## 1.2. Terms and Abbreviations

This document uses the following terms and abbreviations.

Term	Meaning
ALU	Arithmetic/Logical Unit
ASIMD	Advanced SIMD
Mop	Macro-Operation
Uop	Micro-Operation
VFP	Vector Floating Point

## 1.3. Scope

This document provides high-level information about the Cortex-A76 pipeline, instruction performance characteristics, and special performance considerations. This information is intended to aid people who are optimizing software and compilers for Cortex-A76. For a more complete description of the Cortex-A76 processor, please refer to the *Cortex-A76 Technical Reference Manual*.

## 2 Introduction

### 2.1. Pipeline Overview

The following diagram describes the high-level Cortex-A76 instruction processing pipeline. Instructions are first fetched, then decoded into internal macro-operations (Mops). From there, the Mops proceed through register renaming and dispatch stages. A Mop can be split further into two Uops at dispatch stage. Once dispatched, uops wait for their operands and issue out-of-order to one of eight execution pipelines. Each execution pipeline can accept and complete one uop per cycle.

The execution pipelines support different types of operations, as follows:

Pipeline (mnemonic)	Supported functionality
Branch	Branch $\mu$ OPs
Integer Single-Cycle 0/1	Integer ALU $\mu$ OPs
Integer Single/Multi-cycle	Integer shift-ALU, multiply, divide, CRC and sum-of-absolute-differences $\mu$ OPs
Load/Store Address Generation 0/1	Load, Store and special memory uops
FP/ASIMD-0	ASIMD ALU, ASIMD misc, ASIMD integer multiply, FP convert, FP misc, FP add, FP multiply, FP divide, FP sqrt, crypto uops, store data uops
FP/ASIMD-1	ASIMD ALU, ASIMD misc, FP misc, FP add, FP multiply, ASIMD shift uops, store data uops,

## 3 Instruction characteristics

### 3.1. Instruction tables

This chapter describes high-level performance characteristics for most Arm v8.2-A A32, T32 and A64 instructions. A series of tables summarize the effective execution latency and throughput (instruction bandwidth per cycle), pipelines utilized, and special behaviours associated with each group of instructions. Utilized pipelines correspond to the execution pipelines described in chapter 2.

In the tables below, Exec Latency is defined as the minimum latency seen by an operation dependent on an instruction in the described group.

In the tables below, Execution Throughput is defined as the maximum throughput (in instructions per cycle) of the specified instruction group that can be achieved in the entirety of the Cortex-A76 microarchitecture.

### 3.2. Legend for reading the utilized pipelines

Pipeline name	Symbol used in tables
Branch 0/1	B
Integer single Cycle 0/1	S
Integer single Cycle 0/1 and single/multicycle	I
Integer single/multicycle	M
Integer single Cycle 1 and Integer multicycle	D
Load/Store 0/1	L
FP/ASIMD 0/1	V
FP/ASIMD 0	V0
FP/ASIMD 1	V1

### 3.3. Branch Instructions

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Branch, immed	B	1	1	B	
Branch, register	BR, RET	1	1	B	
Branch and link, immed	BL	1	1	I, B	
Branch and link, register (reg != lr)	BLR	1	1	I, B	
Branch and link, register (reg == lr)	BLR	2	1	I, B	
Compare and branch	CBZ, CBNZ, TBZ, TBNZ	1	1	B	

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Branch, immed	B	1	1	B	
Branch, register	BX	1	1	B	
Branch and link, immed	BL, BLX	1	1	I, B	
Branch and link, register (reg != lr)	BLX	1	1	I, B	
Branch and link, register (reg == lr)	BLX	2	1	I, B	
Compare and branch	CBZ, CBNZ	1	1	B	

### 3.4. Arithmetic and Logical Instructions

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Arithmetic, basic	ADD{S}, ADC{S}, SUB{S}, SBC{S}	1	3	I	
Arithmetic, extend and shift	ADD{S}, SUB{S}	2	1	M	
Arithmetic, LSL shift, shift <= 4	ADD{S}, SUB{S}	1	3	I	
Arithmetic, LSR/ASR/ROR shift or LSL shift > 4	ADD{S}, SUB{S}	2	1	M	
Conditional compare	CCMN, CCMP	1	3	I	
Conditional select	CSEL, CSINC, CSINV, CSNEG	1	3	I	
Logical, basic	AND{S}, BIC{S}, EON, EOR, ORN, ORR	1	3	I	
Logical, shift, no flagset	AND, BIC, EON, EOR, ORN, ORR	1	3	I	
Logical, shift, flagset	ANDS, BICS	2	1	M	

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
ALU, basic	ADD{S}, ADC{S}, ADR, AND{S}, BIC{S}, CMN, CMP, EOR{S}, ORN{S}, ORR{S}, RSB{S}, RSC{S}, SUB{S}, SBC{S}, TEQ, TST	1	3	I	
ALU, shift by register, unconditional	(same as ALU, basic)	2	1	M	
ALU, shift by register, conditional	(same as ALU, basic)	2	1	I, M	
Arithmetic, LSL shift by immed, shift <= 4, unconditional	ADD{S}, ADC{S}, RSB{S}, RSC{S}, SUB{S}, SBC{S}	1	3	I	
Arithmetic, LSL shift by immed, shift <= 4, conditional	ADD{S}, ADC{S}, RSB{S}, RSC{S}, SUB{S}, SBC{S}	1	1	M	

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Arithmetic, LSR/ASR/ROR shift by immed or LSL shift by immed > 4	ADD{S}, ADC{S}, RSB{S}, RSC{S}, SUB{S}, SBC{S}	2	1	M	
Logical, shift by immed, noflagset	AND, BIC, EOR, ORN, ORR	1	3	I	
Logical, shift by immed, flagset	AND{S}, BIC{S}, EOR{S}, ORN{S}, ORR{S}	2	1	M	
Test/Compare, shift by immed	CMN, CMP, TEQ, TST	2	1	M	
Branch forms		+1	1	+B	1

## Notes:

1. Branch forms are possible when the instruction destination register is the PC. For those cases, an additional branch uop is required. This adds 1 cycle to the latency.

### 3.5. Move and Shift Instructions

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Move, basic	MOV{S}, MOVW, MVN{S}	1	3	I	
Move, shift by immed, no setflags	ASR, LSL, LSR, ROR, RRX, MVN	1	3	I	
Move, shift by immed, setflags	ASRS, LSLS, LSRS, RORS, RRXS, MVNS	2	1	M	
Move, shift by register, no setflags, unconditional	ASR, LSL, LSR, ROR, RRX, MVN	1	3	I	
Move, shift by register, no setflags, conditional	ASR, LSL, LSR, ROR, RRX, MVN	2	3/2	I	
Move, shift by register, setflags	ASRS, LSLS, LSRS, RORS, RRXS, MVNS	2	1	M	
Move, top	MOVT	1	3	I	
Move, branch forms		+1	1	+B	

### 3.6. Divide and Multiply Instructions

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Divide, W-form	SDIV, UDIV	5 to 12	1/12 to 1/5	M	1
Divide, X-form	SDIV, UDIV	5 to 20	1/20 to 1/5	M	1
Multiply accumulate, W-form	MADD, MSUB	2(1)	1	M	2
Multiply accumulate, X-form	MADD, MSUB	4(3)	1/3	M	2, 4
Multiply accumulate long	SMADDL, SMSUBL, UMADDL, UMSUBL	2(1)	1	M	2

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Multiply high	SMULH, UMULH	5(3)	1/4	M	5

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Divide	SDIV, UDIV	5 to 12	1/12 to 1/5	M	1
Multiply	MUL, SMULBB, SMULBT, SMULTB, SMULTT, SMULWB, SMULWT, SMMUL{R}, SMUAD{X}, SMUSD{X}	2	1	M	
Multiply accumulate, conditional	MLA, MLS, SMLABB, SMLABT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMLAD{X}, SMLS{D}{X}, SMMLA{R}, SMMLS{R}	3	1	M, I	
Multiply accumulate, unconditional	MLA, MLS, SMLABB, SMLABT, SMLATB, SMLATT, SMLAWB, SMLAWT, SMLAD{X}, SMLS{D}{X}, SMMLA{R}, SMMLS{R}	2(1)	1	M	2
Multiply accumulate accumulate long, conditional	UMAAL	4	1	I, M	
Multiply accumulate accumulate long, unconditional	UMAAL	3	1	I, M	
Multiply accumulate long	SMLAL, SMLALBB, SMLALBT, SMLALTB, SMLALTT, SMLALD{X}, SMLS{D}{X}, UMLAL	3	1	M, I	
Multiply long, all setflag, conditional and no setflag	SMULL, UMULL	3	1	M, I	
Multiply long, unconditional and no setflag	SMULL, UMULL	2	1	M	
(Multiply, setflags forms)		+1	(Same as above)	+I	3

## Notes:

- Integer divides are performed using a iterative algorithm and block any subsequent divide operations until complete. Early termination is possible, depending upon the data values.
- Multiply-accumulate pipelines support late-forwarding of accumulate operands from similar uops, allowing a typical sequence of multiply-accumulate uops to issue one every N cycles (accumulate latency N shown in parentheses).
- Multiplies that set the condition flags require an additional integer uop.
- X-form multiply accumulates stall the multiplier pipeline for 2 extra cycles.
- Multiply high operations stall the multiplier pipeline for N extra cycles before any other type M uop can be issued to that pipeline, with N shown in parentheses.

### 3.7. Saturating and Parallel Arithmetic Instructions

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Parallel arith, unconditional	SADD16, SADD8, SSUB16, SSUB8, UADD16, UADD8, USUB16, USUB8	2	1	M	
Parallel arith, conditional	SADD16, SADD8, SSUB16, SSUB8, UADD16, UADD8, USUB16, USUB8	2(4)	3/5	M, I	1
Parallel arith with exchange, unconditional	SASX, SSAX, UASX, USAX	3	1	I, M	
Parallel arith with exchange, conditional	SASX, SSAX, UASX, USAX	3(5)	3/5	I, M	1
Parallel halving arith	SHADD16, SHADD8, SHSUB16, SHSUB8, UHADD16, UHADD8, UHSUB16, UHSUB8	2	1	M	
Parallel halving arith with exchange	SHASX, SHSAX, UHASX, UHSAX	3	1	I, M	
Parallel saturating arith	QADD16, QADD8, QSUB16, QSUB8, UQADD16, UQADD8, UQSUB16, UQSUB8	2	2	M	
Parallel saturating arith with exchange	QASX, QSAX, UQASX, UQSAX	3	1	I, M	
Saturate	SSAT, SSAT16, USAT, USAT16	2	1	M	
Saturating arith	QADD, QSUB	2	1	M	
Saturating doubling arith	QDADD, QDSUB	3	1	I, M	

#### Notes:

1. Conditional GE-setting instructions require three extra uops and two additional cycles to conditionally update the GE field (GE latency shown in parentheses).

### 3.8. Miscellaneous Data-Processing Instructions

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Address generation	ADR, ADRP	1	3	I	
Bitfield extract, one reg	EXTR	1	3	I	
Bitfield extract, two regs	EXTR	3	1	I, M	
Bitfield move, basic	SBFM, UBFM	1	3	I	
Bitfield move, insert	BFM	2	1	M	

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Count leading	CLS, CLZ	1	3	I	
Move immed	MOVN, MOVK, MOVZ	1	3	I	
Reverse bits/bytes	RBIT, REV, REV16, REV32	1	3	I	
Variable shift	ASRV, LSLV, LSRV, RORV	1	3	I	

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Bit field extract	SBFX, UBFX	1	3	I	
Bit field insert/clear	BFI, BFC	2	1	M	
Count leading zeros	CLZ	1	3	I	
Pack halfword	PKH	2	1	M	
Reverse bits/bytes	RBIT, REV, REV16, REVSH	1	3	I	
Select bytes, unconditional	SEL	1	3	I	
Select bytes, conditional	SEL	2	3/2	I	
Sign/zero extend, normal	SXTB, SXTH, UXTB, UXTH	1	3	I	
Sign/zero extend, parallel	SXTB16, UXTB16	2	1	M	
Sign/zero extend and add, normal	SXTAB, SXTAH, UXTAB, UXTAH	2	1	M	
Sign/zero extend and add, parallel	SXTAB16, UXTAB16	4	1/2	M	
Sum of absolute differences	USAD8, USADA8	2	1	M	

### 3.9. Load Instructions

The latencies shown assume the memory access hits in the *Level 1* (L1) data cache.

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Load register, literal	LDR, LDRSW, PRFM	4	2	L	
Load register, unscaled immed	LDUR, LDURB, LDURH, LDURSB, LDURSH, LDURSW, PRFUM	4	2	L	
Load register, immed post-index	LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW	4	2	L, I	
Load register, immed pre-index	LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW	4	2	L, I	

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Load register, immed unprivileged	LDTR, LDTRB, LDTRH, LDTRSB, LDTRSH, LDTRSW	4	2	L	
Load register, unsigned immed	LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW, PRFM	4	2	L	
Load register, register offset, basic	LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW, PRFM	4	2	L	
Load register, register offset, scale by 4/8	LDR, LDRSW, PRFM	4	2	L	
Load register, register offset, scale by 2	LDRH, LDRSH	5	2	I, L	
Load register, register offset, extend	LDR, LDRB, LDRH, LDRSB, LDRSH, LDRSW, PRFM	4	2	L	
Load register, register offset, extend, scale by 4/8	LDR, LDRSW, PRFM	4	2	L

Preload, register offset, minus	PLD, PLDW	5	2	I, L	
Preload, scaled register offset, plus LSL2	PLD, PLDW	5	2	I, L	
Preload, scaled register offset, other	PLD, PLDW	5	2	I L	
Load multiple, no writeback, base reg not in list	LDMIA, LDMIB, LDMDA, LDMDB	N	2/R	L	1, 4, 5

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Load multiple, no writeback, base reg in list	LDMIA, LDMIB, LDMDA, LDMDB	1+ N	2/R	I, L	1, 4, 5
Load multiple, writeback	LDMIA, LDMIB, LDMDA, LDMDB, POP	1+N	2/R	L, I	1, 4, 5
(Load, all branch forms)		+1		+ B	6

## Notes:

1. Condition loads have an extra uop which goes down pipeline I and have 1 cycle extra latency compared to their unconditional counterparts.
2. The throughput of conditional LDRD is 1 as compared to a throughput of 2 for unconditional LDRD.
3. The address update op for addressing forms which use reg scaled reg, or reg extend goes down pipeline 'I' if the shift is LSL where the shift value is less than or equal to 4.
4. N is  $\text{floor}[(\text{num\_reg}+3)/4]$ .
5. R is  $\text{floor}[(\text{num\_reg}+1)/2]$ .
6. Branch forms are possible when the instruction destination register is the PC. For those cases, an additional branch uop is required. This adds 1 cycle to the latency.

### 3.10. Store Instructions

The following table describes performance characteristics for standard store instructions. Stores uops are split into address and data uops at dispatch time. Once executed, stores are buffered and committed in the background.

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Store register, unscaled immed	STUR, STURB, STURH	1	2	L, D	
Store register, immed post-index	STR, STRB, STRH	1	2	L, D	
Store register, immed pre-index	STR, STRB, STRH	1	2	L, D	
Store register, immed unprivileged	STTR, STTRB, STTRH	1	2	L, D	
Store register, unsigned immed	STR, STRB, STRH	1	2	L, D	
Store register, register offset, basic	STR, STRB, STRH	1	2	L, D	
Store register, register offset, scaled by 4/8	STR	1	2	L, D	
Store register, register offset, scaled by 2	STRH	2	3/2	I, L D	
Store register, register offset, extend	STR, STRB, STRH	1	2	L, D	

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Store register, register offset, extend, scale by 4/8	STR	1	2	L, D	
Store register, register offset, extend, scale by 1	STRH	2	3/2	I, L, D	
Store pair, immed offset, W-form	STP, STNP	1	2	L, D	
Store pair, immed offset, X-form	STP, STNP	1	1	L, D	
Store pair, immed post-index, W-form	STP	1	1	L, D	
Store pair, immed post-index, X-form	STP	1	1	L, D	
Store pair, immed pre-index, W-form	STP	1	1	L, D	
Store pair, immed pre-index, X-form	STP	1	1	L, D	

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Store, immed offset	STR{T}, STRB{T}, STRD, STRH{T}	1	2	L, D	
Store, register offset, plus	STR, STRB, STRD, STRH	1	2	L, D	
Store, register offset, minus	STR, STRB, STRD, STRH	1	2	L, D	
Store, register offset, no shift, plus	STR, STRB	1	2	L, D	
Store, scaled register offset, plus LSL2	STR, STRB	1	2	L, D	
Store, scaled register offset, other	STR, STRB	2	3/2	I, L, D	
Store, scaled register offset, minus	STR, STRB	2	3/2	I, L, D

## Notes:

1. The address update op for addressing forms which use reg scaled reg, or reg extend goes down pipeline 'I' if the shift is LSL where the shift value is less than or equal to 4.
2. For store multiple instructions,  $N = \text{floor}((\text{num\_regs} + 3) / 4)$ .

## Notes:

1. FP divide and square root operations are performed using an iterative algorithm and block subsequent similar operations to the same pipeline until complete.
2. FP multiply-accumulate pipelines support late forwarding of the result from FP multiply uops to the accumulate operands of an FP multiply-accumulate uop. The latter can potentially be issued 1 cycle after the FP multiply uop has been issued.
3. FP multiply-accumulate pipelines support late-forwarding of accumulate operands from similar uops, allowing a typical sequence of multiply-accumulate uops to issue one every N cycles (accumulate latency N shown in parentheses).

### 3.13. FP Load Instructions

The latencies shown assume the memory access hits in the Level 1 Data Cache. Compared to standard loads, an extra cycle is required to forward results to FP/ASIMD pipelines.

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Load vector reg, literal, S/D/Q forms	LDR		2	L	
Load vector reg, unscaled immed	LDUR	5	2	L	
Load vector reg, immed post-index	LDR	5	2	L, I

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
Load vector pair, immed pre-index, S/D-form	LDP	5	1	I, L	
Load vector pair, immed pre-index, Q-form	LDP	7	1	L, I	

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
FP load, register	VLDL	4	2	L	1
FP load multiple, S form	VLDLMA, VLDLMD, VPOP	N	2/R	L	1, 2, 3
FP load multiple, D form	VLDLMA, VLDLMD, VPOP	N + 2	1/R	L, V	1, 2, 3
(FP load, writeback forms)		(1)		+ I	4

## Notes:

1. Condition loads have an extra uop which goes down pipeline V and have 2 cycle extra latency compared to their unconditional counterparts.
2. N is  $\text{floor}[(\text{num\_reg}+3)/4]$ .
3. R is  $\text{floor}[(\text{num\_reg}+1)/2]$ .
4. Writeback forms of load instructions require an extra uop to update the base address. This update is typically performed in parallel with or prior to the load uop (update latency shown in parentheses).

### 3.14. FP Store Instructions

Stores Mops are split into store address and store data uops at dispatch time. Once executed, stores are buffered and committed in the background.

FP store multiple, D-form	VSTMIA, VSTMDB, VPUSH	P + 1	1/R	L, V	2, 3
(FP store, writeback forms)		(1)		+ I	4

## Notes:

1. For store multiple instructions,  $N = \text{floor}((\text{num\_regs} + 3) / 4)$ .
2. For store multiple instructions,  $P = \text{floor}((\text{num\_regs} + 1) / 2)$ .
3.  $R = \text{floor}[(\text{num\_regs} + 1) / 2]$ .
4. Writeback forms of store instructions require an extra uop to update the base address. This update is typically performed in parallel with or prior to the store uop (update latency shown in parentheses)

## Notes:

1. Multiply-accumulate pipelines support late-forwarding of accumulate operands from similar uops, allowing a typical sequence of integer multiply-accumulate uops to issue one every cycle or one every other cycle (accumulate latency shown in parentheses).
2. Other accumulate pipelines also support late-forwarding of accumulate operands from similar uops, allowing a typical sequence of such uops to issue one every cycle (accumulate latency shown in parentheses).
3. This category includes instructions of the form “PMULL Vd.8H, Vn.8B, Vm.8B” and “PMULL2 Vd.8H, Vn.16B, Vm.16B”

## Notes:

1. ASIMD multiply-accumulate pipelines support late-forwarding of accumulate operands from similar uops, allowing a typical sequence of floating-point multiply-accumulate uops to issue one every N cycles (accumulate latency N shown in parentheses).
2. ASIMD multiply-accumulate pipelines support late forwarding of the result from ASIMD FP multiply uops to the accumulate operands of an ASIMD FP multiply-accumulate uop. The latter can potentially be issued 1 cycle after the ASIMD FP multiply uop has been issued.
3. ASIMD divide and square root operations are performed using an iterative algorithm and block subsequent similar operations to the same pipeline until complete.

### Notes:

1. Adjacent AESE/AESMC instruction pairs and adjacent AESD/AESIMC instruction pairs will exhibit the performance characteristics described in Section 4.5.

### 3.21. CRC

Instruction group	AArch64 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
CRC checksum ops	CRC32, CRC32C	2	1	M	1

Instruction group	AArch32 instructions	Exec latency	Execution throughput	Utilized Pipelines	Notes
CRC checksum ops	CRC32, CRC32C	2	1	M	1

#### Notes:

1. CRC execution supports late forwarding of the result from a producer uop to a consumer uop. This results in a 1 cycle reduction in latency as seen by the consumer.

## 4 Special considerations

### 4.1. Dispatch Constraints

Dispatch of uops from the in-order portion to the out-of-order portion of the microarchitecture includes a number of constraints. It is important to consider these constraints during code generation in order to maximize the effective dispatch bandwidth and subsequent execution bandwidth of Cortex-A76.

The dispatch stage can process up to 4 Mops per cycle and dispatch up to 8 uops per cycle, with the following limitations on the number of uops of each type that may be simultaneously dispatched.

- Up to 2 uops utilizing B pipeline
- Up to 4 uops utilizing S pipelines
- Up to 2 uops utilizing M pipeline
- Up to 2 uops utilizing each of the V pipelines.
- Up to 2 uops utilizing each of the L pipelines

In the event there are more uops available to be dispatched in a given cycle than can be supported by the constraints above, uops will be dispatched in oldest to youngest age-order to the extent allowed by the above.

### 4.2. Dispatch Stall

In the event of a V-pipeline uop containing more than 1 quad-word register source, a portion or all of which was previously written as one or multiple single words, that uop will stall in dispatch for three cycles. This stall occurs only on the first such instance, and subsequent consumers of the same register will not experience this stall.

### 4.3. Optimizing General-Purpose Register Spills and Fills

Register transfers between general-purpose registers (GPR) and ASIMD registers (VPR) are lower latency than reads and writes to the cache hierarchy, thus it is recommended that GPR registers be filled/spilled to the VPR rather to memory, when possible.

### 4.4. Optimizing Memory Copy

The Cortex-A76 processor includes two load/store pipelines, which allow it to execute two 128 bit load uops and one 128 bit store uop every cycle

To achieve maximum throughput for memory copy (or similar loops), one should do the following.

- Unroll the loop to include multiple load and store operations per iteration, minimizing the overheads of looping.
- Use discrete, non-writeback forms of load and store instructions while interleaving them.
- Align stores on 16B boundary wherever possible.
- The following example shows a recommended instruction sequence for a long memory copy in AArch64 state:

Loop\_start:

```
SUBS    X2,X2,#192
LDP     Q3,Q4,[x1,#0]
STP     Q3,Q4,[x0,#0]
LDP     Q3,Q4,[x1,#32]
STP     Q3,Q4,[x0,#32]
```

```

LDP    Q3,Q4,[x1,#64]
STP    Q3,Q4,[x0,#64]
LDP    Q3,Q4,[x1,#96]
STP    Q3,Q4,[x0,#96]
LDP    Q3,Q4,[x1,#128]
STP    Q3,Q4,[x0,#128]
LDP    Q3,Q4,[x1,#160]
STP    Q3,Q4,[x0,#160]
ADD    X1,X1,#192
ADD    X0,X0,#192
BGT    Loop_start

```

A recommended copy routine for AArch32 would look similar to the sequence above but would use LDRD/STRD instructions. Avoid load-/store-multiple instruction encodings (such as LDM and STM).

## 4.5. Load/Store Alignment

The Arm v8.2-A architecture allows many types of load and store accesses to be arbitrarily aligned. The Cortex-A76 processor handles most unaligned accesses without performance penalties. However, there are cases which reduce bandwidth or incur additional latency, as described below.

- Load operations that cross a cache-line (64-byte) boundary.
- Quad-word load operations that are not 4B aligned.
- Store operations that cross a 16B boundary.

## 4.6. AES Encryption/Decryption

Cortex-A76 can issue one AESE/AESMC/AESD/AESIMC instruction every cycle (fully pipelined) with an execution latency of two cycles. This means encryption or decryption for at least two data chunks should be interleaved for maximum performance:

```

AESE   data0, key0
AESMC  data0, data0
AESE   data1, key0
AESMC  data1, data1
AESE   data0, key0
AESMC  data0, data0
AESE   data1, key1
AESMC  data1, data1
...

```

Pairs of dependent AESE/AESMC and AESD/AESIMC instructions are higher performance when they are adjacent in the program code and both instructions use the same destination register.

## 4.7. Region Based Fast Forwarding

The forwarding logic in the V pipelines is optimized to provide optimal latency for instructions which are expected to commonly forward to one another. These optimized forwarding regions are defined as follows:

Region	Instruction Types
1	ASIMD ALU, ASIMD shift and certain ASIMD Miscellaneous.
2	FP multiply, FP multiply-accumulate, FP compare, FP add/sub and certain ASIMD Miscellaneous.
3	Cryptography Extensions.

In addition to the regions mentioned in the table above, all floating point and ASIMD instructions can fast forward to FP and ASIMD stores

Exceptions to these forwarding regions are as follows:

- Fast forwarding will not occur in AArch32 mode if the consuming register's width is greater than that of the producer.
- Element sources used by FP multiply and multiply-accumulate operations cannot be consumers.
- Complex ASIMD shift by immediate/register and shift accumulate instructions cannot be producers (see section 3.14) in region 1.
- ASIMD extract narrow, saturating instructions cannot be producers (see section 3.16) in region 1.
- ASIMD absolute difference accumulate and pairwise add and accumulate instructions cannot be producers (see section 3.14) in region 1.
- For FP producer-consumer pairs, the precision of the instructions should match (single, double or half) in region 2.
- Pair-wise FP instructions cannot be producers or consumers in region 2.

The effective latency of FP and ASIMD instructions as described in section 3 is increased by one cycle if the producer and consumer instructions are not part of the same forwarding region, or if they are affected by the exceptions described above. ASIMD integer multiply/multiply-accumulate, ASIMD max/min reduction, FP divide and square root, FP convert/round and reciprocal/reciprocal sqrt estimate instructions are not subject to this behavior.

## 4.8. Branch instruction alignment

Branch instruction and branch target instruction alignment and density can affect performance. For best-case performance, consider the following guidelines.

- Avoid placing more than 4 branch instructions within an aligned 32-byte instruction memory region.
- When possible, a branch and its target should be located within the same 2M aligned memory region.

Consider aligning subroutine entry points and branch targets to 32B boundaries, within the bounds of the code-density requirements of the program. This will ensure that the subsequent fetch can maximize bandwidth following the taken branch by bringing in all useful instructions.

For loops which comprise 32 or fewer instruction bytes, it is preferred that the loop be located entirely within a single aligned 32-byte instruction memory region.

## 4.9. FPCR self-synchronization

Programmers and compiler writers should note that writes to the FPCR register are self-synchronizing, i.e. its effect on subsequent instructions can be relied upon without an intervening context synchronizing operation.

## 4.10. Special Register Access

The Cortex-A76 processor performs register renaming for general purpose registers to enable speculative and out-of-order instruction execution. But most special-purpose registers are not renamed. Instructions that read or write non-renamed registers are subjected to one or more of the following additional execution constraints.

- Non-Speculative Execution – Instructions may only execute non-speculatively.
- In-Order Execution – Instructions must execute in-order with respect to other similar instructions or in some cases all instructions.
- Flush Side-Effects – Instructions trigger a flush side-effect after executing for synchronization.

The table below summarizes various special-purpose register read accesses and the associated execution constraints or side-effects.

Register Read	Non-Speculative	In-Order	Flush Side-Effect	Notes
APSR	Yes	Yes	No	3
CurrentEL	No	Yes	No	
DAIF	No	Yes	No	
DLR_ELO	No	Yes	No	
DSPSR_ELO	No	Yes	No	
ELR_*	No	Yes	No	
FPCR	No	Yes	No	
FPSCR	Yes	Yes	No	2
FPSR	Yes	Yes	No	2
NZCV	No	No	No	1
SP_*	No	No	No	1
SPSel	No	Yes	No	
SPSR_*	No	Yes	No	

Notes:

1. The NZCV and SP registers are fully renamed.
2. FPSR/FPSCR reads must wait for all prior instructions that may update the status flags to execute and retire.
3. APSR reads must wait for all prior instructions that may set the Q bit to execute and retire.

The table below summarizes various special-purpose register write accesses and the associated execution constraints or side-effects.

Register Write	Non-Speculative	In-Order	Flush Side-Effect	Notes
APSR	Yes	Yes	No	4
DAIF	Yes	Yes	No	
DLR_ELO	Yes	Yes	No	
DSPSR_ELO	Yes	Yes	No	
ELR_*	Yes	Yes	No	

Register Write	Non-Speculative	In-Order	Flush Side-Effect	Notes
FPCR	Yes	Yes	Maybe	2
FPSCR	Yes	Yes	Maybe	2, 3
FPSR	Yes	Yes	No	3
NZCV	No	No	No	1
SP_*	No	No	No	1
SPSel	Yes	Yes	Yes	
SPSR_*	Yes	Yes	No	

## Notes:

1. The NZCV and SP registers are fully renamed.
2. If the FPCR/FPSCR write is predicted to change the control field values, it will introduce a barrier which prevents subsequent instructions from executing. If the FPCR/FPSCR write is predicted to not change the control field values, it will execute without a barrier but trigger a flush if the values change.
3. FPSR/FPSCR writes must stall at dispatch if another FPSR/FPSCR write is still pending.
4. APSR writes that set the Q bit will introduce a barrier which prevents subsequent instructions from executing until the write completes.

## 4.11. Register Forwarding Hazards

The Armv8-A architecture allows FP/ASIMD instructions to read and write 32-bit S-registers. In AArch32, Each S-register corresponds to one half (upper or lower) of an overlaid 64-bit D-register. A Q register in turn consists of two overlaid D register. Register forwarding hazards may occur when one uop reads a Q-register operand that has recently been written with one or more S-register result. Consider the following scenario.

```
VADD    S0, S1, S2
```

```
VADD    Q6, Q5, Q0
```

The first instruction writes S0, which correspond to the lowest part of Q0. The second instruction then requires Q0 as an input operand. In this scenario, there is a dependency RAW dependency between the first and the second instructions. In most cases, Cortex-A76 performs slightly worse in such situations.

Cortex-A76 is able to avoid this register-hazard condition for certain cases. The following rules describe the conditions under which a register-hazard can occur.

- The producer writes an S-register (not a D[x] scalar)
- The consumer reads an overlapping Q-register (not as a D[x] scalar)
- The consumer is a FP/ASIMD uop (not a store or MOV uop)

To avoid unnecessary hazards, it is recommended that the programmer use D[x] scalar writes when populating registers prior to ASIMD operations. For example, either of the following instruction forms would safely prevent a subsequent hazard.

```
VLD1.32    D0[x], [address]
```

```
VADD        Q1, Q0, Q2F
```

## 4.12. IT Blocks

The Armv8-A architecture performance deprecates some uses of the IT instruction in such a way that software may be written using multiple naïve single instruction IT blocks. It is preferred that software instead generate multi instruction IT blocks rather than single instruction blocks.
