector offset from VBAR_EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

EEL2, bit [18]
When FEAT_SEL2 is implemented:

Secure EL2 Enable.

EEL2	Meaning
0b0	All behaviors associated with Secure EL2 are disabled. All registers, including timer registers, defined by FEAT_SEL2 are UNDEFINED, and those timers are disabled.
0b1	All behaviors associated with Secure EL2 are enabled.

When the value of this bit is 1, then:

- When SCR_EL3.NS == 0, the SCR_EL3.RW bit is treated as 1 for all purposes other than reading or writing the register.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2, using EC syndrome value 0x03 :
  - A read or write of the SCR.
  - A read or write of the NSACR.
  - A read or write of the MVBAR.
  - A read or write of the SDCR.
  - Execution of an ATS12NSO** instruction.
- If Secure EL1 is using AArch32, then any of the following operations, executed in Secure EL1, is trapped to Secure EL2 using EC syndrome value 0x00 :
  - Execution of an SRS instruction that uses R13_mon.
  - Execution of an MRS (Banked register) or MSR (Banked register) instruction that would access SPSR_mon, R13_mon, or R14_mon.

Note

If the Effective value of SCR_EL3.EEL2 is 0, then these operations executed in Secure EL1 using AArch32 are trapped to EL3.

A Secure only implementation that does not implement EL3 but implements EL2, behaves as if SCR_EL3.EEL2 == 1.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

API, bit [17]
When FEAT_PAuth is implemented:

Controls the use of the following instructions related to Pointer Authentication.

- PACGA.
- AUTDA, AUTDB, AUTDZA, AUTDZB, AUTIA, AUTIA1716, AUTIASP, AUTIAZ, AUTIB, AUTIB1716, AUTIBSP, AUTIBZ, AUTIZA, AUTIZB, PACDA, PACDB, PACDZA, PACDZB, PACIA, PACIA1716, PACIASP, PACIAZ, PACIB, PACIB1716, PACIBSP, PACIBZ, PACIZA, PACIZB, RETAA, RETAB, BRAA, BRAB, BLRAA, BLRAB, BRAAZ, BRABZ, BLRAAZ, BLRABZ, ERETAA, ERETAB, LDRAA and LDRAB, when any of the following are true:
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and the associated SCTLR_EL1.En<N><M> == 1.
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and the associated SCTLR_EL2.En<N><M> == 1.
  - In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.
- When FEAT_PAuth_LR is implemented, AUTIASPPC, AUTIASPPCR, AUTIA171615, AUTIBSPPC, AUTIBSPPCR, AUTIB171615, PACIASPPC, PACNBIASPPC, PACIA171615, PACIBSPPC, PACNBIBSPPC, PACIB171615, RETAASPPC, RETAASPPCR, RETABSPPC, RETABSPPCR, when any of the following are true:
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, and the associated SCTLR_EL1.En<N><M> == 1.
  - In EL0, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, and the associated SCTLR_EL2.En<N><M> == 1.
  - In EL1, when the associated SCTLR_EL1.En<N><M> == 1.
  - In EL2, when the associated SCTLR_EL2.En<N><M> == 1.

API	Meaning
0b0	The specified instructions are trapped to EL3, when the instructions are enabled, unless they are trapped to EL2 as a result of the higher priority HCR_EL2.API trap.
0b1	This control does not cause any instructions to be trapped.

Traps are reported using EC syndrome value 0x09.

An instruction is trapped only if Pointer Authentication is enabled for that instruction, for more information, see 'PAC generation and verification keys'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

APK, bit [16]
When FEAT_PAuth is implemented:

Trap registers holding "key" values for Pointer Authentication. Traps accesses to the following registers, using EC syndrome value 0x18, from EL1 or EL2 to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps:

- APIAKeyLo_EL1, APIAKeyHi_EL1, APIBKeyLo_EL1, APIBKeyHi_EL1.
- APDAKeyLo_EL1, APDAKeyHi_EL1, APDBKeyLo_EL1, APDBKeyHi_EL1.
- APGAKeyLo_EL1, and APGAKeyHi_EL1.

APK	Meaning
0b0	Access to the registers holding "key" values for pointer authentication from EL1 or EL2 are trapped to EL3 unless they are trapped to EL2 as a result of the HCR_EL2.APK bit or other traps.
0b1	This control does not cause any instructions to be trapped.

For more information, see 'PAC generation and verification keys'.

Note

If FEAT_PAuth is implemented but EL3 is not implemented, the system behaves as if this bit is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TERR, bit [15]
When FEAT_RAS is implemented:

Trap accesses of Error Record registers. Enables a trap to EL3 on accesses of Error Record registers.

TERR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Accesses of the specified Error Record registers at EL2 and EL1 are trapped to EL3, unless the instruction generates a higher priority exception.

In AArch64 state, the instructions affected by this control are:

- MRS and MSR accesses to ERRSELR_EL1, ERXADDR_EL1, ERXCTLR_EL1, ERXMISC0_EL1, ERXMISC1_EL1, and ERXSTATUS_EL1.
- MRS accesses to ERRIDR_EL1 and ERXFR_EL1.
- If FEAT_RASv1p1 is implemented, MRS and MSR accesses to ERXMISC2_EL1 and ERXMISC3_EL1.
- If FEAT_RASv2 is implemented, MRS accesses to ERXGSR_EL1.

In AArch32 state, the instructions affected by this control are:

- MRC and MCR accesses to ERRSELR, ERXADDR, ERXADDR2, ERXCTLR, ERXCTLR2, ERXMISC0, ERXMISC1, ERXMISC2, ERXMISC3, and ERXSTATUS.
- MRC accesses to ERRIDR, ERXFR, and ERXFR2.
- If FEAT_RASv1p1 is implemented, MRC and MCR accesses to ERXMISC4, ERXMISC5, ERXMISC6, and ERXMISC7.

Unless the instruction generates a higher priority exception, trapped instructions generate an exception to EL3.

Trapped AArch64 instructions are reported using EC syndrome value 0x18.

Trapped AArch32 instructions are reported using EC syndrome value 0x03.

Accessing this field has the following behavior:

- This field is permitted to be RES0 if all of the following are true:
  - ERRSELR_EL1 and all ERX* registers are implemented as UNDEFINED or RAZ/WI.
  - ERRIDR_EL1.NUM is zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TLOR, bit [14]
When FEAT_LOR is implemented:

Trap LOR registers. Traps Non-secure and Realm accesses to the LORSA_EL1, LOREA_EL1, LORN_EL1, LORC_EL1, and LORID_EL1 registers from EL1 and EL2 to EL3, unless the access has been trapped to EL2.

TLOR	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Non-secure and Realm EL1 and EL2 accesses to the LOR registers that are not UNDEFINED are trapped to EL3, unless it is trapped by HCR_EL2.TLOR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWE, bit [13]

Traps EL2, EL1, and EL0 execution of WFE instructions to EL3, from any Security state and both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

TWE	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFE instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWE, HCR.TWE, SCTLR_EL1.nTWE, SCTLR_EL2.nTWE, or HCR_EL2.TWE.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFE instructions can cause the PE to enter a low-power state, see 'Wait for Event mechanism and Send event'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TWI, bit [12]

Traps EL2, EL1, and EL0 execution of WFI instructions to EL3, from any Security state and both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

TWI	Meaning
0b0	This control does not cause any instructions to be trapped.
0b1	Any attempt to execute a WFI instruction at any Exception level lower than EL3 is trapped to EL3, if the instruction would otherwise have caused the PE to enter a low-power state and it is not trapped by SCTLR.nTWI, HCR.TWI, SCTLR_EL1.nTWI, SCTLR_EL2.nTWI, or HCR_EL2.TWI.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

For more information about when WFI instructions can cause the PE to enter a low-power state, see 'Wait for Interrupt'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ST, bit [11]

Traps Secure EL1 accesses to the Counter-timer Physical Secure timer registers to EL3, from AArch64 state only, reported using EC syndrome value 0x18.

ST	Meaning
0b0	Secure EL1 using AArch64 accesses to the CNTPS_TVAL_EL1, CNTPS_CTL_EL1, and CNTPS_CVAL_EL1 are trapped to EL3 when Secure EL2 is disabled. If Secure EL2 is enabled, the behavior is as if the value of this field was 0b1.
0b1	This control does not cause any instructions to be trapped.

Note

Accesses to the Counter-timer Physical Secure timer registers are always enabled at EL3. These registers are not accessible at EL0.

When FEAT_RME is implemented and Secure state is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

RW, bit [10]
When FEAT_AA32EL1 is implemented:

Execution state control for lower Exception levels.

RW	Meaning
0b0	All lower Exception levels are using AArch32.
0b1	The next lower Exception level is using AArch64: • If EL2 is implemented and enabled in the Security state determined by SCR_EL3.{NSE,NS}, then EL2 is using AArch64 and EL2 controls the Execution state for EL1. • If EL2 is not implemented or EL2 is disabled in the Security state determined by SCR_EL3.{NSE,NS}, then EL1 is using AArch64. When executing at EL0, if the next higher Exception level is using AArch64, then the Execution state is determined by PSTATE.nRW. Otherwise, EL0 uses AArch32.

If any of the following apply, then the Effective value of this bit is 1:

- EL2 is implemented and does not support AArch32, and SCR_EL3.NS is 1.
- The Effective value of SCR_EL3.{EEL2,NS} is {1,0}.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RAO/WI.

SIF, bit [9]

Secure instruction fetch. When the PE is in Secure state, this bit disables instruction execution from memory marked in the first stage of translation as being Non-secure.

SIF	Meaning
0b0	Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is permitted.
0b1	Secure state instruction execution from memory marked in the first stage of translation as being Non-secure is not permitted.

When FEAT_RME is implemented and Secure state is not implemented, this bit is RES0.

When FEAT_PAN3 is implemented, it is IMPLEMENTATION DEFINED whether SCR_EL3.SIF is also used to determine instruction access permission for the purpose of PAN.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

HCE, bit [8]

Hypervisor Call instruction enable. Enables HVC instructions at EL3 and, if EL2 is enabled in the current Security state, at EL2 and EL1, in both Execution states, reported using EC syndrome value 0x00.

HCE	Meaning
0b0	HVC instructions are UNDEFINED.
0b1	HVC instructions are enabled at EL3, EL2, and EL1.

Note

HVC instructions are always UNDEFINED at EL0 and, if Secure EL2 is disabled, at Secure EL1. Any resulting exception is taken from the current Exception level to the current Exception level.

If EL2 is not implemented, this bit is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SMD, bit [7]

Secure Monitor Call disable. Disables SMC instructions at EL1 and above, from any Security state and both Execution states, reported using EC syndrome value 0x00.

SMD	Meaning
0b0	SMC instructions are enabled at EL3, EL2 and EL1.
0b1	SMC instructions are UNDEFINED.

Note

SMC instructions are always UNDEFINED at EL0. Any resulting exception is taken from the current Exception level to the current Exception level.

If HCR_EL2.TSC or HCR.TSC traps attempted EL1 execution of SMC instructions to EL2, that trap has priority over this disable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [6]

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

EA, bit [3]

External Abort and SError exception routing.

EA	Meaning
0b0	When executing at Exception levels below EL3, External aborts and SError exceptions are not taken to EL3. In addition, when executing at EL3: • SError exceptions are not taken. • External aborts are taken to EL3.
0b1	When executing at any Exception level, External aborts and SError exceptions are taken to EL3.

This field has no effect on the routing of virtual or delegated SError exceptions.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

FIQ, bit [2]

Physical FIQ Routing.

FIQ	Meaning
0b0	When executing at Exception levels below EL3, physical FIQ interrupts are not taken to EL3. When executing at EL3, physical FIQ interrupts are not taken.
0b1	When executing at any Exception level, physical FIQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRQ, bit [1]

Physical IRQ Routing.

IRQ	Meaning
0b0	When executing at Exception levels below EL3, physical IRQ interrupts are not taken to EL3. When executing at EL3, physical IRQ interrupts are not taken.
0b1	When executing at any Exception level, physical IRQ interrupts are taken to EL3.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

NS, bit [0]
When FEAT_RME is implemented:

Non-secure bit. This field is used in combination with SCR_EL3.NSE to select the Security state of EL2 and lower Exception levels.

NSE	NS	Meaning
0b0	0b0	Secure.
0b0	0b1	Non-secure.
0b1	0b0	Reserved.
0b1	0b1	Realm.

When Secure state is not implemented, SCR_EL3.NS is RES1 and its Effective value is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Non-secure bit.

NS	Meaning
0b0	Indicates that EL0 and EL1 are in Secure state. When FEAT_SEL2 is implemented and SCR_EL3.EEL2 == 1, then EL2 is using AArch64 and in Secure state.
0b1	Indicates that Exception levels lower than EL3 are in Non-secure state, so memory accesses from those Exception levels cannot access Secure memory.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SCR_EL3();
end;
```

MSR SCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0001	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    SCR_EL3() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

SCTLR2_EL1, System Control Register (EL1)

The SCTLR2_EL1 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL1 and EL0.

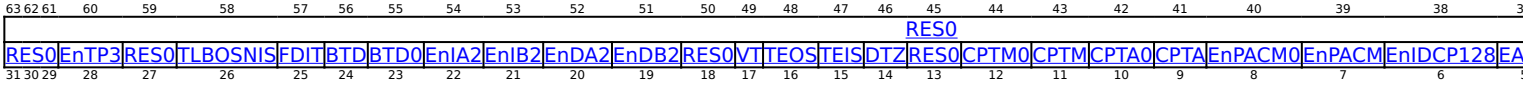
Configuration

This register is present only when FEAT_SCTLR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2_EL1 are UNDEFINED.

Attributes

SCTLR2_EL1 is a 64-bit register.

Field descriptions



Bits [63:29]

Reserved, RES0.

EnTP3, bit [28]
When FEAT_S1POE2 is implemented:

Traps instructions executed at EL0 that access TPIDR3_EL0 to EL1.

The exception is reported using EC syndrome value 0x18.

EnTP3	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnTP3 == '1'.

Otherwise:

Reserved, RES0.

Bit [27]

Reserved, RES0.

TLBOSNIS, bit [26]
When FEAT_TLBID is implemented:

TLBI for Outer shareable excludes Inner shareable.

This control applies to TLBI OS instructions executed at EL1.

TLBOSNIS	Meaning
0b0	TLBI OS instructions affect TLBs in the Inner and Outer shareability domains.
0b1	TLBI OS instructions affect TLBs in the Outer shareability domain, but not in the Inner shareability domain.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.TLBOSNIS == '1'.

Otherwise:

Reserved, RES0.

FDIT, bit [25]
When FEAT_FDIT is implemented:

Enforce data-independent timing for execution at EL0.

FDIT	Meaning
0b0	This control does not affect data-independent timing of execution.
0b1	Data-independent timing of execution is enforced.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.FDIT == '1'.

Otherwise:

Reserved, RES0.

BTD, bit [24]
When FEAT_PAuth_EnhCtl is implemented:

Controls the implicit BTI behavior of the following instructions at EL1:

- PACIASP and PACIBSP

BTD	Meaning
0b0	The implicit BTI behavior of the instructions is unaffected.
0b1	When the instructions are executed, they have no implicit BTI behavior.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.BTD == '1'.

Otherwise:

Reserved, RES0.

BTD0, bit [23]
When FEAT_PAuth_EnhCtl is implemented:

Controls the implicit BTI behavior of the following instructions at EL0 in the EL1&0 translation regime:

- PACIASP and PACIBSP

BTD0	Meaning
0b0	The implicit BTI behavior of the instructions is unaffected.
0b1	When the instructions are executed, they have no implicit BTI behavior.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.BTD0 == '1'.

Otherwise:

Reserved, RES0.

EnIA2, bit [22]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses using the APIAKey_EL1 key, at EL0 in the EL1&0 translation regime. This field is used in conjunction with SCTLR_EL1.EnIA as follows:

EnIA2	EnIA	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnIA2 == '1'.

Otherwise:

Reserved, RES0.

EnIB2, bit [21]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses using the APIBKey_EL1 key, at EL0 in the EL1&0 translation regime. This field is used in conjunction with SCTLR_EL1.EnIB as follows:

EnIB2	EnIB	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnIB2 == '1'.

Otherwise:

Reserved, RES0.

EnDA2, bit [20]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses using the APDAKey_EL1 key, at EL0 in the EL1&0 translation regime. This field is used in conjunction with SCTLR_EL1.EnDA as follows:

EnDA2	EnDA	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnDA2 == '1'.

Otherwise:

Reserved, RES0.

EnDB2, bit [19]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses using the APDBKey_EL1 key, at EL0 in the EL1&0 translation regime. This field is used in conjunction with SCTLR_EL1.EnDB as follows:

EnDB2	EnDB	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnDB2 == '1'.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

VT, bit [17]
When FEAT_VMTE is implemented:

Select Virtual Tagging at EL1 and EL0.

VT	Meaning
0b0	Physical tagging is selected at EL1 and EL0.
0b1	Virtual tagging is selected at EL1 and EL0.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect at EL0.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

Note

Memory tagging at EL1 and EL0 is enabled by the use of SCTLR_EL1.ATA and SCTLR_EL1.ATA0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.VT == '1'.

Otherwise:

Reserved, RES0.

TEOS, bit [16]
When FEAT_TEV is implemented:

Exception returns generated by a TEXIT are context-synchronizing events.

TEOS	Meaning
0b0	The exception return generated by a TEXIT instruction is not a context-synchronizing event.
0b1	The exception return generated by a TEXIT instruction is a context-synchronizing event.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.TEOS == '1'.

Otherwise:

Reserved, RES0.

TEIS, bit [15]
When FEAT_TEV is implemented:

TENTER exceptions are context-synchronizing events.

TEIS	Meaning
0b0	The exception entry for a TENTER exception is not a context-synchronizing event.
0b1	The exception entry for a TENTER exception is a context-synchronizing event.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.TEIS == '1'.

Otherwise:

Reserved, RES0.

DTZ, bit [14]
When FEAT_S1POE2 is implemented:

Default TIndex value of zero on exception entry.

DTZ	Meaning
0b0	TINDEX_EL1 is unchanged by this control on exception entry.
0b1	TINDEX_EL1 is set to zero on exception entry.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

If FEAT_TEV is implemented and VBAR_EL1.UT is 1, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.DTZ == '1'.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

CPTM0, bit [12]
When FEAT_CPA2 is implemented:

This field controls unprivileged Checked Pointer Arithmetic for Multiplication.

CPTM0	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

If the Effective value of SCTLR2_EL1.CPTA0 is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.CPTM0 == '1'.

Otherwise:

Reserved, RES0.

CPTM, bit [11]
When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Multiplication at EL1.

CPTM	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

If the Effective value of SCTLR2_EL1.CPTA is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.CPTM == '1'.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]
When FEAT_CPA2 is implemented:

This field controls unprivileged Checked Pointer Arithmetic for Addition.

CPTA0	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.CPTA0 == '1'.

Otherwise:

Reserved, RES0.

CPTA, bit [9]
When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Addition at EL1.

CPTA	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.CPTA == '1'.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]
When FEAT_PAuth_LR is implemented:

PACM Enable at EL0. Controls the effect of a PACM instruction at EL0.

EnPACM0	Meaning
0b0	The effects of PACM are disabled at EL0.
0b1	A PACM instruction at EL0 causes PSTATE.PACM to be set to 0b1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.PACMEn == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnPACM0 == '1'.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

PACM Enable at EL1. Controls the effect of a PACM instruction at EL1.

EnPACM	Meaning
0b0	The effects of PACM are disabled at EL1.
0b1	A PACM instruction at EL1 causes PSTATE.PACM to be set to 0b1.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.PACMEn == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnPACM == '1'.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]
When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL1 using an ESR_EL1.EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL1.
0b1	No accesses are trapped by this control.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnIDCP128 == '1'.

Otherwise:

Reserved, RES0.

EASE, bit [5]
When FEAT_DoubleFault2 is implemented:

External Aborts to SError exception vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL1 are taken to the appropriate synchronous exception vector offset from VBAR_EL1.
0b1	Synchronous External abort exceptions taken to EL1 are taken to the appropriate SError exception vector offset from VBAR_EL1.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EASE == '1'.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]
When FEAT_ANERR is implemented:

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External aborts on Normal memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.
0b1	External aborts on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL1.EnANERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.EnSNERR is 1.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ADERR is implemented.
- ID_AA64MMFR3_EL1.ANERR reads as 0b0010.
- SCTLR2_EL1.EnADERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnANERR == '1'.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]
When FEAT_ADERR is implemented:

Enable Asynchronous Device Read Error.

EnADERR	Meaning
0b0	External aborts on Device memory reads generate synchronous Data Abort exceptions in the EL1&0 translation regime.
0b1	External aborts on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL1&0 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL1.EnADERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.EnSDERR is 1.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ANERR is implemented.
- ID_AA64MMFR3_EL1.ADERR reads as 0b0010.
- SCTLR2_EL1.EnANERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.EnADERR == '1'.

Otherwise:

Reserved, RES0.

NMEA, bit [2]
When FEAT_DoubleFault2 is implemented:

Non-maskable External Aborts. Controls whether PSTATE.A masks physical SError exceptions at EL1.

NMEA	Meaning
0b0	Physical SError exceptions are not taken at EL1 if PSTATE.A == 1, unless routed to a higher Exception level.
0b1	Physical SError exceptions are taken at EL1 regardless of the value of PSTATE.A, unless routed to a higher Exception level.

This field has no effect on the masking of virtual and delegated SError interrupts.

This field is ignored by the PE and treated as zero when any of the following are true:

- EL3 is implemented and SCR_EL3.SCTLR2En == 0.
- EL2 is implemented and enabled in the current Security state and the Effective value of HCRX_EL2.SCTLR2En is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLR2MASK_EL1.NMEA == '1'.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing SCTLR2_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLR2_EL1 or SCTLR2_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR2_EL1 are masked by SCTLR2MASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2_EL1

SCTLR2_EL2, System Control Register (EL2)

The SCTLR2_EL2 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, these controls also apply to execution at EL0.

Configuration

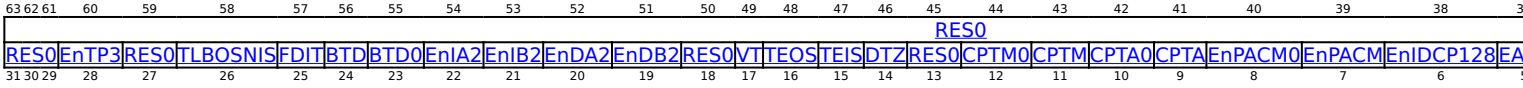
This register is present only when FEAT_SCTLR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR2_EL2 is a 64-bit register.

Field descriptions



Bits [63:29]

Reserved, RES0.

EnTP3, bit [28]
When FEAT_S1POE2 is implemented:

Traps instructions executed at EL0 that access TPIDR3_EL0 to EL2.

The exception is reported using EC syndrome value 0x18.

EnTP3	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnTP3 == '1'.

Otherwise:

Reserved, RES0.

Bit [27]

Reserved, RES0.

TLBOSNIS, bit [26]
When FEAT_TLBID is implemented:

TLBI for Outer shareable excludes Inner shareable.

This control applies to TLBI OS instructions executed at EL2.

TLBOSNIS	Meaning
0b0	TLBI OS instructions affect TLBs in the Inner and Outer shareability domains.
0b1	TLBI OS instructions affect TLBs in the Outer shareability domain, but not in the Inner shareability domain.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.TLBOSNIS == '1'.

Otherwise:

Reserved, RES0.

FDIT, bit [25]
When FEAT_FDIT is implemented:

Enforce data-independent timing for execution at EL0.

FDIT	Meaning
0b0	This control does not affect data-independent timing of execution.
0b1	Data-independent timing of execution is enforced.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

If HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.FDIT == '1'.

Otherwise:

Reserved, RES0.

BTD, bit [24]
When FEAT_PAuth_EnhCtl is implemented:

Controls the implicit BTI behavior of the following instructions at EL2:

- PACIASP and PACIBSP

BTD	Meaning
0b0	The implicit BTI behavior of the instructions is unaffected.
0b1	When the instructions are executed, they have no implicit BTI behavior.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.BTD == '1'.

Otherwise:

Reserved, RES0.

BTD0, bit [23]
When FEAT_PAuth_EnhCtl is implemented:

Controls the implicit BTI behavior of the following instructions at EL0 in the EL2&0 translation regime:

- PACIASP and PACIBSP

BTD0	Meaning
0b0	The implicit BTI behavior of the instructions is unaffected.
0b1	When the instructions are executed, they have no implicit BTI behavior.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.BTD0 == '1'.

Otherwise:

Reserved, RES0.

EnIA2, bit [22]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses using the APIAKey_EL1 key, at EL0 in the EL2&0 translation regime. This field is used in conjunction with SCTLR_EL2.EnIA as follows:

EnIA2	EnIA	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnIA2 == '1'.

Otherwise:

Reserved, RES0.

EnIB2, bit [21]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses using the APIBKey_EL1 key, at EL0 in the EL2&0 translation regime. This field is used in conjunction with SCTLR_EL2.EnIB as follows:

EnIB2	EnIB	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnIB2 == '1'.

Otherwise:

Reserved, RES0.

EnDA2, bit [20]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses using the APDAKey_EL1 key, at EL0 in the EL2&0 translation regime. This field is used in conjunction with SCTLR_EL2.EnDA as follows:

EnDA2	EnDA	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnDA2 == '1'.

Otherwise:

Reserved, RES0.

EnDB2, bit [19]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses using the APDBKey_EL1 key, at EL0 in the EL2&0 translation regime. This field is used in conjunction with SCTLR_EL2.EnDB as follows:

EnDB2	EnDB	Behavior at EL0
0b0	0b0	Disabled
0b0	0b1	Enabled
0b1	0b0	Enabled
0b1	0b1	Disabled

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnDB2 == '1'.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

VT, bit [17]
When FEAT_VMTE is implemented:

Select Virtual Tagging at EL2 and EL0.

VT	Meaning
0b0	Physical tagging is selected at EL2 and EL0.
0b1	Virtual tagging is selected at EL2 and EL0.

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this bit has no effect at EL0.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

Note

Memory tagging is enabled at EL2 and EL0 by the use of SCTLR_EL2.ATA and SCTLR_EL2.ATA0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.VT == '1'.

Otherwise:

Reserved, RES0.

TEOS, bit [16]
When FEAT_TEV is implemented:

Exception returns generated by a TEXIT are context-synchronizing events.

TEOS	Meaning
0b0	The exception return generated by a TEXIT instruction is not a context-synchronizing event.
0b1	The exception return generated by a TEXIT instruction is a context-synchronizing event.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.TEOS == '1'.

Otherwise:

Reserved, RES0.

TEIS, bit [15]
When FEAT_TEV is implemented:

TENTER exceptions are context-synchronizing events.

TEIS	Meaning
0b0	The exception entry for a TENTER exception is not a context-synchronizing event.
0b1	The exception entry for a TENTER exception is a context-synchronizing event.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.TEIS == '1'.

Otherwise:

Reserved, RES0.

DTZ, bit [14]
When FEAT_S1POE2 is implemented:

Default TIndex value of zero on exception entry.

DTZ	Meaning
0b0	TINDEX_EL2 is unchanged by this control on exception entry.
0b1	TINDEX_EL2 is set to zero on exception entry.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

If FEAT_TEV is implemented and VBAR_EL2.UT is 1, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.DTZ == '1'.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

CPTM0, bit [12]
When FEAT_CPA2 is implemented and EffectiveHCR_EL2_E2H() == '1':

This field controls unprivileged Checked Pointer Arithmetic for Multiplication.

CPTM0	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

If HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

If the Effective value of SCTLR2_EL2.CPTA0 is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.CPTM0 == '1'.

Otherwise:

Reserved, RES0.

CPTM, bit [11]
When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Multiplication at EL2.

CPTM	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

If the Effective value of SCTLR2_EL2.CPTA is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.CPTM == '1'.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]
When FEAT_CPA2 is implemented and EffectiveHCR_EL2_E2H() == '1':

This field controls unprivileged Checked Pointer Arithmetic for Addition.

CPTA0	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

If HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.CPTA0 == '1'.

Otherwise:

Reserved, RES0.

CPTA, bit [9]
When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Addition at EL2.

CPTA	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.CPTA == '1'.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]
When FEAT_PAuth_LR is implemented and EffectiveHCR_EL2_E2H() == '1':

PACM Enable at EL0. Controls the effect of a PACM instruction at EL0.

EnPACM0	Meaning
0b0	The effects of PACM are disabled at EL0.
0b1	A PACM instruction at EL0 causes PSTATE.PACM to be set to 0b1.

If HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnPACM0 == '1'.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

PACM Enable at EL2. Controls the effect of a PACM instruction at EL2.

EnPACM	Meaning
0b0	The effects of PACM are disabled at EL2.
0b1	A PACM instruction at EL2 causes PSTATE.PACM to be set to 0b1.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnPACM == '1'.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]
When FEAT_SYSREG128 is implemented:

Enables access to IMPLEMENTATION DEFINED 128-bit System registers.

EnIDCP128	Meaning
0b0	Accesses at EL0 to IMPLEMENTATION DEFINED 128-bit System registers are trapped to EL2 using an ESR_EL2.EC value of 0x14, unless the access generates a higher priority exception. Disables the functionality of the 128-bit IMPLEMENTATION DEFINED System registers that are accessible at EL2.
0b1	No accesses are trapped by this control.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnIDCP128 == '1'.

Otherwise:

Reserved, RES0.

EASE, bit [5]
When FEAT_DoubleFault2 is implemented:

External Aborts to SError exception vector.

EASE	Meaning
0b0	Synchronous External abort exceptions taken to EL2 are taken to the appropriate synchronous exception vector offset from VBAR_EL2.
0b1	Synchronous External abort exceptions taken to EL2 are taken to the appropriate SError exception vector offset from VBAR_EL2.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.

- Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EASE == '1'.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]
When FEAT_ANERR is implemented:

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External aborts on Normal memory reads generate synchronous Data Abort exceptions in the EL2 and EL2&0 translation regimes.
0b1	External aborts on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL2 and EL2&0 translation regimes.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL2.EnANERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Normal memory reads.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ADERR is implemented.
- ID_AA64MMFR3_EL1.ANERR reads as 0b0010.
- SCTLR2_EL2.EnADERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnANERR == '1'.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]
When FEAT_ADERR is implemented:

Enable Asynchronous Device Read Error.

EnADERR	Meaning
0b0	External aborts on Device memory reads generate synchronous Data Abort exceptions in the EL2 and EL2&0 translation regimes.
0b1	External aborts on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL2 and EL2&0 translation regimes.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL2.EnADERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Device memory reads.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

Otherwise, this field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ANERR is implemented.
- ID_AA64MMFR3_EL1.ADERR reads as 0b0010.
- SCTLR2_EL2.EnANERR is 1.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EnADERR == '1'.

Otherwise:

Reserved, RES0.

NMEA, bit [2]
When FEAT_DoubleFault2 is implemented:

Non-maskable External Aborts. Controls whether physical SError exceptions are masked at EL2 when PSTATE.A is 1 or HCR_EL2.{AMO, TGE} is {0, 0}.

NMEA	Meaning
0b0	The masking of physical SError exceptions at EL2 is unaffected by this mechanism.
0b1	Physical SError exceptions are taken at EL2 regardless of whether they are masked by any mechanism, unless they are routed to EL3.

This field has no effect on the masking of delegated SError interrupts.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

For more information, see 'Asynchronous exception routing'.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.NMEA == '1'.

Otherwise:

Reserved, RES0.

EMEC, bit [1]
When FEAT_MEC is implemented:

Enables MEC. When enabled, memory accesses to the Realm physical address space are associated with a MECID.

EMEC	Meaning
0b0	MEC is not enabled for the Realm physical address space.
0b1	MEC is enabled for the Realm physical address space.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.SCTLR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLR2MASK_EL2.EMEC == '1'.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLR2_EL2 or SCTLR2_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR2_EL2 are masked by SCTLR2MASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b011

```
if !(IsFeatureImplemented(FEAT_SCTLR2) && IsFeatureImplemented(FEAT_AA64)) then

SCTLR2_EL3, System Control Register (EL3)

The SCTLR2_EL3 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL3.

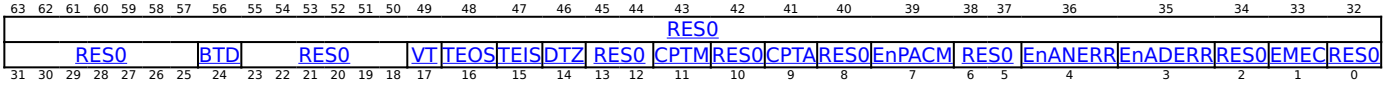
Configuration

This register is present only when FEAT_SCTLR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2_EL3 are UNDEFINED.

Attributes

SCTLR2_EL3 is a 64-bit register.

Field descriptions



Bits [63:25]

Reserved, RES0.

BTD, bit [24]
When FEAT_PAuth_EnhCtl is implemented:

Controls the implicit BTI behavior of the following instructions at EL3:

- PACIASP and PACIBSP

BTD	Meaning
0b0	The implicit BTI behavior of the instructions is unaffected.
0b1	When the instructions are executed, they have no implicit BTI behavior.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [23:18]

Reserved, RES0.

VT, bit [17]
When FEAT_VMTE is implemented:

Select Virtual Tagging at EL3.

VT	Meaning
0b0	Physical tagging is selected at EL3.
0b1	Virtual tagging is selected at EL3.

Note

Memory tagging is enabled at EL3 by the use of SCTLR_EL3.ATA.

The reset behavior of this field is:

- On a Warm reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

TEOS, bit [16]
When FEAT_TEV is implemented:

Exception returns generated by a TEXIT are context-synchronizing events.

TEOS	Meaning
0b0	The exception return generated by a TEXIT instruction is not a context-synchronizing event.
0b1	The exception return generated by a TEXIT instruction is a context-synchronizing event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TEIS, bit [15]
When FEAT_TEV is implemented:

TENTER exceptions are context-synchronizing events.

TEIS	Meaning
0b0	The exception entry for a TENTER exception is not a context-synchronizing event.
0b1	The exception entry for a TENTER exception is a context-synchronizing event.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DTZ, bit [14]
When FEAT_S1POE2 is implemented:

Default TIndex value of zero on exception entry.

DTZ	Meaning
0b0	TINDEX_EL3 is unchanged by this control on exception entry.
0b1	TINDEX_EL3 is set to zero on exception entry.

If FEAT_TEV is implemented and VBAR_EL3.UT is 1, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

CPTM, bit [11]
When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Multiplication at EL3.

CPTM	Meaning
0b0	Pointer Arithmetic for Multiplication is not checked.
0b1	Pointer Arithmetic for Multiplication is checked.

If the Effective value of SCTLR2_EL3.CPTA is 0, then the Effective value of this field is 0.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [10]

Reserved, RES0.

CPTA, bit [9]
When FEAT_CPA2 is implemented:

This field controls Checked Pointer Arithmetic for Addition at EL3.

CPTA	Meaning
0b0	Pointer Arithmetic for Addition is not checked.
0b1	Pointer Arithmetic for Addition is checked.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [8]

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

PACM Enable at EL3. Controls the effect of a PACM instruction at EL3.

EnPACM	Meaning
0b0	The effects of PACM are disabled at EL3.
0b1	A PACM instruction at EL3 causes PSTATE.PACM to be set to 0b1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [6:5]

Reserved, RES0.

EnANERR, bit [4]
When FEAT_ANERR is implemented:

Enable Asynchronous Normal Read Error.

EnANERR	Meaning
0b0	External aborts on Normal memory reads generate synchronous Data Abort exceptions in the EL3 translation regime.
0b1	External aborts on Normal memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL3 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Normal memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL3.EnANERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Normal memory reads.

This field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ADERR is implemented.
- ID_AA64MMFR3_EL1.ANERR reads as 0b0010.
- SCTLR2_EL3.EnADERR is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]
When FEAT_ADERR is implemented:

Enable Asynchronous Device Read Error.

EnADERR	Meaning
0b0	External aborts on Device memory reads generate synchronous Data Abort exceptions in the EL3 translation regime.
0b1	External aborts on Device memory reads generate synchronous Data Abort or asynchronous SError exceptions in the EL3 translation regime.

Implementation-specific exceptions to applications of this field are described in 'Taking error exceptions'.

Setting this field to 0 does not guarantee that the PE is able to take a synchronous Data Abort exception for an External abort on a Device memory read in every case. There might be implementation-specific circumstances when an error on a load cannot be taken synchronously. These circumstances should be rare enough that treating such occurrences as fatal does not cause a significant increase in failure rate.

If FEAT_SVE is implemented, SCTLR2_EL3.EnADERR is 0, and the access generating the External abort is due to any Active element of an SVE Non-fault vector load instruction or an Active element that is not the First active element of an SVE First-fault vector load instruction, then no exception is generated and the External abort is reported in the FFR.

Setting this field to 0 might have a performance impact for Device memory reads.

This field is ignored by the PE and treated as one when all of the following are true:

- FEAT_ANERR is implemented.
- ID_AA64MMFR3_EL1.ADERR reads as 0b0010.
- SCTLR2_EL3.EnANERR is 1.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

EMEC, bit [1]
When FEAT_MEC is implemented:

Enables MEC. When enabled, memory accesses to the Realm physical address space are associated with MECID_RL_A_EL3.

EMEC	Meaning
0b0	MEC is not enabled for the Realm physical address space.
0b1	MEC is enabled for the Realm physical address space.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2_EL3

        AArch64_SystemAccessTrap(EL3, 0x18);
    else
        SCTLR2_EL3() = X{64}(t);
    end;
end;
```

2025-12-10 16:11:30, 2025-12_rel

SCTLR2MASK_EL1, Extended System Control Masking Register (EL1)

The SCTLR2MASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR2_EL1 on writes to SCTLR2_EL1 or SCTLR2ALIAS_EL1.

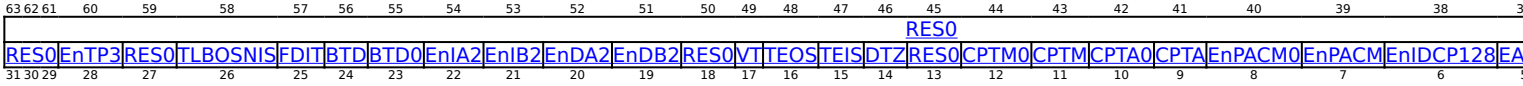
Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2MASK_EL1 are UNDEFINED.

Attributes

SCTLR2MASK_EL1 is a 64-bit register.

Field descriptions



Bits [63:29]

Reserved, RES0.

EnTP3, bit [28]
When FEAT_S1POE2 is implemented:

Mask bit for EnTP3.

EnTP3	Meaning
0b0	SCTLR2_EL1.EnTP3 is writeable.
0b1	SCTLR2_EL1.EnTP3 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [27]

Reserved, RES0.

TLBOSNIS, bit [26]
When FEAT_TLBID is implemented:

Mask bit for TLBOSNIS.

TLBOSNIS	Meaning
0b0	SCTLR2_EL1.TLBOSNIS is writeable.
0b1	SCTLR2_EL1.TLBOSNIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FDIT, bit [25]
When FEAT_FDIT is implemented:

Mask bit for FDIT.

FDIT	Meaning
0b0	SCTLR2_EL1.FDIT is writeable.
0b1	SCTLR2_EL1.FDIT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTD, bit [24]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for BTD.

BTD	Meaning
0b0	SCTLR2_EL1.BTD is writeable.
0b1	SCTLR2_EL1.BTD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTD0, bit [23]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for BTD0.

BTD0	Meaning
0b0	SCTLR2_EL1.BTD0 is writeable.
0b1	SCTLR2_EL1.BTD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA2, bit [22]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnIA2.

EnIA2	Meaning
0b0	SCTLR2_EL1.EnIA2 is writeable.
0b1	SCTLR2_EL1.EnIA2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB2, bit [21]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnIB2.

EnIB2	Meaning
0b0	SCTLR2_EL1.EnIB2 is writeable.
0b1	SCTLR2_EL1.EnIB2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDA2, bit [20]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnDA2.

EnDA2	Meaning
0b0	SCTLR2_EL1.EnDA2 is writeable.
0b1	SCTLR2_EL1.EnDA2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDB2, bit [19]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnDB2.

EnDB2	Meaning
0b0	SCTLR2_EL1.EnDB2 is writeable.
0b1	SCTLR2_EL1.EnDB2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

VT, bit [17]
When FEAT_VMTE is implemented:

Mask bit for VT.

VT	Meaning
0b0	SCTLR2_EL1.VT is writeable.
0b1	SCTLR2_EL1.VT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TEOS, bit [16]
When FEAT_TEV is implemented:

Mask bit for TEOS.

TEOS	Meaning
0b0	SCTLR2_EL1.TEOS is writeable.
0b1	SCTLR2_EL1.TEOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TEIS, bit [15]
When FEAT_TEV is implemented:

Mask bit for TEIS.

TEIS	Meaning
0b0	SCTLR2_EL1.TEIS is writeable.
0b1	SCTLR2_EL1.TEIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DTZ, bit [14]
When FEAT_S1POE2 is implemented:

Mask bit for DTZ.

DTZ	Meaning
0b0	SCTLR2_EL1.DTZ is writeable.
0b1	SCTLR2_EL1.DTZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

CPTM0, bit [12]
When FEAT_CPA2 is implemented:

Mask bit for CPTM0.

CPTM0	Meaning
0b0	SCTLR2_EL1.CPTM0 is writeable.
0b1	SCTLR2_EL1.CPTM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTM, bit [11]
When FEAT_CPA2 is implemented:

Mask bit for CPTM.

CPTM	Meaning
0b0	SCTLR2_EL1.CPTM is writeable.
0b1	SCTLR2_EL1.CPTM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]
When FEAT_CPA2 is implemented:

Mask bit for CPTA0.

CPTA0	Meaning
0b0	SCTLR2_EL1.CPTA0 is writeable.
0b1	SCTLR2_EL1.CPTA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA, bit [9]
When FEAT_CPA2 is implemented:

Mask bit for CPTA.

CPTA	Meaning
0b0	SCTLR2_EL1.CPTA is writeable.
0b1	SCTLR2_EL1.CPTA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]
When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM0.

EnPACM0	Meaning
0b0	SCTLR2_EL1.EnPACM0 is writeable.
0b1	SCTLR2_EL1.EnPACM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM.

EnPACM	Meaning
0b0	SCTLR2_EL1.EnPACM is writeable.
0b1	SCTLR2_EL1.EnPACM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]
When FEAT_SYSREG128 is implemented:

Mask bit for EnIDCP128.

EnIDCP128	Meaning
0b0	SCTLR2_EL1.EnIDCP128 is writeable.
0b1	SCTLR2_EL1.EnIDCP128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EASE, bit [5]
When FEAT_DoubleFault2 is implemented:

Mask bit for EASE.

EASE	Meaning
0b0	SCTLR2_EL1.EASE is writeable.
0b1	SCTLR2_EL1.EASE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]
When FEAT_ANERR is implemented:

Mask bit for EnANERR.

EnANERR	Meaning
0b0	SCTLR2_EL1.EnANERR is writeable.
0b1	SCTLR2_EL1.EnANERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]
When FEAT_ADERR is implemented:

Mask bit for EnADERR.

EnADERR	Meaning
0b0	SCTLR2_EL1.EnADERR is writeable.
0b1	SCTLR2_EL1.EnADERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [2]
When FEAT_DoubleFault2 is implemented:

Mask bit for NMEA.

NMEA	Meaning
0b0	SCTLR2_EL1.NMEA is writeable.
0b1	SCTLR2_EL1.NMEA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [1:0]

Reserved, RES0.

Accessing SCTLR2MASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLR2MASK_EL1 or SCTLR2MASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2MASK_EL1

SCTLR2MASK_EL2, Extended System Control Masking Register (EL2)

The SCTLR2MASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR2_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR2MASK_EL2 are UNDEFINED.

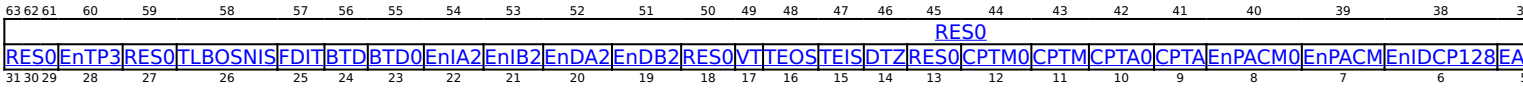
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR2MASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:29]

Reserved, RES0.

EnTP3, bit [28]
When FEAT_S1POE2 is implemented:

Mask bit for EnTP3.

EnTP3	Meaning
0b0	SCTLR2_EL2.EnTP3 is writeable.
0b1	SCTLR2_EL2.EnTP3 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [27]

Reserved, RES0.

TLBOSNIS, bit [26]
When FEAT_TLBID is implemented:

Mask bit for TLBOSNIS.

TLBOSNIS	Meaning
0b0	SCTLR2_EL2.TLBOSNIS is writeable.
0b1	SCTLR2_EL2.TLBOSNIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FDIT, bit [25]
When FEAT_FDIT is implemented:

Mask bit for FDIT.

FDIT	Meaning
0b0	SCTLR2_EL2.FDIT is writeable.
0b1	SCTLR2_EL2.FDIT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTD, bit [24]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for BTD.

BTD	Meaning
0b0	SCTLR2_EL2.BTD is writeable.
0b1	SCTLR2_EL2.BTD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTD0, bit [23]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for BTD0.

BTD0	Meaning
0b0	SCTLR2_EL2.BTD0 is writeable.
0b1	SCTLR2_EL2.BTD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA2, bit [22]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnIA2.

EnIA2	Meaning
0b0	SCTLR2_EL2.EnIA2 is writeable.
0b1	SCTLR2_EL2.EnIA2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB2, bit [21]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnIB2.

EnIB2	Meaning
0b0	SCTLR2_EL2.EnIB2 is writeable.
0b1	SCTLR2_EL2.EnIB2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDA2, bit [20]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnDA2.

EnDA2	Meaning
0b0	SCTLR2_EL2.EnDA2 is writeable.
0b1	SCTLR2_EL2.EnDA2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDB2, bit [19]
When FEAT_PAuth_EnhCtl is implemented:

Mask bit for EnDB2.

EnDB2	Meaning
0b0	SCTLR2_EL2.EnDB2 is writeable.
0b1	SCTLR2_EL2.EnDB2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [18]

Reserved, RES0.

VT, bit [17]
When FEAT_VMTE is implemented:

Mask bit for VT.

VT	Meaning
0b0	SCTLR2_EL2.VT is writeable.
0b1	SCTLR2_EL2.VT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TEOS, bit [16]
When FEAT_TEV is implemented:

Mask bit for TEOS.

TEOS	Meaning
0b0	SCTLR2_EL2.TEOS is writeable.
0b1	SCTLR2_EL2.TEOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TEIS, bit [15]
When FEAT_TEV is implemented:

Mask bit for TEIS.

TEIS	Meaning
0b0	SCTLR2_EL2.TEIS is writeable.
0b1	SCTLR2_EL2.TEIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DTZ, bit [14]
When FEAT_S1POE2 is implemented:

Mask bit for DTZ.

DTZ	Meaning
0b0	SCTLR2_EL2.DTZ is writeable.
0b1	SCTLR2_EL2.DTZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [13]

Reserved, RES0.

CPTM0, bit [12]
When FEAT_CPA2 is implemented:

Mask bit for CPTM0.

CPTM0	Meaning
0b0	SCTLR2_EL2.CPTM0 is writeable.
0b1	SCTLR2_EL2.CPTM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTM, bit [11]
When FEAT_CPA2 is implemented:

Mask bit for CPTM.

CPTM	Meaning
0b0	SCTLR2_EL2.CPTM is writeable.
0b1	SCTLR2_EL2.CPTM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA0, bit [10]
When FEAT_CPA2 is implemented:

Mask bit for CPTA0.

CPTA0	Meaning
0b0	SCTLR2_EL2.CPTA0 is writeable.
0b1	SCTLR2_EL2.CPTA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CPTA, bit [9]
When FEAT_CPA2 is implemented:

Mask bit for CPTA.

CPTA	Meaning
0b0	SCTLR2_EL2.CPTA is writeable.
0b1	SCTLR2_EL2.CPTA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM0, bit [8]
When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM0.

EnPACM0	Meaning
0b0	SCTLR2_EL2.EnPACM0 is writeable.
0b1	SCTLR2_EL2.EnPACM0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnPACM, bit [7]
When FEAT_PAuth_LR is implemented:

Mask bit for EnPACM.

EnPACM	Meaning
0b0	SCTLR2_EL2.EnPACM is writeable.
0b1	SCTLR2_EL2.EnPACM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIDCP128, bit [6]
When FEAT_SYSREG128 is implemented:

Mask bit for EnIDCP128.

EnIDCP128	Meaning
0b0	SCTLR2_EL2.EnIDCP128 is writeable.
0b1	SCTLR2_EL2.EnIDCP128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EASE, bit [5]
When FEAT_DoubleFault2 is implemented:

Mask bit for EASE.

EASE	Meaning
0b0	SCTLR2_EL2.EASE is writeable.
0b1	SCTLR2_EL2.EASE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnANERR, bit [4]
When FEAT_ANERR is implemented:

Mask bit for EnANERR.

EnANERR	Meaning
0b0	SCTLR2_EL2.EnANERR is writeable.
0b1	SCTLR2_EL2.EnANERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnADERR, bit [3]
When FEAT_ADERR is implemented:

Mask bit for EnADERR.

EnADERR	Meaning
0b0	SCTLR2_EL2.EnADERR is writeable.
0b1	SCTLR2_EL2.EnADERR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMEA, bit [2]
When FEAT_DoubleFault2 is implemented:

Mask bit for NMEA.

NMEA	Meaning
0b0	SCTLR2_EL2.NMEA is writeable.
0b1	SCTLR2_EL2.NMEA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EMEC, bit [1]
When FEAT_MEC is implemented:

Mask bit for EMEC.

EMEC	Meaning
0b0	SCTLR2_EL2.EMEC is writeable.
0b1	SCTLR2_EL2.EMEC is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [0]

Reserved, RES0.

Accessing SCTLR2MASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLR2MASK_EL2 or SCTLR2MASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR2MASK_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0100	0b011

SCTLR_EL1, System Control Register (EL1)

The SCTLR_EL1 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL1 and EL0.

Configuration

AArch64 System register SCTLR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SCTLR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR_EL1 are UNDEFINED.

Attributes

SCTLR_EL1 is a 64-bit register.

Field descriptions

TIDCP, bit [63]
When FEAT_TIDCP1 is implemented:

Trap IMPLEMENTATION DEFINED functionality. When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL1.

TIDCP	Meaning
0b0	No instructions accessing the System register or System instruction spaces are trapped by this mechanism.
0b1	Instructions accessing the following System register or System instruction spaces are trapped to EL1 by this mechanism: • In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped: ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYSP, with CRn == {11, 15}, and are reported using EC syndrome value 0x14. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRRS and MSRR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x14. • In AArch32 state, EL0 MCR and MRC access to the following encodings are trapped and reported using EC syndrome value 0x03: ◦ All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TIDCP == '1'.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]
When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL1.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL1.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL1.
0b1	When PSTATE.SP is 1 and execution is at EL1, an IRQ or FIQ interrupt that is targeted to EL1 is masked regardless of any indication of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.SPINTMASK == '1'.

Otherwise:

Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: • The use of the PSTATE.ALLINT interrupt mask. • IRQ and FIQ interrupts to have Superpriority as an additional attribute. • PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.NMI == '1'.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]
When FEAT_SME is implemented:

Traps instructions executed at EL0 that access TPIDR2_EL0 to EL1, or to EL2 when EL2 is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this field has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnTP2 == '1'.

Otherwise:

Reserved, RES0.

TCSO, bit [59]
When FEAT_MTE_STORE_ONLY is implemented:

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Explicit Memory Read Effects generated by instructions executed in EL1 are Tag Unchecked.

When FEAT_VMTETC is implemented the Effective value of this field is 1 if all of the following are true:

- FEAT_VMTETCL is not implemented
- SCTLR2_EL1.VT is 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TCSO == '1'.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]
When FEAT_MTE_STORE_ONLY is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, Tag Checking Store Only in EL0.

TCSO0	Meaning
0b0	This field has no effect on Tag checking.
0b1	Explicit Memory Read Effects generated by instructions executed in EL0 are Tag Unchecked.

When FEAT_VMTETC is implemented the Effective value of this field is 1 if all of the following are true:

- FEAT_VMTETCL is not implemented
- SCTLR2_EL1.VT is 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TCSO0 == '1'.

Otherwise:

Reserved, RES0.

EPAN, bit [57]
When FEAT_PAN3 is implemented:

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL1 data access to a page with stage 1 EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL1 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault as a result of PSTATE.PAN = 1 if the accesses were not speculative, will not cause an allocation into a cache. When executing at EL1, this does not prevent unprivileged speculative accesses generated from the EL0 hardware-defined context from causing allocation into a cache.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EPAN == '1'.

Otherwise:

Reserved, RES0.

EnALS, bit [56]
When FEAT_LS64 is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an LD64B or ST64B instruction at EL0 to EL1.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an LD64B or ST64B instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnALS == '1'.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV0 instruction at EL0 to EL1.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnAS0 == '1'.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented:

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, traps execution of an ST64BV instruction at EL0 to EL1.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL1.
0b1	This control does not cause any instructions to be trapped.

A trap of an ST64BV instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnASR == '1'.

Otherwise:

Reserved, RES0.

Bits [53:50]

Reserved, RES0.

TWEDEL, bits [49:46]
When FEAT_TWED is implemented:

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL1.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL1.nTWE as $2^{(TWEDEL + 8)}$ cycles.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TWEDEL == '1'.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]
When FEAT_TWED is implemented:

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL1.nTWE.

TWEDEn	Meaning
0b0	The delay for taking the trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking the trap is at least the number of cycles defined in SCTLR_EL1.TWEDEL.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TWEDEn == '1'.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL1.
0b1	PSTATE.SSBS is set to 1 on an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.DSSBS == '1'.

Otherwise:

Reserved, RES0.

ATA, bit [43]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Allocation Tag Access in EL1.

Controls use of Memory tagging in EL1.

ATA	Meaning
0b0	Use of Memory tagging is disabled at EL1.
0b1	If SCTLR2_EL1.VT is 1, use of Virtual tagging is enabled at EL1. If SCTLR2_EL1.VT is 0, use of Physical tagging is enabled at EL1.

The Effective value of this field is 0 if any of the following are true:

- SCTLR2_EL1.VT is 0, and the Effective value of HCR_EL2.ATA is 0 or SCR_EL3.ATA is 0.
- SCTLR2_EL1.VT is 1, and any of the following are true:
  - HCRX_EL2.VTAO is 1.
  - HCRX_EL2.VTE is 0.
  - SCR2_EL3.VTE is 0.
  - FEAT_VMTEE is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.ATA == '1'.

Otherwise:

Reserved, RES0.

ATA0, bit [42]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Allocation Tag Access in EL0.

Controls access to Allocation Tags and Tag Check operations in EL0 when HCR_EL2.{E2H,TGE} is not {1,1}.

ATA0	Meaning
0b0	Use of Memory tagging is disabled at EL0.
0b1	If SCTLR2_EL1.VT is 1, use of Virtual tagging is enabled at EL0. If SCTLR2_EL1.VT is 0, use of Physical tagging is enabled at EL0.

The Effective value of this field is 0 if any of the following are true:

- SCTLR2_EL1.VT is 0, and any of the following are true:
  - The Effective value of HCR_EL2.ATA is 0.
  - The Effective value of SCR_EL3.ATA is 0.
- SCTLR2_EL1.VT is 1, and any of the following are true:
  - HCRX_EL2.VTAO is 1.
  - HCRX_EL2.VTE is 0.
  - SCR2_EL3.VTE is 0.
  - FEAT_VMTEE is not implemented.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.ATA0 == '1'.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Tag Check Fault in EL1. Controls the effect of Tag Check Faults due to Loads and Stores in EL1.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE_ASYM_FAULT is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TCF == '1'.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Tag Check Fault in EL0. When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE_ASYM_FAULT is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TCF0 == '1'.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]
When FEAT_MTE_ASYNC is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL1, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1 and TFSR_EL1 registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL1.
0b1	Tag Check Faults are synchronized on entry to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.ITFSB == '1'.

Otherwise:

Reserved, RES0.

BT1, bit [36]
When FEAT_BTI is implemented:

Configures the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL1:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT1	Meaning
0b0	When the PE is executing at EL1, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL1, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.BT1 == '1'.

Otherwise:

Reserved, RES0.

BT0, bit [35]
When FEAT_BTI is implemented:

Configures the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL0:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT0	Meaning
0b0	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

When the value of the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of SCTLR_EL1.BT0 has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.BT0 == '1'.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]
When FEAT_FPMR is implemented:

Enables direct and indirect accesses to FPMR from EL0.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL0 are trapped to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1. These exceptions are reported using EC syndrome value 0x18.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL0.

EnFPM	Meaning
0b0	Direct and indirect accesses to FPMR are disabled at EL0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0, and the SCTLR_EL2.EnFPM control is used for this purpose.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnFPM == '1'.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]
When FEAT_MOPS is implemented:

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.MSCEn == '1'.

Otherwise:

Reserved, RES0.

CMOW, bit [32]
When FEAT_CMOW is implemented:

Controls the required permissions for the following cache maintenance instructions executed at EL0:

- Any DC instruction that operates by VA and performs a clean and invalidate operation.
- Any IC instruction that operates by VA.

CMOW	Meaning
0b0	This control does not cause any instruction to generate a stage 1 Permission fault.
0b1	For these instructions, when executed at EL0, the absence of stage 1 unprivileged write permission generates a stage 1 permission fault.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

For more information, see:

- Stage 1 permissions.
- Implications of enabling the dirty state management mechanism.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.CMOW == '1'.

Otherwise:

Reserved, RES0.

EnIA, bit [31]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnIA	Meaning
0b0	For execution at EL1, pointer authentication of instruction addresses using the APIAKey_EL1 key, is not enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of instruction addresses using the APIAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnIA2.
0b1	For execution at EL1, pointer authentication of instruction addresses using the APIAKey_EL1 key, is enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of instruction addresses using the APIAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnIA2.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. When pointer authentication is enabled, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).

◦ SCTLRMASK_EL1.EnIA == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnIA	Meaning
0b0	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIAKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. When pointer authentication is enabled, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnIA == '1'.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnIB	Meaning
0b0	For execution at EL1, pointer authentication of instruction addresses using the APIBKey_EL1 key, is not enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of instruction addresses using the APIBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnIB2.
0b1	For execution at EL1, pointer authentication of instruction addresses using the APIBKey_EL1 key, is enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of instruction addresses using the APIBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnIB2.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. When pointer authentication is enabled, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnIB == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnIB	Meaning
0b0	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIBKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APIBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. When pointer authentication is enabled, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnIB == '1'.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]
When FEAT_LSMAOC is implemented:

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, T32 and A32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of T32 and A32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.LSMAOE == '1'.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]
When FEAT_LSMAOC is implemented:

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/ Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/ Device-nGnRE/Device-nGnRnE memory are not trapped.

This bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.nTLSMD == '1'.

Otherwise:

Reserved, RES1.

EnDA, bit [27]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses, using the APDAKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnDA	Meaning
0b0	For execution at EL1, pointer authentication of data addresses using the APDAKey_EL1 key, is not enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of data addresses using the APDAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnDA2.
0b1	For execution at EL1, pointer authentication of data addresses using the APDAKey_EL1 key, is enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of data addresses using the APDAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnDA2.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. When pointer authentication is enabled, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnDA == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDAKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnDA	Meaning
0b0	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDAKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. When pointer authentication is enabled, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnDA == '1'.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Traps EL0 execution of cache maintenance instructions, to EL1, or to EL2 when it is implemented and enabled in the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18, as follows:

- DC CVAU, DC CIVAC, DC CVAC, and IC IVAU.
- If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC CGVAC, and DC CGDVAC.
- If FEAT_DPB is implemented, DC CVAP.
- If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
- If FEAT_DPB2 is implemented, DC CVADP.
- If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.

UCI	Meaning
0b0	For each of the specified instructions, if the execution of the instruction can be trapped, access at EL0 using AArch64 is trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.UCI == '1'.

EE, bit [25]
When FEAT_MixedEnd is implemented:

Endianness of data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

The EE bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EE == '1'.

When FEAT_BigEnd is implemented:

Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

Reserved, RES1.

Otherwise:

Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.

Reserved, RES0.

E0E, bit [24]
When FEAT_MixedEndEL0 is implemented:

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

This bit has no effect on the endianness of Explicit Memory Effects generated by unprivileged memory access instructions executed at EL1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.E0E == '1'.

When FEAT_BigEndEL0 is implemented:

Explicit data accesses at EL0 are big-endian.

Reserved, RES1.

Otherwise:

Explicit data accesses at EL0 are little-endian.

Reserved, RES0.

SPAN, bit [23]
When FEAT_PAN is implemented:

Set Privileged Access Never, on taking an exception to EL1.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL1.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.SPAN == '1'.

Otherwise:

Reserved, RES1.

EIS, bit [22]
When FEAT_ExS is implemented:

Exception Entry is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL1 is not a context synchronization event.
0b1	The taking of an exception to EL1 is a context synchronization event.

If SCTLR_EL1.EIS is set to 0b0:

- Indirect writes to ESR_EL1, FAR_EL1, SPSR_EL1, ELR_EL1 are synchronized on exception entry to EL1, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
- Some exception entries reported are not considered IFBEs per the memory model.

The following are not affected by the value of SCTLR_EL1.EIS:

- Changes to the PSTATE information on entry to EL1.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- The memory model requirement for exception entry to generate an Instruction Fetch Barrier Effect for some exception entries. See Basic definitions for the list of exception entries.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EIS == '1'.

Otherwise:

Reserved, RES1.

IESB, bit [21]
When FEAT_IESB is implemented:

Implicit Error Synchronization event enable. Possible values are:

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL1. • Before the operational pseudocode of each Exception Return instruction executed at EL1.

If FEAT_DoubleFault2 is implemented, the PE is in Non-debug state, and the Effective value of SCTLR2_EL1.NMEA is 1, then SCTLR_EL1.IESB is ignored and the PE behaves as if SCTLR_EL1.IESB is 1 for all purposes other than direct read of the register.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL1 and before each DRPS instruction executed at EL1, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.IESB == '1'.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The value of SCXTNUM_EL0 is treated as 0.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.TSCXT == '1'.

Otherwise:

Reserved, RES1.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL1&0 translation regime, this bit can restrict execute permissions on writeable pages.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	In the EL1&0 translation regime, any region of memory that is writeable at EL1 is XN at EL1, and any region of memory that is writeable at EL0 is XN at EL0.

This bit applies only when SCTLR_EL1.M bit is set.

The WXN bit is permitted to be cached in a TLB.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

This field is RES0 if TCR2_EL1.PIE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.WXN == '1'.

nTWE, bit [18]

Traps EL0 execution of WFE instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.nTWE == '1'.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Traps EL0 execution of WFI instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from both Execution states, reported using EC syndrome value 0x01.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.nTWI == '1'.

UCT, bit [15]

Traps EL0 accesses to the CTR_EL0 to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.UCT == '1'.

DZE, bit [14]

Traps EL0 execution of the following instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18:

- DC ZVA.
- If FEAT_MTE is implemented, DC GVA and DC GZVA.
- If FEAT_MTETC is implemented, DC GBVA and DC ZGBVA.

Traps EL0 execution of DC ZVA instructions to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.DZE == '1'.

EnDB, bit [13]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses, using the APDBKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnDB	Meaning
0b0	For execution at EL1, pointer authentication of data addresses using the APDBKey_EL1 key, is not enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of data addresses using the APDBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnDB2.
0b1	For execution at EL1, pointer authentication of data addresses using the APDBKey_EL1 key, is enabled. For execution at EL0 in the EL1&0 translation regime, pointer authentication of data addresses using the APDBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL1.EnDB2.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. When pointer authentication is enabled, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnDB == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDBKey_EL1 key, at EL1 and at EL0 in the EL1&0 translation regime.

EnDB	Meaning
0b0	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDBKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL1 and at EL0 in the EL1&0 translation regime, using the APDBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. When pointer authentication is enabled, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnDB == '1'.

Otherwise:

Reserved, RES0.

I, bit [12]

Stage 1 instruction access Cacheability control, for accesses at EL0 and EL1:

I	Meaning
0b0	All instruction access to Stage 1 Normal memory from EL0 and EL1 are Stage 1 Non-cacheable. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Stage 1 Cacheability of instruction access to Stage 1 Normal memory from EL0 and EL1. If the value of SCTLR_EL1.M is 0, instruction accesses from stage 1 of the EL1&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

When the value of the HCR_EL2.DC bit is 1, then instruction access to Normal memory from EL0 and EL1 are Cacheable regardless of the value of the SCTLR_EL1.I bit.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.I == '1'.

EOS, bit [11]
When FEAT_ExS is implemented:

Exception Exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL1 is not a context synchronization event
0b1	An exception return from EL1 is a context synchronization event

If SCTLR_EL1.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.

- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL1.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL1 and ELR_EL1 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EOS == '1'.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented:

Enable EL0 access to the following System instructions:

- CFPRCTX, DVPRCTX and CPPRCTX instructions.
- If FEAT_SPECRES2 is implemented, COSPRCTX.
- CFP RCTX, DVP RCTX and CPP RCTX instructions.
- If FEAT_SPECRES2 is implemented, COSP RCTX.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1.
0b1	EL0 access to these instructions is enabled.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.EnRCTX == '1'.

Otherwise:

Reserved, RES0.

UMA, bit [9]

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, from AArch64 state only, reported using EC syndrome value 0x18.

UMA	Meaning
0b0	Any attempt at EL0 using AArch64 to execute an MRS, MSR(register), or MSR(immediate) instruction that accesses the DAIF is trapped.
0b1	This control does not cause any instructions to be trapped.

If FEAT_S1POE2 is not implemented, and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of this bit is treated as 0 for all purposes other than reading the value of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.UMA == '1'.

SED, bit [8]
When FEAT_AA32EL0 is implemented:

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32 and any attempt at EL0 to access a SETEND instruction generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1, reported using EC syndrome value 0x00.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.SED == '1'.

Otherwise:

Reserved, RES1.

ITD, bit [7]
When FEAT_AA32EL0 is implemented:

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED and generates an exception, reported using EC syndrome value 0x00, to EL1 or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. ◦ 0b10100xxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers unpredictable cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically as to whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If an instruction in an active IT block that would be disabled by this field sets this field to 1, then behavior is CONSTRAINED UNPREDICTABLE. For more information, see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL1, then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLR.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When an implementation does not implement ITD, access to this field is RAZ/WI.
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.ITD == '1'.

Otherwise:

Reserved, RES1.

nAA, bit [6]
When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL1 and EL0 under certain conditions.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single naturally aligned 16-byte quantity, for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.
- If FEAT_LRCPC3 is implemented, the post index versions of LDAPR and the pre index versions of STLR.
- If FEAT_LRCPC3 and Advanced SIMD and floating-point instructions are implemented, LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP). If FEAT_LRCPC3 is implemented, the following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single naturally aligned 16-byte quantity, for access:
- LDIAPP, STILP.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	This control does not generate Alignment faults.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

For a load-acquire instruction that does not have acquire semantics as the result of the destination register, or registers, being ZR, it is IMPLEMENTATION SPECIFIC whether this field behaves as 1 or the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.nAA == '1'.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]
When FEAT_AA32EL0 is implemented:

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED and generates an exception to EL1, or to EL2 when it is implemented and enabled for the current Security state and HCR_EL2.TGE is 1. The exception is reported using EC syndrome value 0x00.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

CP15BEN is optional, but if it is implemented in the SCTLR_EL1, then it must also be implemented in the SCTLR_EL2, HSCTLR, and SCTLR.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When an implementation does not implement CP15BEN, access to this field is RAO/WI.
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.CP15BEN == '1'.

Otherwise:

Reserved, RES0.

SA0, bit [4]

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on execution at EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.SA0 == '1'.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL1 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.SA == '1'.

C, bit [2]

Stage 1 Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Stage 1 Normal memory from EL0 and EL1, and all Normal memory accesses from unified cache to the EL1&0 Stage 1 translation tables, are treated as Stage 1 Non-cacheable.
0b1	This control has no effect on the Stage 1 Cacheability of: • Data access to Normal memory from EL0 and EL1. • Normal memory accesses to the EL1&0 Stage 1 translation tables.

When the Effective value of the HCR_EL2.DC bit in the current Security state is 1, the PE ignores SCTLR_EL1.C. This means that EL0 and EL1 data accesses to Normal memory are Cacheable.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.C == '1'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL1 and EL0.

A	Meaning
0b0	Alignment fault checking is disabled when executing at EL1 or EL0. Alignment checks on some instructions are not disabled by this control. For more information, see 'Alignment of data accesses'.
0b1	Alignment fault checking is enabled when executing at EL1 or EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of this bit is treated as 0 for all purposes other than reading the value of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.A == '1'.

M, bit [0]

MMU enable for EL1&0 stage 1 address translation.

M	Meaning
0b0	EL1&0 stage 1 address translation disabled. See the SCTLR_EL1.I field for the behavior of instruction accesses to Normal memory.
0b1	EL1&0 stage 1 address translation enabled.

If the Effective value of HCR_EL2.{DC, TGE} in the current Security state is not {0, 0}, then the PE behaves as if the value of the SCTLR_EL1.M field is 0 for all purposes other than returning the value of a direct read of the field.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit has no effect on the PE.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL1.
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - SCTLRMASK_EL1.M == '1'.

Accessing SCTLR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLR_EL1 or SCTLR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR_EL1 are masked by SCTLRMASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL1

op0	op1	CRn	CRm	op2

SCTLR_EL2, System Control Register (EL2)

The SCTLR_EL2 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL2.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, these controls apply also to execution at EL0.

Configuration

AArch64 System register SCTLR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HSCTLR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLR_EL2 is a 64-bit register.

Field descriptions

TIDCP, bit [63]
When FEAT_TIDCP1 is implemented and EffectiveHCR_EL2_E2H() == '1':

Trap IMPLEMENTATION DEFINED functionality. Traps EL0 accesses to the encodings reserved for IMPLEMENTATION DEFINED functionality to EL2.

TIDCP	Meaning
0b0	No instructions accessing the System register or System instruction spaces are trapped by this mechanism.
0b1	If the Effective value of HCR_EL2.TGE is 0, no instructions accessing the System register or System instruction spaces are trapped by this mechanism. If the Effective value of HCR_EL2.TGE is 1, instructions accessing the following System register or System instruction spaces are trapped to EL2 by this mechanism: • In AArch64 state, EL0 access to the encodings in the following reserved encoding spaces are trapped: ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYS and SYSL, with CRn == {11, 15}, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System instructions, which are accessed using SYSP, with CRn == {11, 15}, and are reported using EC syndrome value 0x14. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRS and MSR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x18. ◦ IMPLEMENTATION DEFINED System registers, which are accessed using MRRS and MSRR with the S3_<op1>_<Cn>_<Cm>_<op2> register name, and are reported using EC syndrome value 0x14. • In AArch32 state, EL0 MCR and MRC accesses to the following encodings are trapped and reported using EC syndrome value 0x03: ◦ All coproc==p15, CRn==c9, opc1 == {0-7}, CRm == {c0-c2, c5-c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c10, opc1 =={0-7}, CRm == {c0, c1, c4, c8}, opc2 == {0-7}. ◦ All coproc==p15, CRn==c11, opc1=={0-7}, CRm == {c0-c8, c15}, opc2 == {0-7}.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TIDCP == '1'.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]
When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL2.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL2.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL2.
0b1	When PSTATE.SP is 1 and execution is at EL2, an IRQ or FIQ interrupt that is targeted to EL2 is masked regardless of any indication of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.SPINTMASK == '1'.

Otherwise:

Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: • The use of the PSTATE.ALLINT interrupt mask. • IRQ and FIQ interrupts to have Superpriority as an additional attribute. • PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.NMI == '1'.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]
When FEAT_SME is implemented and EffectiveHCR_EL2_E2H() == '1':

Traps instructions executed at EL0 that access TPIDR2_EL0 to EL2 when EL2 is implemented and enabled for the current Security state. The exception is reported using EC syndrome value 0x18.

EnTP2	Meaning
0b0	This control causes execution of these instructions at EL0 to be trapped.
0b1	This control does not cause execution of any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnTP2 == '1'.

Otherwise:

Reserved, RES0.

TCSO, bit [59]
When FEAT_MTE_STORE_ONLY is implemented:

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Explicit Memory Read Effects generated by instructions executed in EL2 are Tag Unchecked.

When FEAT_VMTETC is implemented the Effective value of this field is 1 if all of the following are true:

- FEAT_VMTETCL is not implemented
- SCTLR2_EL2.VT is 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TCSO == '1'.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]
When FEAT_MTE_STORE_ONLY is implemented and EffectiveHCR_EL2_E2H() == '1':

Tag Checking Store Only in EL0.

TCSO0	Meaning
0b0	This field has no effect on Tag checking.
0b1	Explicit Memory Read Effects generated by instructions executed in EL0 are Tag Unchecked.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When FEAT_VMTETC is implemented the Effective value of this field is 1 if all of the following are true:

- FEAT_VMTETCL is not implemented
- SCTLR2_EL2.VT is 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TCSO0 == '1'.

Otherwise:

Reserved, RES0.

EPAN, bit [57]
When FEAT_PAN3 is implemented and EffectiveHCR_EL2_E2H() == '1':

Enhanced Privileged Access Never. When PSTATE.PAN is 1, determines whether an EL2 data access to a page with EL0 instruction access permission generates a Permission fault as a result of the Privileged Access Never mechanism.

EPAN	Meaning
0b0	No additional Permission faults are generated by this mechanism.
0b1	An EL2 data access to a page with stage 1 EL0 data access permission or stage 1 EL0 instruction access permission generates a Permission fault. Any speculative data accesses that would generate a Permission fault as a result of PSTATE.PAN = 1 if the accesses were not speculative, will not cause an allocation into a cache. When executing at EL2, and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this does not prevent unprivileged speculative accesses generated from the EL0 hardware-defined context from causing allocation into a cache.

Note

The value of HCR_EL2.TGE does not change the effect of this field on privileged accesses.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).

◦ SCTLRMASK_EL2.EPAN == '1'.

Otherwise:

Reserved, RES0.

EnALS, bit [56]
When FEAT_LS64 is implemented and EffectiveHCR_EL2_E2H() == '1':

Traps execution of an LD64B or ST64B instruction at EL0 to EL2.

EnALS	Meaning
0b0	Execution of an LD64B or ST64B instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

A trap of an LD64B or ST64B instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000002.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnALS == '1'.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented and EffectiveHCR_EL2_E2H() == '1':

Traps execution of an ST64BV0 instruction at EL0 to EL2.

EnAS0	Meaning
0b0	Execution of an ST64BV0 instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

A trap of an ST64BV0 instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000001.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnAS0 == '1'.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented and EffectiveHCR_EL2_E2H() == '1':

Traps execution of an ST64BV instruction at EL0 to EL2.

EnASR	Meaning
0b0	Execution of an ST64BV instruction at EL0 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

A trap of an ST64BV instruction is reported using EC syndrome value 0x0A, with an ISS code of 0x0000000.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnASR == '1'.

Otherwise:

Reserved, RES0.

Bits [53:50]

Reserved, RES0.

TWEDEL, bits [49:46]
When FEAT_TWED is implemented and EffectiveHCR_EL2_E2H() == '1':

TWE Delay. A 4-bit unsigned number that, when SCTLR_EL2.TWEDEn is 1, encodes the minimum delay in taking a trap of WFE* caused by SCTLR_EL2.nTWE as $2^{(TWEDEL + 8)}$ cycles.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TWEDEL == '1'.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]
When FEAT_TWED is implemented and EffectiveHCR_EL2_E2H() == '1':

TWE Delay Enable. Enables a configurable delayed trap of the WFE* instruction caused by SCTLR_EL2.nTWE.

TWEDEn	Meaning
0b0	The delay for taking a WFE* trap is IMPLEMENTATION DEFINED.
0b1	The delay for taking a WFE* trap is at least the number of cycles defined in SCTLR_EL2.TWEDEL.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TWEDEn == '1'.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on exception entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL2.
0b1	PSTATE.SSBS is set to 1 on an exception to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.DSSBS == '1'.

Otherwise:

Reserved, RES0.

ATA, bit [43]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Allocation Tag Access in EL2.

Controls use of Memory tagging in EL2.

ATA	Meaning
0b0	Use of Memory tagging is disabled at EL2.
0b1	If SCTLR2_EL2.VT is 1, use of Virtual tagging is enabled at EL2. If SCTLR2_EL2.VT is 0, use of Physical tagging is enabled at EL2.

The Effective value of this field is 0 if any of the following are true:

- SCTLR2_EL2.VT is 0 and SCR_EL3.ATA is 0.
- SCTLR2_EL2.VT is 1, and any of the following are true:
  - SCR2_EL3.VTE is 0.
  - FEAT_VMTEE is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.ATA == '1'.

Otherwise:

Reserved, RES0.

ATA0, bit [42]
When (FEAT_MTE2 is implemented or FEAT_VMTE is implemented) and EffectiveHCR_EL2_E2H() == '1':

Allocation Tag Access in EL0.

Controls use of Memory Tagging in EL0.

ATA0	Meaning
0b0	Use of Memory tagging is disabled at EL0.
0b1	If SCTLR2_EL2.VT is 1, use of Virtual tagging is enabled at EL0. If SCTLR2_EL2.VT is 0, use of Physical tagging is enabled at EL0.

The Effective value of this field is 0 if any of the following are true:

- SCTLR2_EL2.VT is 0 and SCR_EL3.ATA is 0.
- SCTLR2_EL2.VT is 1, and any of the following are true:
  - SCR2_EL3.VTE is 0.
  - FEAT_VMTEE is not implemented.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.ATA0 == '1'.

Otherwise:

Reserved, RES0.

TCF, bits [41:40]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Tag Check Fault in EL2. Controls the effect of Tag Check Faults due to Loads and Stores in EL2.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE_ASYM_FAULT is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TCF == '1'.

Otherwise:

Reserved, RES0.

TCF0, bits [39:38]
When (FEAT_MTE2 is implemented or FEAT_VMTETC is implemented) and EffectiveHCR_EL2_E2H() == '1':

Tag Check Fault in EL0. Controls the effect of Tag Check Faults due to Loads and Stores in EL0.

TCF0	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE_ASYM_FAULT is implemented

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TCF0 == '1'.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]
When FEAT_MTE_ASYNC is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL2, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1, TFSR_EL1, and TFSR_EL2 registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL2.
0b1	Tag Check Faults are synchronized on entry to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.ITFSB == '1'.

Otherwise:

Reserved, RES0.

BT, bit [36]
When FEAT_BTI is implemented:

Indicates the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL2:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this bit is named BT1.

BT	Meaning
0b0	When the PE is executing at EL2, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL2, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.BT == '1'.

Otherwise:

Reserved, RES0.

BT0, bit [35]
When FEAT_BTI is implemented and EffectiveHCR_EL2_E2H() == '1':

Indicates the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL0:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT0	Meaning
0b0	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL0, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.BT0 == '1'.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]
When FEAT_FPMR is implemented and EffectiveHCR_EL2_E2H() == '1':

Enables direct and indirect accesses to FPMR from EL0.

When accesses to FPMR are disabled by this control:

- Direct accesses to FPMR from EL0 are trapped to EL2 and reported using EC syndrome value 0x18.
- Execution of FP8 data-processing instructions that indirectly access FPMR is UNDEFINED at EL0.

EnFPM	Meaning
0b0	Direct and indirect accesses to FPMR are disabled at EL0.
0b1	This control does not cause any instructions to be trapped.

Traps are not taken if there is a higher priority exception generated by the access.

If EL2 is not implemented or is disabled in the current Security state, the Effective value of this field is 0b1.

If the Effective value of HCR_EL2.TGE is 0, this field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnFPM == '1'.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]
When FEAT_MOPS is implemented and EffectiveHCR_EL2_E2H() == '1':

Memory Copy and Memory Set instructions Enable. Enables execution of the Memory Copy and Memory Set instructions at EL0.

MSCEn	Meaning
0b0	Execution of the Memory Copy and Memory Set instructions is UNDEFINED at EL0.
0b1	This control does not cause any instructions to be UNDEFINED.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

When FEAT_MOPS is implemented and the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, the Effective value of this bit is 0b1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.MSCEn == '1'.

Otherwise:

Reserved, RES0.

CMOW, bit [32]
When FEAT_CMOW is implemented and EffectiveHCR_EL2_E2H() == '1':

Controls the required permissions for the following cache maintenance instructions executed at EL0:

- Any DC instruction that operates by VA and performs a clean and invalidate operation.
- Any IC instruction that operates by VA.

CMOW	Meaning
0b0	This control does not cause any instruction to generate a stage 1 Permission fault.
0b1	For these instructions, when executed at EL0, the absence of stage 1 unprivileged write permission generates a stage 1 permission fault.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

For more information, see:

- Stage 1 permissions.
- Implications of enabling the dirty state management mechanism.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.CMOW == '1'.

Otherwise:

Reserved, RES0.

EnIA, bit [31]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnIA	Meaning
0b0	For execution at EL2, pointer authentication of instruction addresses using the APIAKey_EL1 key, is not enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of instruction addresses using the APIAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnIA2.
0b1	For execution at EL2, pointer authentication of instruction addresses using the APIAKey_EL1 key, is enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of instruction addresses using the APIAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnIA2.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. When pointer authentication is enabled, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnIA == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnIA	Meaning
0b0	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIAKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. When pointer authentication is enabled, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnIA == '1'.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnIB	Meaning
0b0	For execution at EL2, pointer authentication of instruction addresses using the APIBKey_EL1 key, is not enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of instruction addresses using the APIBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnIB2.
0b1	For execution at EL2, pointer authentication of instruction addresses using the APIBKey_EL1 key, is enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of instruction addresses using the APIBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnIB2.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. When pointer authentication is enabled, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnIB == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnIB	Meaning
0b0	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIBKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APIBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. When pointer authentication is enabled, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnIB == '1'.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]
When FEAT_LSMAOC is implemented and EffectiveHCR_EL2_E2H() == '1':

Load Multiple and Store Multiple Atomicity and Ordering Enable.

LSMAOE	Meaning
0b0	For all memory accesses at EL0, T32 and A32 Load Multiple and Store Multiple can have an interrupt taken during the sequence memory accesses, and the memory accesses are not required to be ordered.
0b1	The ordering and interrupt behavior of T32 and A32 Load Multiple and Store Multiple at EL0 is as defined for Armv8.0.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.LSMAOE == '1'.

Otherwise:

Reserved, RES1.

nTLSMD, bit [28]
When FEAT_LSMAOC is implemented and EffectiveHCR_EL2_E2H() == '1':

No Trap Load Multiple and Store Multiple to Device-nGRE/Device-nGnRE/Device-nGnRnE memory.

nTLSMD	Meaning
0b0	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are trapped and generate a stage 1 Alignment fault.
0b1	All memory accesses by T32 and A32 Load Multiple and Store Multiple at EL0 that are marked at stage 1 as Device-nGRE/Device-nGnRE/Device-nGnRnE memory are not trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

This bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.nTLSMD == '1'.

Otherwise:

Reserved, RES1.

EnDA, bit [27]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses, using the APDAKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnDA	Meaning
0b0	For execution at EL2, pointer authentication of data addresses using the APDAKey_EL1 key, is not enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of data addresses using the APDAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnDA2.
0b1	For execution at EL2, pointer authentication of data addresses using the APDAKey_EL1 key, is enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of data addresses using the APDAKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnDA2.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. When pointer authentication is enabled, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnDA == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDAKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnDA	Meaning
0b0	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDAKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. When pointer authentication is enabled, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnDA == '1'.

Otherwise:

Reserved, RES0.

UCI, bit [26]
When EffectiveHCR_EL2_E2H() == '1':

Traps execution of cache maintenance instructions at EL0 to EL2, from AArch64 state only, reported using EC syndrome value 0x18, as follows:

- DC CVAU, DC CIVAC, DC CVAC, and IC IVAU.
- If FEAT_MTE is implemented, DC CIGVAC, DC CIGDVAC, DC CGVAC, and DC CGDVAC.
- If FEAT_DPB is implemented, DC CVAP.
- If FEAT_DPB and FEAT_MTE are implemented, DC CGVAP and DC CGDVAP.
- If FEAT_DPB2 is implemented, DC CVADP.
- If FEAT_DPB2 and FEAT_MTE are implemented, DC CGVADP and DC CGDVADP.
- If FEAT_OCCMO is implemented, DC CIVAOC, DC CIGDVAOC, DC CVAOC and DC CGDVAOC.

UCI	Meaning
0b0	For each of the specified instructions, if the execution of the instruction can be trapped, access at EL0 using AArch64 is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.

◦ PSTATE.EL == EL2.
◦ IsSystemRegisterMaskingEnabled(EL2).
◦ SCTLRMASK_EL2.UCI == '1'.

Otherwise:

Reserved, RES0.

EE, bit [25]
When FEAT_MixedEnd is implemented:

Endianness of data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are little-endian.
0b1	Explicit data accesses at EL2, stage 1 translation table walks in the EL2 or EL2&0 translation regime, and stage 2 translation table walks in the EL1&0 translation regime are big-endian.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

• On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
◦ FEAT_SRMASK is implemented.
◦ PSTATE.EL == EL2.
◦ IsSystemRegisterMaskingEnabled(EL2).
◦ SCTLRMASK_EL2.EE == '1'.

When FEAT_BigEnd is implemented:

Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

Reserved, RES1.

Otherwise:

Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.

Reserved, RES0.

E0E, bit [24]
When EffectiveHCR_EL2_E2H() == '1' and FEAT_MixedEndEL0 is implemented:

Endianness of data accesses at EL0.

E0E	Meaning
0b0	Explicit data accesses at EL0 are little-endian.
0b1	Explicit data accesses at EL0 are big-endian.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

This bit has no effect on the endianness of Explicit Memory Effects generated by unprivileged memory access instructions executed at EL2.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
◦ FEAT_SRMASK is implemented.

◦ PSTATE.EL == EL2.
◦ IsSystemRegisterMaskingEnabled(EL2).
◦ SCTLRMASK_EL2.E0E == '1'.

When FEAT_BigEndEL0 is implemented:

Explicit data accesses at EL0 are big-endian.

Reserved, RES1.

Otherwise:

Explicit data accesses at EL0 are little-endian.

Reserved, RES0.

SPAN, bit [23]
When EffectiveHCR_EL2_E2H() == '1':

Set Privileged Access Never, on taking an exception to EL2.

SPAN	Meaning
0b0	PSTATE.PAN is set to 1 on taking an exception to EL2.
0b1	The value of PSTATE.PAN is left unchanged on taking an exception to EL2.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  ◦ FEAT_SRMASK is implemented.
  ◦ PSTATE.EL == EL2.
  ◦ IsSystemRegisterMaskingEnabled(EL2).
  ◦ SCTLRMASK_EL2.SPAN == '1'.

Otherwise:

Reserved, RES1.

EIS, bit [22]
When FEAT_ExS is implemented:

Exception entry is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL2 is not a context synchronization event.
0b1	The taking of an exception to EL2 is a context synchronization event.

If SCTLR_EL2.EIS is set to 0b0:

- Indirect writes to ESR_EL2, FAR_EL2, SPSR_EL2, ELR_EL2, and HPFAR_EL2 are synchronized on exception entry to EL2, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
- Some exception entries reported are not considered IFBEs per the memory model.

The following are not affected by the value of SCTLR_EL2.EIS:

- Changes to the PSTATE information on entry to EL2.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.

- The memory model requirement for exception entry to generate an Instruction Fetch Barrier Effect for some exception entries. See Basic definitions for the list of exception entries.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EIS == '1'.

Otherwise:

Reserved, RES1.

IESB, bit [21]
When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL2. • Before the operational pseudocode of each Exception Return instruction executed at EL2.

If FEAT_DoubleFault2 is implemented, the PE is in Non-debug state, and the Effective value of SCTLR2_EL2.NMEA is 1, then SCTLR_EL2.IESB is ignored and the PE behaves as if SCTLR_EL2.IESB is 1 for all purposes other than direct read of the register.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL2 and before each DRPS instruction executed at EL2, in addition to the other cases where it is added.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.IESB == '1'.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]
When (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented) and EffectiveHCR_EL2_E2H() == '1':

Trap EL0 Access to the SCXTNUM_EL0 register, when EL0 is using AArch64.

TSCXT	Meaning
0b0	EL0 access to SCXTNUM_EL0 is not disabled by this mechanism.
0b1	EL0 access to SCXTNUM_EL0 is disabled, causing an exception to EL2, and the SCXTNUM_EL0 value is treated as 0.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.TSCXT == '1'.

When FEAT_CSV2_2 is not implemented, FEAT_CSV2_1p2 is not implemented, and EffectiveHCR_EL2_E2H() == '1':

Reserved, RES1.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL2 or EL2&0 translation regime, this bit can restrict execute permissions on writeable pages.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	In the EL2 or EL2&0 translation regime, any region of memory that is writeable at EL2 is XN at EL2. In the EL2&0 translation regime, any region of memory that is writeable at EL0 is XN at EL0.

This bit applies only when SCTLR_EL2.M bit is set.

The WXN bit is permitted to be cached in a TLB.

This field is RES0 if TCR2_EL2.PIE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.WXN == '1'.

nTWE, bit [18]
When EffectiveHCR_EL2_E2H() == '1':

Traps execution of WFE instructions at EL0 to EL2, from both Execution states.

When FEAT_WFxT is implemented, this trap also applies to the WFET instruction.

nTWE	Meaning
0b0	Any attempt to execute a WFE instruction at EL0 is trapped to EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

In AArch32 state, the attempted execution of a conditional WFE instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.nTWE == '1'.

Otherwise:

Reserved, RES1.

Bit [17]

Reserved, RES0.

nTWI, bit [16]
When EffectiveHCR_EL2_E2H() == '1':

Traps execution of WFI instructions at EL0 to EL2, from both Execution states.

When FEAT_WFxT is implemented, this trap also applies to the WFIT instruction.

nTWI	Meaning
0b0	Any attempt to execute a WFI instruction at EL0 is trapped EL2, if the instruction would otherwise have caused the PE to enter a low-power state.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

In AArch32 state, the attempted execution of a conditional WFI instruction is only trapped if the instruction passes its condition code check.

Note

Since a WFE or WFI can complete at any time, even without a Wakeup event, the traps on WFE of WFI are not guaranteed to be taken, even if the WFE or WFI is executed when there is no Wakeup event. The only guarantee is that if the instruction does not complete in finite time in the absence of a Wakeup event, the trap will be taken.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.nTWI == '1'.

Otherwise:

Reserved, RES1.

UCT, bit [15]
When EffectiveHCR_EL2_E2H() == '1':

Traps EL0 accesses to the CTR_EL0 to EL2, from AArch64 state only.

UCT	Meaning
0b0	Accesses to the CTR_EL0 from EL0 using AArch64 are trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.UCT == '1'.

Otherwise:

Reserved, RES0.

DZE, bit [14]
When EffectiveHCR_EL2_E2H() == '1':

Traps execution of the following instructions at EL0 to EL2, from AArch64 state only:

- DC ZVA.
- If FEAT_MTE is implemented, DC GVA and DC GZVA.
- If FEAT_MTETC is implemented, DC GBVA and DC ZGBVA.

DZE	Meaning
0b0	Any attempt to execute an instruction that this trap applies to at EL0 using AArch64 is trapped to EL2. Reading DCZID_EL0.DZP from EL0 returns 1, indicating that the instructions that this trap applies to are not supported.
0b1	This control does not cause any instructions to be trapped.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.DZE == '1'.

Otherwise:

Reserved, RES0.

EnDB, bit [13]
When FEAT_PAuth_EnhCtl is implemented:

Controls enabling of pointer authentication of data addresses, using the APDBKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnDB	Meaning
0b0	For execution at EL2, pointer authentication of data addresses using the APDBKey_EL1 key, is not enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of data addresses using the APDBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnDB2.
0b1	For execution at EL2, pointer authentication of data addresses using the APDBKey_EL1 key, is enabled. For execution at EL0 in the EL2&0 translation regime, pointer authentication of data addresses using the APDBKey_EL1 key, is controlled by a combination of this field and SCTLR2_EL2.EnDB2.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. When pointer authentication is enabled, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnDB == '1'.

When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of data addresses, using the APDBKey_EL1 key, at EL2 and at EL0 in the EL2&0 translation regime.

EnDB	Meaning
0b0	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDBKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses at EL2 and at EL0 in the EL2&0 translation regime, using the APDBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. When pointer authentication is enabled, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When pointer authentication is disabled, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnDB == '1'.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0.

I	Meaning
0b0	All instruction accesses to Normal memory from EL2 are Non-cacheable for all levels of instruction and unified cache. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, all instruction accesses to Normal memory from EL0 are Non-cacheable for all levels of instruction and unified cache. If SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, instruction access to Normal memory from EL0. If the value of SCTLR_EL2.M is 0, instruction accesses from stage 1 of the EL2 or EL2&0 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.I == '1'.

EOS, bit [11]
When FEAT_ExS is implemented:

Exception exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL2 is not a context synchronization event.
0b1	An exception return from EL2 is a context synchronization event.

If SCTLR_EL2.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL2.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL2 and ELR_EL2 on exception return is synchronized.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores, and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EOS == '1'.

Otherwise:

Reserved, RES1.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented and EffectiveHCR_EL2_E2H() == '1':

Enable EL0 access to the following System instructions:

- CFPRCTX, DVPRCTX and CPPRCTX instructions.
- If FEAT_SPECRES2 is implemented, COSPRCTX.
- CFP RCTX, DVP RCTX and CPP RCTX instructions.
- If FEAT_SPECRES2 is implemented, COSP RCTX.

EnRCTX	Meaning
0b0	EL0 access to these instructions is disabled, and these instructions are trapped to EL2.
0b1	EL0 access to these instructions is enabled.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.EnRCTX == '1'.

Otherwise:

Reserved, RES0.

UMA, bit [9]
When FEAT_S1POE2 is implemented:

User Mask Access. Traps EL0 execution of MSR and MRS instructions that access the PSTATE.{D, A, I, F} masks to EL2 from AArch64 state only, reported using EC syndrome value 0x18.

UMA	Meaning
0b0	Any attempt at EL0 using AArch64 to execute an MRS, MSR(register), or MSR(immediate) instruction that accesses the DAIF is trapped to EL2.
0b1	This control does not cause any instructions to be trapped.

If EL2 is not enabled in the current Security state, or if the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, then no accesses are trapped by this control.

If FEAT_S1POE2 is not implemented, and the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, the value of this bit is treated as 0 for all purposes other than reading the value of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.UMA == '1'.

Otherwise:

Reserved, RES0.

SED, bit [8]
When FEAT_AA32EL0 is implemented and EffectiveHCR_EL2_E2H() == '1':

SETEND instruction disable. Disables SETEND instructions at EL0 using AArch32.

SED	Meaning
0b0	SETEND instruction execution is enabled at EL0 using AArch32.
0b1	SETEND instructions are UNDEFINED at EL0 using AArch32.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

If the implementation does not support mixed-endian operation at any Exception level, this bit is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.SED == '1'.

When FEAT_AA32EL0 is not implemented and EffectiveHCR_EL2_E2H() == '1':

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

Access to this field is RES1 .

Otherwise:

Reserved, RES0.

ITD, bit [7]
When FEAT_AA32EL0 is implemented and EffectiveHCR_EL2_E2H() == '1':

IT Disable. Disables some uses of IT instructions at EL0 using AArch32.

ITD	Meaning
0b0	All IT instruction functionality is enabled at EL0 using AArch32.
0b1	Any attempt at EL0 using AArch32 to execute any of the following is UNDEFINED: • All encodings of the IT instruction with hw1[3:0]!=1000. • All encodings of the subsequent instruction with the following values for hw1: ◦ 0b11xxxxxxxxxxxxxx: All 32-bit instructions, and the 16-bit instructions B, UDF, SVC, LDM, and STM. ◦ 0b1011xxxxxxxxxxxx: All instructions in 'Miscellaneous 16-bit instructions'. ◦ 0b10100xxxxxxxxxxx: ADD Rd, PC, #imm ◦ 0b01001xxxxxxxxxxx: LDR Rd, [PC, #imm] ◦ 0b0100x1xxx1111xxx: ADD Rdn, PC; CMP Rn, PC; MOV Rd, PC; BX PC; BLX PC. ◦ 0b010001xx1xxxx111: ADD PC, Rm; CMP PC, Rm; MOV PC, Rm. This pattern also covers UNPREDICTABLE cases with BLX Rn. These instructions are always UNDEFINED, regardless of whether they would pass or fail the condition code check that applies to them as a result of being in an IT block. It is IMPLEMENTATION DEFINED whether the IT instruction is treated as: • A 16-bit instruction, that can only be followed by another 16-bit instruction. • The first half of a 32-bit instruction. This means that, for the situations that are UNDEFINED, either the second 16-bit instruction or the 32-bit instruction is UNDEFINED. An implementation might vary dynamically whether IT is treated as a 16-bit instruction or the first half of a 32-bit instruction.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

If an instruction in an active IT block that would be disabled by this field sets this field to 1, then behavior is CONSTRAINED UNPREDICTABLE. For more information see 'Changes to an ITD control by an instruction in an IT block'.

ITD is optional, but if it is implemented in the SCTLR_EL2, then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When an implementation does not implement ITD, access to this field is RAZ/WI.
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.ITD == '1'.

When FEAT_AA32EL0 is not implemented and EffectiveHCR_EL2_E2H() == '1':

Reserved, RES1.

Otherwise:

Reserved, RES0.

nAA, bit [6]
When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults under certain conditions at EL2, and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single naturally aligned 16-byte quantity, for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.
- If FEAT_LRCPC3 is implemented, the post index versions of LDAPR and the pre index versions of STLR.
- If FEAT_LRCPC3 and Advanced SIMD and floating-point instructions are implemented, LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP).

If FEAT_LRCPC3 is implemented, the following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single naturally aligned 16-byte quantity, for access:

- LDIAPP, STILP.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	Unaligned accesses by the specified instructions do not generate an Alignment fault.

For a load-acquire instruction that does not have acquire semantics as the result of the destination register, or registers, being ZR, it is IMPLEMENTATION SPECIFIC whether this field behaves as 1 or the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.nAA == '1'.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]
When FEAT_AA32EL0 is implemented and EffectiveHCR_EL2_E2H() == '1':

System instruction memory barrier enable. Enables accesses to the DMB, DSB, and ISB System instructions in the (coproc==0b1111) encoding space from EL0:

CP15BEN	Meaning
0b0	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is UNDEFINED.
0b1	EL0 using AArch32: EL0 execution of the CP15DMB, CP15DSB, and CP15ISB instructions is enabled.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

CP15BEN is optional, but if it is implemented in the SCTLR_EL2, then it must also be implemented in the SCTLR_EL1, HSCTLR, and SCTLR.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.CP15BEN == '1'.

When FEAT_AA32EL0 is not implemented and EffectiveHCR_EL2_E2H() == '1':

Access to this field is RES0 .

Otherwise:

Reserved, RES1.

SA0, bit [4]
When EffectiveHCR_EL2_E2H() == '1':

SP Alignment check enable for EL0. When set to 1, if a load or store instruction executed at EL0 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

If the Effective value of HCR_EL2.TGE is 0, the field is IGNORED for all purposes other than direct reads and writes of the register.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.SA0 == '1'.

Otherwise:

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL2 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then an SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.SA == '1'.

C, bit [2]

Data access Cacheability control, for accesses at EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0

C	Meaning
0b0	The following are Non-cacheable for all levels of data and unified cache: • Data accesses to Normal memory from EL2. • When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, Normal memory accesses to the EL2 translation tables. • When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}: ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL2. • When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, Normal memory accesses to the EL2 translation tables. • When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}: ◦ Data accesses to Normal memory from EL0. ◦ Normal memory accesses to the EL2&0 translation tables.

This bit has no effect on the EL3 translation regime.

When EL2 is disabled in the current Security state or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, this bit has no effect on the EL1&0 translation regime.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.C == '1'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL2 and, when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL0.

A	Meaning
0b0	Alignment fault checking is disabled when executing at EL2. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, alignment fault checking disabled when executing at EL0. Alignment checks on some instructions are not disabled by this control. For more information, see 'Alignment of data accesses'.
0b1	Alignment fault checking is enabled when executing at EL2. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, alignment fault checking enabled when executing at EL0. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.A == '1'.

M, bit [0]

MMU enable for EL2 or EL2&0 stage 1 address translation.

M	Meaning
0b0	When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL2 stage 1 address translation disabled. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL2&0 stage 1 address translation disabled. See the SCTLR_EL2.I field for the behavior of instruction accesses to Normal memory.
0b1	When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, EL2 stage 1 address translation enabled. When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, EL2&0 stage 1 address translation enabled.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - PSTATE.EL == EL2.
  - FEAT_S1POE2 is implemented.
  - FGDTState.nTT == '1'.
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - SCTLRMASK_EL2.M == '1'.

Accessing SCTLR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLR_EL2 or SCTLR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to SCTLR_EL2 are masked by SCTLRMASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

SCTLR_EL3, System Control Register (EL3)

The SCTLR_EL3 characteristics are:

Purpose

Provides top-level control of the system, including its memory system, at EL3.

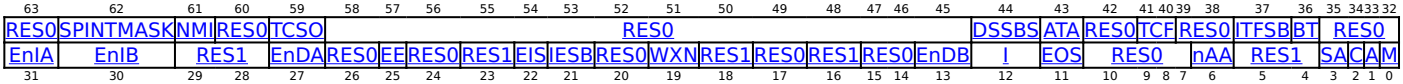
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLR_EL3 are UNDEFINED.

Attributes

SCTLR_EL3 is a 64-bit register.

Field descriptions



Bit [63]

Reserved, RES0.

SPINTMASK, bit [62]
When FEAT_NMI is implemented:

SP Interrupt Mask enable. When SCTLR_EL3.NMI is 1, controls whether PSTATE.SP acts as an interrupt mask, and controls the value of PSTATE.ALLINT on taking an exception to EL3.

SPINTMASK	Meaning
0b0	Does not cause PSTATE.SP to mask interrupts. PSTATE.ALLINT is set to 1 on taking an exception to EL3.
0b1	When PSTATE.SP is 1 and execution is at EL3, an IRQ or FIQ interrupt that is targeted to EL3 is masked regardless of any indication of Superpriority. PSTATE.ALLINT is set to 0 on taking an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:

Non-maskable Interrupt enable.

NMI	Meaning
0b0	This control does not affect interrupt masking behavior.
0b1	This control enables all of the following: • The use of the PSTATE.ALLINT interrupt mask. • IRQ and FIQ interrupts to have Superpriority as an additional attribute. • PSTATE.SP to be used as an interrupt mask.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bit [60]

Reserved, RES0.

TCSO, bit [59]
When FEAT_MTE_STORE_ONLY is implemented:

Tag Checking Store Only.

TCSO	Meaning
0b0	This field has no effect on Tag checking.
0b1	Explicit Memory Read Effects generated by instructions executed in EL3 are Tag Unchecked.

When FEAT_VMTETC is implemented the Effective value of this field is 1 if all of the following are true:

- FEAT_VMTETCL is not implemented
- SCTLR2_EL3.VT is 1

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [58:45]

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Default PSTATE.SSBS value on Exception Entry.

DSSBS	Meaning
0b0	PSTATE.SSBS is set to 0 on an exception to EL3.
0b1	PSTATE.SSBS is set to 1 on an exception to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Otherwise:

Reserved, RES0.

ATA, bit [43]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Allocation Tag Access in EL3.

Controls use of Memory tagging in EL3.

ATA	Meaning
0b0	Use of Memory tagging is disabled at EL3.
0b1	If SCTLR2_EL3.VT is 1, use of Virtual tagging is enabled at EL3. If SCTLR2_EL3.VT is 0, use of Physical tagging is enabled at EL3.

When Virtual tagging is selected, the Effective value of this field is 0 if FEAT_VMTEE is not implemented.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [42]

Reserved, RES0.

TCF, bits [41:40]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Tag Check Fault in EL3. Controls the effect of Tag Check Faults due to Loads and Stores in EL3.

TCF	Meaning	Applies when
0b00	Tag Check Faults have no effect on the PE.	
0b01	Tag Check Faults cause a synchronous exception.	
0b10	Tag Check Faults are asynchronously accumulated.	
0b11	Tag Check Faults cause a synchronous exception on reads, and are asynchronously accumulated on writes.	When FEAT_MTE_ASYM_FAULT is implemented

If FEAT_MTE3 is not implemented, the value 0b11 is reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [39:38]

Reserved, RES0.

ITFSB, bit [37]
When FEAT_MTE_ASYNC is implemented:

When synchronous exceptions are not being generated by Tag Check Faults, this field controls whether on exception entry into EL3, all Tag Check Faults due to instructions executed before exception entry, that are reported asynchronously, are synchronized into TFSRE0_EL1 and TFSR_ELx registers.

ITFSB	Meaning
0b0	Tag Check Faults are not synchronized on entry to EL3.
0b1	Tag Check Faults are synchronized on entry to EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]
When FEAT_BTI is implemented:

Indicates the Branch Type compatibility of the implicit BTI behavior for the following instructions at EL3:

- PACIASP.
- PACIBSP.
- If FEAT_PAuth_LR is implemented, PACIASPPC.
- If FEAT_PAuth_LR is implemented, PACIBSPPC.

BT	Meaning
0b0	When the PE is executing at EL3, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.jc.
0b1	When the PE is executing at EL3, when the specified instructions have an implicit BTI behavior, they are compatible with the same BTYPE values as BTI.c.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:32]

Reserved, RES0.

EnIA, bit [31]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIAKey_EL1 key, in the EL3 translation regime.

Possible values of this bit are:

EnIA	Meaning
0b0	Pointer authentication of instruction addresses, using the APIAKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses, using the APIAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIA and AuthIA pseudocode functions. Specifically, when the field is 1, AddPACIA returns a copy of a pointer to which a pointer authentication code has been added, and AuthIA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APIBKey_EL1 key, in the EL3 translation regime.

Possible values of this bit are:

EnIB	Meaning
0b0	Pointer authentication of instruction addresses, using the APIBKey_EL1 key, is not enabled.
0b1	Pointer authentication of instruction addresses, using the APIBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACIB and AuthIB pseudocode functions. Specifically, when the field is 1, AddPACIB returns a copy of a pointer to which a pointer authentication code has been added, and AuthIB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:28]

Reserved, RES1.

EnDA, bit [27]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APDAKey_EL1 key, in the EL3 translation regime.

EnDA	Meaning
0b0	Pointer authentication of data addresses, using the APDAKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses, using the APDAKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDA and AuthDA pseudocode functions. Specifically, when the field is 1, AddPACDA returns a copy of a pointer to which a pointer authentication code has been added, and AuthDA returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [26]

Reserved, RES0.

EE, bit [25]
When FEAT_MixedEnd is implemented:

Endianness of data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime.

EE	Meaning
0b0	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are little-endian.
0b1	Explicit data accesses at EL3, and stage 1 translation table walks in the EL3 translation regime are big-endian.

The EE bit is permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

When FEAT_BigEnd is implemented:

Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are big-endian.

Reserved, RES1.

Otherwise:

Explicit data accesses at EL1, and stage 1 translation table walks in the EL1&0 translation regime are little-endian.

Reserved, RES0.

Bit [24]

Reserved, RES0.

Bit [23]

Reserved, RES1.

EIS, bit [22]
When FEAT_ExS is implemented:

Exception Entry is a context synchronization event.

EIS	Meaning
0b0	The taking of an exception to EL3 is not a context synchronization event.
0b1	The taking of an exception to EL3 is a context synchronization event.

If SCTLR_EL3.EIS is set to 0b0:

- Indirect writes to ESR_EL3, FAR_EL3, SPSR_EL3, ELR_EL3 are synchronized on exception entry to EL3, so that a direct read of the register after exception entry sees the indirectly written value caused by the exception entry.
- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.
- Some exception entries reported are not considered IFBEs per the memory model.

The following are not affected by the value of SCTLR_EL3.EIS:

- Changes to the PSTATE information on entry to EL3.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- The memory model requirement for exception entry to generate an Instruction Fetch Barrier Effect for some exception entries. See Basic definitions for the list of exception entries.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

IESB, bit [21]
When FEAT_IESB is implemented:

Implicit Error Synchronization event enable.

IESB	Meaning
0b0	Disabled.
0b1	An implicit error synchronization event is added: • At each exception taken to EL3. • Before the operational pseudocode of each Exception Return instruction executed at EL3.

When the PE is in Debug state, the effect of this field is CONSTRAINED UNPREDICTABLE, and its Effective value might be 0 or 1 regardless of the value of the field and, if implemented, SCR_EL3.NMEA. If the Effective value of the field is 1, then an implicit error synchronization event is added after each DCPSx instruction taken to EL3 and before each DRPS instruction executed at EL3, in addition to the other cases where it is added.

When FEAT_DoubleFault is implemented, the PE is in Non-debug state, and the Effective value of SCR_EL3.NMEA is 1, this field is ignored and its Effective value is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [20]

Reserved, RES0.

WXN, bit [19]

Write permission implies XN (Execute-never). For the EL3 translation regime, this bit can force all memory regions that are writable to be treated as XN.

WXN	Meaning
0b0	This control has no effect on memory access permissions.
0b1	Any region that is writable in the EL3 translation regime is forced to XN for accesses from software executing at EL3.

This bit applies only when SCTLR_EL3.M bit is set.

The WXN bit is permitted to be cached in a TLB.

This field is RES0 if TCR_EL3.PIE is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [18]

Reserved, RES1.

Bit [17]

Reserved, RES0.

Bit [16]

Reserved, RES1.

Bits [15:14]

Reserved, RES0.

EnDB, bit [13]
When FEAT_PAuth is implemented:

Controls enabling of pointer authentication of instruction addresses, using the APDBKey_EL1 key, in the EL3 translation regime.

EnDB	Meaning
0b0	Pointer authentication of data addresses, using the APDBKey_EL1 key, is not enabled.
0b1	Pointer authentication of data addresses, using the APDBKey_EL1 key, is enabled.

Note

This field controls the behavior of the AddPACDB and AuthDB pseudocode functions. Specifically, when the field is 1, AddPACDB returns a copy of a pointer to which a pointer authentication code has been added, and AuthDB returns an authenticated copy of a pointer. When the field is 0, both of these functions are NOP.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Instruction access Cacheability control, for accesses at EL3:

I	Meaning
0b0	All instruction access to Normal memory from EL3 are Non-cacheable for all levels of instruction and unified cache. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Non-cacheable, Outer Non-cacheable memory.
0b1	This control has no effect on the Cacheability of instruction access to Normal memory from EL3. If the value of SCTLR_EL3.M is 0, instruction accesses from stage 1 of the EL3 translation regime are to Normal, Outer Shareable, Inner Write-Through, Outer Write-Through memory.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

- On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

EOS, bit [11]
When FEAT_ExS is implemented:

Exception Exit is a context synchronization event.

EOS	Meaning
0b0	An exception return from EL3 is not a context synchronization event
0b1	An exception return from EL3 is a context synchronization event

If SCTLR_EL3.EOS is set to 0b0:

- Memory transactions, including instruction fetches, from an Exception level always use the translation resources associated with that translation regime.
- Exception Catch debug events are synchronous debug events.
- DCPS* and DRPS instructions are context synchronization events.

The following are not affected by the value of SCTLR_EL3.EOS:

- The indirect write of the PSTATE and PC values from SPSR_EL3 and ELR_EL3 on exception return is synchronized.
- If the PE enters Debug state before the first instruction after an Exception return from EL3 to Non-secure state, any pending Halting debug event completes execution.
- The GIC behavior that allocates interrupts to FIQ or IRQ changes simultaneously with leaving the EL3 Exception level.
- Behavior of accessing the banked copies of the stack pointer using the SP register name for loads, stores and data processing instructions.
- Exit from Debug state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES1.

Bits [10:7]

Reserved, RES0.

nAA, bit [6]
When FEAT_LSE2 is implemented:

Non-aligned access. This bit controls generation of Alignment faults at EL3 under certain conditions.

The following instructions generate an Alignment fault if all bytes being accessed are not within a single naturally aligned 16-byte quantity, for access:

- LDAPR, LDAPRH, LDAPUR, LDAPURH, LDAPURSH, LDAPURSW, LDAR, LDARH, LDLAR, LDLARH.
- STLLR, STLLRH, STLR, STLRH, STLUR, and STLURH.
- If FEAT_LRCPC3 is implemented, the post index versions of LDAPR and the pre index versions of STLR.
- If FEAT_LRCPC3 and Advanced SIMD and floating-point instructions are implemented, LDAPUR (SIMD&FP), LDAP1 (SIMD&FP), STLUR (SIMD&FP), and STL1 (SIMD&FP).

If FEAT_LRCPC3 is implemented, the following instructions generate an Alignment fault if all bytes being accessed for a single register are not within a single naturally aligned 16-byte quantity, for access:

- LDIAPP, STILP.

nAA	Meaning
0b0	Unaligned accesses by the specified instructions generate an Alignment fault.
0b1	Unaligned accesses by the specified instructions do not generate an Alignment fault.

For a load-acquire instruction that does not have acquire semantics as the result of the destination register, or registers, being ZR, it is IMPLEMENTATION SPECIFIC whether this field behaves as 1 or the programmed value.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [5:4]

Reserved, RES1.

SA, bit [3]

SP Alignment check enable. When set to 1, if a load or store instruction executed at EL3 uses the SP as the base address and the SP is not aligned to a 16-byte boundary, then a SP alignment fault exception is generated. For more information, see 'SP alignment checking'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Cacheability control, for data accesses.

C	Meaning
0b0	All data access to Normal memory from EL3, and all Normal memory accesses to the EL3 translation tables, are Non-cacheable for all levels of data and unified cache.
0b1	This control has no effect on the Cacheability of: • Data access to Normal memory from EL3. • Normal memory accesses to the EL3 translation tables.

This bit has no effect on the EL1&0, EL2, or EL2&0 translation regimes.

The reset behavior of this field is:

• On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

A, bit [1]

Alignment check enable. This is the enable bit for Alignment fault checking at EL3.

A	Meaning
0b0	Alignment fault checking is disabled when executing at EL3. Alignment checks on some instructions are not disabled by this control. For more information, see 'Alignment of data accesses'.
0b1	Alignment fault checking is enabled when executing at EL3. All instructions that load or store one or more registers have an alignment check that the address being accessed is aligned to the size of the data element(s) being accessed. If this check fails it causes an Alignment fault, which is taken as a Data Abort exception.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

M, bit [0]

MMU enable for EL3 stage 1 address translation. Possible values of this bit are:

M	Meaning
0b0	EL3 stage 1 address translation disabled. See the SCTLR_EL3.I field for the behavior of instruction accesses to Normal memory.
0b1	EL3 stage 1 address translation enabled.

The reset behavior of this field is:

• On a Warm reset, when the highest implemented Exception level is EL3, this field resets to '0'.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
  ◦ PSTATE.EL == EL3.
  ◦ FEAT_S1POE2 is implemented.
  ◦ FGDTState.nTT == '1'.

Accessing SCTLR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SCTLR_EL3();
end;
```

MSR SCTLR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_FGWTE3) && FGWTE3_EL3().SCTLR_EL3 == '1' then
        AArch64_SystemAccessTrap(EL3, 0x18);
    else
        SCTLR_EL3() = X{64}(t);
    end;
end;
```

2025-12-10 16:11:30, 2025-12_rel

SCTLRMASK_EL1, System Control Masking Register (EL1)

The SCTLRMASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR_EL1 on writes to SCTLR_EL1 or SCTLRALIAS_EL1.

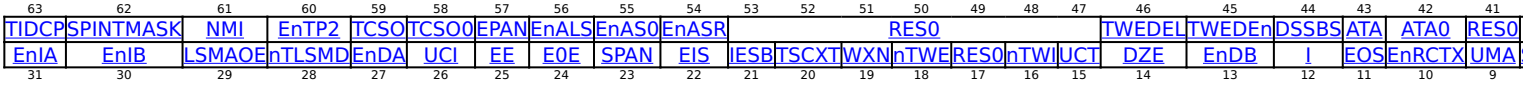
Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLRMASK_EL1 are UNDEFINED.

Attributes

SCTLRMASK_EL1 is a 64-bit register.

Field descriptions



TIDCP, bit [63]
When FEAT_TIDCP1 is implemented:

Mask bit for TIDCP.

TIDCP	Meaning
0b0	SCTLR_EL1.TIDCP is writeable.
0b1	SCTLR_EL1.TIDCP is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]
When FEAT_NMI is implemented:

Mask bit for SPINTMASK.

SPINTMASK	Meaning
0b0	SCTLR_EL1.SPINTMASK is writeable.
0b1	SCTLR_EL1.SPINTMASK is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:

Mask bit for NMI.

NMI	Meaning
0b0	SCTLR_EL1.NMI is writeable.
0b1	SCTLR_EL1.NMI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]
When FEAT_SME is implemented:

Mask bit for EnTP2.

EnTP2	Meaning
0b0	SCTLR_EL1.EnTP2 is writeable.
0b1	SCTLR_EL1.EnTP2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO, bit [59]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO.

TCSO	Meaning
0b0	SCTLR_EL1.TCSO is writeable.
0b1	SCTLR_EL1.TCSO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO0.

TCSO0	Meaning
0b0	SCTLR_EL1.TCSO0 is writeable.
0b1	SCTLR_EL1.TCSO0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]
When FEAT_PAN3 is implemented:

Mask bit for EPAN.

EPAN	Meaning
0b0	SCTLR_EL1.EPAN is writeable.
0b1	SCTLR_EL1.EPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]
When FEAT_LS64 is implemented:

Mask bit for EnALS.

EnALS	Meaning
0b0	SCTLR_EL1.EnALS is writeable.
0b1	SCTLR_EL1.EnALS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented:

Mask bit for EnAS0.

EnAS0	Meaning
0b0	SCTLR_EL1.EnAS0 is writeable.
0b1	SCTLR_EL1.EnAS0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented:

Mask bit for EnASR.

EnASR	Meaning
0b0	SCTLR_EL1.EnASR is writeable.
0b1	SCTLR_EL1.EnASR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:47]

Reserved, RES0.

TWEDEL, bit [46]
When FEAT_TWED is implemented:

Mask bit for TWEDEL.

TWEDEL	Meaning
0b0	SCTLR_EL1.TWEDEL is writeable.
0b1	SCTLR_EL1.TWEDEL is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]
When FEAT_TWED is implemented:

Mask bit for TWEDEn.

TWEDEn	Meaning
0b0	SCTLR_EL1.TWEDEn is writeable.
0b1	SCTLR_EL1.TWEDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Mask bit for DSSBS.

DSSBS	Meaning
0b0	SCTLR_EL1.DSSBS is writeable.
0b1	SCTLR_EL1.DSSBS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [43]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Mask bit for ATA.

ATA	Meaning
0b0	SCTLR_EL1.ATA is writeable.
0b1	SCTLR_EL1.ATA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Mask bit for ATA0.

ATA0	Meaning
0b0	SCTLR_EL1.ATA0 is writeable.
0b1	SCTLR_EL1.ATA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [41]

Reserved, RES0.

TCF, bit [40]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCF.

TCF	Meaning
0b0	SCTLR_EL1.TCF is writeable.
0b1	SCTLR_EL1.TCF is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

TCF0, bit [38]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCF0.

TCF0	Meaning
0b0	SCTLR_EL1.TCF0 is writeable.
0b1	SCTLR_EL1.TCF0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]
When FEAT_MTE_ASYNC is implemented:

Mask bit for ITFSB.

ITFSB	Meaning
0b0	SCTLR_EL1.ITFSB is writeable.
0b1	SCTLR_EL1.ITFSB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT1, bit [36]
When FEAT_BTI is implemented:

Mask bit for BT1.

BT1	Meaning
0b0	SCTLR_EL1.BT1 is writeable.
0b1	SCTLR_EL1.BT1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]
When FEAT_BTI is implemented:

Mask bit for BT0.

BT0	Meaning
0b0	SCTLR_EL1.BT0 is writeable.
0b1	SCTLR_EL1.BT0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]
When FEAT_FPMR is implemented:

Mask bit for EnFPM.

EnFPM	Meaning
0b0	SCTLR_EL1.EnFPM is writeable.
0b1	SCTLR_EL1.EnFPM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]
When FEAT_MOPS is implemented:

Mask bit for MSCEn.

MSCEn	Meaning
0b0	SCTLR_EL1.MSCEn is writeable.
0b1	SCTLR_EL1.MSCEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]
When FEAT_CMOW is implemented:

Mask bit for CMOW.

CMOW	Meaning
0b0	SCTLR_EL1.CMOW is writeable.
0b1	SCTLR_EL1.CMOW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]
When FEAT_PAuth is implemented:

Mask bit for EnIA.

EnIA	Meaning
0b0	SCTLR_EL1.EnIA is writeable.
0b1	SCTLR_EL1.EnIA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth is implemented:

Mask bit for EnIB.

EnIB	Meaning
0b0	SCTLR_EL1.EnIB is writeable.
0b1	SCTLR_EL1.EnIB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]
When FEAT_LSMAOC is implemented:

Mask bit for LSMAOE.

LSMAOE	Meaning
0b0	SCTLR_EL1.LSMAOE is writeable.
0b1	SCTLR_EL1.LSMAOE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTLSMD, bit [28]
When FEAT_LSMAOC is implemented:

Mask bit for nTLSMD.

nTLSMD	Meaning
0b0	SCTLR_EL1.nTLSMD is writeable.
0b1	SCTLR_EL1.nTLSMD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDA, bit [27]
When FEAT_PAuth is implemented:

Mask bit for EnDA.

EnDA	Meaning
0b0	SCTLR_EL1.EnDA is writeable.
0b1	SCTLR_EL1.EnDA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Mask bit for UCI.

UCI	Meaning
0b0	SCTLR_EL1.UCI is writeable.
0b1	SCTLR_EL1.UCI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EE, bit [25]
When FEAT_MixedEnd is implemented:

Mask bit for EE.

EE	Meaning
0b0	SCTLR_EL1.EE is writeable.
0b1	SCTLR_EL1.EE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0E, bit [24]
When FEAT_MixedEndEL0 is implemented:

Mask bit for E0E.

E0E	Meaning
0b0	SCTLR_EL1.E0E is writeable.
0b1	SCTLR_EL1.E0E is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPAN, bit [23]
When FEAT_PAN is implemented:

Mask bit for SPAN.

SPAN	Meaning
0b0	SCTLR_EL1.SPAN is writeable.
0b1	SCTLR_EL1.SPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EIS, bit [22]
When FEAT_ExS is implemented:

Mask bit for EIS.

EIS	Meaning
0b0	SCTLR_EL1.EIS is writeable.
0b1	SCTLR_EL1.EIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IESB, bit [21]
When FEAT_IESB is implemented:

Mask bit for IESB.

IESB	Meaning
0b0	SCTLR_EL1.IESB is writeable.
0b1	SCTLR_EL1.IESB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Mask bit for TSCXT.

TSCXT	Meaning
0b0	SCTLR_EL1.TSCXT is writeable.
0b1	SCTLR_EL1.TSCXT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Mask bit for WXN.

WXN	Meaning
0b0	SCTLR_EL1.WXN is writeable.
0b1	SCTLR_EL1.WXN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Mask bit for nTWE.

nTWE	Meaning
0b0	SCTLR_EL1.nTWE is writeable.
0b1	SCTLR_EL1.nTWE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Mask bit for nTWI.

nTWI	Meaning
0b0	SCTLR_EL1.nTWI is writeable.
0b1	SCTLR_EL1.nTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Mask bit for UCT.

UCT	Meaning
0b0	SCTLR_EL1.UCT is writeable.
0b1	SCTLR_EL1.UCT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Mask bit for DZE.

DZE	Meaning
0b0	SCTLR_EL1.DZE is writeable.
0b1	SCTLR_EL1.DZE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]
When FEAT_PAuth is implemented:

Mask bit for EnDB.

EnDB	Meaning
0b0	SCTLR_EL1.EnDB is writeable.
0b1	SCTLR_EL1.EnDB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Mask bit for I.

I	Meaning
0b0	SCTLR_EL1.I is writeable.
0b1	SCTLR_EL1.I is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EOS, bit [11]
When FEAT_ExS is implemented:

Mask bit for EOS.

EOS	Meaning
0b0	SCTLR_EL1.EOS is writeable.
0b1	SCTLR_EL1.EOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented:

Mask bit for EnRCTX.

EnRCTX	Meaning
0b0	SCTLR_EL1.EnRCTX is writeable.
0b1	SCTLR_EL1.EnRCTX is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]

Mask bit for UMA.

UMA	Meaning
0b0	SCTLR_EL1.UMA is writeable.
0b1	SCTLR_EL1.UMA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SED, bit [8]
When FEAT_AA32EL0 is implemented:

Mask bit for SED.

SED	Meaning
0b0	SCTLR_EL1.SED is writeable.
0b1	SCTLR_EL1.SED is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITD, bit [7]
When FEAT_AA32EL0 is implemented:

Mask bit for ITD.

ITD	Meaning
0b0	SCTLR_EL1.ITD is writeable.
0b1	SCTLR_EL1.ITD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nAA, bit [6]
When FEAT_LSE2:

Mask bit for nAA.

nAA	Meaning
0b0	SCTLR_EL1.nAA is writeable.
0b1	SCTLR_EL1.nAA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CP15BEN, bit [5]
When FEAT_AA32EL0 is implemented:

Mask bit for CP15BEN.

CP15BEN	Meaning
0b0	SCTLR_EL1.CP15BEN is writeable.
0b1	SCTLR_EL1.CP15BEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA0, bit [4]

Mask bit for SA0.

SA0	Meaning
0b0	SCTLR_EL1.SA0 is writeable.
0b1	SCTLR_EL1.SA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

Mask bit for SA.

SA	Meaning
0b0	SCTLR_EL1.SA is writeable.
0b1	SCTLR_EL1.SA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Mask bit for C.

C	Meaning
0b0	SCTLR_EL1.C is writeable.
0b1	SCTLR_EL1.C is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A, bit [1]

Mask bit for A.

A	Meaning
0b0	SCTLR_EL1.A is writeable.
0b1	SCTLR_EL1.A is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

M, bit [0]

Mask bit for M.

M	Meaning
0b0	SCTLR_EL1.M is writeable.
0b1	SCTLR_EL1.M is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing SCTLRMASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCTLRMASK_EL1 or SCTLRMASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLRMASK_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0100	0b000

        SCTLRMASK_EL1() = X{64}(t);
    else
        Undefined();
    end;
end;
```

SCTLRMASK_EL2, System Control Masking Register (EL2)

The SCTLRMASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in SCTLR_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SCTLRMASK_EL2 are UNDEFINED.

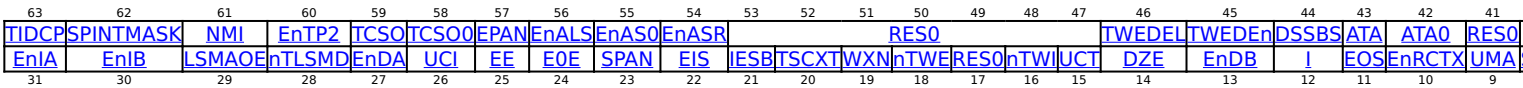
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SCTLRMASK_EL2 is a 64-bit register.

Field descriptions



TIDCP, bit [63]
When FEAT_TIDCP1 is implemented:

Mask bit for TIDCP.

TIDCP	Meaning
0b0	SCTLR_EL2.TIDCP is writeable.
0b1	SCTLR_EL2.TIDCP is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPINTMASK, bit [62]
When FEAT_NMI is implemented:

Mask bit for SPINTMASK.

SPINTMASK	Meaning
0b0	SCTLR_EL2.SPINTMASK is writeable.
0b1	SCTLR_EL2.SPINTMASK is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NMI, bit [61]
When FEAT_NMI is implemented:

Mask bit for NMI.

NMI	Meaning
0b0	SCTLR_EL2.NMI is writeable.
0b1	SCTLR_EL2.NMI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnTP2, bit [60]
When FEAT_SME is implemented:

Mask bit for EnTP2.

EnTP2	Meaning
0b0	SCTLR_EL2.EnTP2 is writeable.
0b1	SCTLR_EL2.EnTP2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO, bit [59]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO.

TCSO	Meaning
0b0	SCTLR_EL2.TCSO is writeable.
0b1	SCTLR_EL2.TCSO is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCSO0, bit [58]
When FEAT_MTE_STORE_ONLY is implemented:

Mask bit for TCSO0.

TCSO0	Meaning
0b0	SCTLR_EL2.TCSO0 is writeable.
0b1	SCTLR_EL2.TCSO0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EPAN, bit [57]
When FEAT_PAN3 is implemented:

Mask bit for EPAN.

EPAN	Meaning
0b0	SCTLR_EL2.EPAN is writeable.
0b1	SCTLR_EL2.EPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnALS, bit [56]
When FEAT_LS64 is implemented:

Mask bit for EnALS.

EnALS	Meaning
0b0	SCTLR_EL2.EnALS is writeable.
0b1	SCTLR_EL2.EnALS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnAS0, bit [55]
When FEAT_LS64_ACCDATA is implemented:

Mask bit for EnAS0.

EnAS0	Meaning
0b0	SCTLR_EL2.EnAS0 is writeable.
0b1	SCTLR_EL2.EnAS0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnASR, bit [54]
When FEAT_LS64_V is implemented:

Mask bit for EnASR.

EnASR	Meaning
0b0	SCTLR_EL2.EnASR is writeable.
0b1	SCTLR_EL2.EnASR is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [53:47]

Reserved, RES0.

TWEDEL, bit [46]
When FEAT_TWED is implemented:

Mask bit for TWEDEL.

TWEDEL	Meaning
0b0	SCTLR_EL2.TWEDEL is writeable.
0b1	SCTLR_EL2.TWEDEL is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TWEDEn, bit [45]
When FEAT_TWED is implemented:

Mask bit for TWEDEn.

TWEDEn	Meaning
0b0	SCTLR_EL2.TWEDEn is writeable.
0b1	SCTLR_EL2.TWEDEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DSSBS, bit [44]
When FEAT_SSBS is implemented:

Mask bit for DSSBS.

DSSBS	Meaning
0b0	SCTLR_EL2.DSSBS is writeable.
0b1	SCTLR_EL2.DSSBS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA, bit [43]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Mask bit for ATA.

ATA	Meaning
0b0	SCTLR_EL2.ATA is writeable.
0b1	SCTLR_EL2.ATA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ATA0, bit [42]
When FEAT_MTE2 is implemented or FEAT_VMTE is implemented:

Mask bit for ATA0.

ATA0	Meaning
0b0	SCTLR_EL2.ATA0 is writeable.
0b1	SCTLR_EL2.ATA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [41]

Reserved, RES0.

TCF, bit [40]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCF.

TCF	Meaning
0b0	SCTLR_EL2.TCF is writeable.
0b1	SCTLR_EL2.TCF is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [39]

Reserved, RES0.

TCF0, bit [38]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCF0.

TCF0	Meaning
0b0	SCTLR_EL2.TCF0 is writeable.
0b1	SCTLR_EL2.TCF0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITFSB, bit [37]
When FEAT_MTE_ASYNC is implemented:

Mask bit for ITFSB.

ITFSB	Meaning
0b0	SCTLR_EL2.ITFSB is writeable.
0b1	SCTLR_EL2.ITFSB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT, bit [36]
When FEAT_BTI is implemented:

Mask bit for BT.

BT	Meaning
0b0	SCTLR_EL2.BT is writeable.
0b1	SCTLR_EL2.BT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BT0, bit [35]
When FEAT_BTI is implemented:

Mask bit for BT0.

BT0	Meaning
0b0	SCTLR_EL2.BT0 is writeable.
0b1	SCTLR_EL2.BT0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnFPM, bit [34]
When FEAT_FPMR is implemented:

Mask bit for EnFPM.

EnFPM	Meaning
0b0	SCTLR_EL2.EnFPM is writeable.
0b1	SCTLR_EL2.EnFPM is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MSCEn, bit [33]
When FEAT_MOPS is implemented:

Mask bit for MSCEn.

MSCEn	Meaning
0b0	SCTLR_EL2.MSCEn is writeable.
0b1	SCTLR_EL2.MSCEn is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

CMOW, bit [32]
When FEAT_CMOW is implemented:

Mask bit for CMOW.

CMOW	Meaning
0b0	SCTLR_EL2.CMOW is writeable.
0b1	SCTLR_EL2.CMOW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIA, bit [31]
When FEAT_PAuth is implemented:

Mask bit for EnIA.

EnIA	Meaning
0b0	SCTLR_EL2.EnIA is writeable.
0b1	SCTLR_EL2.EnIA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnIB, bit [30]
When FEAT_PAuth is implemented:

Mask bit for EnIB.

EnIB	Meaning
0b0	SCTLR_EL2.EnIB is writeable.
0b1	SCTLR_EL2.EnIB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

LSMAOE, bit [29]
When FEAT_LSMAOC is implemented:

Mask bit for LSMAOE.

LSMAOE	Meaning
0b0	SCTLR_EL2.LSMAOE is writeable.
0b1	SCTLR_EL2.LSMAOE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nTLSMD, bit [28]
When FEAT_LSMAOC is implemented:

Mask bit for nTLSMD.

nTLSMD	Meaning
0b0	SCTLR_EL2.nTLSMD is writeable.
0b1	SCTLR_EL2.nTLSMD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnDA, bit [27]
When FEAT_PAuth is implemented:

Mask bit for EnDA.

EnDA	Meaning
0b0	SCTLR_EL2.EnDA is writeable.
0b1	SCTLR_EL2.EnDA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UCI, bit [26]

Mask bit for UCI.

UCI	Meaning
0b0	SCTLR_EL2.UCI is writeable.
0b1	SCTLR_EL2.UCI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EE, bit [25]
When FEAT_MixedEnd is implemented:

Mask bit for EE.

EE	Meaning
0b0	SCTLR_EL2.EE is writeable.
0b1	SCTLR_EL2.EE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0E, bit [24]
When FEAT_MixedEndEL0 is implemented:

Mask bit for E0E.

E0E	Meaning
0b0	SCTLR_EL2.E0E is writeable.
0b1	SCTLR_EL2.E0E is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SPAN, bit [23]

Mask bit for SPAN.

SPAN	Meaning
0b0	SCTLR_EL2.SPAN is writeable.
0b1	SCTLR_EL2.SPAN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EIS, bit [22]
When FEAT_ExS is implemented:

Mask bit for EIS.

EIS	Meaning
0b0	SCTLR_EL2.EIS is writeable.
0b1	SCTLR_EL2.EIS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IESB, bit [21]
When FEAT_IESB is implemented:

Mask bit for IESB.

IESB	Meaning
0b0	SCTLR_EL2.IESB is writeable.
0b1	SCTLR_EL2.IESB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TSCXT, bit [20]
When FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented:

Mask bit for TSCXT.

TSCXT	Meaning
0b0	SCTLR_EL2.TSCXT is writeable.
0b1	SCTLR_EL2.TSCXT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

WXN, bit [19]

Mask bit for WXN.

WXN	Meaning
0b0	SCTLR_EL2.WXN is writeable.
0b1	SCTLR_EL2.WXN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

nTWE, bit [18]

Mask bit for nTWE.

nTWE	Meaning
0b0	SCTLR_EL2.nTWE is writeable.
0b1	SCTLR_EL2.nTWE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [17]

Reserved, RES0.

nTWI, bit [16]

Mask bit for nTWI.

nTWI	Meaning
0b0	SCTLR_EL2.nTWI is writeable.
0b1	SCTLR_EL2.nTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

UCT, bit [15]

Mask bit for UCT.

UCT	Meaning
0b0	SCTLR_EL2.UCT is writeable.
0b1	SCTLR_EL2.UCT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

DZE, bit [14]

Mask bit for DZE.

DZE	Meaning
0b0	SCTLR_EL2.DZE is writeable.
0b1	SCTLR_EL2.DZE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EnDB, bit [13]
When FEAT_PAuth is implemented:

Mask bit for EnDB.

EnDB	Meaning
0b0	SCTLR_EL2.EnDB is writeable.
0b1	SCTLR_EL2.EnDB is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

I, bit [12]

Mask bit for I.

I	Meaning
0b0	SCTLR_EL2.I is writeable.
0b1	SCTLR_EL2.I is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EOS, bit [11]
When FEAT_ExS is implemented:

Mask bit for EOS.

EOS	Meaning
0b0	SCTLR_EL2.EOS is writeable.
0b1	SCTLR_EL2.EOS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EnRCTX, bit [10]
When FEAT_SPECRES is implemented:

Mask bit for EnRCTX.

EnRCTX	Meaning
0b0	SCTLR_EL2.EnRCTX is writeable.
0b1	SCTLR_EL2.EnRCTX is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UMA, bit [9]
When FEAT_S1POE2 is implemented:

Mask bit for UMA.

UMA	Meaning
0b0	SCTLR_EL2.UMA is writeable.
0b1	SCTLR_EL2.UMA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SED, bit [8]
When FEAT_AA32EL0 is implemented:

Mask bit for SED.

SED	Meaning
0b0	SCTLR_EL2.SED is writeable.
0b1	SCTLR_EL2.SED is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ITD, bit [7]
When FEAT_AA32EL0 is implemented:

Mask bit for ITD.

ITD	Meaning
0b0	SCTLR_EL2.ITD is writeable.
0b1	SCTLR_EL2.ITD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

nAA, bit [6]

Mask bit for nAA.

nAA	Meaning
0b0	SCTLR_EL2.nAA is writeable.
0b1	SCTLR_EL2.nAA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

CP15BEN, bit [5]
When FEAT_AA32EL0 is implemented:

Mask bit for CP15BEN.

CP15BEN	Meaning
0b0	SCTLR_EL2.CP15BEN is writeable.
0b1	SCTLR_EL2.CP15BEN is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SA0, bit [4]

Mask bit for SA0.

SA0	Meaning
0b0	SCTLR_EL2.SA0 is writeable.
0b1	SCTLR_EL2.SA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

SA, bit [3]

Mask bit for SA.

SA	Meaning
0b0	SCTLR_EL2.SA is writeable.
0b1	SCTLR_EL2.SA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

C, bit [2]

Mask bit for C.

C	Meaning
0b0	SCTLR_EL2.C is writeable.
0b1	SCTLR_EL2.C is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A, bit [1]

Mask bit for A.

A	Meaning
0b0	SCTLR_EL2.A is writeable.
0b1	SCTLR_EL2.A is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

M, bit [0]

Mask bit for M.

M	Meaning
0b0	SCTLR_EL2.M is writeable.
0b1	SCTLR_EL2.M is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing SCTLRMASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCTLRMASK_EL2 or SCTLRMASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCTLRMASK_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0100	0b000

```

SCXTNUM_EL0, EL0 Read/Write Software Context Number

The SCXTNUM_EL0 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL0 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

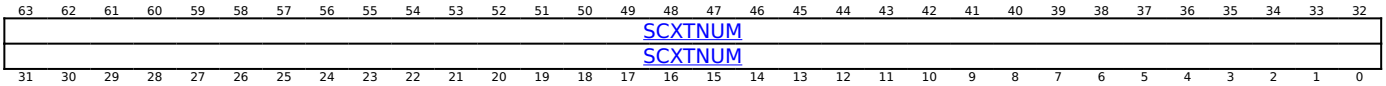
Configuration

This register is present only when (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to SCXTNUM_EL0 are UNDEFINED.

Attributes

SCXTNUM_EL0 is a 64-bit register.

Field descriptions



SCXTNUM, bits [63:0]

Software Context Number. A number to identify the context within the EL0 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCXTNUM_EL0

op0	op1	CRn	CRm	op2
0b11	0b011	0b1101	0b0000	0b111

SCXTNUM_EL1, EL1 Read/Write Software Context Number

The SCXTNUM_EL1 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL1 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

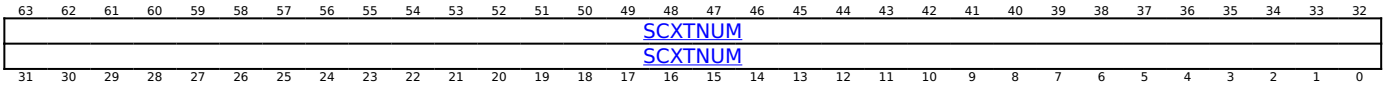
Configuration

This register is present only when (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to SCXTNUM_EL1 are UNDEFINED.

Attributes

SCXTNUM_EL1 is a 64-bit register.

Field descriptions



SCXTNUM, bits [63:0]

Software Context Number. A number to identify the context within the EL1 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SCXTNUM_EL1 or SCXTNUM_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCXTNUM_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b1101	0b0000	0b111

```

SCXTNUM_EL2, EL2 Read/Write Software Context Number

The SCXTNUM_EL2 characteristics are:

Purpose

Provides a number that can be used to separate out different context numbers with the EL2 exception level, for the purpose of protecting against side-channels using branch prediction and similar resources.

Configuration

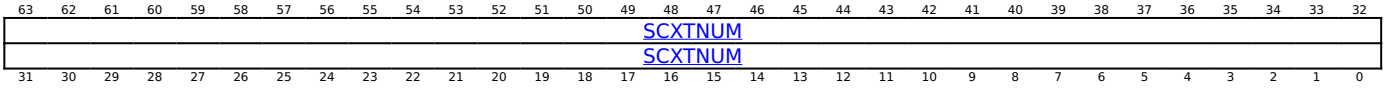
This register is present only when (FEAT_CSV2_2 is implemented or FEAT_CSV2_1p2 is implemented) and FEAT_AA64 is implemented. Otherwise, direct accesses to SCXTNUM_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SCXTNUM_EL2 is a 64-bit register.

Field descriptions



SCXTNUM, bits [63:0]

Software Context Number. A number to identify the context within the EL2 exception level.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SCXTNUM_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SCXTNUM_EL2 or SCXTNUM_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SCXTNUM_EL2

```

SDER32_EL2, AArch32 Secure Debug Enable Register

The SDER32_EL2 characteristics are:

Purpose

Allows access to the AArch32 register SDER from Secure EL2 and EL3 only.

Configuration

AArch64 System register SDER32_EL2 bits [63:0] are architecturally mapped to AArch64 System register SDER32_EL3[63:0] when EL3 is implemented.

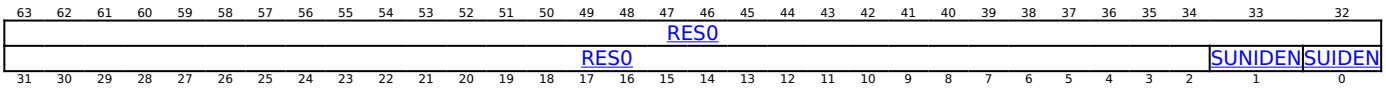
AArch64 System register SDER32_EL2 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL2 is implemented, FEAT_SEL2 is implemented, FEAT_AA32EL1 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SDER32_EL2 are UNDEFINED.

Attributes

SDER32_EL2 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit has no effect on non-invasive debug.
0b1	Non-invasive debug is allowed in Secure EL0 using AArch32.

When Secure EL1 is using AArch32, the forms of non-invasive debug affected by this control are:

- The PC Sample-based Profiling Extension. See About the PC Sample-based Profiling Extension.
- When SelfHostedTraceEnabled() == FALSE, processor trace.
- When EL3 is implemented, Performance Monitors.

When Secure EL1 is using AArch64, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]
When EL3 is implemented:

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing SDER32_EL2

Accesses to this register use the following encodings in the System register encoding space:

        SDER32_EL2() = X{64}(t);
    end;
end;
```

SDER32_EL3, AArch32 Secure Debug Enable Register

The SDER32_EL3 characteristics are:

Purpose

Allows access to the AArch32 register SDER from AArch64 state only. Its value has no effect on execution in AArch64 state.

Configuration

AArch64 System register SDER32_EL3 bits [63:0] are architecturally mapped to AArch64 System register SDER32_EL2[63:0] when EL2 is implemented and FEAT_SEL2 is implemented.

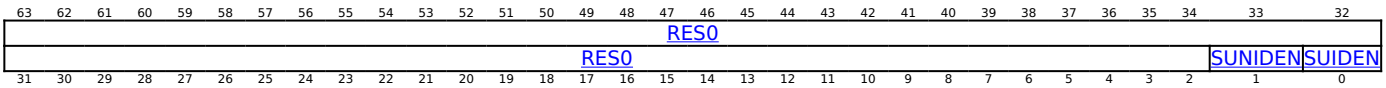
AArch64 System register SDER32_EL3 bits [31:0] are architecturally mapped to AArch32 System register SDER[31:0].

This register is present only when EL3 is implemented, FEAT_AA32EL1 is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SDER32_EL3 are UNDEFINED.

Attributes

SDER32_EL3 is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

SUNIDEN, bit [1]

Secure User Non-Invasive Debug Enable.

SUNIDEN	Meaning
0b0	This bit has no effect on non-invasive debug.
0b1	Non-invasive debug is allowed in Secure EL0 using AArch32.

When Secure EL1 is using AArch32, the forms of non-invasive debug affected by this control are:

- The PC Sample-based Profiling Extension. See About the PC Sample-based Profiling Extension.
- When SelfHostedTraceEnabled() == FALSE, processor trace.
- Performance Monitors.

When Secure EL1 is using AArch64, this bit has no effect.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SUIDEN, bit [0]

Secure User Invasive Debug Enable.

SUIDEN	Meaning
0b0	This bit does not affect the generation of debug exceptions at Secure EL0.
0b1	If EL1 is using AArch32, debug exceptions from Secure EL0 are enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

```

2025-12-10 16:11:30, 2025-12_rel

SMCR_EL1, SME Control Register (EL1)

The SMCR_EL1 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL1 and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL1 are UNDEFINED.

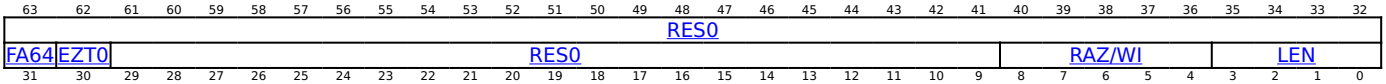
This register has no effect if the PE is not in Streaming SVE mode.

When the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, this register has no effect on execution at EL0.

Attributes

SMCR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FA64, bit [31]
When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction at EL1 is considered legal when executed in Streaming SVE mode.

When the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, controls whether execution of an A64 instruction at EL0 is considered legal when executed in Streaming SVE mode.

FA64	Meaning
0b0	This control does not cause any instruction to be treated as legal when executed in Streaming SVE mode.
0b1	This control causes all implemented A64 instructions to be treated as legal when executed in Streaming SVE mode at EL1 and EL0, if they are treated as legal at more privileged Exception levels in the current Security state.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EZT0, bit [30]
When FEAT_SME2 is implemented:

Traps execution at EL1 and EL0 of the LDR, LUTI2, LUTI4, MOVT, STR, and ZERO instructions that access the ZT0 register to EL1, or to EL2 when EL2 is implemented and enabled in the current Security state and HCR_EL2.TGE is 1.

The exception is reported using ESR_EL1.EC or ESR_EL2.EC value 0x1D, with an ISS code of 0x0000004, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
0b0	This control causes execution of these instructions at EL1 and EL0 to be trapped.
0b1	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL1 of (LEN+1)*128 bits. This field also defines the Effective Streaming SVE vector length at EL0 when EL2 is not implemented, or EL2 is not enabled in the current Security state, or the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL1.

For all purposes other than returning the result of a direct read of SMCR_EL1, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. If EL2 is implemented and enabled in the current Security state, and the requested length is greater than the Effective length at EL2, then the Effective length at EL2 is used.
3. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
4. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL1.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SMCR_EL1 or SMCR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0001	0b0010	0b110

SMCR_EL2, SME Control Register (EL2)

The SMCR_EL2 characteristics are:

Purpose

This register controls aspects of Streaming SVE that are visible at Exception levels EL2, EL1, and EL0.

Configuration

This register is present only when FEAT_SME is implemented. Otherwise, direct accesses to SMCR_EL2 are UNDEFINED.

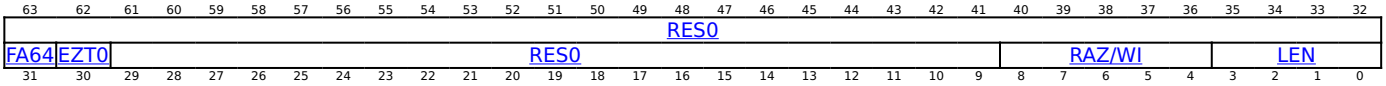
This register has no effect if the PE is not in Streaming SVE mode, or if EL2 is not enabled in the current Security state.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMCR_EL2 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

FA64, bit [31]
When FEAT_SME_FA64 is implemented:

Controls whether execution of an A64 instruction at EL2, EL1, and EL0 when EL2 is implemented and enabled in the current Security state is considered legal when executed in Streaming SVE mode.

FA64	Meaning
0b0	This control does not cause any instruction to be treated as legal when executed in Streaming SVE mode.
0b1	This control causes all implemented A64 instructions to be treated as legal when executed in Streaming SVE mode at EL2, EL1, and EL0, if they are treated as legal at EL3.

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EZT0, bit [30]
When FEAT_SME2 is implemented:

Traps execution at EL2, EL1, and EL0 of the LDR, LUTI2, LUTI4, MOVT, STR, and ZERO instructions that access the ZT0 register to EL2, when EL2 is enabled in the current Security state.

The exception is reported using ESR_EL2.EC value 0x1D, with an ISS code of 0x0000004, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
0b0	This control causes execution of these instructions at EL2, EL1, and EL0 to be trapped.
0b1	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL2 of (LEN+1)*128 bits. This field also defines the Effective Streaming SVE vector length at EL0 when the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL2.

For all purposes other than returning the result of a direct read of SMCR_EL2, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. If EL3 is implemented and the requested length is greater than the Effective length at EL3, then the Effective length at EL3 is used.
3. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL2.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SMCR_EL2 or SMCR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL2

0b0	This control does not cause any instruction to be treated as legal when executed in Streaming SVE mode.
0b1	This control causes all implemented A64 instructions to be treated as legal when executed in Streaming SVE mode .

Arm recommends that portable SME software should not rely on this optional feature, and that operating systems should provide a means to test for compliance with this recommendation.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EZT0, bit [30]
When FEAT_SME2 is implemented:

Traps execution at all Exception levels of the LDR, LUTI2, LUTI4, MOVT, STR, and ZERO instructions that access the ZT0 register to EL3.

The exception is reported using ESR_EL3.EC value 0x1D, with an ISS code of 0x0000004, at a lower priority than a trap due to PSTATE.SM or PSTATE.ZA.

EZT0	Meaning
0b0	This control causes execution of these instructions at all Exception levels to be trapped.
0b1	This control does not cause execution of any instruction to be trapped.

Changes to this field only affect whether instructions that access ZT0 are trapped. They do not affect the contents of ZT0, which remain valid so long as PSTATE.ZA is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:9]

Reserved, RES0.

Bits [8:4]

Reserved, RAZ/WI.

LEN, bits [3:0]

Requests an Effective Streaming SVE vector length (SVL) at EL3 of (LEN+1)*128 bits.

The Streaming SVE vector length can be any power of two from 128 bits to 2048 bits inclusive. An implementation can support any subset of the architecturally permitted lengths.

When the PE is in Streaming SVE mode, the Effective SVE vector length (VL) is equal to SVL.

When FEAT_SVE is implemented, and the PE is not in Streaming SVE mode, VL is equal to the Effective Non-streaming SVE vector length. See ZCR_EL3.

For all purposes other than returning the result of a direct read of SMCR_EL3, the PE selects the Effective Streaming SVE vector length by performing checks in the following order:

1. If the requested length is less than the minimum implemented Streaming SVE vector length, then the Effective length is the minimum implemented Streaming SVE vector length.
2. Otherwise, the Effective length is the highest supported Streaming SVE vector length that is less than or equal to the requested length.

An indirect read of SMCR_EL3.LEN appears to occur in program order relative to a direct write of the same register, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0001	0b0010	0b110

```

SMIDR_EL1, Streaming Mode Identification Register

The SMIDR_EL1 characteristics are:

Purpose

Provides additional identification mechanisms for scheduling purposes, for a PE that supports Streaming SVE mode.

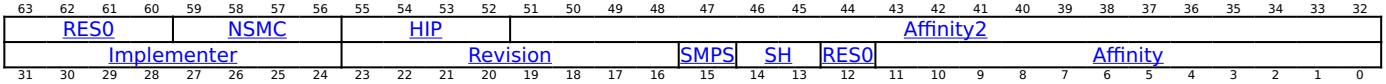
Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SMIDR_EL1 are UNDEFINED.

Attributes

SMIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:60]

Reserved, RES0.

NSMC, bits [59:56]

If SMIDR_EL1.{SH,Affinity} indicates that the implementation of Streaming SVE mode is shared, then this field identifies the number of SMCUs, minus 1, associated with the concatenated SMIDR_EL1.{Affinity2,Affinity} 32-bit value.

If SMIDR_EL1.{SH,Affinity} indicates that the implementation of Streaming SVE mode is not shared, then this field is zero and should be ignored by software.

The value of this field is an IMPLEMENTATION DEFINED choice of:

NSMC	Meaning
0b0000	The implementation of Streaming SVE mode associated with this PE is not shared or is a single SMCU.
0b0001..0b1110	The number of SMCUs in the group of SMCUs providing the implementation of Streaming SVE mode for this PE, minus 1.
0b1111	Reserved.

Access to this field is RO.

HIP, bits [55:52]
When FEAT_SME2p2 is implemented and SMIDR_EL1.SMPS == '1':

Highest Implemented Priority. If Streaming SVE mode execution priority is supported, this field indicates the range of priority levels implemented by the PE, and the Highest Implemented Priority value.

The value of this field is an IMPLEMENTATION DEFINED choice of:

HIP	Meaning
0b0000	All streaming execution priorities from 0 to 15 are implemented. The Highest Implemented Priority value is 15.
0b0001..0b1111	All streaming execution priorities less than or equal to this value are implemented. The Highest Implemented Priority value is the value of this field.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Affinity2, bits [51:32]

The most significant 20 bits of the SMCU affinity for this PE, to be used in conjunction with SMIDR_EL1.Affinity.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by Arm.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Implementer	Meaning
0x00	Reserved for software use.
0x41	Arm Limited.
0x42	Broadcom Corporation.
0x43	Cavium Inc.
0x44	Digital Equipment Corporation.
0x46	Fujitsu Ltd.
0x49	Infineon Technologies AG.
0x4D	Motorola or Freescale Semiconductor Inc.
0x4E	NVIDIA Corporation.
0x50	Applied Micro Circuits Corporation.
0x51	Qualcomm Inc.
0x56	Marvell International Ltd.
0x69	Intel Corporation.
0xC0	Ampere Computing.

Arm can assign codes that are not published in this manual. All values not assigned by Arm are reserved and must not be used.

It is not required that this value is the same as the value of MIDR_EL1.Implementer.

Access to this field is RO.

Revision, bits [23:16]

Revision number for the Streaming Mode Compute Unit (SMCU).

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SMPS, bit [15]

Indicates support for Streaming SVE mode execution priority.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SMPS	Meaning
0b0	Priority control not supported.
0b1	Priority control supported.

Access to this field is RO.

SH, bits [14:13]

Indicates whether the implementation of Streaming SVE mode in this PE is shared with other PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

SH	Meaning
0b00	Refer to SMIDR_EL1.Affinity.
0b01	Reserved.
0b10	The implementation of Streaming SVE mode is not shared with other PEs.
0b11	The implementation of Streaming SVE mode is shared with other PEs.

Access to this field is RO.

Bit [12]

Reserved, RES0.

Affinity, bits [11:0]

The least significant 12 bits of the SMCU affinity for this PE.

If the implementation of Streaming SVE mode is shared, then the concatenated SMIDR_EL1.{Affinity2,Affinity} 32-bit value identifies which shared SMCUs are associated with this PE. Every PE that shares the same SMCUs has the same 32-bit affinity value. The 32-bit affinity value is unique within the system as a whole.

The SMIDR_EL1.SH field indicates whether the implementation of Streaming SVE mode is shared with other PEs. However, if SMIDR_EL1.SH is zero, then SMIDR_EL1.Affinity is used to indicate whether the implementation of Streaming SVE is shared, as follows:

- If SMIDR_EL1.Affinity is zero, then the implementation of Streaming SVE mode is not shared with other PEs.
- If SMIDR_EL1.Affinity is not zero, then the implementation of Streaming SVE mode is shared with other PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing SMIDR_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMIDR_EL1

op0	op1	CRn	CRm	op2
0b11	0b001	0b0000	0b0000	0b110

```
if !(IsFeatureImplemented(FEAT_SME) && IsFeatureImplemented(FEAT_AA64)) then
    UnimplementedIDRegister();
elsif PSTATE.EL == EL0 then
    if IsFeatureImplemented(FEAT_IDST) then
        if EL2Enabled() && HCR_EL2().TGE == '1' then
            AArch64_SystemAccessTrap(EL2, 0x18);
        else
            AArch64_SystemAccessTrap(EL1, 0x18);
        end;
    else
        Undefined();
    end;
elsif PSTATE.EL == EL1 then
    if EL2Enabled() && HCR_EL2().TID1 == '1' then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        X{64}(t) = SMIDR_EL1();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = SMIDR_EL1();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SMIDR_EL1();
end;
```

2025-12-10 16:11:30, 2025-12_rel

SMPRI_EL1, Streaming Mode Priority Register

The SMPRI_EL1 characteristics are:

Purpose

Configures the streaming execution priority for instructions executed on a shared Streaming Mode Compute Unit (SMCU) when the PE is in Streaming SVE mode at any Exception level.

Configuration

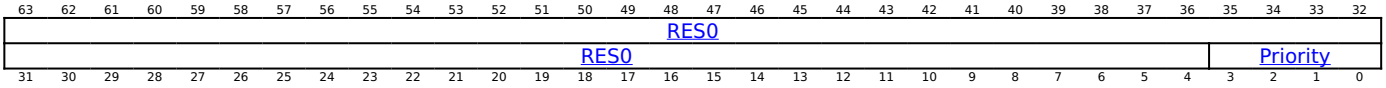
This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SMPRI_EL1 are UNDEFINED.

When SMIDR_EL1.SMPS is '0', this register is RES0.

Attributes

SMPRI_EL1 is a 64-bit register.

Field descriptions



Bits [63:4]

Reserved, RES0.

Priority, bits [3:0]

Streaming execution priority value.

Either this value is used directly, or it is mapped into an effective priority value using SMPRIMAP_EL2.

This value is used directly when any of the following are true:

- The current Exception level is EL3 or EL2.
- The current Exception level is EL1 or EL0, if EL2 is implemented and enabled in the current Security state and HCRX_EL2.SMPME is '0'.
- The current Exception level is EL1 or EL0, if EL2 is either not implemented or not enabled in the current Security state.

The precise meaning and behavior of each streaming execution priority value is IMPLEMENTATION DEFINED.

In an implementation that shares execution resources between PEs, higher priority values are allocated more processing resource than other PEs configured with lower priority values in the same Priority domain.

If FEAT_SME2p2 is implemented, and this field is greater than the Highest Implemented Priority value indicated by SMIDR_EL1.HIP, then the PE uses the Highest Implemented Priority value as the priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMPRI_EL1

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMPRI_EL1

op0	op1	CRn	CRm	op2

    end;
end;
```

SMPRIMAP_EL2, Streaming Mode Priority Mapping Register

The SMPRIMAP_EL2 characteristics are:

Purpose

Maps the value in SMPRI_EL1 to a streaming execution priority value for instructions executed at EL1 and EL0 in the same Security states as EL2.

Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SMPRIMAP_EL2 are UNDEFINED.

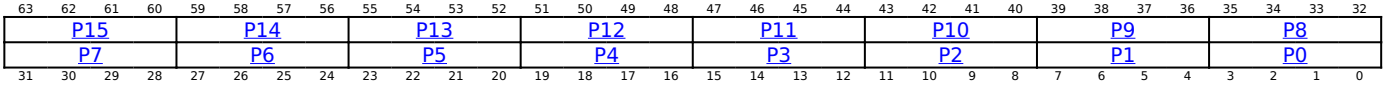
When SMIDR_EL1.SMPS is '0', this register is RES0.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SMPRIMAP_EL2 is a 64-bit register.

Field descriptions



When all of the following are true, the value in SMPRI_EL1 is mapped to a streaming execution priority using this register:

- The current Exception level is EL1 or EL0.
- EL2 is implemented and enabled in the current Security state.
- HCRX_EL2.SMPME is '1'.

Otherwise, SMPRI_EL1 holds the streaming execution priority value.

P15, bits [63:60]

Priority Mapping Entry 15. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '15'.

This value is the highest streaming execution priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P14, bits [59:56]

Priority Mapping Entry 14. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '14'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P13, bits [55:52]

Priority Mapping Entry 13. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '13'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P12, bits [51:48]

Priority Mapping Entry 12. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '12'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P11, bits [47:44]

Priority Mapping Entry 11. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '11'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P10, bits [43:40]

Priority Mapping Entry 10. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '10'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P9, bits [39:36]

Priority Mapping Entry 9. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '9'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P8, bits [35:32]

Priority Mapping Entry 8. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '8'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P7, bits [31:28]

Priority Mapping Entry 7. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '7'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P6, bits [27:24]

Priority Mapping Entry 6. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '6'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P5, bits [23:20]

Priority Mapping Entry 5. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '5'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P4, bits [19:16]

Priority Mapping Entry 4. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '4'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P3, bits [15:12]

Priority Mapping Entry 3. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '3'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P2, bits [11:8]

Priority Mapping Entry 2. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '2'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P1, bits [7:4]

Priority Mapping Entry 1. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '1'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

P0, bits [3:0]

Priority Mapping Entry 0. This entry is used when priority mapping is supported and enabled, and the SMPRI_EL1.Priority value is '0'.

This value is the lowest streaming execution priority.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SMPRIMAP_EL2

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SMPRIMAP_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0001	0b0010	0b101

SP_EL0, Stack Pointer (EL0)

The SP_EL0 characteristics are:

Purpose

Holds the stack pointer associated with EL0. At higher Exception levels, this is used as the current stack pointer when the value of SPSel.SP is 0.

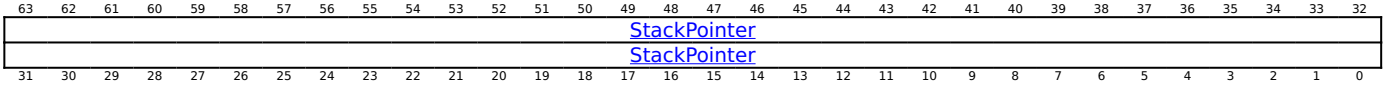
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SP_EL0 are UNDEFINED.

Attributes

SP_EL0 is a 64-bit register.

Field descriptions



StackPointer, bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL0

When the value of PSTATE.SP is 0, this register is accessible at all Exception levels as the current stack pointer.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SP_EL0

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0001	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then

SP_EL1, Stack Pointer (EL1)

The SP_EL1 characteristics are:

Purpose

Holds the stack pointer associated with EL1. The value of SPSel.SP determines the current stack pointer.

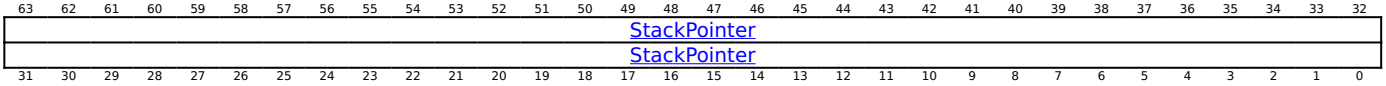
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SP_EL1 are UNDEFINED.

Attributes

SP_EL1 is a 64-bit register.

Field descriptions



StackPointer, bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL1

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSel.SP is 1, this register is also accessible at EL1 as the current stack pointer.

Note

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SP_EL1

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0001	0b000

SP_EL2, Stack Pointer (EL2)

The SP_EL2 characteristics are:

Purpose

Holds the stack pointer associated with EL2. The value of SPSel.SP determines the current stack pointer.

Configuration

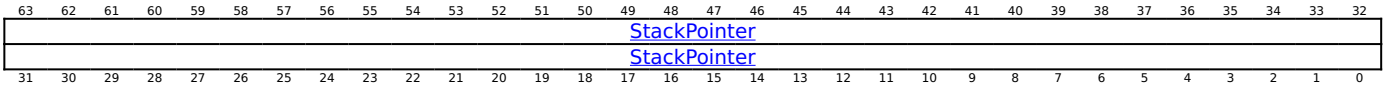
This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SP_EL2 are UNDEFINED.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SP_EL2 is a 64-bit register.

Field descriptions



StackPointer, bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL2

This accessibility information only applies to accesses using the MRS or MSR instructions.

When the value of SPSel.SP is 1, this register is also accessible at EL2 as the current stack pointer.

Note

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

SP_EL3, Stack Pointer (EL3)

The SP_EL3 characteristics are:

Purpose

Holds the stack pointer associated with EL3. The value of SPSel.SP determines the current stack pointer.

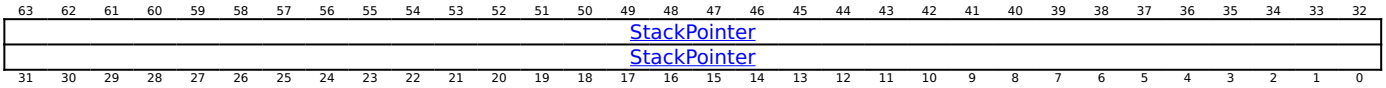
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SP_EL3 are UNDEFINED.

Attributes

SP_EL3 is a 64-bit register.

Field descriptions



StackPointer, bits [63:0]

Stack pointer.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SP_EL3

This register is not accessible using MRS and MSR instructions.

When the value of SPSel.SP is 1, this register is accessible at EL3 as the current stack pointer.

Note

When the value of SPSel.SP is 0, SP_EL0 is used as the current stack pointer at all Exception levels.

2025-12-10 16:11:30, 2025-12_rel

SPMACCESSR_EL1, System Performance Monitors Access Register (EL1)

The SPMACCESSR_EL1 characteristics are:

Purpose

Controls access to System PMUs from EL0.

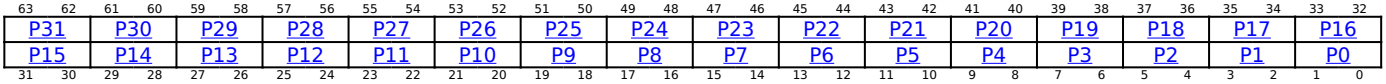
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMACCESSR_EL1 are UNDEFINED.

Attributes

SPMACCESSR_EL1 is a 64-bit register.

Field descriptions



P<m>, bits [2m+1:2m], for m = 31 to 0

System PMU <m> access. Controls access to System PMU <m>.

P<m>	Meaning
0b00	MRS read and MSR write System register accesses to System PMU <m> at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
0b01	MSR write System register accesses to System PMU <m> at EL0 are trapped to EL1, unless the instruction generates a higher priority exception.
0b11	This control does not cause any instructions to be trapped.

All other values are reserved.

The registers trapped by this control are:

AArch64: SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMOVSCLR_EL0, and SPMOVSSET_EL0.

This field is ignored by the PE when all of the following are true:

- EL2 is implemented and enabled in the current Security state.
- The Effective value of HCR_EL2.{E2H,TGE} is {1,1}.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m > UInt(ID_AA64DFR1_EL1.SYSPMUID), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing SPMACCESSR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SPMACCESSR_EL1 or SPMACCESSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMACCESSR_EL1

SPMACCESSR_EL2, System Performance Monitors Access Register (EL2)

The SPMACCESSR_EL2 characteristics are:

Purpose

Controls access to System PMUs from EL1 and EL0.

Configuration

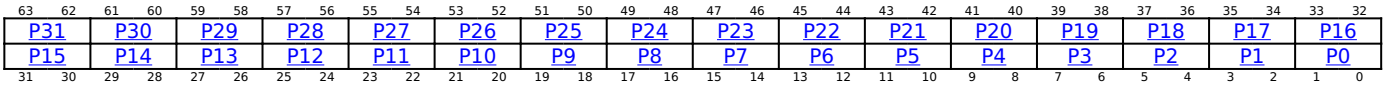
This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMACCESSR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

Attributes

SPMACCESSR_EL2 is a 64-bit register.

Field descriptions



P<m>, bits [2m+1:2m], for m = 31 to 0

System PMU <m> access. Controls access to System PMU <m>.

P<m>	Meaning
0b00	MRS read and MSR write System register accesses to System PMU <m> at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b01	MSR write System register accesses to System PMU <m> at EL1 and EL0 are trapped to EL2, unless the instruction generates a higher priority exception.
0b11	This control does not cause any instructions to be trapped.

All other values are reserved.

The registers trapped by this control are:

AArch64: SPMCFGR_EL1, SPMCGCR<n>_EL1, SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMDEVAFF_EL1, SPMDEVARCH_EL1, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMIIDR_EL1, SPMINTENCLR_EL1, SPMINTENSET_EL1, SPMOVSCLR_EL0, SPMOVSSET_EL0, and SPMSCR_EL1.

This field is ignored by the PE when EL2 is not implemented or disabled in the current Security state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m > UInt(ID_AA64DFR1_EL1.SYSPMUID), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing SPMACCESSR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SPMACCESSR_EL2 or SPMACCESSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

SPMACCESSR_EL3, System Performance Monitors Access Register (EL3)

The SPMACCESSR_EL3 characteristics are:

Purpose

Controls access to System PMUs from EL2, EL1 and EL0.

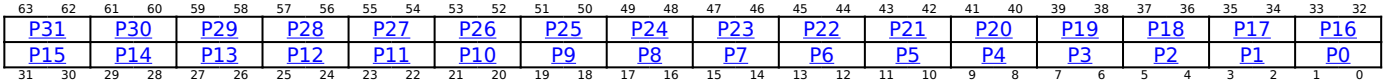
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMACCESSR_EL3 are UNDEFINED.

Attributes

SPMACCESSR_EL3 is a 64-bit register.

Field descriptions



P<m>, bits [2m+1:2m], for m = 31 to 0

System PMU <m> access. Controls access to System PMU <m>.

P<m>	Meaning
0b00	MRS read and MSR write System register accesses to System PMU <m> at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception.
0b01	MSR write System register accesses to System PMU <m> at EL2, EL1, and EL0 are trapped to EL3, unless the instruction generates a higher priority exception.
0b11	This control does not cause any instructions to be trapped.

All other values are reserved.

The registers trapped by this control are:

AArch64: SPMCFGR_EL1, SPMCGCR<n>_EL1, SPMCNTENCLR_EL0, SPMCNTENSET_EL0, SPMCR_EL0, SPMDEVAFF_EL1, SPMDEVARCH_EL1, SPMEVCNTR<n>_EL0, SPMEVFILT2R<n>_EL0, SPMEVFILTR<n>_EL0, SPMEVTYPER<n>_EL0, SPMIIDR_EL1, SPMINTENCLR_EL1, SPMINTENSET_EL1, SPMOVSCLR_EL0, SPMOVSSET_EL0, and SPMSCR_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When m > UInt(ID_AA64DFR1_EL1.SYSPMUID), access to this field is RES0 .
- Otherwise, access to this field is RW.

Accessing SPMACCESSR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMACCESSR_EL3

op0	op1	CRn	CRm	op2
0b10	0b110	0b1001	0b1101	0b011

```

SPMCFGR_EL1, System Performance Monitors Configuration Register

The SPMCFGR_EL1 characteristics are:

Purpose

Describes the capabilities of System PMU <s>.

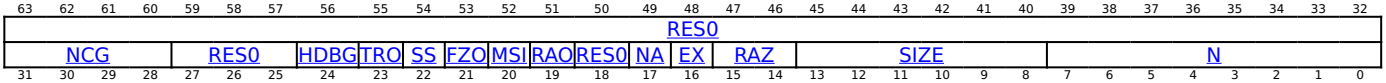
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCFGR_EL1 are UNDEFINED.

Attributes

SPMCFGR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

NCG, bits [31:28]

Counter Groups.

Defines the number of counter groups implemented by System PMU <s>, minus one.

If this field is zero, then one counter group is implemented and SPMCGCR<n>_EL1 read-as-zero.

Otherwise, for each counter group <m>, SPMCGCR<m DIV 8>_EL1.N<m MOD 8> defines the number of counters in the group.

Locating the first counter in each group depends on the number of implemented groups. Each counter group starts with counter:

- SPMEVTYPER<m×32>_EL0, meaning there are at most 32 counters per group, if there are 2 counter groups.
- SPMEVTYPER<m×16>_EL0, meaning there are at most 16 counters per group, if there are 3 or 4 counter groups.
- SPMEVTYPER<m×8>_EL0, meaning there are at most 8 counters per group, if there are between 5 and 8 counter groups.
- SPMEVTYPER<m×4>_EL0, meaning there are at most 4 counters per group, if there are more than 8 counter groups.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [27:25]

Reserved, RES0.

HDBG, bit [24]

Halt-on-debug supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

TRO, bit [23]

Trace output supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

SS, bit [22]

Snapshot supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

FZO, bit [21]

Freeze-on-overflow supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

MSI, bit [20]

Message-signaled interrupts supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bit [19]

Reserved, RAO.

Bit [18]

Reserved, RES0.

NA, bit [17]

No write access when running. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

EX, bit [16]

Export supported. For more information on this field, see 'CoreSight PMU Architecture'.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Bits [15:14]

Reserved, RAZ.

SIZE, bits [13:8]

Counter size. The size of the largest counter implemented by System PMU <s>.

SIZE	Meaning
0b000111	8-bit counters.
0b001001	10-bit counters.
0b001011	12-bit counters.
0b001111	16-bit counters.
0b010011	20-bit counters.
0b010111	24-bit counters.
0b011111	32-bit counters.
0b100011	36-bit counters.
0b100111	40-bit counters.
0b101011	44-bit counters.
0b101111	48-bit counters.
0b110011	52-bit counters.
0b110111	56-bit counters.
0b111111	64-bit counters.

All other values are reserved.

Not all counters must be this size. For example, a System PMU might include a mix of 32-bit and 64-bit counters.

N, bits [7:0]

Number of event counters implemented by System PMU <s>, minus 1.

N	Meaning
0x00..0x3F	Number of event counters implemented by System PMU <s>, minus 1.

All other values are reserved.

Accessing SPMCFGR_EL1

To access SPMCFGR_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCFGR_EL1 reads-as-zero if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCFGR_EL1

2025-12-10 16:11:30, 2025-12_rel

SPMCGCR<n>_EL1, System PMU Counter Group Configuration Registers, n = 0 - 1

The SPMCGCR<n>_EL1 characteristics are:

Purpose

Describes the configuration of counter groups in System PMU <s>.

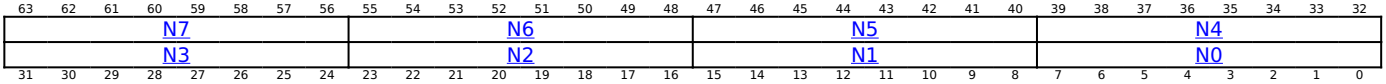
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCGCR<n>_EL1 are UNDEFINED.

Attributes

SPMCGCR<n>_EL1 is a 64-bit register.

Field descriptions



N<m>, bits [8m+7:8m], for m = 7 to 0

Number of counters in counter group 8n+m.

The maximum size of each counter group depends on the number of implemented groups and the largest implemented counter size. For more information, see SPMCFGR_EL1.NCG.

Accessing SPMCGCR<n>_EL1

To access SPMCGCR<n>_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCGCR<n>_EL1 reads-as-zero if any of the following are true:

- System PMU <s> implements one counter group (SPMCFGR_EL1.NCG is zero).
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCGCR<m>_EL1 ; Where m = 0-1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b00:m[0]

```

SPMCNTENCLR_EL0, System Performance Monitors Count Enable Clear Register

The SPMCNTENCLR_EL0 characteristics are:

Purpose

Disable event counters in System PMU <s>.

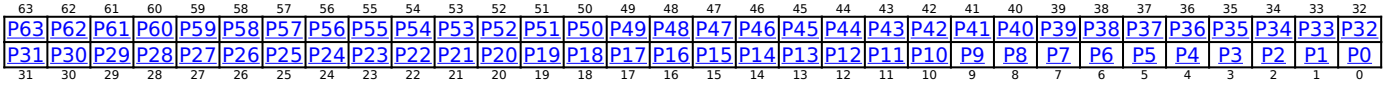
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCNTENCLR_EL0 are UNDEFINED.

Attributes

SPMCNTENCLR_EL0 is a 64-bit register.

Field descriptions



P<m>, bit [m], for m = 63 to 0

Event counter <m> disable.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> is disabled.
0b1	Event counter <m> in System PMU <s> is enabled.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When event counter <m> is not implemented by System PMU <s>, access to this field is RAZ/WI.
- Otherwise, access to this field is W1C.

Accessing SPMCNTENCLR_EL0

To access SPMCNTENCLR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCNTENCLR_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCNTENCLR_EL0

SPMCNTENSET_EL0, System Performance Monitors Count Enable Set Register

The SPMCNTENSET_EL0 characteristics are:

Purpose

Enables event counters in System PMU <s>.

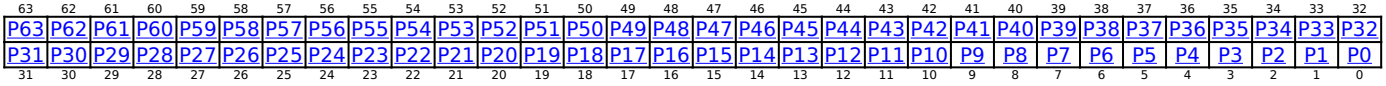
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCNTENSET_EL0 are UNDEFINED.

Attributes

SPMCNTENSET_EL0 is a 64-bit register.

Field descriptions



P<m>, bit [m], for m = 63 to 0

Event counter <m> enable.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> is disabled.
0b1	Event counter <m> in System PMU <s> is enabled.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When event counter <m> is not implemented by System PMU <s>, access to this field is RAZ/WI.
- Otherwise, access to this field is W1S.

Accessing SPMCNTENSET_EL0

To access SPMCNTENSET_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCNTENSET_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCNTENSET_EL0

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b001

SPMCR_EL0, System Performance Monitor Control Register

The SPMCR_EL0 characteristics are:

Purpose

Main control register for System PMU <s>.

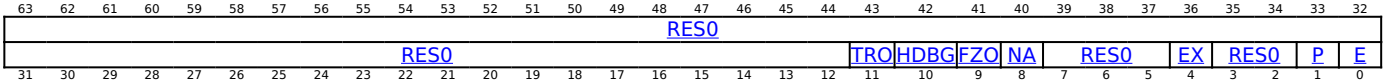
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMCR_EL0 are UNDEFINED.

Attributes

SPMCR_EL0 is a 64-bit register.

Field descriptions



Bits [63:12]

Reserved, RES0.

TRO, bit [11]
When SPMCFGR_EL1.TRO == '1':

Trace enable. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When PSTATE.EL == EL0, access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

HDBG, bit [10]
When SPMCFGR_EL1.HDBG == '1':

Halt-on-debug. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When PSTATE.EL == EL0, access to this field is RO.
- Otherwise, access to this field is RW.

Otherwise:

Reserved, RES0.

FZO, bit [9]
When SPMCFGR_EL1.FZO == '1':

Freeze-on-overflow. For more information on this field, see 'CoreSight PMU Architecture'.

Note

If implemented by a System PMU, then freeze-on-overflow affects only the counters of System PMU <s>, not other System PMUs nor the PE PMU.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NA, bit [8]
When SPMCFGR_EL1.NA == '1':

Not accessible. For more information on this field, see 'CoreSight PMU Architecture'.

Access to this field is RO.

Otherwise:

Reserved, RES0.

Bits [7:5]

Reserved, RES0.

EX, bit [4]
When SPMCFGR_EL1.EX == '1':

Export enable. For more information on this field, see 'CoreSight PMU Architecture'.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [3:2]

Reserved, RES0.

P, bit [1]

Event counter reset.

P	Meaning
0b0	Write is ignored.
0b1	Reset all event counters in System PMU <s> to zero.

Note

Resetting the event counters does not affect any overflow flags.

Access to this field is WO/RAZ.

E, bit [0]

Count enable. This field controls System PMU <s>.

E	Meaning
0b0	Monitor is disabled.
0b1	Monitor is enabled.

Performance monitor overflow IRQs are only signaled by System PMU <s> when this field is 1.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

Accessing SPMCR_EL0

To access SPMCR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMCR_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMCR_EL0

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b000

SPMDEVAFF_EL1, System Performance Monitors Device Affinity Register

The SPMDEVAFF_EL1 characteristics are:

Purpose

For additional information, see the CoreSight Architecture Specification.

For a System PMU that has affinity with a single PE or a group of PEs, SPMDEVAFF_EL1 is a copy of MPIDR_EL1 or part of MPIDR_EL1:

- If the System PMU has affinity with a single PE, then the affinity level is 0 and SPMDEVAFF_EL1 reads the same value as MPIDR_EL1, and SPMDEVAFF_EL1.F0V reads-as-one to indicate affinity level 0.
- If the System PMU has affinity with a group of PEs, then the affinity level is 1, 2, or 3, parts of SPMDEVAFF_EL1 reads the same value as parts of MPIDR_EL1, and the rest of SPMDEVAFF_EL1 indicates the level.

For example, if the group of PEs is a subset of the PEs at affinity level 1, then all of the following are true:

- All the PEs in the group have the same values in MPIDR_EL1.{Aff3,Aff2}, and these values are equal to SPMDEVAFF_EL1.{Aff3,Aff2}.
- SPMDEVAFF_EL1.Aff1 is nonzero and not 0x80, and SPMDEVAFF_EL1.{Aff0,F0V} read-as-zero, to indicate at least affinity level 1. The subset of PEs at level 1 that the System PMU has affinity with is indicated by the least-significant set bit in SPMDEVAFF_EL1.Aff1. In this example, if SPMDEVAFF_EL1.Aff1[2:0] is 0b100, then the System PMU has affinity with the up-to 8 PEs that have MPIDR_EL1.Aff1[7:3] == SPMDEVAFF_EL1.Aff1[7:3].

Depending on the IMPLEMENTATION DEFINED nature of the system, it might be possible that SPMDEVAFF_EL1 is read before system firmware has configured the System PMU and/or the PE or group of PEs that the System PMU has affinity with. When this is the case, SPMDEVAFF_EL1 reads-as-zero.

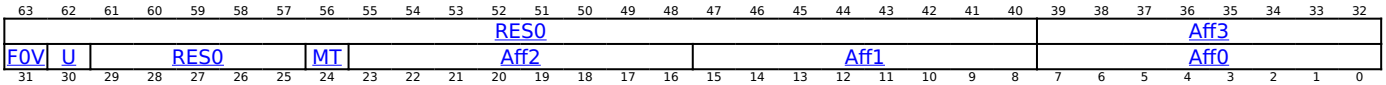
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMDEVAFF_EL1 are UNDEFINED.

Attributes

SPMDEVAFF_EL1 is a 64-bit register.

Field descriptions



Bits [63:40]

Reserved, RES0.

Aff3, bits [39:32]

PE affinity level 3. The MPIDR_EL1.Aff3 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

F0V, bit [31]

Indicates that the SPMDEVAFF_EL1.Aff0 field is valid.

The value of this field is an IMPLEMENTATION DEFINED choice of:

F0V	Meaning
0b0	SPMDEVAFF_EL1.Aff0 is not valid, and the PE affinity is above level 0 or a subset of level 0.
0b1	SPMDEVAFF_EL1.Aff0 is valid, and the PE affinity is at level 0.

Access to this field is RO.

U, bit [30]
When SPMDEVAFF_EL1.F0V == '1':

Uniprocessor. The MPIDR_EL1.U field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, UNKNOWN.

Bits [29:25]

Reserved, RES0.

MT, bit [24]
When SPMDEVAFF_EL1.F0V == '1':

Multithreaded. The MPIDR_EL1.MT field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Otherwise:

Reserved, UNKNOWN.

Aff2, bits [23:16]
When affine with a PE or PEs at affinity level 2 or below:

PE affinity level 2. The MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When affine with a sub-set of PEs at affinity level 2:

PE affinity level 2. Defines part of the MPIDR_EL1.Aff2 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff2	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff2[7:1] is the value of MPIDR_EL1.Aff2[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff2[7:2] is the value of MPIDR_EL1.Aff2[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff2[7:3] is the value of MPIDR_EL1.Aff2[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff2[7:4] is the value of MPIDR_EL1.Aff2[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff2[7:5] is the value of MPIDR_EL1.Aff2[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff2[7:6] is the value of MPIDR_EL1.Aff2[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff2[7] is the value of MPIDR_EL1.Aff2[7], viewed from the highest Exception level of the associated PEs.

Access to this field is RO.

Otherwise:

PE affinity level NOT DEFINED. Indicates whether the PE affinity is at level 3.

Aff2	Meaning
0x80	PE affinity is at level 3.

All other values are reserved.

Access to this field is RO.

Aff1, bits [15:8]
When affine with a PE or PEs at affinity level 1 or below:

PE affinity level 1. The MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PE or PEs.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When affine with a sub-set of PEs at affinity level 1:

PE affinity level 1. Defines part of the MPIDR_EL1.Aff1 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff1	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff1[7:1] is the value of MPIDR_EL1.Aff1[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff1[7:2] is the value of MPIDR_EL1.Aff1[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff1[7:3] is the value of MPIDR_EL1.Aff1[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff1[7:4] is the value of MPIDR_EL1.Aff1[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff1[7:5] is the value of MPIDR_EL1.Aff1[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff1[7:6] is the value of MPIDR_EL1.Aff1[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff1[7] is the value of MPIDR_EL1.Aff1[7], viewed from the highest Exception level of the associated PEs.

Access to this field is RO.

Otherwise:

PE affinity level 1. Indicates whether the PE affinity is at level 2.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff1	Meaning
0x00	PE affinity is above level 2 or a subset of level 2.
0x80	PE affinity is at level 2.

Access to this field is RO.

Aff0, bits [7:0]
When affine with a PE at affinity level 0:

PE affinity level 0. The MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PE.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

When affine with a sub-set of PEs at affinity level 0:

PE affinity level 0. Defines part of the MPIDR_EL1.Aff0 field, viewed from the highest Exception level of the associated PEs.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff0	Meaning
0bxxxxxxx1	SPMDEVAFF_EL1.Aff0[7:1] is the value of MPIDR_EL1.Aff0[7:1], viewed from the highest Exception level of the associated PEs.
0bxxxxxx10	SPMDEVAFF_EL1.Aff0[7:2] is the value of MPIDR_EL1.Aff0[7:2], viewed from the highest Exception level of the associated PEs.
0bxxxxx100	SPMDEVAFF_EL1.Aff0[7:3] is the value of MPIDR_EL1.Aff0[7:3], viewed from the highest Exception level of the associated PEs.
0bxxxx1000	SPMDEVAFF_EL1.Aff0[7:4] is the value of MPIDR_EL1.Aff0[7:4], viewed from the highest Exception level of the associated PEs.
0bxxx10000	SPMDEVAFF_EL1.Aff0[7:5] is the value of MPIDR_EL1.Aff0[7:5], viewed from the highest Exception level of the associated PEs.
0bxx100000	SPMDEVAFF_EL1.Aff0[7:6] is the value of MPIDR_EL1.Aff0[7:6], viewed from the highest Exception level of the associated PEs.
0bx1000000	SPMDEVAFF_EL1.Aff0[7] is the value of MPIDR_EL1.Aff0[7], viewed from the highest Exception level of the associated PEs.

Access to this field is RO.

Otherwise:

PE affinity level 0. Indicates whether the PE affinity is at level 1.

The value of this field is an IMPLEMENTATION DEFINED choice of:

Aff0	Meaning
0x00	PE affinity is above level 1 or a subset of level 1.
0x80	PE affinity is at level 1.

Access to this field is RO.

Accessing SPMDEVAFF_EL1

Reads of SPMDEVAFF_EL1 are not affected by the value of VMPIDR_EL2 at any Exception level.

If System PMU <s> has affinity only with this PE, then it is IMPLEMENTATION DEFINED whether SPMDEVAFF_EL1 reads-as-zero or reads the same value as MPIDR_EL1.

To access SPMDEVAFF_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMDEVAFF_EL1 reads-as-zero if any of the following are true:

- System PMU <s> is not implemented.

- System PMU <s> has no affinity with the PE or cluster of PEs.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMDEVAFF_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b110

SPMDEVARCH_EL1, System Performance Monitors Device Architecture Register

The SPMDEVARCH_EL1 characteristics are:

Purpose

Provides discovery information for System PMU <s>.

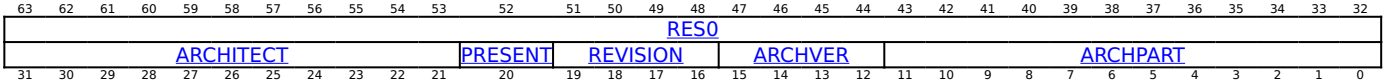
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMDEVARCH_EL1 are UNDEFINED.

Attributes

SPMDEVARCH_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ARCHITECT, bits [31:21]

Architect. Defines the architect of the component. Bits [31:28] are the JEP106 continuation code (JEP106 bank ID, minus 1) and bits [27:21] are the JEP106 ID code.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

PRESENT, bit [20]

DEVARCH present. Defines that SPMDEVARCH_EL1 register is present.

PRESENT	Meaning
0b0	Device Architecture information not present.
0b1	Device Architecture information present.

If SPMDEVARCH_EL1 is not present, the register is RES0.

REVISION, bits [19:16]

Revision. Defines the architecture revision of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ARCHVER, bits [15:12]

Architecture Version. Defines the architecture version of the component.

SPMDEVARCH_EL1.ARCHVER and SPMDEVARCH_EL1.ARCHPART are also defined as a single field, SPMDEVARCH_EL1.ARCHID, so that SPMDEVARCH_EL1.ARCHVER is SPMDEVARCH_EL1.ARCHID[15:12].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

ARCHPART, bits [11:0]

Architecture Part. Defines the architecture of the component.

SPMDEVARCH_EL1.ARCHVER and SPMDEVARCH_EL1.ARCHPART are also defined as a single field, SPMDEVARCH_EL1.ARCHID, so that SPMDEVARCH_EL1.ARCHPART is SPMDEVARCH_EL1.ARCHID[11:0].

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing SPMDEVARCH_EL1

To access SPMDEVARCH_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMDEVARCH_EL1 reads-as-zero if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMDEVARCH_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMDEVARCH_EL1

op0	op1	CRn	CRm	op2
0b10	0b000	0b1001	0b1101	0b101

SPMEVCNTR<n>_EL0, System Performance Monitors Event Count Register, n = 0 - 63

The SPMEVCNTR<n>_EL0 characteristics are:

Purpose

Event counter <n> in System PMU <s>, where n is 0 to 63.

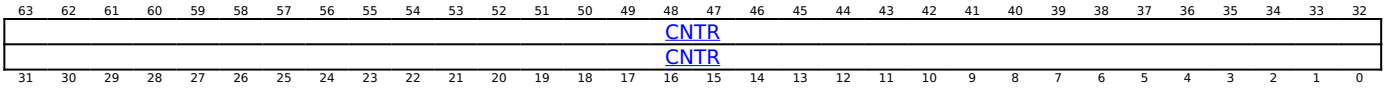
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMEVCNTR<n>_EL0 are UNDEFINED.

Attributes

SPMEVCNTR<n>_EL0 is a 64-bit register.

Field descriptions



CNTR, bits [63:0]

Event counter n.

The number of implemented bits for SPMEVCNTR<n>_EL0 is IMPLEMENTATION DEFINED. Unimplemented bits are RES0.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMEVCNTR<n>_EL0

To access SPMEVCNTR<n>_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s and SPMSELR_EL0.BANK to n[5:4].

SPMEVCNTR<n>_EL0 reads-as-zero and ignores writes if any of the following are true:

- Event counter <n> is not implemented by System PMU <s>.
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMEVCNTR<m>_EL0 ; Where m = 0-15

op0	op1	CRn	CRm	op2
0b10	0b011	0b1110	0b000:m[3]	m[2:0]

SPMEVFILT2R<n>_EL0, System Performance Monitors Event Filter Control Register 2, n = 0 - 63

The SPMEVFILT2R<n>_EL0 characteristics are:

Purpose

With SPMEVTYPER<n>_EL0 and SPMEVFILTR<n>_EL0, configures when event counter SPMEVCNTR<n>_EL0 in System PMU <s> increments.

The contents of this register are IMPLEMENTATION DEFINED. For more information, see SPMEVTYPER<n>_EL0.

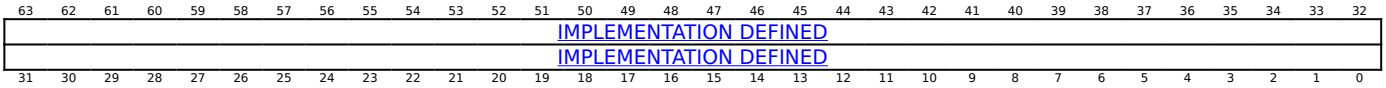
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMEVFILT2R<n>_EL0 are UNDEFINED.

Attributes

SPMEVFILT2R<n>_EL0 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing SPMEVFILT2R<n>_EL0

To access SPMEVFILT2R<n>_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s and SPMSELR_EL0.BANK to n[5:4].

SPMEVFILT2R<n>_EL0 reads-as-zero and ignores writes if any of the following are true:

- Event counter <n> is not implemented by System PMU <s>.
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMEVFILT2R<m>_EL0 ; Where m = 0-15

op0	op1	CRn	CRm	op2
0b10	0b011	0b1110	0b011:m[3]	m[2:0]

```

SPMEVTYPER<n>_EL0, System Performance Monitors Event Type Register, n = 0 - 63

The SPMEVTYPER<n>_EL0 characteristics are:

Purpose

With SPMEVFILTR<n>_EL0 and SPMEVFILT2R<n>_EL0, configures when event counter SPMEVCNTR<n>_EL0 in System PMU <s> increments.

The contents of this register are IMPLEMENTATION DEFINED. An Event Type Select Register typically contains:

- A field defining the event that the counter is responsive to, in the least-significant bits.
- Controls for per-counter filtering, such as by mode or state.
- Additional controls, such as for a per-counter state machine.

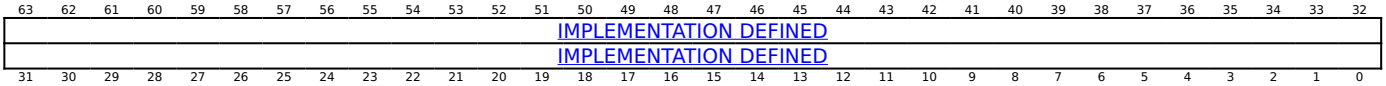
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMEVTYPER<n>_EL0 are UNDEFINED.

Attributes

SPMEVTYPER<n>_EL0 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:0]

IMPLEMENTATION DEFINED.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Accessing SPMEVTYPER<n>_EL0

To access SPMEVTYPER<n>_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s and SPMSELR_EL0.BANK to n[5:4].

SPMEVTYPER<n>_EL0 reads-as-zero and ignores writes if any of the following are true:

- Event counter <n> is not implemented by System PMU <s>.
- System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMEVTYPER<m>_EL0 ; Where m = 0-15

SPMIIDR_EL1, System PMU Implementation Identification Register

The SPMIIDR_EL1 characteristics are:

Purpose

Provides discovery information for System PMU <s>.

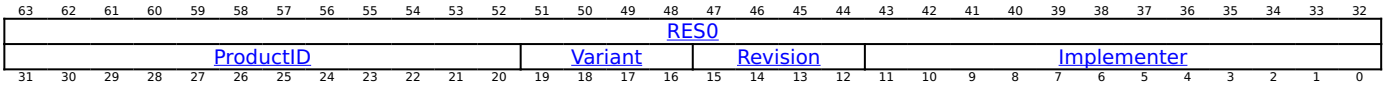
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMIIDR_EL1 are UNDEFINED.

Attributes

SPMIIDR_EL1 is a 64-bit register.

Field descriptions



Bits [63:32]

Reserved, RES0.

ProductID, bits [31:20]

Part number, bits [11:0]. The part number is selected by the designer of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Variant, bits [19:16]

Component major revision.

Defines either a variant of the component defined by SPMIIDR_EL1.ProductID, or the major revision of the component.

When defining a major revision, SPMIIDR_EL1.Variant and SPMIIDR_EL1.Revision together form the revision number of the component, with SPMIIDR_EL1.Variant being the most significant part and SPMIIDR_EL1.Revision the least significant part. When a component is changed, SPMIIDR_EL1.Variant or SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component. If SPMIIDR_EL1.Variant is increased then SPMIIDR_EL1.Revision should be set to 0b0000.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Revision, bits [15:12]

Component minor revision.

When a component is changed:

- If SPMIIDR_EL1.Variant and SPMIIDR_EL1.Revision together form the revision number of the component then:
  - SPMIIDR_EL1.Variant or SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component.
  - If Variant is increased then Revision should be set to 0b0000.
- Otherwise, SPMIIDR_EL1.Revision is increased to ensure that software can differentiate the different revisions of the component.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Implementer, bits [11:0]

Contains the JEP106 manufacturer's identification code of the designer of the System PMU.

The code identifies the designer of the component, which might not be the same as the implementer of the device containing the component.

For an implementation designed by Arm, this field reads as 0x43B.

Bits [11:8] contain the JEP106 bank identifier of the designer minus 1.

Bit 7 is RES0.

Bits [6:0] contain bits [6:0] of the JEP106 manufacturer's identification code of the designer.

This field has an IMPLEMENTATION DEFINED value.

Access to this field is RO.

Accessing SPMIIDR_EL1

To access SPMIIDR_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMIIDR_EL1 reads-as-zero if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMIIDR_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMIIDR_EL1

SPMOVSCLR_EL0, System Performance Monitors Overflow Flag Status Clear Register

The SPMOVSCLR_EL0 characteristics are:

Purpose

Clears the state of overflow bits for event counters in System PMU <s>.

Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMOVSCLR_EL0 are UNDEFINED.

Attributes

SPMOVSCLR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

P<m>, bit [m], for m = 63 to 0

Event counter <m> unsigned overflow bit clear.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> has not overflowed.
0b1	Event counter <m> in System PMU <s> has overflowed.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if any the following are true:
  - event counter <m> is not implemented by System PMU <s>.
  - event counter <m> does not implement an overflow flag.
- Otherwise, access to this field is W1C.

Accessing SPMOVSCLR_EL0

To access SPMOVSCLR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMOVSCLR_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMOVSCLR_EL0

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b011

SPMOVSSET_EL0, System Performance Monitors Overflow Flag Status Set Register

The SPMOVSSET_EL0 characteristics are:

Purpose

Sets the state of overflow bits for event counters in System PMU <s>.

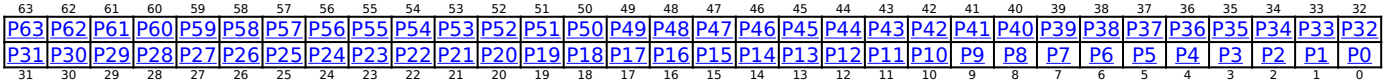
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMOVSSET_EL0 are UNDEFINED.

Attributes

SPMOVSSET_EL0 is a 64-bit register.

Field descriptions



P<m>, bit [m], for m = 63 to 0

Event counter <m> unsigned overflow bit set.

P<m>	Meaning
0b0	Event counter <m> in System PMU <s> has not overflowed.
0b1	Event counter <m> in System PMU <s> has overflowed.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RAZ/WI if any the following are true:
  - event counter <m> is not implemented by System PMU <s>.
  - event counter <m> does not implement an overflow flag.
- Otherwise, access to this field is W1S.

Accessing SPMOVSSET_EL0

To access SPMOVSSET_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMOVSSET_EL0 reads-as-zero and ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMOVSSET_EL0

op0	op1	CRn	CRm	op2

SPMROOTCR_EL3, System Performance Monitors Root and Realm Control Register

The SPMROOTCR_EL3 characteristics are:

Purpose

Controls observability of Root and Realm events by System PMU <s>.

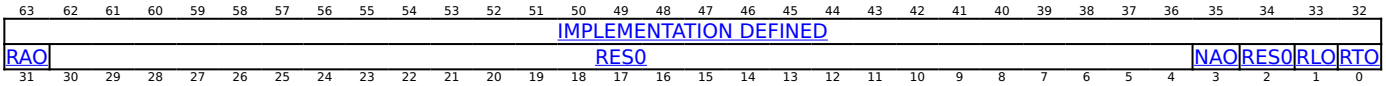
Configuration

This register is present only when FEAT_RME is implemented, FEAT_SPMU is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMROOTCR_EL3 are UNDEFINED.

Attributes

SPMROOTCR_EL3 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED bits to control certain types of filter or events by System PMU <s>.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [31]

Reserved, RAO.

Indicates SPMROOTCR_EL3 is implemented by System PMU <s>.

Bits [30:4]

Reserved, RES0.

NAO, bit [3]
When System PMU <s> can count or monitor non-attributable events:

Non-attributable Observation. Controls whether events or monitorable characteristics not attributable with any source can be monitored by System PMU <s>.

NAO	Meaning
0b0	Events not attributable with any event source are not counted by System PMU <s>.
0b1	Counting non-attributable events by System PMU <s> is not prevented by this mechanism.

When both SPMROOTCR_EL3 and SPMSCR_EL1 are implemented, non-attributable events are counted only if both SPMROOTCR_EL3.NAO is 1 and SPMSCR_EL1.{NAO, SO} is nonzero.

SPMROOTCR_EL3.NAO has the opposite reset polarity to SPMSCR_EL1.NAO.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '1'.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

RLO, bit [1]

Realm Observation. Controls whether events or monitorable characteristics attributable to a Realm event source can be monitored by System PMU <s>.

RLO	Meaning
0b0	Events attributable to a Realm event source are not counted by System PMU <s>.
0b1	Counting events by System PMU <s> that are attributable to a Realm event source is not prevented by this mechanism.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

RTO, bit [0]

Root Observation. Controls whether events or monitorable characteristics attributable to a Root event source can be monitored by System PMU <s>.

RTO	Meaning
0b0	Events attributable to a Root event source are not counted by System PMU <s>.
0b1	Counting events by System PMU <s> that are attributable to a Root event source is not prevented by this mechanism.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

Accessing SPMROOTCR_EL3

To access SPMROOTCR_EL3 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMROOTCR_EL3 reads-as-zero and ignores writes if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMROOTCR_EL3.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMROOTCR_EL3

op0	op1	CRn	CRm	op2
0b10	0b110	0b1001	0b1110	0b111

```

SPMSCR_EL1, System Performance Monitors Secure Control Register

The SPMSCR_EL1 characteristics are:

Purpose

Controls observability of Secure events by System PMU <s>, and optionally controls Secure attributes for message signaled interrupts and Non-secure access to the performance monitor registers.

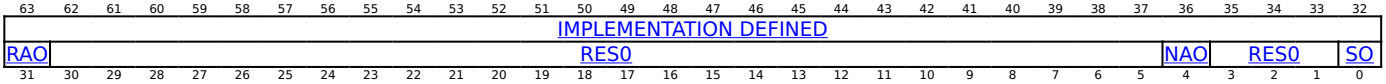
Configuration

This register is present only when Secure EL1 is implemented, FEAT_SPMU is implemented, and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMSCR_EL1 are UNDEFINED.

Attributes

SPMSCR_EL1 is a 64-bit register.

Field descriptions



IMPLEMENTATION DEFINED, bits [63:32]

IMPLEMENTATION DEFINED observation controls. Additional IMPLEMENTATION DEFINED bits to control certain types of filter or events by System PMU <s>.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an IMPLEMENTATION DEFINED value.

Bit [31]

Reserved, RAO.

Indicates SPMSCR_EL1 is implemented by System PMU <s>.

This field reads-as-one.

Bits [30:5]

Reserved, RES0.

NAO, bit [4]
When System PMU <s> can count or monitor non-attributable events:

Non-attributable Observation. Controls whether events or monitorable characteristics not attributable with any source can be monitored by System PMU <s>.

NAO	Meaning
0b0	Events not attributable with any event source are not counted by System PMU <s>, unless overridden by SPMSCR_EL1.SO.
0b1	Counting non-attributable events by System PMU <s> is not prevented by this mechanism.

When both SPMROOTCR_EL3 and SPMSCR_EL1 are implemented, non-attributable events are counted only if both SPMROOTCR_EL3.NAO is 1 and SPMSCR_EL1.{NAO, SO} is nonzero.

SPMSCR_EL1.NAO has the opposite reset polarity to SPMROOTCR_EL3.NAO.

This field is optional if Root and Realm states are not implemented. When this field is not implemented, System PMU <s> behaves as if SPMSCR_EL1.NAO is 0, and whether events or monitorable characteristics not attributable with any source can be monitored is controlled by SPMSCR_EL1.SO.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

Otherwise:

Reserved, RES0.

Bits [3:1]

Reserved, RES0.

SO, bit [0]

Secure Observation. Controls whether events or monitorable characteristics attributable to a Secure event source can be monitored by System PMU <s>.

SO	Meaning
0b0	Events attributable to a Secure event source are not counted by System PMU <s>.
0b1	Counting events by System PMU <s> that are attributable to a Secure event source is not prevented by this mechanism.

Also controls whether events or monitorable characteristics not attributable with any source can be monitored by System PMU <s>. See SPMSCR_EL1.NAO.

The reset behavior of this field is:

- On a System PMU reset, this field resets to '0'.

Accessing SPMSCR_EL1

To access SPMSCR_EL1 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMSCR_EL1 reads-as-zero and ignores writes if any of the following are true:

- System PMU <s> is not implemented.
- System PMU <s> does not implement SPMSCR_EL1.

SPMSCR_EL1 is UNDEFINED if accessed in Non-secure or Realm state.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMSCR_EL1

SPMSELR_EL0, System Performance Monitors Select Register

The SPMSELR_EL0 characteristics are:

Purpose

Selects the System PMU and event counter registers to access.

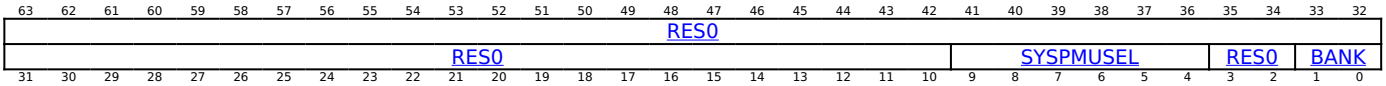
Configuration

This register is present only when FEAT_SPMU is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMSELR_EL0 are UNDEFINED.

Attributes

SPMSELR_EL0 is a 64-bit register.

Field descriptions



Bits [63:10]

Reserved, RES0.

SYSPMUSEL, bits [9:4]

System PMU Select. Selects a System PMU <s> to access.

Values 0x20 to 0x3F are reserved.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [3:2]

Reserved, RES0.

BANK, bits [1:0]

System PMU bank access control. Selects a bank of 16 System PMU event counters and related controls to access.

BANK	Meaning
0b00	Select event counters 0 to 15.
0b01	Select event counters 16 to 31.
0b10	Select event counters 32 to 47.
0b11	Select event counters 48 to 63.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPMSELR_EL0

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPMSELR_EL0

op0	op1	CRn	CRm	op2
0b10	0b011	0b1001	0b1100	0b101

```

SPMZR_EL0, System Performance Monitors Zero with Mask

The SPMZR_EL0 characteristics are:

Purpose

Zero the set of System PMU event counters specified by the mask written to SPMZR_EL0.

Configuration

This register is present only when FEAT_SPMU2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPMZR_EL0 are UNDEFINED.

Attributes

SPMZR_EL0 is a 64-bit register.

Field descriptions

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32

P<m>, bit [m], for m = 63 to 0

Zero event counter <m>.

P<m>	Meaning
0b0	Write is ignored.
0b1	Set event counter<m> in System PMU <s> to zero.

The reset behavior of this field is:

- On a System PMU reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When event counter <m> is not implemented by System PMU <s>, access to this field is RAZ/WI.
- Otherwise, access to this field is WO/RAZ.

Accessing SPMZR_EL0

To access SPMZR_EL0 for System PMU <s>, set SPMSELR_EL0.SYSPMUSEL to s.

SPMZR_EL0 ignores writes if System PMU <s> is not implemented.

Accesses to this register use the following encodings in the System register encoding space:

MSR SPMZR_EL0, <Xt>

SPSel, Stack Pointer Select

The SPSel characteristics are:

Purpose

Allows the Stack Pointer to be selected between SP_EL0 and SP_ELx.

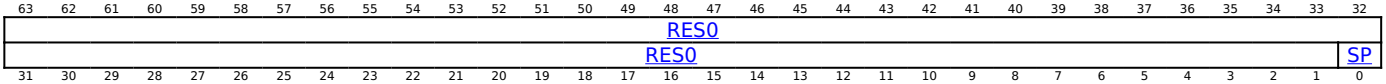
Configuration

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSel are UNDEFINED.

Attributes

SPSel is a 64-bit register.

Field descriptions



Bits [63:1]

Reserved, RES0.

SP, bit [0]

Stack pointer to use. Possible values of this bit are:

SP	Meaning
0b0	Use SP_EL0 at all Exception levels.
0b1	Use SP_ELx for Exception level ELx. When FEAT_NMI is implemented and SCTLR_ELx.SPINTMASK is 1, if execution is at ELx, an IRQ or FIQ interrupt that is targeted to ELx is masked regardless of any indication of Superpriority.

The reset behavior of this field is:

- On a Warm reset, this field resets to '1'.

Accessing SPSel

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSel

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0010	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

elsif PSTATE.EL == EL2 then
    PSTATE.SP = X{64}(t)[0];
elsif PSTATE.EL == EL3 then
    PSTATE.SP = X{64}(t)[0];
end;
```

MSR SPSel, #<imm>

op0	op1	CRn	op2
0b00	0b000	0b0100	0b101

2025-12-10 16:11:30, 2025-12_rel

SPSR_abt, Saved Program Status Register (Abort mode)

The SPSR_abt characteristics are:

Purpose

Holds the saved process state when an exception is taken to Abort mode.

Configuration

AArch64 System register SPSR_abt bits [31:0] are architecturally mapped to AArch32 System register SPSR_abt[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_abt are UNDEFINED.

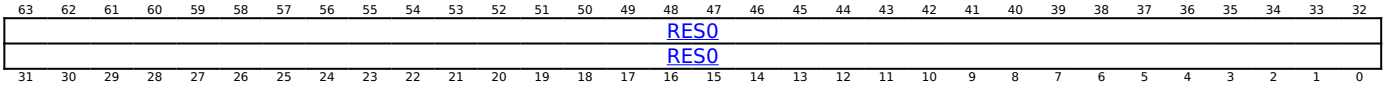
If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_abt is a 64-bit register.

Field descriptions

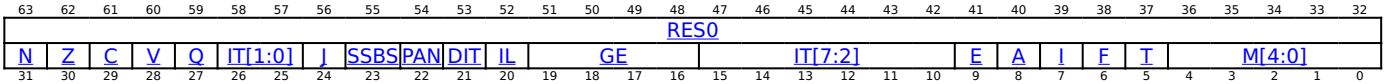
When FEAT_AA32EL1 is not implemented:



Bits [63:0]

Reserved, RES0.

Otherwise:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Abort mode, and copied to PSTATE.N on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Abort mode, and copied to PSTATE.Z on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Abort mode, and copied to PSTATE.C on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Abort mode, and copied to PSTATE.V on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Abort mode, and copied to PSTATE.Q on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Abort mode, and copied to PSTATE.IT on executing an exception return operation in Abort mode.

On executing an exception return operation in Abort mode, SPSR_abt.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_abt[26:25].
- IT[7:2] is SPSR_abt[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Abort mode, and copied to PSTATE.SSBS on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Abort mode, and copied to PSTATE.PAN on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Abort mode, and copied to PSTATE.DIT on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Abort mode, and copied to PSTATE.IL on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Abort mode, and copied to PSTATE.GE on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Abort mode, and copied to PSTATE.E on executing an exception return operation in Abort mode.

If the implementation does not support big-endian operation, SPSR_abt.E is RES0. If the implementation does not support little-endian operation, SPSR_abt.E is RES1. On executing an exception return operation in Abort mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_abt.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_abt.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Abort mode, and copied to PSTATE.A on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Abort mode, and copied to PSTATE.I on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Abort mode, and copied to PSTATE.F on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Abort mode, and copied to PSTATE.T on executing an exception return operation in Abort mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Abort mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Abort mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_abt.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Abort mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_abt

The MSR (register) and MRS instructions used to access SPSR_abt are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_abt

op0	op1	CRn	CRm	op2

SPSR_EL1, Saved Program Status Register (EL1)

The SPSR_EL1 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL1.

Configuration

AArch64 System register SPSR_EL1 bits [31:0] are architecturally mapped to AArch32 System register SPSR_svc[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_EL1 are UNDEFINED.

Attributes

SPSR_EL1 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented and exception taken from AArch32 state:

63	62	61	60	59	58	57	56	55	54	53	52	51	50	49	48	47	46	45	44	43	42	41	40	39	38	37	36	35	34	33	32
RES0																											UINJ	RES0		PPEND	RES0
N	Z	C	V	Q	IT[1:0]		DIT	SSBS	PAN	SS	IL	GE				IT[7:2]						E	A	I	F	T	M[4]	M[3:0]			
31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]
When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL1, and copied to PSTATE.UINJ on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:34]

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL1, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL1, and copied to PSTATE.Q on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL1, and copied to PSTATE.IT on executing an exception return operation in EL1.

On executing an exception return operation in EL1, SPSR_EL1.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL1[26:25].
- IT[7:2] is SPSR_EL1[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL1, and copied to PSTATE.GE on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL1, and copied to PSTATE.E on executing an exception return operation in EL1.

If the implementation does not support big-endian operation, SPSR_EL1.E is RES0. If the implementation does not support little-endian operation, SPSR_EL1.E is RES1. On executing an exception return operation in EL1, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL1.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL1.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL1, and copied to PSTATE.T on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL1 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL1, and copied to PSTATE.M[3:0] on executing an exception return operation in EL1.

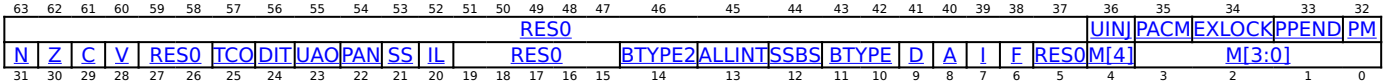
M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:



An exception return from EL1 using AArch64 makes SPSR_EL1 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]
When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL1, and copied to PSTATE.UINJ on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACM, bit [35]
When FEAT_PAuth_LR is implemented:

PACM. Set to the value of PSTATE.PACM on taking an exception to EL1, and copied to PSTATE.PACM on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLOCK, bit [34]
When FEAT_GCS is implemented:

Exception return state lock. Set to the value of PSTATE.EXLOCK on taking an exception to EL1, and copied to PSTATE.EXLOCK on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL1, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]
When FEAT_EBEP is implemented:

Profiling exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL1, and copied to PSTATE.PM on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL1, and copied to PSTATE.N on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL1, and copied to PSTATE.Z on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL1, and copied to PSTATE.C on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL1, and copied to PSTATE.V on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]
When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL1, and copied to PSTATE.TCO on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL1, and copied to PSTATE.DIT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL1, and copied to PSTATE.UAO on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL1, and copied to PSTATE.PAN on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL1, and conditionally copied to PSTATE.SS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL1, and copied to PSTATE.IL on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:15]

Reserved, RES0.

BTYPE2, bit [14]
When FEAT_BTIE is implemented:

Bit [2] of Branch Type Indicator. Set to the value of PSTATE.BTYPE[2] on taking an exception to EL1, and copied to PSTATE.BTYPE[2] on executing an exception return operation in EL1. This field is evaluated in conjunction with SPSR_EL1.BTYPE to give BTYPE[2:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALLINT, bit [13]
When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL1, and copied to PSTATE.ALLINT on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL1, and copied to PSTATE.SSBS on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]
When FEAT_BTI is implemented:

Bits [1:0] of Branch Type Indicator. Set to the value of PSTATE.BTYPE[1:0] on taking an exception to EL1, and copied to PSTATE.BTYPE[1:0] on executing an exception return operation in EL1. If FEAT_BTIE is implemented, this field is evaluated in conjunction with SPSR_EL1.BTYPE2 to give BTYPE[2:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL1, and copied to PSTATE.D on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL1, and copied to PSTATE.A on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL1, and copied to PSTATE.I on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL1, and copied to PSTATE.F on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL1 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL1.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0.
0b0100	EL1 with SP_EL0 (EL1t).
0b0101	EL1 with SP_EL1 (EL1h).
0b1000	EL1 with SP_EL0 (EL1t) and either HCR_EL2.{NV, NV1} is {1,0} or HCR_EL2.{NV, NV2} is {1,1}.
0b1001	EL1 with SP_EL1 (EL1h) and either HCR_EL2.{NV, NV1} is {1,0} or HCR_EL2.{NV, NV2} is {1,1}.

Other values are reserved. If SPSR_EL1.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL1 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2]: On an exception to EL1:
  - If the exception is taken from EL0:
    - M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1.
  - If the exception is taken from EL1:
    - If the Effective value of HCR_EL2.{NV, NV1} is not {1,0} and the Effective value of HCR_EL2.{NV, NV2} is not {1,1}, then M[3:2] is set to the value of PSTATE.EL on taking an exception to EL1.
    - If the Effective value of HCR_EL2.{NV, NV1} is {1,0} or if the Effective value of HCR_EL2.{NV, NV2} is {1,1}, then M[3:2] is set to 0b10.
  - M[3:2] is copied to PSTATE.EL on executing a legal exception return operation in EL1.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL1 and copied to PSTATE.SP on executing an exception return operation in EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name SPSR_EL1 or SPSR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

The MSR (register) and MRS instructions used to access SPSR_EL1 are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL1

SPSR_EL2, Saved Program Status Register (EL2)

The SPSR_EL2 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL2.

Configuration

AArch64 System register SPSR_EL2 bits [31:0] are architecturally mapped to AArch32 System register SPSR_hyp[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_EL2 are UNDEFINED.

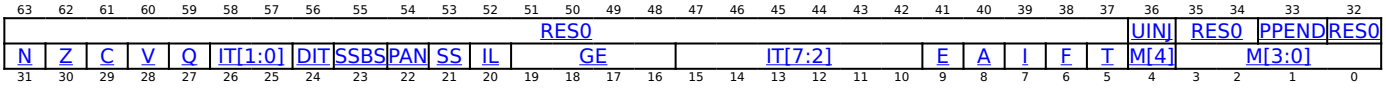
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

SPSR_EL2 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented and exception taken from AArch32 state:



An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]
When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL2, and copied to PSTATE.UINJ on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:34]

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL2, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL2, and copied to PSTATE.Q on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL2, and copied to PSTATE.IT on executing an exception return operation in EL2.

On executing an exception return operation in EL2, SPSR_EL2.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL2[26:25].
- IT[7:2] is SPSR_EL2[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL2, and copied to PSTATE.GE on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL2, and copied to PSTATE.E on executing an exception return operation in EL2.

If the implementation does not support big-endian operation, SPSR_EL2.E is RES0. If the implementation does not support little-endian operation, SPSR_EL2.E is RES1. On executing an exception return operation in EL2, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL2.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL2.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL2, and copied to PSTATE.T on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL2 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL2, and copied to PSTATE.M[3:0] on executing an exception return operation in EL2.

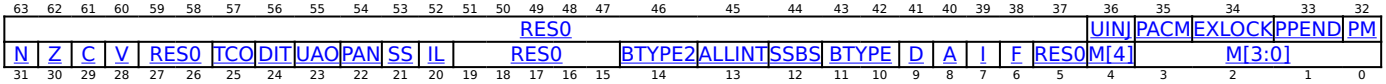
M[3:0]	Meaning
0b0000	User.
0b0001	FIQ.
0b0010	IRQ.
0b0011	Supervisor.
0b0111	Abort.
0b1010	Hyp.
0b1011	Undefined.
0b1111	System.

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:



An exception return from EL2 using AArch64 makes SPSR_EL2 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]
When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL2, and copied to PSTATE.UINJ on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACM, bit [35]
When FEAT_PAuth_LR is implemented:

PACM. Set to the value of PSTATE.PACM on taking an exception to EL2, and copied to PSTATE.PACM on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLOCK, bit [34]
When FEAT_GCS is implemented:

Exception return state lock. Set to the value of PSTATE.EXLOCK on taking an exception to EL2, and copied to PSTATE.EXLOCK on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL2, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]
When FEAT_EBEP is implemented:

Profiling exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL2, and copied to PSTATE.PM on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL2, and copied to PSTATE.N on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL2, and copied to PSTATE.Z on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL2, and copied to PSTATE.C on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL2, and copied to PSTATE.V on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]
When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL2, and copied to PSTATE.TCO on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL2, and copied to PSTATE.DIT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL2, and copied to PSTATE.UAO on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL2, and copied to PSTATE.PAN on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL2, and conditionally copied to PSTATE.SS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL2, and copied to PSTATE.IL on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:15]

Reserved, RES0.

BTYPE2, bit [14]
When FEAT_BTIE is implemented:

Bit [2] of Branch Type Indicator. Set to the value of PSTATE.BTYPE[2] on taking an exception to EL2, and copied to PSTATE.BTYPE[2] on executing an exception return operation in EL2. This field is evaluated in conjunction with SPSR_EL2.BTYPE to give BTYPE[2:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALLINT, bit [13]
When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL2, and copied to PSTATE.ALLINT on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL2, and copied to PSTATE.SSBS on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]
When FEAT_BTI is implemented:

Bits [1:0] of Branch Type Indicator. Set to the value of PSTATE.BTYPE[1:0] on taking an exception to EL2, and copied to PSTATE.BTYPE[1:0] on executing an exception return operation in EL2. If FEAT_BTIE is implemented, this field is evaluated in conjunction with SPSR_EL2.BTYPE2 to give BTYPE[2:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL2, and copied to PSTATE.D on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL2, and copied to PSTATE.A on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL2, and copied to PSTATE.I on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL2, and copied to PSTATE.F on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL2 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL2.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning
0b0000	EL0.
0b0100	EL1 with SP_EL0 (EL1t).
0b0101	EL1 with SP_EL1 (EL1h).
0b1000	EL2 with SP_EL0 (EL2t).
0b1001	EL2 with SP_EL2 (EL2h).

Other values are reserved. If SPSR_EL2.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL2 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL2 and copied to PSTATE.EL on executing an exception return operation in EL2.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL2 and copied to PSTATE.SP on executing an exception return operation in EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name SPSR_EL2 or SPSR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

The MSR (register) and MRS instructions used to access SPSR_EL2 are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then

SPSR_EL3, Saved Program Status Register (EL3)

The SPSR_EL3 characteristics are:

Purpose

Holds the saved process state when an exception is taken to EL3.

Configuration

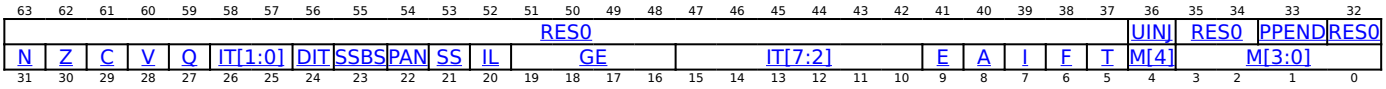
This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_EL3 are UNDEFINED.

Attributes

SPSR_EL3 is a 64-bit register.

Field descriptions

When FEAT_AA32 is implemented and exception taken from AArch32 state:



An exception return from EL3 using AArch64 makes SPSR_EL3 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]
When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL3, and copied to PSTATE.UINJ on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [35:34]

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL3, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to EL3, and copied to PSTATE.Q on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to EL3, and copied to PSTATE.IT on executing an exception return operation in EL3.

On executing an exception return operation in EL3, SPSR_EL3.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_EL3[26:25].
- IT[7:2] is SPSR_EL3[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to EL3, and copied to PSTATE.GE on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to EL3, and copied to PSTATE.E on executing an exception return operation in EL3.

If the implementation does not support big-endian operation, SPSR_EL3.E is RES0. If the implementation does not support little-endian operation, SPSR_EL3.E is RES1. On executing an exception return operation in EL3, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_EL3.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_EL3.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to EL3, and copied to PSTATE.T on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4], bit [4]

Execution state. Set to 0b1, the value of PSTATE.nRW, on taking an exception to EL3 from AArch32 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b1	AArch32 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch32 Mode. Set to the value of PSTATE.M[3:0] on taking an exception to EL3, and copied to PSTATE.M[3:0] on executing an exception return operation in EL3.

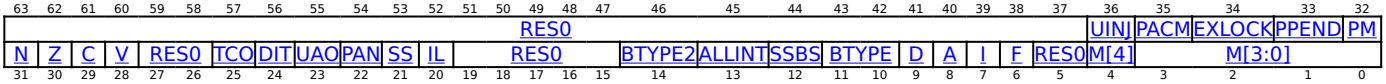
M[3:0]	Meaning	Applies when
0b0000	User.	
0b0001	FIQ.	
0b0010	IRQ.	
0b0011	Supervisor.	
0b0110	Monitor.	When FEAT_EL3 is implemented
0b0111	Abort.	
0b1010	Hyp.	
0b1011	Undefined.	
0b1111	System.	

Other values are reserved. If SPSR_EL3.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When exception taken from AArch64 state:



An exception return from EL3 using AArch64 makes SPSR_EL3 become UNKNOWN.

Bits [63:37]

Reserved, RES0.

UINJ, bit [36]
When FEAT_UINJ is implemented:

Inject Undefined Instruction exception. Set to 0 on taking an exception to EL3, and copied to PSTATE.UINJ on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PACM, bit [35]
When FEAT_PAuth_LR is implemented:

PACM. Set to the value of PSTATE.PACM on taking an exception to EL3, and copied to PSTATE.PACM on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

EXLOCK, bit [34]
When FEAT_GCS is implemented:

Exception return state lock. Set to the value of PSTATE.EXLOCK on taking an exception to EL3, and copied to PSTATE.EXLOCK on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PPEND, bit [33]
When FEAT_SEBEP is implemented:

PMU Profiling exception pending bit. Set to the value of PSTATE.PPEND on taking an exception to EL3, and conditionally copied to PSTATE.PPEND on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PM, bit [32]
When FEAT_EBEP is implemented:

Profiling exception mask bit. Set to the value of PSTATE.PM on taking an exception to EL3, and copied to PSTATE.PM on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to EL3, and copied to PSTATE.N on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to EL3, and copied to PSTATE.Z on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to EL3, and copied to PSTATE.C on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to EL3, and copied to PSTATE.V on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [27:26]

Reserved, RES0.

TCO, bit [25]
When FEAT_MTE is implemented:

Tag Check Override. Set to the value of PSTATE.TCO on taking an exception to EL3, and copied to PSTATE.TCO on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [24]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to EL3, and copied to PSTATE.DIT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

UAO, bit [23]
When FEAT_UAO is implemented:

User Access Override. Set to the value of PSTATE.UAO on taking an exception to EL3, and copied to PSTATE.UAO on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to EL3, and copied to PSTATE.PAN on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SS, bit [21]

Software Step. Set to the value of PSTATE.SS on taking an exception to EL3, and conditionally copied to PSTATE.SS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to EL3, and copied to PSTATE.IL on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [19:15]

Reserved, RES0.

BTYPE2, bit [14]
When FEAT_BTIE is implemented:

Bit [2] of Branch Type Indicator. Set to the value of PSTATE.BTYPE[2] on taking an exception to EL3, and copied to PSTATE.BTYPE[2] on executing an exception return operation in EL3. This field is evaluated in conjunction with SPSR_EL3.BTYPE to give BTYPE[2:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

ALLINT, bit [13]
When FEAT_NMI is implemented:

All IRQ or FIQ interrupts mask. Set to the value of PSTATE.ALLINT on taking an exception to EL3, and copied to PSTATE.ALLINT on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

SSBS, bit [12]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to EL3, and copied to PSTATE.SSBS on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

BTYPE, bits [11:10]
When FEAT_BTI is implemented:

Bits [1:0] of Branch Type Indicator. Set to the value of PSTATE.BTYPE[1:0] on taking an exception to EL3, and copied to PSTATE.BTYPE[1:0] on executing an exception return operation in EL3. If FEAT_BTIE is implemented, this field is evaluated in conjunction with SPSR_EL3.BTYPE2 to give BTYPE[2:0].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

D, bit [9]

Debug exception mask. Set to the value of PSTATE.D on taking an exception to EL3, and copied to PSTATE.D on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to EL3, and copied to PSTATE.A on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to EL3, and copied to PSTATE.I on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to EL3, and copied to PSTATE.F on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [5]

Reserved, RES0.

M[4], bit [4]

Execution state. Set to 0b0, the value of PSTATE.nRW, on taking an exception to EL3 from AArch64 state, and copied to PSTATE.nRW on executing an exception return operation in EL3.

M[4]	Meaning
0b0	AArch64 execution state.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[3:0], bits [3:0]

AArch64 Exception level and selected Stack Pointer.

M[3:0]	Meaning	Applies when
0b0000	EL0.	
0b0100	EL1 with SP_EL0 (EL1t).	
0b0101	EL1 with SP_EL1 (EL1h).	
0b1000	EL2 with SP_EL0 (EL2t).	
0b1001	EL2 with SP_EL2 (EL2h).	
0b1100	EL3 with SP_EL0 (EL3t).	When FEAT_EL3 is implemented
0b1101	EL3 with SP_EL3 (EL3h).	When FEAT_EL3 is implemented

Other values are reserved. If SPSR_EL3.M[3:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in EL3 is an illegal return event, as described in 'Illegal return events from AArch64 state'.

The bits in this field are interpreted as follows:

- M[3:2] is set to the value of PSTATE.EL on taking an exception to EL3 and copied to PSTATE.EL on executing an exception return operation in EL3.
- M[1] is unused and is 0 for all non-reserved values.
- M[0] is set to the value of PSTATE.SP on taking an exception to EL3 and copied to PSTATE.SP on executing an exception return operation in EL3.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_EL3

The MSR (register) and MRS instructions used to access SPSR_EL3 are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SPSR_EL3();
end;
```

MSR SPSR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0100	0b0000	0b000

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_GCS) && GetCurrentEXLOCKEN() && !Halted() && PSTATE.EXLOCK == '1' then
        EXLOCKException();
    else
        SPSR_EL3() = X{64}(t);
    end;
end;
```

SPSR_fiq, Saved Program Status Register (FIQ mode)

The SPSR_fiq characteristics are:

Purpose

Holds the saved process state when an exception is taken to FIQ mode.

Configuration

AArch64 System register SPSR_fiq bits [31:0] are architecturally mapped to AArch32 System register SPSR_fiq[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_fiq are UNDEFINED.

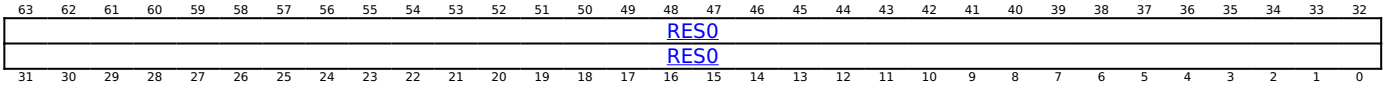
If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_fiq is a 64-bit register.

Field descriptions

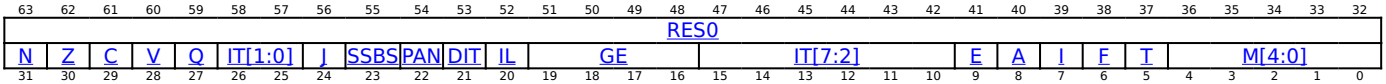
When FEAT_AA32EL1 is not implemented:



Bits [63:0]

Reserved, RES0.

Otherwise:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to FIQ mode, and copied to PSTATE.N on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to FIQ mode, and copied to PSTATE.Z on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to FIQ mode, and copied to PSTATE.C on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to FIQ mode, and copied to PSTATE.V on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to FIQ mode, and copied to PSTATE.Q on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to FIQ mode, and copied to PSTATE.IT on executing an exception return operation in FIQ mode.

On executing an exception return operation in FIQ mode, SPSR_fiq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_fiq[26:25].
- IT[7:2] is SPSR_fiq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to FIQ mode, and copied to PSTATE.SSBS on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to FIQ mode, and copied to PSTATE.PAN on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to FIQ mode, and copied to PSTATE.DIT on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to FIQ mode, and copied to PSTATE.IL on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to FIQ mode, and copied to PSTATE.GE on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to FIQ mode, and copied to PSTATE.E on executing an exception return operation in FIQ mode.

If the implementation does not support big-endian operation, SPSR_fiq.E is RES0. If the implementation does not support little-endian operation, SPSR_fiq.E is RES1. On executing an exception return operation in FIQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_fiq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_fiq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to FIQ mode, and copied to PSTATE.A on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to FIQ mode, and copied to PSTATE.I on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to FIQ mode, and copied to PSTATE.F on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to FIQ mode, and copied to PSTATE.T on executing an exception return operation in FIQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to FIQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in FIQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_fiq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in FIQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_fiq

The MSR (register) and MRS instructions used to access SPSR_fiq are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_fiq

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b011

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = SPSR_fiq();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SPSR_fiq();
end;
```

MSR SPSR_fiq, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b011

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    SPSR_fiq() = X{64}(t);
elsif PSTATE.EL == EL3 then
    SPSR_fiq() = X{64}(t);
end;
```

2025-12-10 16:11:30, 2025-12_rel

SPSR_irq, Saved Program Status Register (IRQ mode)

The SPSR_irq characteristics are:

Purpose

Holds the saved process state when an exception is taken to IRQ mode.

Configuration

AArch64 System register SPSR_irq bits [31:0] are architecturally mapped to AArch32 System register SPSR_irq[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_irq are UNDEFINED.

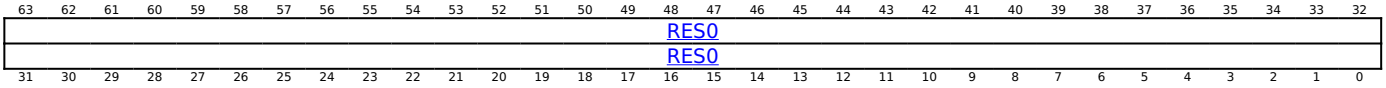
If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_irq is a 64-bit register.

Field descriptions

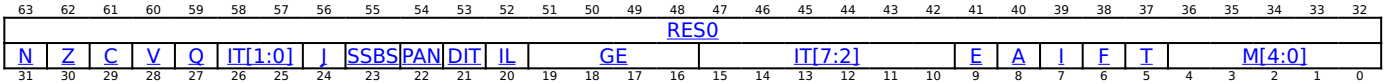
When FEAT_AA32EL1 is not implemented:



Bits [63:0]

Reserved, RES0.

Otherwise:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to IRQ mode, and copied to PSTATE.N on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to IRQ mode, and copied to PSTATE.Z on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to IRQ mode, and copied to PSTATE.C on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to IRQ mode, and copied to PSTATE.V on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to IRQ mode, and copied to PSTATE.Q on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to IRQ mode, and copied to PSTATE.IT on executing an exception return operation in IRQ mode.

On executing an exception return operation in IRQ mode, SPSR_irq.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_irq[26:25].
- IT[7:2] is SPSR_irq[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to IRQ mode, and copied to PSTATE.SSBS on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to IRQ mode, and copied to PSTATE.PAN on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to IRQ mode, and copied to PSTATE.DIT on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to IRQ mode, and copied to PSTATE.IL on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to IRQ mode, and copied to PSTATE.GE on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to IRQ mode, and copied to PSTATE.E on executing an exception return operation in IRQ mode.

If the implementation does not support big-endian operation, SPSR_irq.E is RES0. If the implementation does not support little-endian operation, SPSR_irq.E is RES1. On executing an exception return operation in IRQ mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_irq.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_irq.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to IRQ mode, and copied to PSTATE.A on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to IRQ mode, and copied to PSTATE.I on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to IRQ mode, and copied to PSTATE.F on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to IRQ mode, and copied to PSTATE.T on executing an exception return operation in IRQ mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to IRQ mode, and copied to PSTATE.M[4:0] on executing an exception return operation in IRQ mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_irq.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in IRQ mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_irq

The MSR (register) and MRS instructions used to access SPSR_irq are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_irq

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = SPSR_irq();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SPSR_irq();
end;
```

MSR SPSR_irq, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b000

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    SPSR_irq() = X{64}(t);
elsif PSTATE.EL == EL3 then
    SPSR_irq() = X{64}(t);
end;
```

SPSR_und, Saved Program Status Register (Undefined mode)

The SPSR_und characteristics are:

Purpose

Holds the saved process state when an exception is taken to Undefined mode.

Configuration

AArch64 System register SPSR_und bits [31:0] are architecturally mapped to AArch32 System register SPSR_und[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to SPSR_und are UNDEFINED.

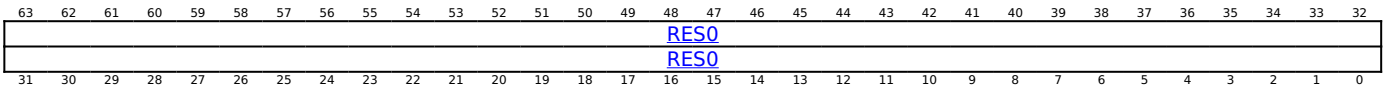
If EL1 only supports execution in AArch64 state, this register is RES0 from EL2 and EL3.

Attributes

SPSR_und is a 64-bit register.

Field descriptions

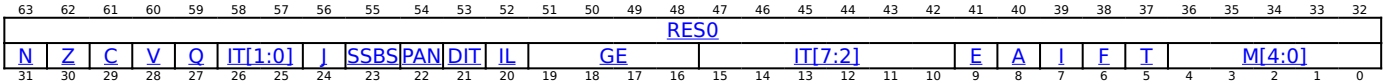
When FEAT_AA32EL1 is not implemented:



Bits [63:0]

Reserved, RES0.

Otherwise:



Bits [63:32]

Reserved, RES0.

N, bit [31]

Negative Condition flag. Set to the value of PSTATE.N on taking an exception to Undefined mode, and copied to PSTATE.N on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Z, bit [30]

Zero Condition flag. Set to the value of PSTATE.Z on taking an exception to Undefined mode, and copied to PSTATE.Z on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

C, bit [29]

Carry Condition flag. Set to the value of PSTATE.C on taking an exception to Undefined mode, and copied to PSTATE.C on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

V, bit [28]

Overflow Condition flag. Set to the value of PSTATE.V on taking an exception to Undefined mode, and copied to PSTATE.V on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Q, bit [27]

Overflow or saturation flag. Set to the value of PSTATE.Q on taking an exception to Undefined mode, and copied to PSTATE.Q on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IT, bits [15:10, 26:25]

If-Then. Set to the value of PSTATE.IT on taking an exception to Undefined mode, and copied to PSTATE.IT on executing an exception return operation in Undefined mode.

On executing an exception return operation in Undefined mode, SPSR_und.IT must contain a value that is valid for the instruction being returned to.

The IT field is split as follows:

- IT[1:0] is SPSR_und[26:25].
- IT[7:2] is SPSR_und[15:10].

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

J, bit [24]

RES0.

In previous versions of the architecture, the {J, T} bits determined the AArch32 Instruction set state.

Armv8 does not support either Jazelle state or T32EE state, and the T bit determines the Instruction set state.

SSBS, bit [23]
When FEAT_SSBS is implemented:

Speculative Store Bypass. Set to the value of PSTATE.SSBS on taking an exception to Undefined mode, and copied to PSTATE.SSBS on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PAN, bit [22]
When FEAT_PAN is implemented:

Privileged Access Never. Set to the value of PSTATE.PAN on taking an exception to Undefined mode, and copied to PSTATE.PAN on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DIT, bit [21]
When FEAT_DIT is implemented:

Data Independent Timing. Set to the value of PSTATE.DIT on taking an exception to Undefined mode, and copied to PSTATE.DIT on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

IL, bit [20]

Illegal Execution state. Set to the value of PSTATE.IL on taking an exception to Undefined mode, and copied to PSTATE.IL on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

GE, bits [19:16]

Greater than or Equal flags. Set to the value of PSTATE.GE on taking an exception to Undefined mode, and copied to PSTATE.GE on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

E, bit [9]

Endianness. Set to the value of PSTATE.E on taking an exception to Undefined mode, and copied to PSTATE.E on executing an exception return operation in Undefined mode.

If the implementation does not support big-endian operation, SPSR_und.E is RES0. If the implementation does not support little-endian operation, SPSR_und.E is RES1. On executing an exception return operation in Undefined mode, if the implementation does not support big-endian operation at the Exception level being returned to, SPSR_und.E is RES0, and if the implementation does not support little-endian operation at the Exception level being returned to, SPSR_und.E is RES1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

A, bit [8]

SError exception mask. Set to the value of PSTATE.A on taking an exception to Undefined mode, and copied to PSTATE.A on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

I, bit [7]

IRQ interrupt mask. Set to the value of PSTATE.I on taking an exception to Undefined mode, and copied to PSTATE.I on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

F, bit [6]

FIQ interrupt mask. Set to the value of PSTATE.F on taking an exception to Undefined mode, and copied to PSTATE.F on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

T, bit [5]

T32 Instruction set state. Set to the value of PSTATE.T on taking an exception to Undefined mode, and copied to PSTATE.T on executing an exception return operation in Undefined mode.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

M[4:0], bits [4:0]

Mode. Set to the value of PSTATE.M[4:0] on taking an exception to Undefined mode, and copied to PSTATE.M[4:0] on executing an exception return operation in Undefined mode.

M[4:0]	Meaning
0b10000	User.
0b10001	FIQ.
0b10010	IRQ.
0b10011	Supervisor.
0b10111	Abort.
0b11011	Undefined.
0b11111	System.

Other values are reserved. If SPSR_und.M[4:0] has a Reserved value, or a value for an unimplemented Exception level, executing an exception return operation in Undefined mode is an illegal return event, as described in 'Illegal return events from AArch32 state'.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing SPSR_und

The MSR (register) and MRS instructions used to access SPSR_und are data-independent-time instructions as described in About PSTATE.DIT.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SPSR_und

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    X{64}(t) = SPSR_und();
elsif PSTATE.EL == EL3 then
    X{64}(t) = SPSR_und();
end;
```

MSR SPSR_und, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0011	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then
        AArch64_SystemAccessTrap(EL2, 0x18);
    else
        Undefined();
    end;
elsif PSTATE.EL == EL2 then
    SPSR_und() = X{64}(t);
elsif PSTATE.EL == EL3 then
    SPSR_und() = X{64}(t);
end;
```

SSBS, Speculative Store Bypass Safe

The SSBS characteristics are:

Purpose

Allows access to the Speculative Store Bypass Safe bit.

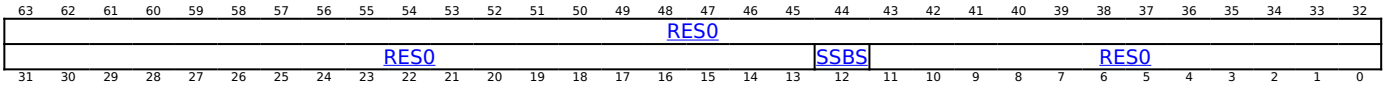
Configuration

This register is present only when FEAT_SSBS2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SSBS are UNDEFINED.

Attributes

SSBS is a 64-bit register.

Field descriptions



Bits [63:13]

Reserved, RES0.

SSBS, bit [12]

Speculative Store Bypass Safe.

Prohibits speculative loads or stores which might practically allow a cache timing side channel.

A speculative value in a register is used in a potentially speculatively exploitable manner if it is used to form an address, generate condition codes, or generate SVE predicate values to be used by other instructions in the speculative sequence or if the execution timing of any other instructions in the speculative sequence is a function of the data loaded under speculation.

SSBS	Meaning
0b0	Hardware is not permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.
0b1	When the value of PSTATE.SSBS is 1, hardware is permitted to use speculative register values in a potentially speculatively exploitable manner if the speculative read that loads the register is from earlier in the coherence order than the entry generated by the latest store to that location using the same virtual address as the load instruction.

The value of this bit is set to the value in the SCTLR_ELx.DSSBS field on taking an exception to ELx.

The reset behavior of this field is:

- On a Warm reset, this field resets to an IMPLEMENTATION DEFINED value.

Bits [11:0]

Reserved, RES0.

Accessing SSBS

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SSBS

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b110

```
if !(IsFeatureImplemented(FEAT_SSBS2) && IsFeatureImplemented(FEAT_AA64)) then

2025-12-10 16:11:30, 2025-12_rel

STINDEX_EL1, Saved TIndex (EL1)

The STINDEX_EL1 characteristics are:

Purpose

Value of TIndex for EL1 saved on exception entry.

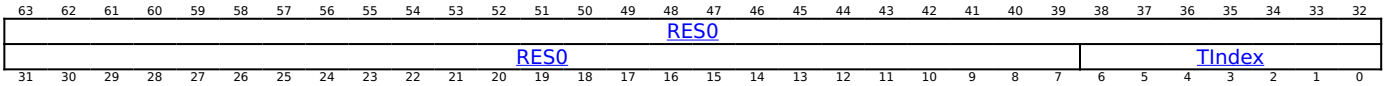
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to STINDEX_EL1 are UNDEFINED.

Attributes

STINDEX_EL1 is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TIndex, bits [6:0]

The saved value of TIndex for EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing STINDEX_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name STINDEX_EL1 or STINDEX_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, STINDEX_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0100	0b0000	0b010

STINDEX_EL2, Saved TIndex (EL2)

The STINDEX_EL2 characteristics are:

Purpose

Value of TIndex for EL2 saved on exception entry.

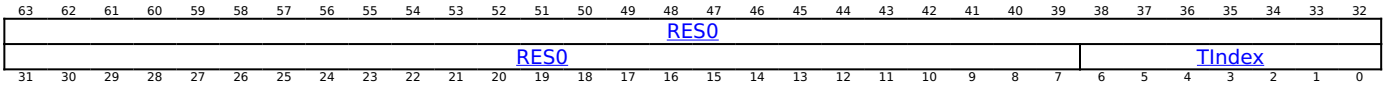
Configuration

This register is present only when FEAT_S1POE2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to STINDEX_EL2 are UNDEFINED.

Attributes

STINDEX_EL2 is a 64-bit register.

Field descriptions



Bits [63:7]

Reserved, RES0.

TIndex, bits [6:0]

The saved value of TIndex for EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing STINDEX_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name STINDEX_EL1 or STINDEX_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, STINDEX_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0100	0b0000	0b010

elsif PSTATE.EL == EL3 then
    STINDEX_EL3() = X{64}(t);
end;
```

SVCR, Streaming Vector Control Register

The SVCR characteristics are:

Purpose

Allows access to the Streaming SVE mode in PSTATE.SM, and the SME storage enable in PSTATE.ZA.

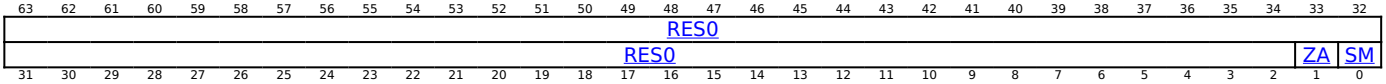
Configuration

This register is present only when FEAT_SME is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to SVCR are UNDEFINED.

Attributes

SVCR is a 64-bit register.

Field descriptions



Bits [63:2]

Reserved, RES0.

ZA, bit [1]

Access to PSTATE.ZA, SME storage enable.

When this storage is disabled, execution of an instruction which can access it is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x3}.

The possible values of this bit are:

ZA	Meaning
0b0	SME ZA storage and, if implemented, ZT0 storage are invalid and not accessible. This control causes execution at any Exception level of instructions that can access this storage to be trapped.
0b1	SME ZA storage and, if implemented, ZT0 storage are valid and accessible. This control does not cause execution of any instructions to be trapped.

When a write to SVCR.ZA changes the value of PSTATE.ZA from 0 to 1, all implemented bits of the storage are set to zero.

Changes to this field do not have an effect on the SVE vector and predicate registers and FPSR.

A direct or indirect read of ZA appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRZA and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, PSTATE.ZA resets to '0'.

SM, bit [0]

Access to PSTATE.SM, Streaming SVE mode.

When the PE is in Streaming SVE mode, the Streaming SVE vector length (SVL) applies to SVE instructions, and execution at any Exception level of an instruction which is illegal in that mode is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x1}.

When the PE is not in Streaming SVE mode, the SVE vector length (VL) applies to SVE instructions, and execution at any Exception level of an instruction which is only legal in that mode is trapped. The exception is reported using an ESR_ELx.{EC, SMTC} value of {0x1D, 0x2}.

The possible values of this bit are:

SM	Meaning
0b0	The PE is not in Streaming SVE mode.
0b1	The PE is in Streaming SVE mode.

When a write to SVCR.SM changes the value of PSTATE.SM, the following applies:

- When changed from 0 to 1, an entry to Streaming SVE mode is performed.
- When changed from 1 to 0, an exit from Streaming SVE mode is performed.
- All implemented bits of the SVE registers Z0-Z31, P0-P15, and FFR in the new mode are set to zero.
- All bits in FPMR are set to zero.
- FPSR in the new mode is set to 0x0000_0000_0800_009f, in which all cumulative status bits are set to 1.

Changes to this field do not have an effect on SME ZA storage or, if implemented, ZT0 storage.

A direct or indirect read of SM appears to occur in program order relative to a direct write of SVCR, and to MSR SVCRSM and MSR SVCRSMZA instructions, without the need for explicit synchronization.

The reset behavior of this field is:

- On a Warm reset, PSTATE.SM resets to '0'.

Accessing SVCR

SVCR is read/write and can be accessed from any Exception level.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, SVCR

TCO, Tag Check Override

The TCO characteristics are:

Purpose

When FEAT_MTE is implemented, this register allows tag checks to be disabled globally.

When neither FEAT_MTE2 nor FEAT_VMTETC are implemented, it is IMPLEMENTATION DEFINED if accesses to this register access PSTATE.TCO or are RAZ/WI.

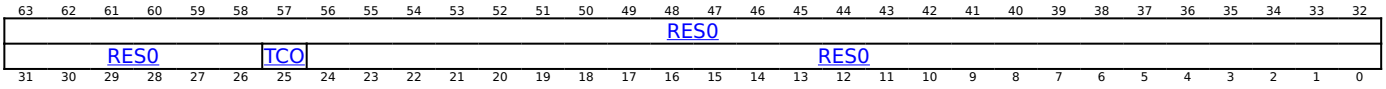
Configuration

This register is present only when FEAT_MTE is implemented. Otherwise, direct accesses to TCO are UNDEFINED.

Attributes

TCO is a 64-bit register.

Field descriptions



Bits [63:26]

Reserved, RES0.

TCO, bit [25]

Allows memory tag checks to be globally disabled.

TCO	Meaning
0b0	Loads and Stores are not affected by this control.
0b1	Loads and Stores are unchecked.

Bits [24:0]

Reserved, RES0.

Accessing TCO

For information about the operation of the MSR (immediate) accessor, see MSR (immediate).

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCO

op0	op1	CRn	CRm	op2
0b11	0b011	0b0100	0b0010	0b111

```
if !IsFeatureImplemented(FEAT_MTE) then

TCR2_EL1, Extended Translation Control Register (EL1)

The TCR2_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

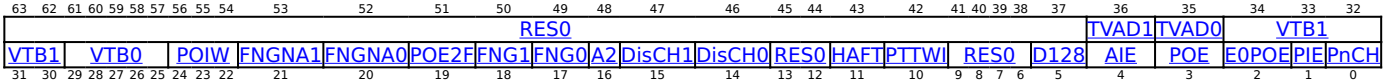
Configuration

This register is present only when FEAT_TCR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2_EL1 are UNDEFINED.

Attributes

TCR2_EL1 is a 64-bit register.

Field descriptions



Unless stated otherwise, all the bits in TCR2_EL1 are permitted to be cached in a TLB.

Bits [63:37]

Reserved, RES0.

TVAD1, bit [36]
When FEAT_VMTE is implemented:

Faulting control for access to an address that is a Tag VA determined by TCR2_EL1.VTB1.

TVAD1	Meaning
0b0	Access using an address generated by an instruction that is the same as a Tag VA will not generate a fault by this mechanism.
0b1	Access using an address generated by an instruction that is the same as a Tag VA will generate a level 0 Translation fault.

This field does not control access if any of the following are true:

- Virtual tagging is disabled for the EL1&0 translation regime.
- Stage 1 of translation for the EL1&0 translation regime is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.TVAD1 == '1'.

Otherwise:

Reserved, RES0.

TVAD0, bit [35]
When FEAT_VMTE is implemented:

Faulting control for access to an address that is a Tag VA determined by TCR2_EL1.VTB0.

TVAD0	Meaning
0b0	Access using an address generated by an instruction that is the same as a Tag VA will not generate a fault by this mechanism.
0b1	Access using an address generated by an instruction that is the same as a Tag VA will generate a level 0 Translation fault.

This field does not control access if any of the following are true:

- Virtual tagging is disabled for the EL1&0 translation regime.
- Stage 1 of translation for the EL1&0 translation regime is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.TVAD0 == '1'.

Otherwise:

Reserved, RES0.

VTB1, bits [34:30]
When FEAT_VMTE is implemented:

Base address of the range of Tag VAs translated by TTBR1_EL1. The base address is Zeros(64-iasize):VTB1:Zeros(iasize-5), where iasize = 64-TCR_EL1.T1SZ.

The size of the range of Tag VAs translated by TTBR1_EL1 is $2^{(iasize-5)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.VTB1 == '1'.

Otherwise:

Reserved, RES0.

VTB0, bits [29:25]
When FEAT_VMTE is implemented:

Base address of the range of Tag VAs translated by TTBR0_EL1. The base address is Zeros(64-iasize):VTB0:Zeros(iasize-5), where iasize = 64-TCR_EL1.T0SZ.

The size of the range of Tag VAs translated by TTBR0_EL1 is $2^{(iasize-5)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.VTB0 == '1'.

Otherwise:

Reserved, RES0.

POIW, bits [24:22]
When FEAT_S1POE2 is implemented:

POIndex width.

Values less than 3 are reserved and behave as if the value is 3.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.POIW == '1'.

Otherwise:

Reserved, RES0.

FNGNA1, bit [21]
When FEAT_THE is implemented:

Force non-global for unassured translations using TTBR1_EL1.

FNGNA1	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR1_EL1 are treated as non-global regardless of the value of the nG bit if all of the following is true: • The translation is for the EL1&0 translation regime. • Stage 1 and stage 2 translation are enabled. • Protection is enabled. • The final stage 1 translation using the descriptor does not have the Assured Translation property.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.FNGNA1 == '1'.

Otherwise:

Reserved, RES0.

FNGNA0, bit [20]
When FEAT_THE is implemented:

Force non-global for unassured translations using TTBR0_EL1.

FNGNA0	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR0_EL1 are treated as non-global regardless of the value of the nG bit if all of the following is true: • The translation is for the EL1&0 translation regime. • Stage 1 and stage 2 translation are enabled. • Protection is enabled. • The final stage 1 translation using the descriptor does not have the Assured Translation property.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.FNGNA0 == '1'.

Otherwise:

Reserved, RES0.

POE2F, bit [19]
When FEAT_S1POE2 is implemented:

Enable POE2 translation table descriptor format for the EL1&0 stage 1 translation regime.

POE2F	Meaning
0b0	The POE2 translation table descriptor format is disabled.
0b1	The POE2 translation table descriptor format is enabled.

If HCRX_EL2.POE2En is 0 or SCR_EL3.POE2En is 0, the Effective value of this field is 0.

If SCTLR_EL1.M is 0, this field is treated as 0 for all purposes other than:

- Reading back the value of the field.
- Being cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.

◦ IsSystemRegisterMaskingEnabled(EL1).
◦ TCR2MASK_EL1.POE2F == '1'.

Otherwise:

Reserved, RES0.

FNG1, bit [18]
When FEAT_ASID2 is implemented:

Force non-global translations for TTBR1_EL1.

FNG1	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR1_EL1 are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.FNG1 == '1'.

Otherwise:

Reserved, RES0.

FNG0, bit [17]
When FEAT_ASID2 is implemented:

Force non-global translations for TTBR0_EL1.

FNG0	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations using TTBR0_EL1 are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.

◦ IsSystemRegisterMaskingEnabled(EL1).
◦ TCR2MASK_EL1.FNG0 == '1'.

Otherwise:

Reserved, RES0.

A2, bit [16]
When FEAT_ASID2 is implemented:

Enable use of two ASIDs.

A2	Meaning
0b0	Use of two ASIDs is disabled.
0b1	Use of two ASIDs is enabled.

This bit is permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.A2 == '1'.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]
When FEAT_D128 is implemented and TCR2_EL1.D128 == '1':

Disable the Contiguous bit for the Start Table for TTBR1_EL1.

DisCH1	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL1 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL1 is treated as 0.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.DisCH1 == '1'.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]
When FEAT_D128 is implemented and TCR2_EL1.D128 == '1':

Disable the Contiguous bit for the Start Table for TTBR0_EL1.

DisCH0	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL1 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL1 is treated as 0.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.DisCH0 == '1'.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

HAFT, bit [11]
When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.

- PSTATE.EL == EL1.
- IsSystemRegisterMaskingEnabled(EL1).
- TCR2MASK_EL1.HAFT == '1'.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]
When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL1&0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL1&0 have the Reduced Coherence property if HCRX_EL2.PTTWI is 1.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.PTTWI == '1'.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]
When FEAT_D128 is implemented:

Enables VMSAv9-128 translation system.

D128	Meaning
0b0	Translation system follows VMSAv8-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.D128 == '1'.

Otherwise:

Reserved, RES0.

AIE, bit [4]
When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

This field is RES1 when TCR2_EL1.D128 is 1.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.AIE == '1'.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Enables Permission Overlays for privileged accesses from EL1&0 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL1 access in stage 1 of EL1&0 translation regime.
0b1	Permission overlay enabled for EL1 access in stage 1 of EL1&0 translation regime.

This bit is not permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.POE == '1'.

Otherwise:

Reserved, RES0.

E0POE, bit [2]
When FEAT_S1POE is implemented:

Enables Permission Overlays for unprivileged accesses from EL1&0 translation regime.

E0POE	Meaning
0b0	Permission overlay disabled for EL0 access in stage 1 of EL1&0 translation regime.
0b1	Permission overlay enabled for EL0 access in stage 1 of EL1&0 translation regime.

This bit is not permitted to be cached in a TLB.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.E0POE == '1'.

Otherwise:

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR2_EL1.D128 is 1.

This field is RES1 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.PIE == '1'.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of the stage 1 translation table entries as the Protected bit, for translations using TTBRn_EL1.

PnCH	Meaning
0b0	For translations using TTBRn_EL1, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBRn_EL1, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR2_EL1.D128 is 1.

This field is ignored by the PE and treated as zero when any of the following are true:

- All of the following are true:
  - EL2 is implemented and enabled in the current Security state.
  - The Effective value of HCRX_EL2.TCR2En is 0.
- EL3 is implemented and SCR_EL3.TCR2En == 0.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCR2MASK_EL1.PnCH == '1'.

Otherwise:

Reserved, RES0.

Accessing TCR2_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCR2_EL1 or TCR2_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR2_EL1 are masked by TCR2MASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR2_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0000	0b011

TCR2_EL2, Extended Translation Control Register (EL2)

The TCR2_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2&0 translation regime.

Configuration

This register is present only when FEAT_TCR2 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2_EL2 are UNDEFINED.

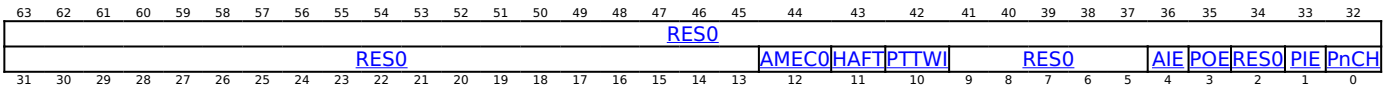
If EL2 is not implemented, this register is RES0 from EL3.

Attributes

TCR2_EL2 is a 64-bit register.

Field descriptions

When EffectiveHCR_EL2_E2H() == '0':



Unless stated otherwise, all the bits in TCR2_EL2 are permitted to be cached in a TLB.

Bits [63:13]

Reserved, RES0.

AMEC0, bit [12]
When FEAT_MEC is implemented:

This field controls the enabling of the Alternate MECID translations for the EL2 translation regime.

TCR2_EL2.AMEC0 is provided to enable the safe update of MECID_A0_EL2, by disabling access and speculation to AMEC==1 Block or Page descriptors during the update.

AMEC0	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A0_EL2.

This bit is permitted to be cached in a TLB only if it is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

When SCTLR2_EL2.EMEC is 0, this field is ignored by the PE and the bit position of AMEC is RES0 in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is RES0 .
- When IsCurrentSecurityState(SS_NonSecure), access to this field is RES0 .

Otherwise:

Reserved, RES0.

HAFT, bit [11]
When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]
When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL2 or EL2&0 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL2 or EL2&0 have the Reduced Coherence property.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:5]

Reserved, RES0.

AIE, bit [4]
When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Enables Permission Overlay for EL2 accesses.

POE	Meaning
0b0	Permission overlay disabled for EL2 access in stage 1 of EL2 translation regime.
0b1	Permission overlay enabled for EL2 access in stage 1 of EL2 translation regime.

This bit is not permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [2]

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of stage 1 translation table entries as the Protected bit, for translations using TTBR0_EL2 when HCR_EL2.E2H is 0.

PnCH	Meaning
0b0	For translations using TTBRn_EL2, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBR0_EL2, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR2_EL2.D128 is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

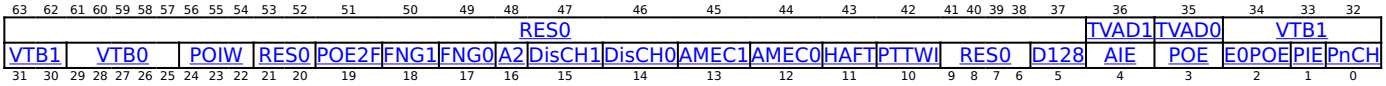
The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

When EffectiveHCR_EL2_E2H() == '1':



Unless stated otherwise, all the bits in TCR2_EL2 are permitted to be cached in a TLB.

Bits [63:37]

Reserved, RES0.

TVAD1, bit [36]
When FEAT_VMTE is implemented:

Faulting control for access to an address that is a Tag VA determined by TCR2_EL2.VTB1.

TVAD1	Meaning
0b0	Access using an address generated by an instruction that is the same as a Tag VA will not generate a fault by this mechanism.
0b1	Access using an address generated by an instruction that is the same as a Tag VA will generate a level 0 Translation fault.

This field does not control access if any of the following are true:

- Virtual tagging is disabled for the EL2&0 translation regime.
- Stage 1 of translation for the EL2&0 translation regime is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.TVAD1 == '1'.

Otherwise:

Reserved, RES0.

TVAD0, bit [35]
When FEAT_VMTE is implemented:

Faulting control for access to an address that is a Tag VA determined by TCR2_EL2.VTB0.

TVAD0	Meaning
0b0	Access using an address generated by an instruction that is the same as a Tag VA will not generate a fault by this mechanism.
0b1	Access using an address generated by an instruction that is the same as a Tag VA will generate a level 0 Translation fault.

This field does not control access if any of the following are true:

- Virtual tagging is disabled for the EL2&0 translation regime.
- Stage 1 of translation for the EL2&0 translation regime is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.TVAD0 == '1'.

Otherwise:

Reserved, RES0.

VTB1, bits [34:30]
When FEAT_VMTE is implemented:

Base address of the range of Tag VAs translated by TTBR1_EL2. The base address is Zeros(64-iasize):VTB1:Zeros(iasize-5), where iasize = 64-TCR_EL2.T1SZ.

The size of the range of Tag VAs translated by TTBR1_EL2 is $2^{(iasize-5)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.VTB1 == '1'.

Otherwise:

Reserved, RES0.

VTB0, bits [29:25]
When FEAT_VMTE is implemented:

Base address of the range of Tag VAs translated by TTBR0_EL2. The base address is Zeros(64-iasize):VTB0:Zeros(iasize-5), where iasize = 64-TCR_EL2.T0SZ.

The size of the range of Tag VAs translated by TTBR0_EL2 is $2^{(iasize-5)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.VTB0 == '1'.

Otherwise:

Reserved, RES0.

POIW, bits [24:22]
When FEAT_S1POE2 is implemented:

POIndex width.

Values less than 3 are reserved and behave as if the width is 3.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '000'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.POIW == '1'.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

POE2F, bit [19]
When FEAT_S1POE2 is implemented:

Enable POE2 translation table descriptor format for the EL2&0 stage 1 translation regime.

POE2F	Meaning
0b0	The POE2 translation table descriptor format is disabled.
0b1	The POE2 translation table descriptor format is enabled.

If SCR_EL3.POE2En is 0, the Effective value of this field is 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

If SCTLR_EL2.M is 0, this field is treated as 0 for all purposes other than:

- Reading back the value of the field.
- Being cached in a TLB.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.POE2F == '1'.

Otherwise:

Reserved, RES0.

FNG1, bit [18]
When FEAT_ASID2 is implemented:

Force non-global translations for TTBR1_EL2.

FNG1	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.FNG1 == '1'.

Otherwise:

Reserved, RES0.

FNG0, bit [17]
When FEAT_ASID2 is implemented:

Force non-global translations for TTBR0_EL2.

FNG0	Meaning
0b0	This bit has no effect on the interpretation of the nG bit.
0b1	Translations are treated as non-global regardless of the value of the nG bit.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.FNG0 == '1'.

Otherwise:

Reserved, RES0.

A2, bit [16]
When FEAT_ASID2 is implemented:

Enable use of two ASIDs.

A2	Meaning
0b0	Use of two ASIDs is disabled.
0b1	Use of two ASIDs is enabled.

This bit is permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.A2 == '1'.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]
When FEAT_D128 is implemented and TCR2_EL2.D128 == '1':

Disable the Contiguous bit for the Start Table for TTBR1_EL2.

DisCH1	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL2 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR1_EL2 is treated as 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.DisCH1 == '1'.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]
When FEAT_D128 is implemented and TCR2_EL2.D128 == '1':

Disable the Contiguous bit for the Start Table for TTBR0_EL2.

DisCH0	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL2 is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table for TTBR0_EL2 is treated as 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.DisCH0 == '1'.

Otherwise:

Reserved, RES0.

AMEC1, bit [13]
When FEAT_MEC is implemented:

This field controls the enabling of the Alternate MECID translations for accesses in the TTBR1_EL2 half of the VA range, for the EL2&0 translation regime.

TCR2_EL2.AMEC1 is provided to enable the safe update of MECID_A1_EL2, by disabling access and speculation to AMEC == 1 Block or Page descriptors during the update.

AMEC1	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A1_EL2.

This bit is permitted to be cached in a TLB only if it is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

When SCTLR2_EL2.EMEC is 0, this field is ignored by the PE and the bit position of AMEC is RES0 in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is RES0 .
- When IsCurrentSecurityState(SS_NonSecure), access to this field is RES0 .
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.AMEC1 == '1'.

Otherwise:

Reserved, RES0.

AMEC0, bit [12]
When FEAT_MEC is implemented:

This field controls the enabling of the Alternate MECID translations for accesses in the TTBR0_EL2 half of the VA range, for the EL2&0 translation regime.

TCR2_EL2.AMEC0 is provided to enable the safe update of MECID_A0_EL2, by disabling access and speculation to AMEC==1 Block or Page descriptors during the update.

AMEC0	Meaning
0b0	Use of a Block or Page descriptor containing AMEC == 1 generates a Translation fault.
0b1	Accesses translated by a Block or Page descriptor containing AMEC == 1 are associated with the MECID configured in MECID_A0_EL2.

This bit is permitted to be cached in a TLB only if it is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

When SCTLR2_EL2.EMEC is 0, this field is ignored by the PE and the bit position of AMEC is RES0 in Block and Page descriptors.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- When IsCurrentSecurityState(SS_Secure), access to this field is RES0 .
- When IsCurrentSecurityState(SS_NonSecure), access to this field is RES0 .
- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.

◦ IsSystemRegisterMaskingEnabled(EL2).
◦ TCR2MASK_EL2.AMEC0 == '1'.

Otherwise:

Reserved, RES0.

HAFT, bit [11]
When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.HAFT == '1'.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]
When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS have the Reduced Coherence property.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.PTTWI == '1'.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]
When FEAT_D128 is implemented:

Enables VMSAv9-128 translation system.

D128	Meaning
0b0	Translation system follows VMSAv8-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.D128 == '1'.

Otherwise:

Reserved, RES0.

AIE, bit [4]
When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

This field is RES1 when TCR2_EL2.D128 is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.AIE == '1'.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Enables Permission Overlay for privileged accesses from EL2&0 translation regime.

POE	Meaning
0b0	Permission overlay disabled for EL2 access in stage 1 of EL2&0 translation regime.
0b1	Permission overlay enabled for EL2 access in stage 1 of EL2&0 translation regime.

This bit is not permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.POE == '1'.

Otherwise:

Reserved, RES0.

E0POE, bit [2]
When FEAT_S1POE is implemented:

Enables Permission Overlay for unprivileged accesses from EL2&0 translation regime.

E0POE	Meaning
0b0	Permission overlay disabled for EL0 access in stage 1 of EL2&0 translation regime.
0b1	Permission overlay enabled for EL0 access in stage 1 of EL2&0 translation regime.

This bit is not permitted to be cached in a TLB.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.E0POE == '1'.

Otherwise:

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR2_EL2.D128 is 1.

This field is RES1 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.PIE == '1'.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of stage 1 translation table entries as the Protected bit, for translations using TTBRn_EL2 when HCR_EL2.E2H is 1.

PnCH	Meaning
0b0	For translations using TTBRn_EL2, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBR0_EL2, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR2_EL2.D128 is 1.

When EL3 is implemented and SCR_EL3.TCR2En == 0, this field is ignored by the PE and treated as zero.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCR2MASK_EL2.PnCH == '1'.

Otherwise:

Reserved, RES0.

Accessing TCR2_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCR2_EL2 or TCR2_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR2_EL2 are masked by TCR2MASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

When FEAT_VHE is implemented

2025-12-10 16:11:30, 2025-12_rel

TCR2MASK_EL1, Extended Translation Control Masking Register (EL1)

The TCR2MASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR2_EL1 on writes to TCR2_EL1 or TCR2ALIAS_EL1.

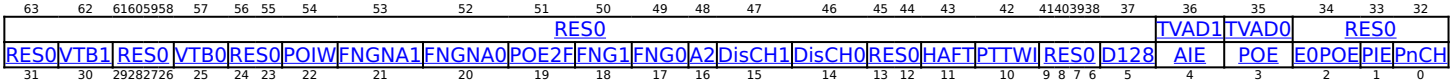
Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2MASK_EL1 are UNDEFINED.

Attributes

TCR2MASK_EL1 is a 64-bit register.

Field descriptions



Bits [63:37]

Reserved, RES0.

TVAD1, bit [36]
When FEAT_VMTE is implemented:

Mask bit for TVAD1.

TVAD1	Meaning
0b0	TCR2_EL1.TVAD1 is writeable.
0b1	TCR2_EL1.TVAD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TVAD0, bit [35]
When FEAT_VMTE is implemented:

Mask bit for TVAD0.

TVAD0	Meaning
0b0	TCR2_EL1.TVAD0 is writeable.
0b1	TCR2_EL1.TVAD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:31]

Reserved, RES0.

VTB1, bit [30]
When FEAT_VMTE is implemented:

Mask bit for VTB1.

VTB1	Meaning
0b0	TCR2_EL1.VTB1 is writeable.
0b1	TCR2_EL1.VTB1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:26]

Reserved, RES0.

VTB0, bit [25]
When FEAT_VMTE is implemented:

Mask bit for VTB0.

VTB0	Meaning
0b0	TCR2_EL1.VTB0 is writeable.
0b1	TCR2_EL1.VTB0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:23]

Reserved, RES0.

POIW, bit [22]
When FEAT_S1POE2 is implemented:

Mask bit for POIW.

POIW	Meaning
0b0	TCR2_EL1.POIW is writeable.
0b1	TCR2_EL1.POIW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNGNA1, bit [21]
When FEAT_THE is implemented:

Mask bit for FNGNA1.

FNGNA1	Meaning
0b0	TCR2_EL1.FNGNA1 is writeable.
0b1	TCR2_EL1.FNGNA1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNGNA0, bit [20]
When FEAT_THE is implemented:

Mask bit for FNGNA0.

FNGNA0	Meaning
0b0	TCR2_EL1.FNGNA0 is writeable.
0b1	TCR2_EL1.FNGNA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE2F, bit [19]
When FEAT_S1POE2 is implemented:

Mask bit for POE2F.

POE2F	Meaning
0b0	TCR2_EL1.POE2F is writeable.
0b1	TCR2_EL1.POE2F is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG1, bit [18]
When FEAT_ASID2 is implemented:

Mask bit for FNG1.

FNG1	Meaning
0b0	TCR2_EL1.FNG1 is writeable.
0b1	TCR2_EL1.FNG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG0, bit [17]
When FEAT_ASID2 is implemented:

Mask bit for FNG0.

FNG0	Meaning
0b0	TCR2_EL1.FNG0 is writeable.
0b1	TCR2_EL1.FNG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

A2, bit [16]
When FEAT_ASID2 is implemented:

Mask bit for A2.

A2	Meaning
0b0	TCR2_EL1.A2 is writeable.
0b1	TCR2_EL1.A2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]
When FEAT_D128 is implemented:

Mask bit for DisCH1.

DisCH1	Meaning
0b0	TCR2_EL1.DisCH1 is writeable.
0b1	TCR2_EL1.DisCH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]
When FEAT_D128 is implemented:

Mask bit for DisCH0.

DisCH0	Meaning
0b0	TCR2_EL1.DisCH0 is writeable.
0b1	TCR2_EL1.DisCH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [13:12]

Reserved, RES0.

HAFT, bit [11]
When FEAT_HAFT is implemented:

Mask bit for HAFT.

HAFT	Meaning
0b0	TCR2_EL1.HAFT is writeable.
0b1	TCR2_EL1.HAFT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]
When FEAT_THE is implemented:

Mask bit for PTTWI.

PTTWI	Meaning
0b0	TCR2_EL1.PTTWI is writeable.
0b1	TCR2_EL1.PTTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]
When FEAT_D128 is implemented:

Mask bit for D128.

D128	Meaning
0b0	TCR2_EL1.D128 is writeable.
0b1	TCR2_EL1.D128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]
When FEAT_AIE is implemented:

Mask bit for AIE.

AIE	Meaning
0b0	TCR2_EL1.AIE is writeable.
0b1	TCR2_EL1.AIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Mask bit for POE.

POE	Meaning
0b0	TCR2_EL1.POE is writeable.
0b1	TCR2_EL1.POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]
When FEAT_S1POE is implemented:

Mask bit for E0POE.

E0POE	Meaning
0b0	TCR2_EL1.E0POE is writeable.
0b1	TCR2_EL1.E0POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Mask bit for PIE.

PIE	Meaning
0b0	TCR2_EL1.PIE is writeable.
0b1	TCR2_EL1.PIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Mask bit for PnCH.

PnCH	Meaning
0b0	TCR2_EL1.PnCH is writeable.
0b1	TCR2_EL1.PnCH is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TCR2MASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCR2MASK_EL1 or TCR2MASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR2MASK_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0111	0b011

```

TCR2MASK_EL2, Extended Translation Control Masking Register (EL2)

The TCR2MASK_EL2 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR2_EL2 on writes.

Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR2MASK_EL2 are UNDEFINED.

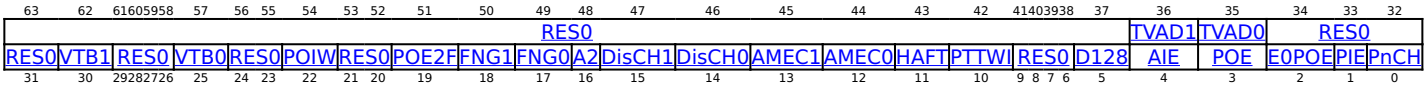
If EL2 is not implemented, this register is RES0 from EL3.

This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR2MASK_EL2 is a 64-bit register.

Field descriptions



Bits [63:37]

Reserved, RES0.

TVAD1, bit [36]
When FEAT_VMTE is implemented:

Mask bit for TVAD1.

TVAD1	Meaning
0b0	TCR2_EL2.TVAD1 is writeable.
0b1	TCR2_EL2.TVAD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TVAD0, bit [35]
When FEAT_VMTE is implemented:

Mask bit for TVAD0.

TVAD0	Meaning
0b0	TCR2_EL2.TVAD0 is writeable.
0b1	TCR2_EL2.TVAD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [34:31]

Reserved, RES0.

VTB1, bit [30]
When FEAT_VMTE is implemented:

Mask bit for VTB1.

VTB1	Meaning
0b0	TCR2_EL2.VTB1 is writeable.
0b1	TCR2_EL2.VTB1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [29:26]

Reserved, RES0.

VTB0, bit [25]
When FEAT_VMTE is implemented:

Mask bit for VTB0.

VTB0	Meaning
0b0	TCR2_EL2.VTB0 is writeable.
0b1	TCR2_EL2.VTB0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [24:23]

Reserved, RES0.

POIW, bit [22]
When FEAT_S1POE2 is implemented:

Mask bit for POIW.

POIW	Meaning
0b0	TCR2_EL2.POIW is writeable.
0b1	TCR2_EL2.POIW is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [21:20]

Reserved, RES0.

POE2F, bit [19]
When FEAT_S1POE2 is implemented:

Mask bit for POE2F.

POE2F	Meaning
0b0	TCR2_EL2.POE2F is writeable.
0b1	TCR2_EL2.POE2F is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG1, bit [18]
When FEAT_ASID2 is implemented:

Mask bit for FNG1.

FNG1	Meaning
0b0	TCR2_EL2.FNG1 is writeable.
0b1	TCR2_EL2.FNG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

FNG0, bit [17]
When FEAT_ASID2 is implemented:

Mask bit for FNG0.

FNG0	Meaning
0b0	TCR2_EL2.FNG0 is writeable.
0b1	TCR2_EL2.FNG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

A2, bit [16]
When FEAT_ASID2 is implemented:

Mask bit for A2.

A2	Meaning
0b0	TCR2_EL2.A2 is writeable.
0b1	TCR2_EL2.A2 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH1, bit [15]
When FEAT_D128 is implemented:

Mask bit for DisCH1.

DisCH1	Meaning
0b0	TCR2_EL2.DisCH1 is writeable.
0b1	TCR2_EL2.DisCH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [14]
When FEAT_D128 is implemented:

Mask bit for DisCH0.

DisCH0	Meaning
0b0	TCR2_EL2.DisCH0 is writeable.
0b1	TCR2_EL2.DisCH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMEC1, bit [13]
When FEAT_MEC is implemented:

Mask bit for AMEC1.

AMEC1	Meaning
0b0	TCR2_EL2.AMEC1 is writeable.
0b1	TCR2_EL2.AMEC1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AMEC0, bit [12]
When FEAT_MEC is implemented:

Mask bit for AMEC0.

AMEC0	Meaning
0b0	TCR2_EL2.AMEC0 is writeable.
0b1	TCR2_EL2.AMEC0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HAFT, bit [11]
When FEAT_HAFT is implemented:

Mask bit for HAFT.

HAFT	Meaning
0b0	TCR2_EL2.HAFT is writeable.
0b1	TCR2_EL2.HAFT is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [10]
When FEAT_THE is implemented:

Mask bit for PTTWI.

PTTWI	Meaning
0b0	TCR2_EL2.PTTWI is writeable.
0b1	TCR2_EL2.PTTWI is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [9:6]

Reserved, RES0.

D128, bit [5]
When FEAT_D128 is implemented:

Mask bit for D128.

D128	Meaning
0b0	TCR2_EL2.D128 is writeable.
0b1	TCR2_EL2.D128 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [4]
When FEAT_AIE is implemented:

Mask bit for AIE.

AIE	Meaning
0b0	TCR2_EL2.AIE is writeable.
0b1	TCR2_EL2.AIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [3]
When FEAT_S1POE is implemented:

Mask bit for POE.

POE	Meaning
0b0	TCR2_EL2.POE is writeable.
0b1	TCR2_EL2.POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0POE, bit [2]
When FEAT_S1POE is implemented:

Mask bit for E0POE.

E0POE	Meaning
0b0	TCR2_EL2.E0POE is writeable.
0b1	TCR2_EL2.E0POE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [1]
When FEAT_S1PIE is implemented:

Mask bit for PIE.

PIE	Meaning
0b0	TCR2_EL2.PIE is writeable.
0b1	TCR2_EL2.PIE is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [0]
When FEAT_THE is implemented:

Mask bit for PnCH.

PnCH	Meaning
0b0	TCR2_EL2.PnCH is writeable.
0b1	TCR2_EL2.PnCH is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL2, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Accessing TCR2MASK_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCR2MASK_EL2 or TCR2MASK_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR2MASK_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0111	0b011

```

TCR_EL1, Translation Control Register (EL1)

The TCR_EL1 characteristics are:

Purpose

The control register for stage 1 of the EL1&0 translation regime.

Configuration

AArch64 System register TCR_EL1 bits [31:0] are architecturally mapped to AArch32 System register TTBCR[31:0].

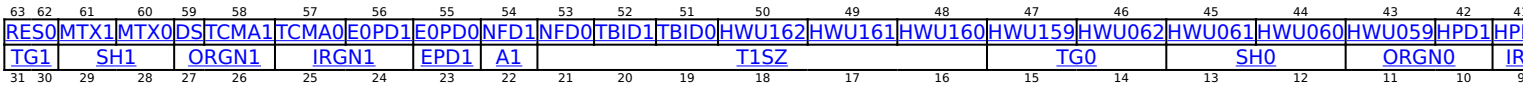
AArch64 System register TCR_EL1 bits [63:32] are architecturally mapped to AArch32 System register TTBCR2[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TCR_EL1 are UNDEFINED.

Attributes

TCR_EL1 is a 64-bit register.

Field descriptions



Any of the bits in TCR_EL1, other than the EPDx bits when they have the value 1, and the A1 bit are permitted to be cached in a TLB.

Bits [63:62]

Reserved, RES0.

MTX1, bit [61]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and Canonical tagging when EL0 and EL1 are using AArch64 where the data address would be translated by tables pointed to by TTBR1_EL1.

This control has an effect regardless of whether stage 1 of the EL1&0 translation regime is enabled or not.

MTX1	Meaning
0b0	Canonical tagging is disabled. This control has no effect on address generation.
0b1	Canonical tagging is enabled. Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b1111 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

For more information see Logical address tagging and Memory region tagging types.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.MTX1 == '1'.

Otherwise:

Reserved, RES0.

MTX0, bit [60]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and Canonical tagging when EL0 and EL1 are using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL1.

This control has an effect regardless of whether stage 1 of the EL1&0 translation regime is enabled or not.

MTX0	Meaning
0b0	Canonical tagging is disabled. This control has no effect on address generation.
0b1	Canonical tagging is enabled. Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

For more information see Logical address tagging and Memory region tagging types.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.MTX0 == '1'.

Otherwise:

Reserved, RES0.

DS, bit [59]
When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or TCR2_EL1.D128 == '0'):

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL1.{T0SZ,T1SZ}.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware. The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of Translation table descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by: • TCR_EL1.SH0 if the VA is translated using tables pointed to by TTBR0_EL1. • TCR_EL1.SH1 if the VA is translated using tables pointed to by TTBR1_EL1. The minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL1 or TTBR1_EL1 are used to hold bits[51:48] of the output address in all cases. Note As FEAT_LVA must be implemented if TCR_EL1.DS == 1, the minimum value of the TCR_EL1.{T0SZ, T1SZ} fields is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. Note This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

• On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

• Access to this field is RO if all the following are true:
  ◦ FEAT_SRMASK is implemented.
  ◦ PSTATE.EL == EL1.
  ◦ IsSystemRegisterMaskingEnabled(EL1).
  ◦ TCRMASK_EL1.DS == '1'.

Otherwise:

The Effective value of this bit is 0b0.

Access to this field is RES0 .

TCMA1, bit [58]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.TCMA1 == '1'.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Controls the generation of Unchecked accesses at EL1, and at EL0 if the Effective value of HCR_EL2.{E2H, TGE} is not {1, 1}, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL1 or EL0.
0b1	All accesses at EL1 and EL0 are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.TCMA0 == '1'.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]
When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR1_EL1.

E0PD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.E0PD1 == '1'.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]
When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR0_EL1.

E0PD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL1 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL1 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.E0PD0 == '1'.

Otherwise:

Reserved, RES0.

NFD1, bit [54]
When FEAT_SVE is implemented:

Non-Fault translation timing Disable when using TTBR1_EL1.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

NFD1	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR1_EL1.
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL1 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.

◦ PSTATE.EL == EL1.
◦ IsSystemRegisterMaskingEnabled(EL1).
◦ TCRMASK_EL1.NFD1 == '1'.

Otherwise:

Reserved, RES0.

NFD0, bit [53]
When FEAT_SVE is implemented:

Non-Fault translation timing Disable when using TTBR0_EL1.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL1.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

NFD0	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR0_EL1.
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL1 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  ◦ FEAT_SRMASK is implemented.
  ◦ PSTATE.EL == EL1.
  ◦ IsSystemRegisterMaskingEnabled(EL1).
  ◦ TCRMASK_EL1.NFD0 == '1'.

Otherwise:

Reserved, RES0.

TBID1, bit [52]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID1	Meaning
0b0	TCR_EL1.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  ◦ FEAT_SRMASK is implemented.
  ◦ PSTATE.EL == EL1.

◦ IsSystemRegisterMaskingEnabled(EL1).
◦ TCRMASK_EL1.TBID1 == '1'.

Otherwise:

Reserved, RES0.

TBID0, bit [51]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID0	Meaning
0b0	TCR_EL1.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL1.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.TBID0 == '1'.

Otherwise:

Reserved, RES0.

HWU162, bit [50]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU162	Meaning
0b0	For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU162 == '1'.

Otherwise:

Reserved, RES0.

HWU161, bit [49]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU161	Meaning
0b0	For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU161 == '1'.

Otherwise:

Reserved, RES0.

HWU160, bit [48]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU160	Meaning
0b0	For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU160 == '1'.

Otherwise:

Reserved, RES0.

HWU159, bit [47]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL1.

HWU159	Meaning
0b0	For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD1 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU159 == '1'.

Otherwise:

Reserved, RES0.

HWU062, bit [46]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU062	Meaning
0b0	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU062 == '1'.

Otherwise:

Reserved, RES0.

HWU061, bit [45]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU061	Meaning
0b0	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU061 == '1'.

Otherwise:

Reserved, RES0.

HWU060, bit [44]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU060	Meaning
0b0	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU060 == '1'.

Otherwise:

Reserved, RES0.

HWU059, bit [43]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL1.

HWU059	Meaning
0b0	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL1, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL1.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL1.HPD0 is 0.

This field is RES0 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HWU059 == '1'.

Otherwise:

Reserved, RES0.

HPD1, bit [42]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL1.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field is RES1 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HPD1 == '1'.

Otherwise:

Reserved, RES0.

HPD0, bit [41]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL1.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field is RES1 when TCR2_EL1.POE2F is 1 and TCR2_EL1.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HPD0 == '1'.

Otherwise:

Reserved, RES0.

HD, bit [40]
When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL0 and EL1.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL1.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HD == '1'.

Otherwise:

Reserved, RES0.

HA, bit [39]
When FEAT_HAF is implemented:

Hardware Access flag update in stage 1 translations from EL0 and EL1.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.HA == '1'.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL1 region, or ignored and used for tagged addresses.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID1 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.TBI1 == '1'.

TBI0, bit [37]

Top Byte ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL1 region, or ignored and used for tagged addresses.

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL1 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL1. It has an effect whether the EL1&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL1.TBID0 is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL0 or EL1.
- An exception taken to EL1.
- An exception return to EL0 or EL1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.TBI0 == '1'.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL1 and TTBR1_EL1 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL1 and TTBR1_EL1 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.AS == '1'.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.
0b111	56 bits, 64PB.

The values 0b110 and 0b111 represent different output address sizes depending on implementation choices and translation configuration.

The following table captures the output address size represented by the value 0b110:

Descriptor Format	ID_AA64MMFR0_EL1.PARange	Translation Granule	DS[1]	Represented OA size
Any	0b0101	Any	Any	48 bits, 256TB
VMSAv8-64	0b011x	4KB or 16KB	0	48 bits, 256TB
VMSAv8-64	0b011x	4KB or 16KB	1	52 bits, 4PB
VMSAv8-64	0b011x	64KB	N/A	52 bits, 4PB
VMSAv9-128	0b011x	Any	N/A	52 bits, 4PB

[1] This column represents the value of TCR_EL1.DS.

The following table captures the output address size represented by the value 0b111:

Descriptor Format	ID_AA64MMFR0_EL1.PARange	Translation Granule	Represented OA size
Any	0b0110	Any	OA size represented by0b110
VMSAv8-64	0b0111	Any	OA size represented by0b110
VMSAv9-128	0b0111	Any	56 bits, 64PB

If 52-bit PA is supported, and the translation table descriptors cannot express an OA larger than 48-bits, then bits[51:48] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL1.

If 56-bit PA is supported, and the translation table descriptors cannot express an OA larger than 52-bits, then bits[55:52] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL1.

If the output address size represented by this field is larger than the supported PA size expressed in ID_AA64MMFR0_EL1.PARange, then the output address size is treated as being the same as the supported PA size. Arm strongly recommends that software avoids configuring this field to a value representing an output address size larger than the supported PA size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.IPS == '1'.

TG1, bits [31:30]

Granule size for the TTBR1_EL1.

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.TG1 == '1'.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL1.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.SH1 == '1'.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.ORGN1 == '1'.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL1.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.IRGN1 == '1'.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL1. The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL1.
0b1	A TLB miss on an address that is translated using TTBR1_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.EPD1 == '1'.

A1, bit [22]

Selects whether TTBR0_EL1 or TTBR1_EL1 defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL1.ASID defines the ASID.
0b1	TTBR1_EL1.ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.A1 == '1'.

T1SZ, bits [21:16]

The size offset of the memory region addressed by TTBR1_EL1. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.T1SZ == '1'.

TG0, bits [15:14]

Granule size for the TTBR0_EL1.

TG0	Meaning
0b00	4KB
0b01	64KB
0b10	16KB

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.TG0 == '1'.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL1.

SH0	Meaning
0b00	Non-shareable
0b10	Outer Shareable
0b11	Inner Shareable

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.SH0 == '1'.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.ORGN0 == '1'.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL1.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.IRGN0 == '1'.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0_EL1. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL1. The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL1.
0b1	A TLB miss on an address that is translated using TTBR0_EL1 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.EPD0 == '1'.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL1. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL1.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL1.
  - IsSystemRegisterMaskingEnabled(EL1).
  - TCRMASK_EL1.T0SZ == '1'.

Accessing TCR_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCR_EL1 or TCR_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR_EL1 are masked by TCRMASK_EL1.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL1

op0	op1	CRn	CRm	op2

```

2025-12-10 16:11:30, 2025-12_rel

TCR_EL2, Translation Control Register (EL2)

The TCR_EL2 characteristics are:

Purpose

The control register for stage 1 of the EL2, or EL2&0, translation regime:

- When the Effective value of HCR_EL2.E2H is not 1, this register controls stage 1 of the EL2 translation regime, that supports a single VA range, translated using TTBR0_EL2.
- When the Effective value of HCR_EL2.E2H is 1, this register controls stage 1 of the EL2&0 translation regime, that supports both:
  - A lower VA range, translated using TTBR0_EL2.
  - A higher VA range, translated using TTBR1_EL2.

Configuration

AArch64 System register TCR_EL2 bits [31:0] are architecturally mapped to AArch32 System register HTCR[31:0].

This register is present only when FEAT_AA64 is implemented. Otherwise, direct accesses to TCR_EL2 are UNDEFINED.

If EL2 is not implemented, this register is RES0 from EL3.

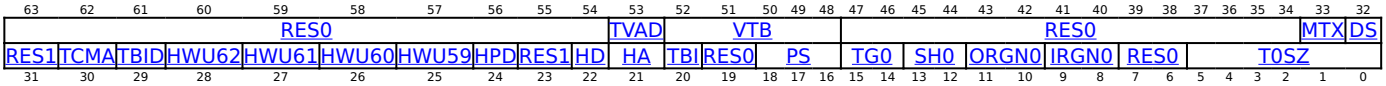
This register has no effect if EL2 is not enabled in the current Security state.

Attributes

TCR_EL2 is a 64-bit register.

Field descriptions

When EffectiveHCR_EL2_E2H() == '0':



Any of the bits in TCR_EL2 are permitted to be cached in a TLB.

Bits [63:54]

Reserved, RES0.

TVAD, bit [53]
When FEAT_VMTE is implemented:

Faulting control for access to an address that is a Tag VA determined by TCR_EL2.VTB.

TVAD	Meaning
0b0	Access using an address generated by an instruction that is the same as a Tag VA will not generate a fault by this mechanism.
0b1	Access using an address generated by an instruction that is the same as a Tag VA will generate a level 0 Translation fault.

This field does not control access if any of the following are true:

- Virtual tagging is disabled for the EL2 translation regime.
- Stage 1 of translation for the EL2 translation regime is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTB, bits [52:48]
When FEAT_VMTE is implemented:

Base address of the range of Tag VAs translated by TTBR0_EL2. The base address is Zeros(64-iasize):VTB:Zeros(iasize-5), where iasize = 64-TCR_EL2.T0SZ.

The size of the range of Tag VAs translated by TTBR0_EL2 is $2^{(iasize-5)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [47:34]

Reserved, RES0.

MTX, bit [33]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and Canonical tagging when EL2 is using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL2.

This control has an effect regardless of whether stage 1 of the EL2 translation regime is enabled or not.

MTX	Meaning
0b0	Canonical tagging is disabled. This control has no effect on address generation.
0b1	Canonical tagging is enabled. Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

For more information see Logical address tagging and Memory region tagging types.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]
When FEAT_LPA2 is implemented:

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL2.T0SZ.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of TCR_EL2.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of Translation table descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by TCR_EL2.SH0. The minimum value of TCR_EL2.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL2 are used to hold bits[51:48] of the output address in all cases. Note As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.T0SZ field is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. Note This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

The Effective value of this bit is 0b0.

Access to this field is RES0 .

Bit [31]

Reserved, RES1.

TCMA, bit [30]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Controls the generation of Unchecked accesses at EL2 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID	Meaning
0b0	TCR_EL2.TBI applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled. Note In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field is RES1 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]
When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL2.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]
When FEAT_HAF is implemented:

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging'.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID is 1, then this field only applies to Data accesses.

If the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2.
- An exception taken to EL2.
- An exception return to EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.

The following table captures the output address size represented by the value 0b110:

ID_AA64MMFR0_EL1.PARange	Translation Granule	DS[1]	Represented OA size
0b0101	Any	Any	48 bits, 256TB
0b011x	4KB or 16KB	0	48 bits, 256TB
0b011x	4KB or 16KB	1	52 bits, 4PB
0b011x	64KB	N/A	52 bits, 4PB

[1] This column represents the value of TCR_EL2.DS.

The output address size represented by the value 0b111 is the OA size represented by 0b110.

If 52-bit PA is supported, and the translation table descriptors cannot express an OA larger than 48-bits, then bits[51:48] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL2.

If 56-bit PA is supported, and the translation table descriptors cannot express an OA larger than 52-bits, then bits[55:52] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL2.

If the output address size represented by this field is larger than the supported PA size expressed in ID_AA64MMFR0_EL1.PARange, then the output address size is treated as being the same as the supported PA size. Arm strongly recommends that software avoids configuring this field to a value representing an output address size larger than the supported PA size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL2.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

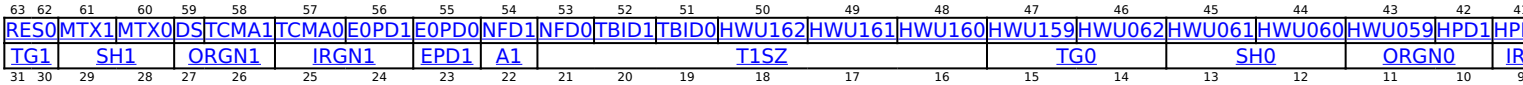
For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

When EffectiveHCR_EL2_E2H() == '1':



Any of the bits in TCR_EL2, other than the EPDx bits when they have the value 1, and the A1 bit are permitted to be cached in a TLB.

Bits [63:62]

Reserved, RES0.

MTX1, bit [61]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and Canonical tagging when EL0 and EL2 are using AArch64 where the data address would be translated by tables pointed to by TTBR1_EL2.

This control has an effect regardless of whether stage 1 of the EL2&0 translation regime is enabled or not.

MTX1	Meaning
0b0	Canonical tagging is disabled. This control has no effect on address generation.
0b1	Canonical tagging is enabled. Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b1111 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

For more information see Logical address tagging and Memory region tagging types.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.MTX1 == '1'.

Otherwise:

Reserved, RES0.

MTX0, bit [60]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and Canonical tagging when EL0 and EL2 are using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL2.

This control has an effect regardless of whether stage 1 of the EL2&0 translation regime is enabled or not.

MTX0	Meaning
0b0	Canonical tagging is disabled. This control has no effect on address generation.
0b1	Canonical tagging is enabled. Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

For more information see Logical address tagging and Memory region tagging types.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.MTX0 == '1'.

Otherwise:

Reserved, RES0.

DS, bit [59]
When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or TCR2_EL2.D128 == '0'):

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL2.{T0SZ,T1SZ}.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in table descriptors are ignored by hardware. The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of Translation table descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by: • TCR_EL2.SH0 if the VA is an address that is translated using tables pointed to by TTBR0_EL2. • TCR_EL2.SH1 if the VA is an address that is translated using tables pointed to by TTBR1_EL2. The minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 16 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL2 or TTBR1_EL2 are used to hold bits[51:48] of the output address in all cases. Note As FEAT_LVA must be implemented if TCR_EL2.DS == 1, the minimum value of the TCR_EL2.{T0SZ, T1SZ} fields is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. Note This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.DS == '1'.

Otherwise:

Reserved, RES0, and the Effective value of this bit is 0b0.

TCMA1, bit [58]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b11111.

TCMA1	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TCMA1 == '1'.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Controls the generation of Unchecked accesses at EL2, and at EL0 if HCR_EL2.TGE=1, when address[59:55] = 0b00000.

TCMA0	Meaning
0b0	This control has no effect on the generation of Unchecked accesses at EL2 or EL0.
0b1	All accesses are Unchecked.

Note

Software may change this control bit on a context switch.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TCMA0 == '1'.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]
When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR1_EL2.

E0PD1	Meaning
0b0	Unprivileged access to any address translated by TTBR1_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR1_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.E0PD1 == '1'.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]
When FEAT_E0PD is implemented:

Faulting control for unprivileged access to any address translated by TTBR0_EL2.

E0PD0	Meaning
0b0	Unprivileged access to any address translated by TTBR0_EL2 will not generate a fault by this mechanism.
0b1	Unprivileged access to any address translated by TTBR0_EL2 will generate a level 0 Translation fault.

Level 0 Translation faults generated as a result of this field are not counted as TLB misses for performance monitoring. The fault should take the same time to generate, whether the address is present in the TLB or not, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.E0PD0 == '1'.

Otherwise:

Reserved, RES0.

NFD1, bit [54]
When FEAT_SVE is implemented:

Non-Fault translation timing Disable when using TTBR1_EL2.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR1_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

NFD1	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR1_EL2.
0b1	A TLB miss on a virtual address that is translated using TTBR1_EL2 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.NFD1 == '1'.

Otherwise:

Reserved, RES0.

NFD0, bit [53]
When FEAT_SVE is implemented:

Non-Fault translation timing Disable when using TTBR0_EL2.

Controls how a TLB miss is reported in response to a non-fault unprivileged access for a virtual address that is translated using TTBR0_EL2.

If SVE is implemented, the affected access types include:

- All accesses due to an SVE non-fault contiguous load instruction.
- Accesses due to an SVE first-fault gather load instruction that are not for the First active element. Accesses due to an SVE first-fault contiguous load instruction are not affected.
- Accesses due to prefetch instructions might be affected, but the effect is not architecturally visible.

NFD0	Meaning
0b0	Does not affect the handling of a TLB miss on accesses translated using TTBR0_EL2.
0b1	A TLB miss on a virtual address that is translated using TTBR0_EL2 due to the specified access types causes the access to fail without taking an exception. The amount of time that the failure takes to be handled should not predictively leak whether it was caused by a TLB miss or a Permission fault, to mitigate attacks that use fault timing.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.NFD0 == '1'.

Otherwise:

Reserved, RES0.

TBID1, bit [52]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

For more information, see 'Address tagging'.

TBID1	Meaning
0b0	TCR_EL2.TBI1 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI1 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR1_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TBID1 == '1'.

Otherwise:

Reserved, RES0.

TBID0, bit [51]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

For more information, see 'Address tagging'.

TBID0	Meaning
0b0	TCR_EL2.TBI0 applies to Instruction and Data accesses.
0b1	TCR_EL2.TBI0 applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL2.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TBID0 == '1'.

Otherwise:

Reserved, RES0.

HWU162, bit [50]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU162	Meaning
0b0	For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HWU162 == '1'.

Otherwise:

Reserved, RES0.

HWU161, bit [49]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU161	Meaning
0b0	For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HWU161 == '1'.

Otherwise:

Reserved, RES0.

HWU160, bit [48]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU160	Meaning
0b0	For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HWU160 == '1'.

Otherwise:

Reserved, RES0.

HWU159, bit [47]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR1_EL2.

HWU159	Meaning
0b0	For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR1_EL2, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD1 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD1 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HWU159 == '1'.

Otherwise:

Reserved, RES0.

HWU062, bit [46]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL2.

HWU062	Meaning
0b0	For translations using TTBR0_EL2, bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL2, bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HWU062 == '1'.

Otherwise:

Reserved, RES0.

HWU061, bit [45]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL2.

HWU061	Meaning
0b0	For translations using TTBR0_EL2, bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL2, bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HWU061 == '1'.

Otherwise:

Reserved, RES0.

HWU060, bit [44]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL2.

HWU060	Meaning
0b0	For translations using TTBR0_EL2, bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL2, bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.

◦ PSTATE.EL == EL2.
◦ IsSystemRegisterMaskingEnabled(EL2).
◦ TCRMASK_EL2.HWU060 == '1'.

Otherwise:

Reserved, RES0.

HWU059, bit [43]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry for translations using TTBR0_EL2.

HWU059	Meaning
0b0	For translations using TTBR0_EL2, bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	For translations using TTBR0_EL2, bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL2.HPD0 is 1.

The Effective value of this field is 0 if the value of TCR_EL2.HPD0 is 0.

This field is RES0 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HWU059 == '1'.

Otherwise:

Reserved, RES0.

HPD1, bit [42]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR1_EL2.

HPD1	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field is RES1 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HPD1 == '1'.

Otherwise:

Reserved, RES0.

HPD0, bit [41]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL2.

HPD0	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled.

When disabled, the permissions are treated as if the bits are zero.

This field is RES1 when TCR2_EL2.POE2F is 1 and TCR2_EL2.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HPD0 == '1'.

Otherwise:

Reserved, RES0.

HD, bit [40]
When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL2.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL2.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HD == '1'.

Otherwise:

Reserved, RES0.

HA, bit [39]
When FEAT_HAF is implemented:

Hardware Access flag update in stage 1 translations from EL2.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.HA == '1'.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR1_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging'.

TBI1	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR1_EL2. It has an effect whether the EL2&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID1 is 1, then this field only applies to Data accesses.

If the value of TBI1 is 1 and bit [55] of the target address to be stored to the PC is 1, then bits[63:56] of that target address are also set to 1 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2
- If the Effective value of HCR_EL2.{E2H, TGE} is {1,1}, a branch or procedure return within EL0.
- An exception taken to EL2.
- An exception return to EL2.
- If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, then an exception return to EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TBI1 == '1'.

TBI0, bit [37]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL2 region, or ignored and used for tagged addresses.

For more information, see 'Address tagging'.

TBI0	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL0 and EL2 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL2. It has an effect whether the EL2&0 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL2.TBID0 is 1, then this field only applies to Data accesses.

If the value of TBI0 is 1 and bit [55] of the target address to be stored to the PC is 0, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL2
- If the Effective value of HCR_EL2.{E2H, TGE} is {1,1}, a branch or procedure return within EL0.
- An exception taken to EL2.
- An exception return to EL2.
- If the Effective value of HCR_EL2.{E2H, TGE} is {1, 1}, then an exception return to EL0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TBI0 == '1'.

AS, bit [36]

ASID Size.

AS	Meaning
0b0	8 bit - the upper 8 bits of TTBR0_EL2 and TTBR1_EL2 are ignored by hardware for every purpose except reading back the register, and are treated as if they are all zeros for when used for allocation and matching entries in the TLB.
0b1	16 bit - the upper 16 bits of TTBR0_EL2 and TTBR1_EL2 are used for allocation and matching in the TLB.

If the implementation has only 8 bits of ASID, this field is RES0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.AS == '1'.

Bit [35]

Reserved, RES0.

IPS, bits [34:32]

Intermediate Physical Address Size.

IPS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.
0b111	56 bits, 64PB.

The values 0b110 and 0b111 represent different output address sizes depending on implementation choices and translation configuration.

The following table captures the output address size represented by the value 0b110:

Descriptor Format	ID_AA64MMFR0_EL1.PARange	Translation Granule	DS[1]	Represented OA size
Any	0b0101	Any	Any	48 bits, 256TB
VMSAv8-64	0b011x	4KB or 16KB	0	48 bits, 256TB
VMSAv8-64	0b011x	4KB or 16KB	1	52 bits, 4PB
VMSAv8-64	0b011x	64KB	N/A	52 bits, 4PB
VMSAv9-128	0b011x	Any	N/A	52 bits, 4PB

[1] This column represents the value of TCR_EL2.DS.

The following table captures the output address size represented by the value 0b111:

Descriptor Format	ID_AA64MMFR0_EL1.PARange	Translation Granule	Represented OA size
Any	0b0110	Any	OA size represented by0b110
VMSAv8-64	0b0111	Any	OA size represented by0b110
VMSAv9-128	0b0111	Any	56 bits, 64PB

If 52-bit PA is supported, and the translation table descriptors cannot express an OA larger than 48-bits, then bits[51:48] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL2.

If 56-bit PA is supported, and the translation table descriptors cannot express an OA larger than 52-bits, then bits[55:52] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL2.

If the output address size represented by this field is larger than the supported PA size expressed in ID_AA64MMFR0_EL1.PARange, then the output address size is treated as being the same as the supported PA size. Arm strongly recommends that software avoids configuring this field to a value representing an output address size larger than the supported PA size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.IPS == '1'.

TG1, bits [31:30]

Granule size for the TTBR1_EL2.

TG1	Meaning
0b01	16KB.
0b10	4KB.
0b11	64KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TG1 == '1'.

SH1, bits [29:28]

Shareability attribute for memory associated with translation table walks using TTBR1_EL2.

SH1	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.SH1 == '1'.

ORGN1, bits [27:26]

Outer cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

ORGN1	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.ORGN1 == '1'.

IRGN1, bits [25:24]

Inner cacheability attribute for memory associated with translation table walks using TTBR1_EL2.

IRGN1	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.IRGN1 == '1'.

EPD1, bit [23]

Translation table walk disable for translations using TTBR1_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR1_EL2. The encoding of this bit is:

EPD1	Meaning
0b0	Perform translation table walks using TTBR1_EL2.
0b1	A TLB miss on an address that is translated using TTBR1_EL2 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.EPD1 == '1'.

A1, bit [22]

Selects whether TTBR0_EL2 or TTBR1_EL2 defines the ASID. The encoding of this bit is:

A1	Meaning
0b0	TTBR0_EL2.ASID defines the ASID.
0b1	TTBR1_EL2.ASID defines the ASID.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.A1 == '1'.

T1SZ, bits [21:16]

The size offset of the memory region addressed by TTBR1_EL2. The region size is $2^{(64-T1SZ)}$ bytes.

The maximum and minimum possible values for T1SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.T1SZ == '1'.

TG0, bits [15:14]

Granule size for the TTBR0_EL2.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value, or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.TG0 == '1'.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL2.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.SH0 == '1'.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.ORGN0 == '1'.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL2.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.IRGN0 == '1'.

EPD0, bit [7]

Translation table walk disable for translations using TTBR0_EL2. This bit controls whether a translation table walk is performed on a TLB miss, for an address that is translated using TTBR0_EL2. The encoding of this bit is:

EPD0	Meaning
0b0	Perform translation table walks using TTBR0_EL2.
0b1	A TLB miss on an address that is translated using TTBR0_EL2 generates a Translation fault. No translation table walk is performed.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.EPD0 == '1'.

Bit [6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL2. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL2.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing this field has the following behavior:

- Access to this field is RO if all the following are true:
  - FEAT_SRMASK is implemented.
  - PSTATE.EL == EL2.
  - IsSystemRegisterMaskingEnabled(EL2).
  - TCRMASK_EL2.T0SZ == '1'.

Accessing TCR_EL2

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL2 using the accessor name TCR_EL2 or TCR_EL1 are not guaranteed to be ordered with respect to accesses using the other accessor name.

If FEAT_SRMASK is implemented, accesses to TCR_EL2 are masked by TCRMASK_EL2.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL2

op0	op1	CRn	CRm	op2
0b11	0b100	0b0010	0b0000	0b010

```
if !IsFeatureImplemented(FEAT_AA64) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    if EffectiveHCR_EL2_NVx() IN {'xx1'} then

end;
```

2025-12-10 16:11:30, 2025-12_rel

TCR_EL3, Translation Control Register (EL3)

The TCR_EL3 characteristics are:

Purpose

The control register for stage 1 of the EL3 translation regime.

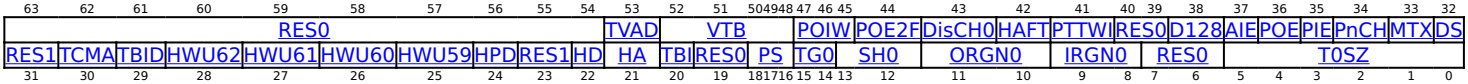
Configuration

This register is present only when EL3 is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCR_EL3 are UNDEFINED.

Attributes

TCR_EL3 is a 64-bit register.

Field descriptions



Unless stated otherwise, any of the bits in TCR_EL3 are permitted to be cached in a TLB.

Bits [63:54]

Reserved, RES0.

TVAD, bit [53]
When FEAT_VMTE is implemented:

Faulting control for access to an address that is a Tag VA determined by TCR_EL3.VTB.

TVAD	Meaning
0b0	Access using an address generated by an instruction that is the same as a Tag VA will not generate a fault by this mechanism.
0b1	Access using an address generated by an instruction that is the same as a Tag VA will generate a level 0 Translation fault.

This field does not control access if any of the following are true:

- Virtual tagging is disabled for the EL3 translation regime.
- Stage 1 of translation for the EL3 translation regime is disabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

VTB, bits [52:48]
When FEAT_VMTE is implemented:

Base address of the range of Tag VAs translated by TTBR0_EL3. The base address is Zeros(64-iasize):VTB:Zeros(iasize-5), where iasize = 64-TCR_EL3.T0SZ.

The size of the range of Tag VAs translated by TTBR0_EL3 is $2^{(iasize-5)}$ bytes.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POIW, bits [47:45]
When FEAT_S1POE2 is implemented:

POIndex width.

Values less than 3 are reserved and behave as if the value is 3.

This field is permitted to be cached in a PLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE2F, bit [44]
When FEAT_S1POE2 is implemented:

Enable POE2 translation table descriptor format for the EL3 stage 1 translation regime.

POE2F	Meaning
0b0	The POE2 translation table descriptor format is disabled.
0b1	The POE2 translation table descriptor format is enabled.

If SCTLR_EL3.M is 0, this field is treated as 0 for all purposes other than:

- Reading back the value of the field.
- Being cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DisCH0, bit [43]
When FEAT_D128 is implemented and TCR_EL3.D128 == '1':

Disable the Contiguous bit for the Start Table.

DisCH0	Meaning
0b0	The Contiguous bit of Block or Page descriptors of the Start Table is not affected by this field.
0b1	The Contiguous bit of Block or Page descriptors of the Start Table is treated as 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HAFT, bit [42]
When FEAT_HAFT is implemented:

Hardware managed Access Flag for Table descriptors.

Enables the Hardware managed Access Flag for Table descriptors.

HAFT	Meaning
0b0	Hardware managed Access Flag for Table descriptors is disabled.
0b1	Hardware managed Access Flag for Table descriptors is enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PTTWI, bit [41]
When FEAT_THE is implemented:

Permit Translation table walk Incoherence.

Permits RCWS instructions to generate writes that have the Reduced Coherence property.

PTTWI	Meaning
0b0	Write accesses generated by RCWS at EL3 do not have the Reduced Coherence property.
0b1	Write accesses generated by RCWS at EL3 have the Reduced Coherence property.

This bit is permitted to be implemented as a read-only bit with a fixed value of 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bits [40:39]

Reserved, RES0.

D128, bit [38]
When FEAT_D128 is implemented:

Enables VMSAv9-128 translation system.

D128	Meaning
0b0	Translation system follows VMSAv8-64 translation process.
0b1	Translation system follows VMSAv9-128 translation process.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

AIE, bit [37]
When FEAT_AIE is implemented:

Enable Attribute Indexing Extension.

AIE	Meaning
0b0	Attribute Indexing Extension Disabled.
0b1	Attribute Indexing Extension Enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

POE, bit [36]
When FEAT_S1POE is implemented:

Enables Permission Overlay for EL3 accesses.

POE	Meaning
0b0	Permission overlay disabled for EL3 access in stage 1 of EL3 translation regime.
0b1	Permission overlay enabled for EL3 access in stage 1 of EL3 translation regime.

This bit is not permitted to be cached in a TLB.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PIE, bit [35]
When FEAT_S1PIE is implemented:

Enables usage of Indirect Permission Scheme.

PIE	Meaning
0b0	Direct permission model.
0b1	Indirect permission model.

This field is RES1 when TCR_EL3.D128 is 1.

This field is RES1 when TCR_EL3.POE2F is 1 and TCR_EL3.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

PnCH, bit [34]
When FEAT_THE is implemented:

Protected attribute enable. Enables use of bit[52] of the stage 1 translation table entries as the Protected bit, for translations using TTBR0_EL3.

PnCH	Meaning
0b0	For translations using TTBR0_EL3, bit[52] of each stage 1 translation table entry is not the Protected bit.
0b1	For translations using TTBR0_EL3, bit[52] of each stage 1 translation table entry is the Protected bit.

If bit[52] is used as the Protected bit, it is not used as the Contiguous bit.

This field is RES0 when TCR_EL3.D128 is 1.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX, bit [33]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Extended memory tag checking.

This field controls address generation and Canonical tagging when EL3 is using AArch64 where the data address would be translated by tables pointed to by TTBR0_EL3.

This control has an effect regardless of whether stage 1 of the EL3 translation regime is enabled or not.

MTX	Meaning
0b0	Canonical tagging is disabled. This control has no effect on address generation.
0b1	Canonical tagging is enabled. Bits[59:56] of a 64-bit VA hold a Logical Address Tag, and all of the following apply: • Bits[59:56] are treated as 0b0000 when checking if the address is out of range. • If FEAT_PAuth is implemented, bits[59:56] are not part of the PAC field. • A Canonical Tag Check operation is performed on Tag Checked memory accesses to a Canonically Tagged memory location.

For more information see Logical address tagging and Memory region tagging types.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [32]
When FEAT_LPA2 is implemented and (FEAT_D128 is not implemented or TCR_EL3.D128 == '0'):

This field affects:

- Whether a 52-bit output address can be described by the translation tables of the 4KB or 16KB translation granules.
- The minimum value of TCR_EL3.T0SZ.
- How and where shareability for Block and Page descriptors are encoded.

DS	Meaning
0b0	Bits[49:48] of translation descriptors are RES0. Bits[9:8] in Block and Page descriptors encode shareability information in the SH[1:0] field. Bits[9:8] in Table descriptors are ignored by hardware. The minimum value of TCR_EL3.T0SZ is 16. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. Output address[51:48] is 0b0000.
0b1	Bits[49:48] of translation descriptors hold output address[49:48]. Bits[9:8] of table translation descriptors hold output address[51:50]. The shareability information of Block and Page descriptors for cacheable locations is determined by TCR_EL3.SH0. The minimum value of TCR_EL3.T0SZ is 12. Any memory access using a smaller value generates a stage 1 level 0 translation table fault. All calculations of the stage 1 base address are modified for tables of fewer than 8 entries so that the table is aligned to 64 bytes. Bits[5:2] of TTBR0_EL3 are used to hold bits[51:48] of the output address in all cases. Note As FEAT_LVA must be implemented if TCR_EL3.DS == 1, the minimum value of the TCR_EL3.T0SZ field is 12, as determined by that extension. For the TLBI Range instructions affecting VA, the format of the argument is changed so that bits[36:0] hold BaseADDR[52:16]. For the 4KB translation granule, bits[15:12] of BaseADDR are treated as 0b0000. For the 16KB translation granule, bits[15:14] of BaseADDR are treated as 0b00. Note This forces alignment of the ranges used by the TLBI range instructions.

This field is RES0 for a 64KB translation granule.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

The Effective value of this bit is 0b0.

Access to this field is RES0 .

Bit [31]

Reserved, RES1.

TCMA, bit [30]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Controls the generation of Unchecked accesses at EL3 when address [59:56] = 0b0000.

TCMA	Meaning
0b0	This control has no effect on the generation of Unchecked accesses.
0b1	All accesses are Unchecked.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID, bit [29]
When FEAT_PAuth is implemented:

Controls the use of the top byte of instruction addresses for address matching.

TBID	Meaning
0b0	TCR_EL3.TBI applies to Instruction and Data accesses.
0b1	TCR_EL3.TBI applies to Data accesses only.

This affects addresses where the address would be translated by tables pointed to by TTBR0_EL3.

For the purpose of this field, all cache maintenance and address translation instructions that perform address translation are treated as data accesses.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU62, bit [28]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[62] of the stage 1 translation table Block or Page entry.

HWU62	Meaning
0b0	Bit[62] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[62] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field is RES0 when TCR_EL3.POE2F is 1 and TCR_EL3.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU61, bit [27]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[61] of the stage 1 translation table Block or Page entry.

HWU61	Meaning
0b0	Bit[61] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[61] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field is RES0 when TCR_EL3.POE2F is 1 and TCR_EL3.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU60, bit [26]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[60] of the stage 1 translation table Block or Page entry.

HWU60	Meaning
0b0	Bit[60] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[60] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field is RES0 when TCR_EL3.POE2F is 1 and TCR_EL3.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU59, bit [25]
When FEAT_HPDS2 is implemented:

Hardware Use. Indicates IMPLEMENTATION DEFINED hardware use of bit[59] of the stage 1 translation table Block or Page entry.

HWU59	Meaning
0b0	Bit[59] of each stage 1 translation table Block or Page entry cannot be used by hardware for an IMPLEMENTATION DEFINED purpose.
0b1	Bit[59] of each stage 1 translation table Block or Page entry can be used by hardware for an IMPLEMENTATION DEFINED purpose if the value of TCR_EL3.HPD is 1.

The Effective value of this field is 0 if the value of TCR_EL3.HPD is 0.

This field is RES0 when TCR_EL3.POE2F is 1 and TCR_EL3.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD, bit [24]
When FEAT_HPDS is implemented:

Hierarchical Permission Disables. This affects the hierarchical control bits, APTable, PXNTable, and UXNTable, except NSTable, in the translation tables pointed to by TTBR0_EL3.

HPD	Meaning
0b0	Hierarchical permissions are enabled.
0b1	Hierarchical permissions are disabled. Note In this case, bit[61] (APTable[0]) and bit[59] (PXNTable) of the next level descriptor attributes are required to be ignored by the PE, and are no longer reserved, allowing them to be used by software.

When disabled, the permissions are treated as if the bits are zero.

This field is RES1 when TCR_EL3.POE2F is 1 and TCR_EL3.D128 is 0.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

Bit [23]

Reserved, RES1.

HD, bit [22]
When FEAT_HAFDBS is implemented:

Hardware management of dirty state in stage 1 translations from EL3.

HD	Meaning
0b0	Stage 1 hardware management of dirty state disabled.
0b1	Stage 1 hardware management of dirty state enabled.

When the Effective value of TCR_EL3.HA is 0, this field behaves as 0 for all purposes other than a direct read of the value of this field.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [21]
When FEAT_HAF is implemented:

Hardware Access flag update in stage 1 translations from EL3.

HA	Meaning
0b0	Stage 1 Access flag update disabled.
0b1	Stage 1 Access flag update enabled.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI, bit [20]

Top Byte Ignored. Indicates whether the top byte of an address is used for address match for the TTBR0_EL3 region, or ignored and used for tagged addresses.

TBI	Meaning
0b0	Top Byte used in the address calculation.
0b1	Top Byte ignored in the address calculation.

This affects addresses generated in EL3 using AArch64 where the address would be translated by tables pointed to by TTBR0_EL3. It has an effect whether the EL3 translation regime is enabled or not.

If FEAT_PAuth is implemented and TCR_EL3.TBID is 1, then this field only applies to Data accesses.

Otherwise, if the value of TBI is 1, then bits[63:56] of that target address are also set to 0 before the address is stored in the PC, in the following cases:

- A branch or procedure return within EL3.
- A exception taken to EL3.
- An exception return to EL3.

For more information, see 'Address tagging'.

Note

This control detrmines the scope of address tagging. It never causes an exception to be generated.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bit [19]

Reserved, RES0.

PS, bits [18:16]

Physical Address Size.

PS	Meaning
0b000	32 bits, 4GB.
0b001	36 bits, 64GB.
0b010	40 bits, 1TB.
0b011	42 bits, 4TB.
0b100	44 bits, 16TB.
0b101	48 bits, 256TB.
0b110	52 bits, 4PB.
0b111	56 bits, 64PB.

The values 0b110 and 0b111 represent different output address sizes depending on implementation choices and translation configuration.

The following table captures the output address size represented by the value 0b110:

Descriptor Format	ID_AA64MMFR0_EL1.PARange	Translation Granule	DS[1]	Represented OA size
Any	0b0101	Any	Any	48 bits, 256TB
VMSAv8-64	0b011x	4KB or 16KB	0	48 bits, 256TB
VMSAv8-64	0b011x	4KB or 16KB	1	52 bits, 4PB
VMSAv8-64	0b011x	64KB	N/A	52 bits, 4PB
VMSAv9-128	0b011x	Any	N/A	52 bits, 4PB

[1] This column represents the value of TCR_EL3.DS.

The following table captures the output address size represented by the value 0b111:

Descriptor Format	ID_AA64MMFR0_EL1.PARange	Translation Granule	Represented OA size
Any	0b0110	Any	OA size represented by0b110
VMSAv8-64	0b0111	Any	OA size represented by0b110
VMSAv9-128	0b0111	Any	56 bits, 64PB

If 52-bit PA is supported, and the translation table descriptors cannot express an OA larger than 48-bits, then bits[51:48] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL3.

If 56-bit PA is supported, and the translation table descriptors cannot express an OA larger than 52-bits, then bits[55:52] of every translation table base address are treated as 0b0000 for the stage of translation controlled by TCR_EL3.

If the output address size represented by this field is larger than the supported PA size expressed in ID_AA64MMFR0_EL1.PARange, then the output address size is treated as being the same as the supported PA size. Arm strongly recommends that software avoids configuring this field to a value representing an output address size larger than the supported PA size.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

TG0, bits [15:14]

Granule size for the TTBR0_EL3.

TG0	Meaning
0b00	4KB.
0b01	64KB.
0b10	16KB.

Other values are reserved.

If the value is programmed to either a reserved value or a size that has not been implemented, then the hardware will treat the field as if it has been programmed to an IMPLEMENTATION DEFINED choice of the sizes that has been implemented for all purposes other than the value read back from this register.

It is IMPLEMENTATION DEFINED whether the value read back is the value programmed or the value that corresponds to the size chosen.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

SH0, bits [13:12]

Shareability attribute for memory associated with translation table walks using TTBR0_EL3.

SH0	Meaning
0b00	Non-shareable.
0b10	Outer Shareable.
0b11	Inner Shareable.

Other values are reserved. The effect of programming this field to a Reserved value is that behavior is CONSTRAINED UNPREDICTABLE.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

ORGN0, bits [11:10]

Outer cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

ORGN0	Meaning
0b00	Normal memory, Outer Non-cacheable.
0b01	Normal memory, Outer Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Outer Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Outer Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

IRGN0, bits [9:8]

Inner cacheability attribute for memory associated with translation table walks using TTBR0_EL3.

IRGN0	Meaning
0b00	Normal memory, Inner Non-cacheable.
0b01	Normal memory, Inner Write-Back Read-Allocate Write-Allocate Cacheable.
0b10	Normal memory, Inner Write-Through Read-Allocate No Write-Allocate Cacheable.
0b11	Normal memory, Inner Write-Back Read-Allocate No Write-Allocate Cacheable.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Bits [7:6]

Reserved, RES0.

T0SZ, bits [5:0]

The size offset of the memory region addressed by TTBR0_EL3. The region size is $2^{(64-T0SZ)}$ bytes.

The maximum and minimum possible values for T0SZ depend on the level of translation table and the memory translation granule size, as described in the AArch64 Virtual Memory System Architecture chapter.

Note

For the 4KB translation granule, if FEAT_LPA2 is implemented, TCR_EL3.DS is 1, and this field is less than 16, the translation table walk begins with a level -1 initial lookup.

For the 16KB translation granule, if FEAT_LPA2 is implemented, TCR_EL3.DS is 1, and this field is less than 17, the translation table walk begins with a level 0 initial lookup.

The reset behavior of this field is:

- On a Warm reset, this field resets to an architecturally UNKNOWN value.

Accessing TCR_EL3

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCR_EL3

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    X{64}(t) = TCR_EL3();
end;
```

MSR TCR_EL3, <Xt>

op0	op1	CRn	CRm	op2
0b11	0b110	0b0010	0b0000	0b010

```
if !(HaveEL(EL3) && IsFeatureImplemented(FEAT_AA64)) then
    Undefined();
elsif PSTATE.EL == EL0 then
    Undefined();
elsif PSTATE.EL == EL1 then
    Undefined();
elsif PSTATE.EL == EL2 then
    Undefined();
elsif PSTATE.EL == EL3 then
    if IsFeatureImplemented(FEAT_FGWTE3) && FGWTE3_EL3().TCR_EL3 == '1' then
        AArch64_SystemAccessTrap(EL3, 0x18);
    elsif IsFeatureImplemented(FEAT_S1POE2) && FGDTState.nTT == '1' then
        AArch64_FGDTSystemAccessTrap(EL3, 0x18);
    else
        TCR_EL3() = X{64}(t);
    end;
end;
```

2025-12-10 16:11:30, 2025-12_rel

TCRMASK_EL1, Translation Control Masking Register (EL1)

The TCRMASK_EL1 characteristics are:

Purpose

Mask register to prevent updates of fields in TCR_EL1 on writes to TCR_EL1 or TCRALIAS_EL1.

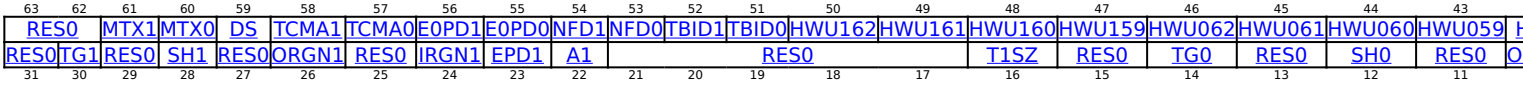
Configuration

This register is present only when FEAT_SRMASK is implemented and FEAT_AA64 is implemented. Otherwise, direct accesses to TCRMASK_EL1 are UNDEFINED.

Attributes

TCRMASK_EL1 is a 64-bit register.

Field descriptions



Bits [63:62]

Reserved, RES0.

MTX1, bit [61]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX1.

MTX1	Meaning
0b0	TCR_EL1.MTX1 is writeable.
0b1	TCR_EL1.MTX1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

MTX0, bit [60]
When FEAT_MTE_NO_ADDRESS_TAGS is implemented or FEAT_MTE_CANONICAL_TAGS is implemented:

Mask bit for MTX0.

MTX0	Meaning
0b0	TCR_EL1.MTX0 is writeable.
0b1	TCR_EL1.MTX0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

DS, bit [59]
When FEAT_LPA2 is implemented:

Mask bit for DS.

DS	Meaning
0b0	TCR_EL1.DS is writeable.
0b1	TCR_EL1.DS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA1, bit [58]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCMA1.

TCMA1	Meaning
0b0	TCR_EL1.TCMA1 is writeable.
0b1	TCR_EL1.TCMA1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TCMA0, bit [57]
When FEAT_MTE2 is implemented or FEAT_VMTETC is implemented:

Mask bit for TCMA0.

TCMA0	Meaning
0b0	TCR_EL1.TCMA0 is writeable.
0b1	TCR_EL1.TCMA0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD1, bit [56]
When FEAT_E0PD is implemented:

Mask bit for E0PD1.

E0PD1	Meaning
0b0	TCR_EL1.E0PD1 is writeable.
0b1	TCR_EL1.E0PD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

E0PD0, bit [55]
When FEAT_E0PD is implemented:

Mask bit for E0PD0.

E0PD0	Meaning
0b0	TCR_EL1.E0PD0 is writeable.
0b1	TCR_EL1.E0PD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD1, bit [54]
When FEAT_SVE is implemented:

Mask bit for NFD1.

NFD1	Meaning
0b0	TCR_EL1.NFD1 is writeable.
0b1	TCR_EL1.NFD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

NFD0, bit [53]
When FEAT_SVE is implemented:

Mask bit for NFD0.

NFD0	Meaning
0b0	TCR_EL1.NFD0 is writeable.
0b1	TCR_EL1.NFD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID1, bit [52]
When FEAT_PAuth is implemented:

Mask bit for TBID1.

TBID1	Meaning
0b0	TCR_EL1.TBID1 is writeable.
0b1	TCR_EL1.TBID1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBID0, bit [51]
When FEAT_PAuth is implemented:

Mask bit for TBID0.

TBID0	Meaning
0b0	TCR_EL1.TBID0 is writeable.
0b1	TCR_EL1.TBID0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU162, bit [50]
When FEAT_HPDS2 is implemented:

Mask bit for HWU162.

HWU162	Meaning
0b0	TCR_EL1.HWU162 is writeable.
0b1	TCR_EL1.HWU162 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU161, bit [49]
When FEAT_HPDS2 is implemented:

Mask bit for HWU161.

HWU161	Meaning
0b0	TCR_EL1.HWU161 is writeable.
0b1	TCR_EL1.HWU161 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU160, bit [48]
When FEAT_HPDS2 is implemented:

Mask bit for HWU160.

HWU160	Meaning
0b0	TCR_EL1.HWU160 is writeable.
0b1	TCR_EL1.HWU160 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU159, bit [47]
When FEAT_HPDS2 is implemented:

Mask bit for HWU159.

HWU159	Meaning
0b0	TCR_EL1.HWU159 is writeable.
0b1	TCR_EL1.HWU159 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU062, bit [46]
When FEAT_HPDS2 is implemented:

Mask bit for HWU062.

HWU062	Meaning
0b0	TCR_EL1.HWU062 is writeable.
0b1	TCR_EL1.HWU062 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU061, bit [45]
When FEAT_HPDS2 is implemented:

Mask bit for HWU061.

HWU061	Meaning
0b0	TCR_EL1.HWU061 is writeable.
0b1	TCR_EL1.HWU061 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU060, bit [44]
When FEAT_HPDS2 is implemented:

Mask bit for HWU060.

HWU060	Meaning
0b0	TCR_EL1.HWU060 is writeable.
0b1	TCR_EL1.HWU060 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HWU059, bit [43]
When FEAT_HPDS2 is implemented:

Mask bit for HWU059.

HWU059	Meaning
0b0	TCR_EL1.HWU059 is writeable.
0b1	TCR_EL1.HWU059 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD1, bit [42]
When FEAT_HPDS is implemented:

Mask bit for HPD1.

HPD1	Meaning
0b0	TCR_EL1.HPD1 is writeable.
0b1	TCR_EL1.HPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HPD0, bit [41]
When FEAT_HPDS is implemented:

Mask bit for HPD0.

HPD0	Meaning
0b0	TCR_EL1.HPD0 is writeable.
0b1	TCR_EL1.HPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HD, bit [40]
When FEAT_HAFDBS is implemented:

Mask bit for HD.

HD	Meaning
0b0	TCR_EL1.HD is writeable.
0b1	TCR_EL1.HD is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

HA, bit [39]
When FEAT_HAF is implemented:

Mask bit for HA.

HA	Meaning
0b0	TCR_EL1.HA is writeable.
0b1	TCR_EL1.HA is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Otherwise:

Reserved, RES0.

TBI1, bit [38]

Mask bit for TBI1.

TBI1	Meaning
0b0	TCR_EL1.TBI1 is writeable.
0b1	TCR_EL1.TBI1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

TBI0, bit [37]

Mask bit for TBI0.

TBI0	Meaning
0b0	TCR_EL1.TBI0 is writeable.
0b1	TCR_EL1.TBI0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

AS, bit [36]

Mask bit for AS.

AS	Meaning
0b0	TCR_EL1.AS is writeable.
0b1	TCR_EL1.AS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [35:33]

Reserved, RES0.

IPS, bit [32]

Mask bit for IPS.

IPS	Meaning
0b0	TCR_EL1.IPS is writeable.
0b1	TCR_EL1.IPS is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [31]

Reserved, RES0.

TG1, bit [30]

Mask bit for TG1.

TG1	Meaning
0b0	TCR_EL1.TG1 is writeable.
0b1	TCR_EL1.TG1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [29]

Reserved, RES0.

SH1, bit [28]

Mask bit for SH1.

SH1	Meaning
0b0	TCR_EL1.SH1 is writeable.
0b1	TCR_EL1.SH1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [27]

Reserved, RES0.

ORGN1, bit [26]

Mask bit for ORGN1.

ORGN1	Meaning
0b0	TCR_EL1.ORGN1 is writeable.
0b1	TCR_EL1.ORGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [25]

Reserved, RES0.

IRGN1, bit [24]

Mask bit for IRGN1.

IRGN1	Meaning
0b0	TCR_EL1.IRGN1 is writeable.
0b1	TCR_EL1.IRGN1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD1, bit [23]

Mask bit for EPD1.

EPD1	Meaning
0b0	TCR_EL1.EPD1 is writeable.
0b1	TCR_EL1.EPD1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

A1, bit [22]

Mask bit for A1.

A1	Meaning
0b0	TCR_EL1.A1 is writeable.
0b1	TCR_EL1.A1 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [21:17]

Reserved, RES0.

T1SZ, bit [16]

Mask bit for T1SZ.

T1SZ	Meaning
0b0	TCR_EL1.T1SZ is writeable.
0b1	TCR_EL1.T1SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [15]

Reserved, RES0.

TG0, bit [14]

Mask bit for TG0.

TG0	Meaning
0b0	TCR_EL1.TG0 is writeable.
0b1	TCR_EL1.TG0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [13]

Reserved, RES0.

SH0, bit [12]

Mask bit for SH0.

SH0	Meaning
0b0	TCR_EL1.SH0 is writeable.
0b1	TCR_EL1.SH0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [11]

Reserved, RES0.

ORGN0, bit [10]

Mask bit for ORGN0.

ORGN0	Meaning
0b0	TCR_EL1.ORGN0 is writeable.
0b1	TCR_EL1.ORGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bit [9]

Reserved, RES0.

IRGN0, bit [8]

Mask bit for IRGN0.

IRGN0	Meaning
0b0	TCR_EL1.IRGN0 is writeable.
0b1	TCR_EL1.IRGN0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

EPD0, bit [7]

Mask bit for EPD0.

EPD0	Meaning
0b0	TCR_EL1.EPD0 is writeable.
0b1	TCR_EL1.EPD0 is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Bits [6:1]

Reserved, RES0.

T0SZ, bit [0]

Mask bit for T0SZ.

T0SZ	Meaning
0b0	TCR_EL1.T0SZ is writeable.
0b1	TCR_EL1.T0SZ is not writeable.

The reset behavior of this field is:

- On a Warm reset:
  - When the highest implemented Exception level is EL1, this field resets to '0'.
  - Otherwise, this field resets to an architecturally UNKNOWN value.

Accessing TCRMASK_EL1

When the Effective value of HCR_EL2.E2H is 1, without explicit synchronization, accesses from EL3 using the accessor name TCRMASK_EL1 or TCRMASK_EL12 are not guaranteed to be ordered with respect to accesses using the other accessor name.

Accesses to this register use the following encodings in the System register encoding space:

MRS <Xt>, TCRMASK_EL1

op0	op1	CRn	CRm	op2
0b11	0b000	0b0010	0b0111	0b010

```
